Re: Comments on the Olympic Region Clean Air Agency's Preliminary Determination to Conditionally Approve Pacific Northwest Renewable Energy's Request to Construct a New Wood Pellet Manufacturing Facility at 411 Moon Island Road, Hoquiam, WA 98550

Dear Ms. Whybrew:

The National Parks Conservation Association, Earthjustice, and Olympic Park Advocates ("Conservation Organizations") submit the following comments on the Olympic Region Clean Air Agency's ("ORCAA") preliminary determination to conditionally approve Pacific Northwest Renewable Energy's ("PNWRE") request to construct a new wood pellet manufacturing facility ("Proposed Pellet Mill") at 411 Moon Island Road, Hoquiam, WA 98550. ORCAA's public notice explains that:

> If approved, the proposed facility will emit air pollution from combustion of woody biomass in an industrial furnace, from the drying of biomass feedstock, and from other wood processing activities. The facility will be a "Major Source" of air pollution [under Title V] because emissions of several air pollutants, including Oxides of Nitrogen (NO_x), Carbon Monoxide (CO), and Particulate Matter (PM), may exceed 100 tons per year or more.[1]

ORCAA's preliminary determination suggests that proposed pellet mill is not a "Major Stationary Source" as defined in 40 C.F.R. § 52.21(b) and not subject to the Prevention of Significant Deterioration ("PSD") permitting program required by WAC 173-400-700 through

[1] ORCAA Public Notice, *available at* https://www.orcaa.org/notices/notice-of-construction-pacific-northwest-renewable-energy-2/.

WAC 173-400-860.[2] ORCAA's preliminary determination further suggests that "[t]his conclusion will be assured through annual limits."[3]

As discussed in these comments, there are serious errors in the permit application and associated analysis. Contrary to ORCAA's preliminary determination, the proposed pellet mill is subject to the PSD major source construction permit requirements and case-by-case Maximum Achievable Control Technology determination air toxics requirements. Notably, using emission data collected from other wood pellet mills, the facility-wide potential to emit for several air pollutants greatly exceed the estimates in the application submitted by the permit applicant. The estimates in the table below are conservative because as discussed in these comments the permit applicant did not include all emitting sources, such as from the marine vessels, all emergency engines and other sources.

Table 1. Facility-Wide Potential Estimates: Permit Applicant's and Revised Based on Source Test Data from Wood Pellet Mills.

	VOC	**HAPs**	**CO**	**NOx**	**PM** (filterable)
Permit Applicant Estimate	67 TPY	1.32 TPY	185 TPY	230 TPY	108
Revised Estimate	215 TPY	40 TPY	493 TPY	113 TPY	108
Brief summary of the issue	The permit applicant failed to include VOC emission from: the five pellet storage silos (discussed in section I.B) and from the wet hammermills (discussed in section I.D).	The permit applicant failed to accurately and completely calculate HAP emissions. Discussed in sections I.D and I.E).	The permit applicant failed to include CO emissions from the five pellet storage silos. Discussed in section I.C.	The permit applicant applied an incorrect emission factor for calculating NOx emissions. Discussed in section II.A.	Because the proposed pellet mill is subject to PSD, fugitive emissions for PM (and the other pollutants) must also be included.

Based on the revised facility-wide potential to emit estimates, the proposed pellet mill would be:

- A major source of HAPs (and required to conduct a case-by-case Maximum Achievable Control Technology analysis)
- Trigger PSD major source requirements for CO emissions (at both the 100 TPY and 250 TPY thresholds)
- Trigger PSD major source requirements for VOCs (at the 100 TPY threshold)

[2] ORCAA, New Source Preliminary Determination to Approve, Wood Pellet Manufacturing Facility, Pacific Northwest Renewable Energy, LLC, No. 23NOC1606 (Nov. 30, 2023), at 30. ("Preliminary Determination"). (Attachment A).
[3] Preliminary Determination at 30.

- Trigger PSD major source requirements for NOx (at the 100 tpy threshold)
- Trigger PSD major source requirements for PM (at the 100 tpy threshold)

National Parks Conservation Association (NPCA) is a national organization whose mission is to protect and enhance America's National Parks for present and future generations. NPCA performs its work through advocacy and education. NPCA has over 1.5 million members and supporters nationwide, including more than 49,000 members and supporters in Washington state, with its main office in Washington, D.C., and 24 regional and field offices. NPCA is active nation-wide in advocating for strong air quality requirements to protect our parks, including submission of petitions and comments relating to visibility issues, regional haze SIPs, climate change and mercury impacts on parks, and emissions from individual power plants and other sources of pollution affecting National Parks and communities. NPCA's members live near, work at, and recreate in all the national parks and wilderness areas, including those that would be directly affected by emissions from the proposed new wood pellet mill.

Earthjustice is a non-profit public-interest environmental law organization that partners with community groups and non-profits to protect people's health, to preserve magnificent places and wildlife, to advance clean energy, and to combat climate change.

Olympic Park Advocates (OPA) is a 501(c)(3) nonprofit citizens conservation organization working to protect the beauty, integrity and biological diversity of Olympic National Park and the Olympic ecosystem. OPA was founded in 1948 to defend the Park against attacks on its spectacular old-growth rain forest valleys. Seventy-three years later, OPA's more than 240 Washington members recognize that having pristine air in Olympic National Park is necessary for the protection of this special place.

If granted, this permit would allow harmful amounts of pollution from this facility, degrading air quality in Olympic and Mount Rainier national parks and harming human health in nearby communities.

The Clean Air Act ("CAA" or "Act") requirements for new source construction are not met in PNWRE's permit application. Despite the Act's regional haze legal requirements to ensure reasonable progress at national parks and the federal and state permitting requirements for construction of new sources, PNWRE's permit application contains fundamental flaws. ORCAA must issue a denial of the request to construct unless PNWRE supplements its permit application with the missing information that complies with the legal requirements of ORCAA's regulations, the Act and federal regulations, and ORCAA and the Washington Department of Ecology require that the proposed new emissions meet all legal requirements.

Of significant concern are the proposed new air pollutant emissions that would contribute to regional haze pollution at nearby Olympic[4] and Mount Rainier National Parks[5], as well as contribute to local impacts. Olympic and Mount Rainier National Parks are designated as Class I air protection areas. National parks over 6,000 acres, like Olympic and Mount Rainier, and national wilderness areas over 5,000 acres that were in existence before August 1977 are designated as Class I areas, as defined by an amendment to the Clean Air Act. Olympic is approximately 75 km and Mount Rainier approximately 150 km in distance from the proposed

[4] Nitrogen deposition is a concern of the National Park Service at Olympic National Park ("… accumulation of nitrogen in mountain lakes influence water quality in Olympic National Park," *see* National Park Service, Olympic National Park, Environmental Factors, *available at* https://www.nps.gov/olym/learn/nature/environmentalfactors.htm. (Attachment B).

[5] "Mount Rainier National Park staff are very involved in the National Park Service's comprehensive air resources management program, designed to assess air pollution impacts and protect air quality related values. Air quality related values include scenic vistas; sensitive natural ecosystem processes, functions, and components; and cultural resources. … **Air Pollution at Mount Rainier** Mount Rainier National Park is located downwind of a number of urban and industrial areas to the northwest and southwest and is not isolated from the by-products of industrialization. Man-made air pollutants are transported long distances and have been detected through air quality monitoring programs. A number of stationary and mobile sources of pollutants affecting the park include a variety of sources in the Puget Sound region as far north as Vancouver, and as far south as Portland, Oregon. …**Visibility Impairment** Nearly two million visitors come to Mount Rainier each year to enjoy the scenery, but the view is often obscured by regional haze, especially in the summer. Haze is caused when sunlight encounters fine pollution particles in the air. Some light is absorbed by particles. Other light is scattered away before it reaches an observer. More pollutants result in more absorption and scattering of light, which reduce the clarity and color of what we see. … **Acid Deposition** As precipitation water passes through the air it reacts with carbon dioxide, sulfur oxides, and nitrogen oxides to form acids. These compounds then fall to the Earth in either dry form (such as gas and particles) or wet form (such as rain, snow, and fog). The park's lakes and streams are very sensitive to acidic deposition because the soils and bedrock cannot neutralize acids well. Acid deposition impacts aquatic organisms and ecosystems as well as terrestrial life through direct contact and by changing the chemical balance in the soil and increasing the acidity of lakes and streams. Water quality for approximately 20 of the major streams in the park have been inventoried along with approximately 48% of the park lakes. Of these, 10 stream sites have been documented as extremely sensitive, while lakes on the west and south sides of the park tend to be more sensitive. Spring snowmelt or late summer storms can cause highly acidic deposition events which can affect the aquatic ecology of these surface waters. … **Ozone** Plants can be sensitive to ozone at levels well under the national health standards for people. Lichens, mosses, and liverworts are often the most sensitive components of the vegetation within an ecosystem and can serve as early indicators of air pollution effects. Plants such as trees, shrubs, and herbaceous species are also injured by ozone which can damage leaves and needles and weaken the plants' ability to withstand disease and insect infestations. Clean air is defined as ozone concentrations ranging from 15 to 30 ppb (parts per billion). Elevated ozone levels (above 80 ppb) were measured at Longmire in the southwest section of Mount Rainier National Park during the summers of 1987 and 1988. Values above 80 ppb were not uncommon at an ozone monitor at Carbon River in the northwest corner of the park during 1989 to 1992 and there were a few readings above 100 ppb. Similar values have been measured at Tahoma Woods, while ozone levels at Paradise have, on some days, been the highest recorded in the state. High levels of ozone have also been measured in rural areas surrounding the park in Enumclaw (10 miles north of the park), Cedar River (30 miles north of the park), and Pack Forest (15 miles west of the park). Chlorotic foliar spotting on the foliage of ponderosa pine at Pack Forest has been reported and scientists hypothesized that ozone-sulfur dioxide synergism was responsible for the damage. Ozone impacts on sensitive vegetation in the Pacific Northwest have received little attention until recent years because of the relatively low levels of ozone in the area. Ozone sensitive species in Mount Rainier have recently been identified and are being monitored in selected areas. … **Air Toxics** Air Toxics is a term that includes persistent organic pollutants and heavy metals. … Air toxics also originate from local and regional sources. These contaminants … may accumulate in annual snowpack, particularly in higher elevation ecosystems. Once deposited, many pollutants, particularly persistent organic pollutants, accumulate and concentrate in foodwebs, threatening the viability of aquatic and terrestrial ecosystems. These air toxics are of particular concern because they remain in the environment a long time, can accumulate in the biological tissue of organisms, and are toxic to humans and wildlife." *Infra* n.6.

pellet mill. In addition to these parks, some of the surrounding U.S. Forest Service wilderness areas are also designated as Class I areas. Areas designated as Class I and are intended to receive the highest level of air-quality protection including being subject to the Prevention of Significant Deterioration (PSD) provisions under the Clean Air Act.[6]

Factual and Legal Background

The proposed pellet mill would be located on an approximately 60-acre parcel in the city of Hoquiam, Washington. The Proposed pellet mill is designed to produce, store, and export up to 440,800 short tons per year ("TPY") of wood pellets and is proposed to operate at least 8,000 hours per year. The proposed location is adjacent to the Willis Enterprises Moon Island Chip Mill ("Willis Enterprises") and near Terminal 3 at the Port of Grays Harbor.[7] An automated enclosed conveyor would draw pellets from the silos according to loading schedules and transport them via enclosed conveyor[8] to the neighboring Willis Enterprises' existing conveyors and marine vessel loadout facilities.[9]

ORCAA'S regulations provide that a Notice of Construction (NOC) Application is required for the Construction of any stationary source. The NOC must be approved by ORCAA, unless certain actions are involved (which do not apply the Proposed pellet mill).[10]

In order to receive approval from ORCAA, the proposed construction of the stationary source must meet certain requirements.[11] These requirements include the local/State Best

[7] Preliminary Determination at 3.

[8] Port of Grays Harbor Wood Pellet Plant, Notice of Construction Permit Application (July 2023), at 3 ("A new conveyor would transport wood pellets from the silos and connect them to the existing Willis Enterprises conveyor system located on the Willis Enterprises chip mill site. Pellets would then be conveyed to the Port of Grays Harbor Terminal 3 for loading onto vessels.") ("Permit Application"). (Attachment D).

[9] Preliminary Determination at 11. (Willis Enterprises operates under an RC2-class ORCAA registration (source number 2112, file number 647), its classification means than it has reported potential to emit greater than or equal to 30 TPY of any combination of pollutants. The existing conveyors and vessel loadout facilities owned by Willis Enterprises are under a separate air permit and already registered with ORCAA.)

[10] Excerpt from EPA-approved SIP rules for ORCAA, 40 C.F.R. part 52.2470(c) Table 6 – Additional Regulations Approved for the Olympic Region Clean Air Agency (ORCAA) Jurisdiction, *available at* https://www.epa.gov/air-quality-implementation-plans/washington-sip-epa-approved-regulations-table-6-olympic-region. (Attachment E).
ORCAA Rule 6.1 Notice of Construction Required
(a) Approval of a Notice of Construction (NOC) Application required. It is unlawful for any person to cause or allow the following actions unless a Notice of Construction application has been filed with and approved by the Agency, except for those actions involving stationary sources excluded under Rule 6.1(b) and (c):
(1) Construction, installation, or establishment of any stationary source;
(2) Modification to any existing stationary source; or,
(3) Replacement or substantial alteration of emission control technology installed on an existing stationary source.

[11] ***ORCAA Rule 6.1.4 Requirements for Approval***
(a) Attainment or Unclassified area requirements. The following requirements apply to any new stationary source or modification proposed in an attainment or unclassified area:

Available Control Technology ("State-BACT").[12] ORCAA Rule 6.1.4(a)(2) and the Washington State Implementation Plan under 40 C.F.R. part 52.2470(c), Table 6, require a finding that a new source in an attainment area will employ State-BACT for all pollutants not previously emitted. State-BACT is defined in WAC 173-400-030(13) as:[13]

> [A]n emission limitation based on the maximum degree of reduction for each air pollutant subject to regulation under chapter 70A.15 RCW emitted from or which results from any new or modified stationary source, which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of each pollutant.

Preliminary Determination at 25. Additionally, the emission limitations established through the State-BACT analysis must be met continuously.[14] The State-BACT emission limitation and compliance requirements mirror the Federal-BACT requirements for major sources.[15] *Moreover, while these comments generally focus on the flaws in "State-BACT" requirements, to the extent the proposed pellet mill is a major source for an air pollutant, the "State-BACT" issues are also relevant to the PSD BACT requirements.*

In 2001, EPA explained that it was not necessary to approve the Act's section 112(g) (case-by-case Maximum Achievable Control Technology (MACT) standards for the 188

---

(1) The proposed new stationary source or modification will comply with all applicable new source performance standards, national emission standards for hazardous air pollutants, national emission standards for hazardous air pollutants for source categories, emission standards adopted under chapter 70A.15 RCW [Washington Clean Air Act] and applicable emission standards in ORCAA's Regulations.
(2) The proposed new stationary source or modification will employ BACT for all air pollutants not previously emitted or whose emissions would increase because of the new stationary source or modification. …
(4) If the proposed project is subject to WAC 173-400-700 through 750 [Review of Major Stationary Sources of Air Pollution, PSD permits] or WAC 173-400-800 through 860 [Major Stationary Source and Major Modification in a Nonattainment Area], Ecology has issued a final permit under those programs.
(5) If the proposed new stationary source or the proposed modification will emit any toxic air pollutants regulated under chapter 173-460 WAC [CONTROLS FOR NEW SOURCES OF TOXIC AIR POLLUTANTS], the stationary source meets all applicable requirements of that program."

[13] EPA Approved Regulations in the Washington SIP, *available at* https://www.epa.gov/sites/default/files/2017-02/documents/sip-wa-approved-regulations-ecology-table2.pdf. (Attachment F).
[14] *See* ORCAA Rule 1.4 Definitions. "'Emission standard' and 'emission limitation' means a requirement established under the FCAA or chapter 70.94 RCW [this chapter of Washington State law was recodified to 70A.15 RCW[14]] which limits the quantity, rate, or concentration of emissions of air contaminants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure *continuous emission reduction* and any design, equipment work practice, or operational standard promulgated under the FCAA or chapter 70.94 RCW."
[15] WAC 173-400-710(1) adopts the federal definition of BACT by reference; *see also* "WAC 173-400-030 (29) "Emission standard," "emission limitation" and "emission limit" means a requirement established under the Federal Clean Air Act or chapter 70.94 RCW which limits the quantity, rate, or concentration of emissions of air contaminants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction and any design, equipment work practice, or operational standard promulgated under the federal Clean Air Act or chapter 70.94 RCW."

hazardous air pollutants) delegation to this local air permitting agency because the Act directly confers on the permitting authority the obligation to implement section 112(g) and to adopt a program which conforms to the requirements of EPA's regulation. Therefore, the permitting authority need not apply for approval under section 112(l) in order to use its own program to implement section 112(g).[16]

ORCAA's rules contain the requirements for processing NOC applications and where a proposed project "does not meet the applicable approval requirements in Rule 6.1.3, then a final determination to deny approval and an Order to Deny Construction will be issued…"[17]

---

[16] 66 Fed. Reg. 48,211, 48,212-48,213 (Oct. 19, 2001) ("Additionally, EPA is not delegating the regulations that implement CAA sections 112(g) and 112(j), codified at 40 CFR part 63, subpart B, to Ecology and the four local agencies. EPA recognizes that subpart B need not be delegated under the section 112(l) approval process. When promulgating the regulations implementing CAA section 112(g), EPA stated its view that "the Act directly confers on the permitting authority the obligation to implement section 112(g) and to adopt a program which conforms to the requirements of this rule. Therefore, the permitting authority need not apply for approval under section 112(l) in order to use its own program to implement section 112(g)" (see 61 FR 68397). Similarly, when promulgating the regulations implementing section 112(j), EPA stated its belief that "section 112(l) approvals do not have a great deal of overlap with the section 112(j) provision, because section 112(j) is designed to use the Title V permit process as the primary vehicle for establishing requirements" (see 59 FR 26447). Therefore, state or local agencies implementing the requirements under sections 112(g) and 112(j) do not need approval under section 112(l).")

[17] ***ORCAA Rule 6.1.2 Application Processing***

(f) Denial. If the Agency determines that a proposed project subject to approval of an NOC application does not meet the applicable approval requirements in Rule 6.1.3, then a final determination to deny approval and an Order to Deny Construction will be issued and served as provided for in these Regulations. Any Order to Deny Construction must:

(1) Be in writing;

(2) Set forth the objections in detail regarding the specific law or rule or rules of these Regulations that will not be met by the proposed project; and,

(3) Must be signed by the Executive Director of the Agency or an authorized representative.

Table of Contents

I. The Permit Application is Materially Incomplete. 10

A. The Proposed Pellet Mill Must be Classified as a Fuel Conversion Plant under the federal Clean Air Act Major Source Prevention of Significant Deterioration Permit Program. 10

B. VOC Emissions from the Five Wood Pellet Storage Silos Are Not Included in the Permit Application. 15

C. Carbon Monoxide Emissions from the Five Wood Pellet Storage Silos Are Not Included in the Permit Application. 15

D. The Permit Application Fails to Include Emissions from and Propose Controls for the VOC and HAP Emissions from the Hammermills. 16

E. The Permit Application Includes Woefully Inaccurate Emission Estimates for Hazardous Air Pollutants, Which Must be Revised and a Case-by-Case MACT Analysis Conducted. 17

F. The Calculations for NOx Emissions Must be Corrected. 18

II. The Permit Application is Missing Emitting Units and Emission Sources. 19

A. The Permit Application Fails to Disclose and Use Accurate Methodology to Estimate NOx Emissions. 19

B. The Permit Application Does Not Appear to Include NOx Emissions for Several Sources. 20

C. The Permit Application Fails to Include Maritime Vessel Emissions from the Loadout Area, which is on Adjacent Property That Would Serve the Proposed Pellet Mill. 21

D. Permit Application Fails to Include Emissions from the Transport of Finished Product from the Five Wood Pellet Silos to the Ship Loadout Area. 22

E. The Permit Application Fails to Include Any Emissions for Construction Activities. 22

III. The Permit Application Fails to Address the Act's Regional Haze Four-Factor Analysis Requirements. 23

IV. The Proposed State-BACT Determinations are Flawed and Incomplete, and the Proposed Emission Limitations Fail to Reflect State-BACT. 23

A. The Permit Applicant Must Look Beyond a Search of EPA's RACT/BACT/LAER Clearinghouse Database to Identify State-BACT Control Technologies. 23

B. The Proposed NOx Emission Limitations for the Dying Line Do Not Reflect State-BACT Requirements. 25

C. It is Unclear Whether the Proposed PM Emission Limitations for Dry Hammer Mills and Pellet Line Meet the State-BACT Requirements. 25

D. The Proposed Emission Limitations for the Emergency Generator and Fire Pump Engines Do Not Reflect State-BACT Requirements. 26

E. The Proposed SO_2 Requirements for the Drying Line Do Not Reflect State-BACT Requirements. 26

F. State-BACT Determinations Must be Included for the Missing Emitting Units and Emission Sources. 26

G. State-BACT Emission Limitations are Continuous Requirements and All Operating Scenarios Must Have State-BACT Determinations. 27

V. The Proposed Conditions of Approval Authorize Bypass of the Air Pollution Controls, Unlawfully Excusing the Proposed Pellet Mill from Continuous Compliance with Case-by-Case Maximum Achievable Control Technology (MACT). 28

VI. The Permit Applicant Must Prepare and Submit a Permit Application to the Department of Ecology for PSD BACT for CO and CO_2e Emissions. 29

VII. The Permit Application Contains Deficient and Inaccurate Ambient Air Modeling. 29

A. The Permit Applicant Must Correct the Missing and Inaccurate Information and Rerun the AERMOD Model Using the Current Model Version. 29

B. Ambient Air Background Concentration Data Used Does Not Represent Current Conditions. 30

C. The Permit Application Fails to Include Modeling Runs for the Range of Operating Conditions. 31

VIII. The Draft Approval Order's Terms and Conditions are Insufficient to Ensure Compliance with the Clean Air Act. 32

A. The Final Approval Order Must Contain When and How Often Stack Testing is Required. 32

B. The Approval Conditions Must Include Detailed Reporting Requirements. 34

C. ORCAA Must Remove the Provisions that Provide for Director's Discretion. 35

D. ORCAA Must Require Implementation of Source-Specific Fugitive Dust Requirements. 35

E. The Opacity Monitoring is Not Effective to Detect and Remedy Excess Emissions. 36

F. The Proposed Approval Conditions Are Utterly Devoid of a Mechanism to Monitor Facility-Wide Emissions and Compliance with PTE Limits. 38

IX. ORCAA Cannot Rely on the Project's Invalid Determination of Non-Significance to Meet its SEPA Obligations. 39

A. Legal Requirements. 39

B. The DNS Air Emission Calculations Are Wrong. 40

C. The DNS Did Not Disclose and Consider All Climate Impacts From Greenhouse Gas Emissions. 40

D. ORCAA Must Deny the NOC Application and Undertake Its Own Full SEPA Review of the Project's Air Emissions. 41

Conclusion 41

I. The Permit Application is Materially Incomplete.

A. The Proposed Pellet Mill Must be Classified as a Fuel Conversion Plant under the federal Clean Air Act Major Source Prevention of Significant Deterioration Permit Program.

The major source Prevention of Significant Deterioration ("PSD") permit requirements applicable to the proposed pellet plant are found in WAC 173-400-700 through 173-400-860. The State's PSD requirements, just like federal PSD regulations in 40 C.F.R. § 52.21, adopt by reference the definition of "major stationary source" in 40 C.F.R. § 51.21(b), which contains the list of 28 source categories for which the major source emissions threshold is 100 tons per year (TPY) of any individual regulated new source review (NSR) pollutant.[18] Sources not listed have a major source emissions threshold of 250 TPY. The relevant category on the list of 28 is "fuel conversion plant." EPA's regulations do not include a definition of "fuel conversion plant" nor do the State's.

The permit applicant and ORCAA suggest that wood pellet production is not among the 28 listed categories, and therefore the threshold for PSD applicability is 250 TPY and fugitive emissions are not included for comparison to the major-source threshold.[19] Neither the ORCAA nor the permit applicant provide any discussion or rationale for the assertion that none of 28 categories apply. ORCAA further suggests that "[t]his conclusion will be assured through annual limits. "[20] Neither the permit applicant nor ORCAA addressed the question of whether the proposed pellet plant should be considered a "fuel conversion plant" – one of the 28 listed categories – for PSD applicability purposes. As the agency in the State responsible for implementing EPA PSD permit program, Washington must reasonably interpret and apply the PSD regulations. Based on the below analysis, the pellet plant operations (and emissions units) associated with the process change of solidifying the wet woody biomass into pellets constitutes a fuel conversion plant.

Classifying the process of converting wood from one form to another as a process covered by "fuel conversion plants" is consistent with EPA's statement in the Cleveland Electric memo.[21] At the plant in question, Cleveland Electric proposed to produce fuel gas by means of gasifying municipal waste. EPA concluded that this process qualified as a fuel conversion plant and made the following statement: "Fuel conversion plants obviously include those plants which accomplish a change in state (e.g., solid to liquid to gas) for a fuel. This definition includes conversion of the following fuels: fossil (e.g., coal or oil shale); biomass (e.g., wood or peat);

[21] EPA Memorandum from Edward J. Lillis, Chief Permits Programs Branch, AQMD, to George T. Czerniak, Chief Air Enforcement Branch, Region V, Applicability of Prevention of Significant Deterioration (PSD) and New Source Performance Standards (NSPS) to the Cleveland Electric, Incorporated, Plant in Willoughby, Ohio (May 26, 1992), *available at* https://www.epa.gov/sites/default/files/2015-07/documents/clvlndel.pdf. ("Cleveland Electric Memo") (Attachment H).

and anthropogenic (e.g., municipal waste derived fuel and inorganic fuel). The majority of such sources are likely to accomplish these changes through either gasification, liquefaction, or solidification. .. . Generally, however, applicability for this source category is determined by whether a facility changes state (e.g., solid to gas) or form (e.g., process sawdust into a pellet) of a fuel"[22] and the change is permanent, not temporary.[23]

The proposed wood pellet mill is a "fuel conversion plant" under the PSD regulations. First, the proposed processes at the wood pellet mill would convert the wet raw wood material to a solid form, the pellets, which changes the state of the wood.[24] Moreover, in the drying line, natural gas, diesel, and propane are used as fuels for the furnace and hog fuel (wood bark) would be burned to produce energy for drying the wet raw wood material. Natural gas would be burned for RTO. The RCO for the four dry hammer mills and pellet coolers would burn natural gas. The essential features of the pellet mill use a process and change material from a wet, raw material to a solid form. The solidification processes that would be used to create the pellets also would use natural gas, diesel, and propane to start the furnace process, wood to fuel the furnace, and natural gas to power the control air pollution emissions at the RTO and RCO.

This interpretation is also consistent with EPA's statements in its July 31, 2003 letter.[25] In that analysis, while EPA communicated that the change in state in that instance was from a liquid to a gas, it concluded that the plant at issue was not a fuel conversion plant because the vaporization of liquid natural gas occurs without the need for chemical or process change. The permit applicant's process here of converting wet woody biomass to a solid form – the wood pellets – would not occur without a process, such as that proposed by the permit applicant. Moreover, in the 2003 letter, EPA provided a list of the types of fuel conversion plants under the

Foster, Jr., Director, Air and Hazardous Materials Division, U.S. EPA Region IV, "Clarification of Sources Subject to Prevention of Significant Deterioration (PSD) Review" at 1 (Jan. 20, 1976), *available at* https://www.epa.gov/sites/default/files/2015-07/documents/phosphat.pdf (Explaining that "Fuel conversion plants are defined for purposes of PSD as those plants which accomplish a change in state for a given fossil fuel. The large majority of these plants are likely to accomplish these changes through coal gasification, coal liquefaction, or oil shale processing.") (Attachment J). Notably, EPA Memorandum did not say "all" of the fuel conversion plants accomplish the changes through the examples provided.); *see also* "Cleveland Electric Memo", at 3, ("The production of low heat value fuel gas at the Cleveland Electric facility also classifies the source as a fuel conversion plant. Fuel conversion plants obviously include those plants which accomplish a change in state (e.g., solid to liquid to gas) for a fuel. This definition includes conversion of the following fuels: fossil (e.g., coal or oil shale); biomass (e.g., wood or peat); and anthropogenic (e.g., municipal waste derived fuel and inorganic fuel). The majority of such sources are likely to accomplish these changes through either gasification, liquefaction, or solidification. The category of fuel conversion plants may include, but is not limited to, some types of sources within standard industrial classifications 1311, 2819, 2969, 2421, and 2999. Generally, however, applicability for this source category is determined by whether a facility changes the state (e.g., solid to gas) or form (e.g., process sawdust into a pellet) of a fuel. Therefore, the Cleveland Electric facility fits into the fuel conversion plant category as well.")

[25] EPA Memorandum from Racqueline Shelton, Group Leader, Integrated Implementation Group, to Guy Donaldson, Acting Chief, Air Permits Section, EPA Region 6, Request for Guidance on the Definition of Fuel Conversion Plants for Purposes of Prevention of Significant Deterioration (PSD) (July 31, 2003), *available at* https://www.epa.gov/nsr/guidance-definition-fuel-conversion-plants. (Attachment K).

PSD regulations and the list included "coal gasification, oil shale processing, conversion of municipal waste to fuel gas, processing of sawdust into pellets."[26]

The legislative history regarding the addition of "fuel conversion plant" to the definition of "major emitting facilities" shows that EPA recommended adding fuel conversion plants when the source category was added as one of the 100 TPY major source categories in the Clean Air Act Amendments of 1977. Yet the amendments did not include a definition for this source category. Rather, the legislative history made a one passing reference to the coal gasification, coal liquefication, and oil share processing "etc." to provide examples of the types of facilities that would be included.[27]

Wood is a type of fuel used in a wide variety of stationary source combustion activities. For example, the 1977 legislative history shows that when EPA reported to congress in how it collected emission inventory information from combustion activities at stationary sources, air pollutant emissions were reported by the type of fuel used in different applications.[28] Indeed, the use of wood as a fuel was included as a category for which emission inventory information was reported to EPA in all three areas of the stationary source combustion activities (residential, commercial and institutional, and industrial). Additionally, when the National Academy of Sciences provided its Report to congress during the 1977 legislative session, it explained that

---

[26] *Id.* at 1-2.

[27] The legislative history is also instructive in considering whether the proposed wood pellet mill should be classified as a "fuel conversion plant." In August 1977, Congress adopted the Clean Air Act Amendments of 1977 with the statutory PSD section. The 1977 amendments included the PSD 100 TPY / 250 TPY two-tier concept in the definition of "major emitting facilities" along with a list of the source categories having a 100-TPY PSD major source threshold. EPA developed a list of 19 source categories to include in the list of sources subject to the 100-TPY threshold and EPA's list was an extract from the Research Corp. of New England, which had listed 190 types of sources. The "committee took 28, be printed in the RECORD at this point as an illustration of what the committee examined and the kinds of sources the committee intended to include and exclude…" 1976 WL 162302 (CAA77), 18, A&P 122 Cong. Record S12775, S12782] 1977 WL 173804 (CAA77), 1977 WL 173804 (CAA77), 20 (Aug. 2, 1976). Of the categories listed, 17 that were covered by EPA's regulation included the largest emitters of SO_2 and TSP on a nationwide basis at that time. The legislative history explains that the "fuel conversion plants, are fuel conversion plants (coal gasification and liquefication, oil shale processing, etc.) were included due to their significant growth potential…" 1977 WL 173804 (CAA77), 20 (Aug. 2, 1976), citing *Technical Support Document--EPA Regulations for Preventing the Significant Deterioration of Air Quality,* U.S. Environmental Protection Agency, Office of Air Quality Planning & Standards (Jan. 1975), at 27-28.; The listed categories included fuel conversion plants, but without any definition of the term. 42 U.S.C. § 7479(1). Pub.L. 95-95, Title I, § 127(a), Aug. 7, 1977, 91 Stat. 740.

[28] The legislative history includes two citations to the EPA Federal Register notice summarizing emission inventory data for fuel used in residential, commercial and institutional, and industrial applications. In all three applications, one of the types of fuel identified was "wood" (For the types of fuel used in residential applications, and commercial and institutional, EPA's emission inventory included: Anthracite Coal, Bituminous Coal, Distillate Oil, Residual Oil, Natural Gas, Wood, and Other. For the types of fuel used in industrial applications, EPA's emission inventory included: Anthracite Coal, Bituminous Coal, Coke, Distillate Oil, Residual Oil, Natural Gas, Wood, and Other.); 1971 WL 120521 (CAA77), 24, A&P CAA77 HEARINGS (20) (Part 7 OF 7), 514, citing APPENDIX D. (POLLUTANT) EMISSIONS INVENTORY SUMMARY, (EXAMPLE REGIONS AND WHERE EMISSION LIMITATIONS ARE DEVELOPED) ______________ AIR QUALITY CONTROL REGION--DATA REPRESENTATIVE OF CALENDAR YEAR; *see also* 1972 WL 121321 (CAA77), 62, A&P CAA77 HEARINGS (27B) (Part 6 OF 6), 883, citing FEDERAL REGISTER, VOL. 36, NO. 158-AUG. 14, 1971, Appendix D--(Pollutant) Emissions Inventory Summary, tons/yr. (or metric tons/yr.) (Example Regions) ________________________ Air Quality Control Region Data Representative of Calendar Year ___." (emphasis added).

"[t]he primary emissions for stationary sources are from fuel combustion" and included in the list of fuels used during combustion was "wood waste."[29] From the 1977 legislative history it is clear that "wood" and "wood waste" were considered a type of fuel.

Furthermore, it appears the only location in the 1977 legislative history where "fuel conversion plants" were referred to "fossil fuel conversion plants" was in testimony discussing the then "shortages in low-sulfur liquid fuel" and because of the shortages a particular category of conversion plants had "become increasingly dependent on coal to generate electricity."[30] Thus, it logically follows that in addition to the examples of "coal gasification," "coal liquefaction" and "oil shale processing" that fuel conversion plants must also include other sources used for fuel, notably wood.

Congress explicitly identified the major source category relevant here in the definition of "major emitting facility" as "fuel conversion plant." The major source category was neither identified as fossil fuel conversion plants nor is there anything in the legislative history to suggest congress intended that the category include only those plants that convert fossil fuels.[31]

Since EPA's proposed PSD regulations in 1973, to the list of source categories that is used today, the "fuel conversion plant" category has never been defined.[32] This list (still without

(Attachment M).

[32] When EPA added the term "major stationary source" to its PSD regulations it adopted the source categories from the Act, it did not add definitions. Prior to 1977 amendments to the Clean Air Act, EPA's 1973 proposed PSD regulations listed 16 source categories, that list did not include fuel conversion plants. 38 Fed. Reg. 18,986 (July 16, 1973). EPA's 1974's preamble that proposed amendments to PSD regulations mentioned that the list of sources subject to the permit program had been expanded to include the "fuel conversion plants" and noted that that source type include sources "such as coal gasification and oil shale plants." 39 Fed. Reg. 31,000, 31,003 (Aug. 27, 1974). EPA's statement was in a proposed action and thus not a final agency action. Furthermore, EPA's 1974 preamble statement "such as" merely provided examples of the types of sources that could be included as fuel conversion plants, it was neither limiting the types of fuel covered nor a definition. EPA promulgated the first set of PSD regulations in 1974 and these regulations contained "fuel conversion plants" as a listed source category but EPA did

a definition for fuel plant conversion) remains in current federal PSD regulated and is adopted by reference in the current Washington State PSD regulations.

ORCAA does not have authority to interpret and implement the PSD regulations. The PSD regulations applicable to wood pellet plant are in the SIP regulations that EPA approved for the Washington Department of Ecology to implement.[33] The PSD regulations are not part of ORCAA's EPA-approved SIP regulations. Notably, ORCAA Rule 1.4 explicitly explains that the local permitting agency does not have authority to implement the PSD regulations:

> **"Prevention of Significant Deterioration (PSD)"** means the program in WAC 173-400-700 to 173-400-750. Ecology is responsible for the PSD program for stationary sources in ORCAA's jurisdiction.

Instead, the PSD regulations fall under the Washington Department of Ecology's jurisdiction. Thus, ORCAA does not have authority to interpret the PSD regulations and answer the question of whether the proposed plant is a "fuel conversion plant." Furthermore, as discussed below, several of the regulated NSR pollutants exceed the 100 TPY threshold and at least one exceeds the 250 TPY threshold. Therefore, the permit applicant must seek a PSD permit from the State for this major stationary source under either the 100 or 250 TPY threshold. If ORCAA attempts to create emission limitations and associated monitoring, recordkeeping and reporting requirements to allow the proposed pellet mill to escape major source PSD permitting, ORCAA must nevertheless defer to the State in responding to this significant question raised during the public comment period of whether the proposed pellet mill constitutes a "fuel conversion plant." The State's proposed determination must be subject to the State's notice and comment process.

In addition to ORCAA's mischaracterization of the proposed pellet mill, as discussed below, the proposed approval order terms are not adequate to create synthetic minor emission limits and fail to include the required monitoring, recordkeeping and reporting requirements necessary for practical enforceability. Moreover, the permit applicant has not accurately calculated many of the air pollutants, including carbon monoxide ("CO") emissions. Using the correct emission factor from the stack test at another wood pellet mill, the potential criteria pollutant CO emissions exceed the 250 TPY PSD thresholds. Additionally, applying the 100 TPY PSD threshold, PM, NOx and VOC would be triggered for PSD review, along with greenhouse gases. ORCAA must deny the permit application. The permit applicant must apply to Washington for a PSD permit.

In summary, ORCAA lacks authority to consider and respond to this comment. It must defer to the State of Washington. Based on the above analysis the proposed wood pellet plant must classified as a fuel conversion plant because the proposed wood pellet plant would a process to solidify the wet woody biomass to the solid pellet form.

---

not define the term. 39 Fed. Reg. 42,510, 45,516 (Dec. 5, 1974). In 1978, EPA promulgated the PSD regulations, which were pursuant to the Clean Air Act Amendments of 1977, and subsequently amended them in August 1980 in response to *Alabama Power Company v. Costle,* 636 F.2d 323 (D.C. Cir. 1979). The 1980 PSD regulations contained the 100-tpy source category list with fuel conversion plants as one of the categories but without a definition.

[33] WAC 173-400-700 to 173-400-750, *supra* n.13.

B. VOC Emissions from the Five Wood Pellet Storage Silos Are Not Included in the Permit Application.

The permit application does not include any VOC emissions from the silos that will store wood pellets. Thus, the permit application's State-BACT analysis ignores VOC emissions from the storage silos,[34] does not establish a State-BACT emission limit, and underestimates the proposed pellet mill's true potential to emit of VOCs. This is in contrast to existing source testing for wood pellet storage silos, conducted by the State of Georgia at the Georgia Biomass wood pellet plant.[35] The State of Georgia permitting agency, Georgia Environmental Protection Division ("Georgia EPD") formulated an emission factor for wood pellet storage and handling of 0.4 lb/ oven dried tons (ODT), which the agency requires wood pellet plants to use in calculating PTE, with limited recent exception.[36] This emission factor is based on direct emissions testing of the wood pellet storage silos at Georgia Biomass, an 825,000 TPY wood pellet plant located in Waycross, Georgia.[37] Based on the Georgia EPD emission factor, an additional 88 TPY of VOC emissions must be added to the proposed pellet mill's facility-wide emission inventory for the emissions from the five pellet silos (EP-10, EP-11, EP-12, EP-13 and EP-14), a State-BACT analysis conducted, and an emission limit established for the VOC emissions from the five pellet storage silos.[38] Thus, the revised estimate of facility-wide VOC should be 155 TPY. If the permit applicant wishes to use a lower emission factor, it can only do so after providing adequate justification, supported by credible evidence, demonstrating that the planned silos are not capable of emitting at the same rate as those tested at Georgia Biomass.

C. Carbon Monoxide Emissions from the Five Wood Pellet Storage Silos Are Not Included in the Permit Application.

According to the permit application, the proposed pellet mill's five pellet storage silos will not emit any carbon monoxide (CO).[39] This conclusion, however, contradicts numerous studies conducted over the past decade demonstrating that bulk storage of wood pellets is a significant source of CO emissions.[40] Tragically, numerous real-world incidents have confirmed

Hyg., No. 4, 339-349 (2004) (Attachment Q); Lydia Soto-Garcia, *et al.*, *Exposures to Carbon Monoxide from Off-Gassing of Bulk Stored Wood Pellets*, Center for Air Resources Engineering and Science, Clarkson University, Energy Fuels, 29, 218-226 (2015) (Attachment R); Mohamad Arifur Rahman, *et al.*, *Carbon Monoxide Off-Gassing From Bags of Wood Pellets*, 62 Annals of Work Exposures and Health, Issue 2, 248-252 (Dec. 25, 2017) (Attachment S) ("Rahman, *et al.*"); Jaya Shankar Tumuluru, *et al., Analysis on Storage Off-Gas Emissions From Woody, Herbaceous, and Torrefied Biomass*, 8 Energies 1745, 1751 (March 2, 2015) (Attachment T); Xingya Kuang, *et al.*, *Rate and Peak Concentrations of Off-Gas Emissions in Stored Wood Pellets—Sensitivities to Temperature, Relative Humidity, and Headspace*, 53 Ann. Occup. Hyg., No. 8,

this, with at least 14 fatal accidents due to carbon monoxide poisoning from bulk wood pellet storage since 2002.[41] The danger is so high that the New York State Department of Health has recommended that "signs should be posted at [wood pellet] storage areas to warn everyone about potential carbon monoxide hazards."[42]

Most critically, in terms of an emission factor, one study found that softwood pellets stored at 35º C (95º F) for two days had an emission factor of approximately 0.7 g/kg, which equates to 1.4 lb/ton of pellets.[43] This emission factor produces an emission rate at the proposed pellet mill of 308 tons of CO per year, well over either of PSD major-source thresholds (100 or 250) TPY. Wood pellets stored in silos frequently reach and maintain temperatures well above 35º C even when ambient temperatures are much lower, meaning this emission factor is likely applicable nearly year-round.

The additional CO emissions of 308 TPY must be added to the proposed pellet mill's facility-wide emission inventory estimate for CO of 185 TPY, a major source PSD BACT analysis conducted, a permit application submitted to the Washington Department of Ecology, and either an emission limit established by Washington Department of Ecology for the CO emissions from the five pellet storage silos or an approval order denial issued. Because ORCAA does not have authority to act on sources with potential to emit at levels subject to the major source PSD regulations, it must defer to the Washington Department of Ecology's determination for the CO emissions from the proposed pellet mill.

D. The Permit Application Fails to Include Emissions from and Propose Controls for the VOC and HAP Emissions from the Hammermills.

As discussed in the letter from SELC, the permit applicant proposes to operate wet (aka green) hammermills that will not be vented to any VOC controls.[44] Moreover, the permit applicant improperly listed these hammermills as not emitting any VOCs or HAPs. Most comparable wood pellet mills vent these units to the furnace or dryer RTO for VOC and HAP control. Furthermore, emission stack tests on uncontrolled wet hammermills[45] show the proposed wet hammermills will likely emit up to 60 tons of VOCs and six tons of HAPs (in addition to the emission rates calculated elsewhere in these comments). These emissions and controls must be included in a revised permit application.

E. The Permit Application Includes Woefully Inaccurate Emission Estimates for Hazardous Air Pollutants, Which Must be Revised and a Case-by-Case MACT Analysis Conducted.

As discussed in the comment letter submitted from SELC to ORCAA,[46] the permit application estimates plant-wide hazardous air pollutants ("HAP") at 1.32 TPY,[47] relying on EPA AP-42 emission factors that are specific to wood pellet plants and other inappropriate emission factors. This estimate is woefully inaccurate. The HAP pollutant emissions are of concern to NPCA not only because of the potential adverse impacts to the adjacent residential community and nearby elementary, middle and high schools (the proposed pellet mill is within a mile and a half of Emerson elementary school, Hoquiam middle school and Hoquiam high school), but because the HAPs that would be emitted at the greatest quantifies by the proposed pellet mill are also characterized as VOCs. By volume, the most significant HAPs emitted are all also VOCs, and include the following:

- Acrolein
- Acetaldehyde
- Formaldehyde
- Methanol
- Phenol
- Propionaldehyde

These particular VOC pollutants impact regional haze at the National Parks. Moreover, the National Park Service expresses concerns regarding the impacts of air toxic pollution at Mount Rainier National Park.[48]

Reliance on emissions factors is problematic because the EPA AP-42 emission factors do not reliably predict emissions from specific sources and should not be used to establish or demonstrate compliance with approval order limits. The emission factors were developed to provide *approximations* of average emissions from certain kinds of activities and equipment and were not intended to be used for permitting and enforcement.[49] Consequently, EPA has repeatedly cautioned that the AP-42 factors "are not likely to be accurate" and thus "[u]se of these factors as source-specific permit limits … is not recommended by EPA."[50]

---

[46] SELC Letter.
[47] Permit Application, Appendix C at PDF 4.
[48] *See supra* n.5.
[49] EPA, A-42, *available at* https://www.epa.gov/system/files/documents/2024-01/introduction_2024.pdf. EPA explains that an AP-42 emission factor is "a representative value that attempts to relate the quantity of a pollutant released to the atmosphere with an activity associated with the release of that pollutant. These factors are usually expressed as the mass of the pollutant divided by a unit mass, volume, distance, or duration of the activity emitting the pollutant (e.g., kilograms of particulate matter emitted per megagram of coal burned). Such factors facilitate estimation of emissions from various sources of air pollution. In most cases, these factors are simply averages of all available data of acceptable quality, and are generally assumed to be representative of long-term averages for all facilities in the source category (i.e., a population average)." AP-42 (2024), Introduction at 1 (underlining in original), *available at* https://www.epa.gov/sites/default/files/2020-09/documents/c00s00.pdf.
[50] EPA, Reminder About Inappropriate Use of AP-42 Emission Factors, Publication No. EPA 325-N-20-001 at 1, (Nov. 2020) ("EPA AP-42 Enforcement Alert"), *available at* https://www.epa.gov/sites/default/files/2021-01/documents/ap42-enforcementalert.pdf.

The recent permit application for a proposed pellet mill in Longview ("Proposed Longview Pellet Mill") of similar size (450,00 oven dry metric tons (ODMT)/yr) submitted to Washington's Southwest Clean Air Agency includes a plant-wide HAP emission inventory of 48.90 TPY for all HAPs, and 22.55 TPY for the maximum of a single HAP.[51] The Proposed Longview Pellet Mill application explains that "HAP/TAP [toxic air pollutants under State law][52] and VOC emissions from the hammermills and pelletizers were updated [in the permit application] to use stack test data from a representative site, the ABE Facility in Gloster, MS." [53] The permit applicant further explained that it used "HAP/TAP emissions from the dryer use stack test data from the ABE Facility to supplement the AP-42 factors used in the Application." Furthermore, the permit applicant added "[a] safety factor of 25% … to the emission factors for conservatism … [all of which] … resulted in additional HAP/TAP being included in the emission calculations."[54]

The permit applicant for the proposed pellet mill must supplement its permit application with accurate HAP/TAP and VOC emission calculations, following the methodology used at the Proposed Longview Pellet Mill. Once the emission estimates are updated, the proposed pellet mill must be classified as a major source of HAPs under the federal Clean Air Act. The permit applicant must conduct the case-by-case MACT analysis required under the federal Clean Air Act. The permit applicant must also use the corrected emission inventory of TAP emissions rerun the TAP model analysis required by State law.[55]

F. The Calculations for NOx Emissions Must be Corrected.

The permit applicant erred in calculating the emission factor for NOx for the furnace emissions estimated for drying line emissions based on 52 lbs/hour for total PTE of 227.8 TPY.[56] This emission factor is based on the amount of wood in the dryer. This is improper; NOx is a product of combustion, and therefore the amount of wood being dried is not directly correlated to NOx emissions. In terms of the Enviva Greenwood testing,[57] the wood pellet furnace there operated at an average heat input of 135 MMBtu/hr during the testing,[58] and emitted NOx at a rate of 18.5 lb/hr.[59] Based on the emission testing at the Enviva Greenwood pellet mill, the proper emission factor therefore is 0.137 lb/MMBtu, not the 52 lbs/hour suggested by the permit applicant.

---

[51] Letter from Jennifer Pohlman, Senior Consultant, Trinity Consultants, to Danny Phipps, Air Quality Engineer 1, Southwest Clean Air Agency, Completeness Determination for ADP Application CO-1057 dated August 25, 2022 (March 29, 2022) at PDF 18. (Attachment AA). ("SWCAA Letter").

[52] Preliminary Determination at 28 ("The Air Toxics Rule provides a multi-tiered, screening approach under WAC 173-460-080 to assess health impacts and demonstrate compliance with the ambient impact requirement under WAC 173-460-070, which is that TAP increases must be sufficiently low to protect human health and safety from potential carcinogenic and/or other toxic effects.")

[53] SWCAA Letter at PDF 2.

[54] SWCAA Letter at PDF 2.

[55] Preliminary Determination at 2, 28-30.

[56] Permit Application, Appendix C, Table C-8a at PDF 14.

[57] Air Control Techniques, Air Emissions Test Report for Enviva Pellets Greenwood, at 20 (April 4, 2019) (Attachment BB) ("Enviva Greenwood Test Report").

[58] *Id.* at Appendix IG: Process Data, Table 4 at 212.

[59] *Id.* at 20.

The Preliminary Determination explains that the furnace will combust hog fuel to provide heat for the dryer and will have a maximum heat input capacity of 164.81 MMBtu/hr,[60] and the conditions of approval allow for heat rate at the furnace of 165 MMBtu/hr.[61] Based on the heat input, the furnace at the proposed pellet mill will emit 113 TPY of NOx.[62] The permit applicant must include all sources of NOx (*i.e.*, Regenerative Catalytic Oxidizer (”RCO”) emissions from the dry hammermill and pellet cooler (5.8 MMBtu/hr gas consumption[63]), Regenerative Thermal Oxidizer (“RTO”) emissions (20.2 MMBtu/hr gas consumption[64]), all emergency engines (e.g., emergency generators and fire water pumps), the marine vessels, and any other combustion sources not yet disclosed (e.g., propane vaporizer) at the proposed pellet mill and recalculate the total TPY of NOx.

II. The Permit Application is Missing Emitting Units and Emission Sources.

Once the missing emission units are added and the emission estimates corrected, ORCAA must re-evaluate applicability of the Act’s requirements. Once emissions from the missing emission units are added and the emission estimates corrected, ORCAA must evaluate applicability of the Act’s requirements, as well as whether the proposed pellet mill exceeds major source thresholds. ORCAA must provide the public with an opportunity to review and comment on the new information, or, if the proposed pellet mill exceeds major source thresholds, defer permitting authority to the Washington Department of Ecology.

A. The Permit Application Fails to Disclose and Use Accurate Methodology to Estimate NOx Emissions.

Proposed potential facility-wide NOx emissions are projected at 230 TPY from three emission units:

- Drying line (EP-04) (227.76 TPY)
- Emergency generator (GEN-01) (0.17 TPY)
- RCO at the dry hammer mill and pellet cooler (EP-08) (1.82 TPY)[65]

This projection is of concern because it is close to the threshold for PSD major source permitting, which is 250 TPY. The permit application fails to provide the supporting documentation necessary for the public to review and comment on the emission estimate for the drying line. For the projected 227.76 TPY from the drying line, the permit application indicates

[60] Preliminary Determination at 7.
[61] *Id.* at 33, (Recommended Conditions of Approval ¶ 2).
[62] We calculate this as follows: (0.137 lb/MMBtu * 1,650,000 MMBtu/year) / 2000 lbs/ton = 113 TPY of NOx from the furnace, while the remainder of known emissions from the proposed pellet mill would emit 17 TPY NOx (0.137 lb/MMBtu * (58,000 MMBtu/hr RCO + 20,200 MMBtu/hr RTO), for a total of 130 TPY NOx. This facility-wide NOx emission estimate does not include emissions from the emergency engines (because it appears the permit applicant did not include all the engines and did not use the BACT assumptions) and the permit applicant did not include NOx emissions from the marine vessels.
[63] Preliminary Determination, at 34, (Recommended Conditions of Approval ¶ 2).
[64] Preliminary Determination, at 33, (Recommended Conditions of Approval ¶ 2).
[65] Permit Application, Appendix C, Table C-1 at PDF 3.

that the "[e]mission rates are based on vendor data,"[66] however, there is neither a citation to where that vendor data can be located in the application nor does our review of the application find any vendor data. The public must be provided access to the "vendor data" in order to review and comment. The permit applicant must supplement the application with this missing information so that the public can fully evaluate the accuracy of the potential to emit estimate.

For emissions from the emergency generator, the permit application indicates that emissions are based on "EPA Tier 3 emission standards."[67] As discussed below, the Tier 3 engines are not representative of BACT controls.

Finally, the permit application explains that the projected emissions of 1.82 TPY NOx from the RCO at the dry hammer mill and pellet cooler were estimated based on EPA's AP-42 emission factors,[68] and the application used the emission factor for "Residential Furnaces" to estimate these emissions. The RCO is not a residential furnace, and the permit applicant does not explain why this generic emission factor for residential emission units is representative of emissions from the units at the proposed pellet mill. Furthermore, as discussed above, the permit applicant's reliance on emissions factors is problematic because AP-42 emission factors do not reliably predict emissions from specific sources and should not be used to establish or demonstrate compliance with approval order limits. EPA's 2020 Enforcement Alert further explained AP-42 emission factors should not be used to establish or determine compliance with source-specific emission limits because of impacts to 1-hour and short-term National Ambient Air Quality Standards (NAAQS).[69]

B. The Permit Application Does Not Appear to Include NOx Emissions for Several Sources.

The permit application does not appear to include estimates for NOx emissions from the combustion of gas in the estimates for the Dryer RTO.[70] Notably the emission estimates for those emission units include break-out tables for other pollutants that are created from combustions of gas (SO_2 and N_2O), however, NOx emissions are not identified and included in those tables. NOx emissions from combustion of gas must be added or the permit applicant must explain how they are included in the overall total estimate.

---

[66] Permit Application, Appendix C, Table C-8a at PDF 14.
[67] Permit Application, Appendix C, Table C-12a at PDF 21.
[68] Permit Application, Appendix C, Table C-9a at PDF 17 ("Combustion emission factors are from AP-42, Table 1.4-1, No SCC – Uncontrolled, 7/98, and Table 1.2-2".)
[69] EPA, AP-42 Enforcement Alert at 1-2. ("With the advent of 1-hour and short-term National Ambient Air Quality Standards (NAAQS), permit limits must be able to account for short term fluctuations. AP-42 emission factors also do not account for short term variation in emissions as the emission factors are intended for use in developing area-wide annual or triannual inventories. In developing emission factors, test data are typically taken from normal operating conditions and generally avoid conditions that can cause short-term fluctuations in emissions. These short-term fluctuations in emissions can stem from variations in process conditions, control device conditions, raw materials, ambient conditions, or other similar factors. This means that if facilities use AP-42 emission factors as permit limits, facilities increase their chances of violating their short-term permit limits. It also increases the likelihood of a geographic area's noncompliance with the NAAQS.")
[70] Permit Application, Appendix C, at Table C-8a at PDF 14 (does not indicate if NOx emissions from gas combustions are included).

Furthermore, the permit applicant indicates that diesel engines will power the emergency fire pump,[71] however, there are no emission estimates for these engines identified in the permit application. In contrast, the permit application for the Longview Pellet Mill expressly includes NOx emissions from the engines that will support the fire pumps.[72] The missing information must be clarified, and emission estimates added as necessary.

C. The Permit Application Fails to Include Maritime Vessel Emissions from the Loadout Area, which is on Adjacent Property That Would Serve the Proposed Pellet Mill.

The permit applicant proposes to draw finished wood pellets from the storage silos and transport them via enclosed conveyor to the adjacent property owned by another company, Willis Enterprises. Once the wood pellets are on Willis Enterprises' property, the wood pellets would be moved via that company's existing conveyors and marine vessel loadout facilities.[73] Loadout of the wood pellet product is primarily planned to occur at the ship loadout facility on the adjacent owner's property.[74] The permit applicant explains that "[t]he Project would increase vessel traffic by approximately one ship every 5 to 6 weeks, or 10 per year." Emissions from vessels at berth ("dockside") that would load the wood pellets for transport[75] are considered primary emissions for estimating facility-wide emissions for applicability of the Clean Air Act requirements[76] because they are maritime emissions from operations related to the "ship loadout

---

[71] The Vendor Information provided in Appendix D, expressly notes that unless expressly mentioned certain parts and services are not included in the quote, these items include "water pumps." Permit Application, Appendix D, Vendor Information at 70. ("Permit Application, Appendix D"). (Attachment CC). However, Appendix A indicates that the proposed pellet plant would include fire water pumps and generators. ("Stationary sources of diesel particulate matter (DPM) would be emitted at rates greater than regulatory *de minimis* levels by the emergency generator and diesel engines that power the <u>emergency fire water pumps</u>, but these sources would only operate during an emergency, and would fall within acceptable cancer risk and ORCAA thresholds.") Permit Application, Appendix A at PDF 30. (<u>emphasis added</u>). The permit applicant's apparent assertion that this emitting units and air pollution would be excused from permitting requirements is wrong. The emissions from all emitting units must be considered in the facility-wide emission inventory prepared to determine applicable requirements under the Act.

[72] *See e.g.* SWCAA Letter at PDF 17.

[73] Preliminary Determination at 11.

[74] Preliminary Determination at 11 ("PNWRE will also have the ability to deliver pellets via a truck unloading system; however, this system would be used only in special circumstances. PNWRE proposes no more than 10 loaded trucks per day and 32,000 tons per year of truck loadout utilization.")

[75] Permit Application, Appendix A at PDF 25 ("The processing of wood chips at the proposed facility includes … a ship loadout area.")

[76] EPA Draft NSR Workshop Manual at A-18 (Oct. 1990), *available at* https://www.epa.gov/nsr/nsr-workshop-manual-draft-october-1990 ("Secondary emissions do not include any emissions which come directly from a mobile source, such as emissions from the tailpipe of a motor vehicle or from the propulsion unit of a train or a vessel. This exclusion is limited, however, to only those mobile sources that are regulated under Title II of the Act (see 43 FR 26403 - note #9). Most off-road vehicles are not regulated under Title II and are usually treated as area sources. [As a result of a court decision in *NRDC v. EPA*, 725 F.2d 761 (D.C. Circuit 1984), emissions from vessels at berth ("dockside") not to be included in the determination of secondary emissions but are considered primary emissions for applicability purposes.]" ("NSR Workshop Manual.") That the vessel emissions generated in loading the pellets at the port should be included in the applicability determination comes from definitions in the Act. The Act's definition of "stationary source" requires the permitting agency authority to consider emissions from external combustion engine vessels in preconstruction and operating permits. 42 U.S.C. § 7602(z). That definition means "generally any source of an air pollutant except those emissions resulting directly from an internal combustion

area." The permit applicant must estimate air pollutant emissions from the vessel traffic and supplement the permit application.[77] Because emissions from the vessels will impact air quality at considerable distances from the proposed pellet mill and these impacts are not limited to just the area near the loading dock. The air quality modeling must consider maritime emissions associated with the project beyond those that occur close to the loading dock because they will have an impact on air quality concentrations.

D. Permit Application Fails to Include Emissions from the Transport of Finished Product from the Five Wood Pellet Silos to the Ship Loadout Area.

The permit application fails to disclose and quantify emission estimates from the transport of the finished product from the five wood pellet silos to the ship loadout area. This information must be quantified and included in a revised application. The preliminary determination explains that the adjacent property owner holds an existing air permit for its operations and that the permit applicant proposes to use the existing equipment at the adjacent property to transport the finished product to the ship loadout area. However, what is not disclosed is how the increase in operational capacity on the adjacent property impacts emissions. The proposed action does not quantify and disclose new emissions from operations at the adjacent property including emissions from moving the finished product to the ship loadout area and emissions from transferring the finished product to the marine vessels, notably other state permits for similar operations include a baghouse to control emissions are a ship loadout area. There is nothing in the proposed action to cover permit modifications for the existing source's operations. The permitting authority must clearly identify what owner/operator is responsible for emission from use of the equipment on the adjacent property that is proposed to be used by two separate legal entities, and how that information will be monitored, what records will be keep and how that information is reported to the permitting agency.

E. The Permit Application Fails to Include Any Emissions for Construction Activities.

The permit application explains that this is a new source and that substantial earth moving will be involved.[78] Emissions of air pollutants from construction differs from

---

engine for transportation purposes or from a nonroad engine or nonroad vehicle as defined in section 216." CAA Section 216 definitions of "nonroad engine" and "nonroad vehicle" are limited to internal combustion engines. 42 U.S.C. §§ 7550(10), (11). Thus, the vessels powered by external combustion engines that arrive at the port and load the wood pellets would be a "stationary source" for permitting purposes. The air pollutant emissions from activities in support of the proposed pellet plant, including those for transporting the pellets from the proposed pellet mill for sale at other locations, including those from marine vessels propelled by external combustion engines, are considered stationary emissions of the proposed pellet mill for CAA Title I and Title V purposes.]

[77] In estimating criteria, HAP and TAP air emissions, the permit applicant must estimate the maximum number of marine vessels per year, including any operations for support (*e.g.*, tugs), including the total number of hours per call and hours spent beyond the loadout area. Air pollutants emitted from marine vessels are anticipated to include the following: NOx, CO, SO_2, PM_{10}, $PM_{2.5}$, VOC, HAPs, TAP, and CO_2e.

[78] For example, particulate emissions from the following activity must be included, "Grading will be needed to prepare the building site, and other site components. Approximately 110,279 cubic yards of material will be excavated at the Project Site, from within an area approximately 46.5 acres in size, associated with construction of

operation, and the permit application fails to disclose and quantify those emissions. The application must be revised to include these activities, the associated emission estimates. The approval order must include methods for control, as well as the associated monitoring, recording and reporting requirements.

III. The Permit Application Fails to Address the Act's Regional Haze Four-Factor Analysis Requirements.

Under 40 C.F.R. § 51.307(c), permitting agencies must ensure that new major sources or major modifications will be consistent with the Act's Regional Haze Program requirement to make reasonable progress toward the national visibility goal. As a result, permitting agencies must conduct Four-Factor Analyses for new major sources or major modifications to satisfy the Act's requirements. The Four-factor Analysis includes consideration of the following:

- Consider the costs of compliance,
- The time necessary for compliance,
- The energy and non-air quality environmental impacts of compliance, and
- The remaining useful life of any potentially affected sources.[79]

Washington's Department of Ecology, as the State's permitting agency approved by EPA to implement the permit program for new major sources, must ensure that for pollutants for which the proposed pellet mill is major, the 40 C.F.R. § 51.307(c) requirements are met. As the ORCAA is aware, EPA's program approval does not give it the authority to conduct these activities and make these determinations.

IV. The Proposed State-BACT Determinations are Flawed and Incomplete, and the Proposed Emission Limitations Fail to Reflect State-BACT.

A. The Permit Applicant Must Look Beyond a Search of EPA's RACT/BACT/LAER Clearinghouse Database to Identify State-BACT Control Technologies.

For two emitting units, the permit applicant explains that it only searched the EPA's RACT/BACT/LAER Clearinghouse ("RBLC") to identify emission control technologies for certain emitting units. These emitting units include the following:

- **NO_X BACT for Drying Line** (potential NOx emissions of 227.76 TPY)

  An RBLC search to identify NOx control technologies for hog fuel-fired or wet barkfired dryers at wood pellet facilities did not yield any results. Therefore, good

the facilities. A total of approximately 41.2 acres of the site will be graded to prepare the site." Permit Application, Appendix A at PDF 28.

[79] 42 U.S.C. § 7491(g)(1); 40 C.F.R. 51.308(f)(2)(i).

combustion practices, which is always available, is the only available control technology.[80]

- **SO_2 BACT for Drying Line** (potential SO2 emissions of 18.5 TPY)

  An RBLC search to identify SO_2 controls applied to hog fuel or wet bark combustion did not yield any results. Accordingly, good combustion practices, which are always available, are proposed to satisfy BACT for SO_2.[81]

The permit applicant only considered and proposed controls if they were found in the RBLC database. While EPA created the RBLC to be used as a database of air pollution technology information, it is not a comprehensive compilation. For example, there are numerous emission control projects in the U.S. that are not subject to the Act's major source permitting programs and therefore are not documented in the RBLC. Furthermore, not all permitting agencies routinely upload determinations. The RBLC is not a comprehensive and inclusive collection of permit applications and determinations. Permit applicants must look elsewhere. Indeed, ORCAA's fact sheet on BACT determinations recognizes the need for permit applicants to look beyond the RBLC. Though ORCAA cites the Clearinghouse as "one very good resource,"[82] it does not suggest it is the only resource. When conducting a federal BACT analysis for the major source permitting requirements – which are the same as the State-BACT elements – EPA explains that:

> Applicants are expected to identify all demonstrated and potentially applicable control technology alternatives. Information sources to consider include: EPA's BACT/LAER Clearinghouse and Control Technology Center; Best Available Control Technology Guideline – South Coast Air Quality Management District; control technology vendors; Federal/State/Local new source review permits and associated inspection/performance test reports; environmental consultants; technical journals, reports and newsletters (e.g., JAPCA and the McIvaine reports), air pollution control seminars; and EPA's New Source Review (NSR) bulletin board. The applicant should make a good faith effort to compile appropriate information from available information sources, including any sources specified as necessary by the permit agency.[83]

---

[80] Permit Application at 19.
[81] Permit Application at 20.
[82] ORCAA, Instructions for Form 6, Best Available Control Technology (BACT) at 1, *available at* https://www.orcaa.org/wp-content/uploads/Form-6-BACT-Analysis-2018.pdf ("STEP 1: IDENTIFY AVAILABLE CONTROL TECHNOLOGIES: For the source, emissions unit, activity, or process requiring BACT, identify and list all "available" emissions control options for the pollutant in question. Available control options are those air pollution control technologies and techniques with a practical potential for application to the source, emissions unit, activity, or process. In general, any control option in commercial use in the U.S. at the time the analysis is performed should be included on the list of available control options. One very good resource for obtaining listings of control options in use for a particular source type is the U.S. EPA BACT/LAER Clearinghouse (RBLC) which can be viewed at http://cfpub.epa.gov/RBLC/.") (emphasis added) (Attachment DD).
[83] NSR Workshop Manual at B.11.

The permit applicant's search of just one location failed to identify all demonstrated and potentially applicable control technology alternatives. ORCAA's responsibility is to "review the background search and resulting list of control alternatives presented by the applicant to check that it is complete and comprehensive."[84] As discussed below, because there are control alternatives available, the permit applicant failed to perform its due diligence in searching. ORCAA must require the complete search.

B. The Proposed NOx Emission Limitations for the Dying Line Do Not Reflect State-BACT Requirements.

For NOx emissions from the drying line, the permit applicant merely proposes good combustion practices—which it asserts is the only available control technology—with NOx emissions not to exceed 52 lb/hr as BACT for the drying line. The permit applicant suggests that NOx emissions from the drying line would result in 227.76 TPY. The permit applicant failed to evaluate low NOx burner controls, which are used at other existing pellet mills to control NOx. For example, based on source test results at the Enviva Pellets Greenwood Facility and the emission factor developed for its use of low NOx burners, the permit applicant did not propose an emission limitation based on the maximum degree of reduction, as required by State-BACT.[85] A second example of the availability of low NOx burner technology for the wood pellet industry is the proposed Longview Pellet Mill, which proposes to install low NOx burners because it is a demonstrated control technology in pellet manufacturing facilities.[86]

C. It is Unclear Whether the Proposed PM Emission Limitations for Dry Hammer Mills and Pellet Line Meet the State-BACT Requirements.

The vendor information for the "Pelleting Line" indicates that there was a design change from cyclones to baghouses,[87] while the permit application indicates both control devices are planned, proposing "the combined use of cyclofilters and baghouses for controlling PM from the dry hammer mills and pellet line." [88] As this could impact the stringency of the emission limitations, this discrepancy must be clarified and corrected. Furthermore, the proposed determination must be supported by determinations and source tests conducted at other pellet mills.[89]

---

[84] NSR Workshop Manual at B.11.

[85] For example, in terms of the Enviva Greenwood testing, the furnace there operated at an average heat input of 135 MMBtu/hr during the testing, and emitted NOx at a rate of 18.5 lb/hr. *See* Enviva Greenwood Test Report, at 20; *see also id.* at Appendix IG: Process Data, Table 4 at 212. The proper emission factor therefore is 0.137 lb/MMBtu, not the 52 lb/hr suggested by Port of Grays Harbor Wood Pellet Plan. (0.137 lb/MMBtu * 1,648,100) / 2000 lbs/ton = 129 tpy NOx.)

[86] *See* SWCAA Letter, at PDF 4.

[87] Permit Application, Appendix D at PDF 19.

[88] Permit Application at 22.

[89] *See e.g.* SWCAA Letter at PDF 6; *see also id.* at PDF 7.

D. The Proposed Emission Limitations for the Emergency Generator and Fire Pump Engines Do Not Reflect State-BACT Requirements.

The permit applicant explains that a 300-kilowatt backup emergency generator would be installed at the proposed pellet mill. The diesel-fired engine for this generator would be certified to meet the emissions standards of 40 CFR 60, Subpart IIII and would be fired with ultra-low-sulfur diesel only. Other than emergency use, backup emergency engines are limited by 40 C.F.R. 60, Subpart IIII to no more than 100 hours per year of operation for maintenance checks and readiness testing.[90] The permit applicant further proposes that BACT/tBACT[91] for all pollutants emitted from the generator would be good combustion practices, following manufacturer's instructions for maintenance, and compliance with the applicable conditions for emergency engines from 40 CFR 60, Subpart IIII.[92] As discussed above, the permit applicant indicates there will be diesel engine(s) to run the emergency fire pumps.

Given that State-BACT is supposed to be based on the maximum degree of emission reduction achievable and the fact that this would be a new pellet mill, all diesel engines must meet Tier 4 emission standards as State-BACT limits. Tier 4 engines are readily available and, given that Tier 4 engines achieve the lowest emission rates of NOx, PM, and CO, such engines must be considered State-BACT for the firewater pump, emergency generator, and any other diesel engines at the proposed pellet mill.

E. The Proposed SO_2 Requirements for the Drying Line Do Not Reflect State-BACT Requirements.

As discussed above, the permit applicant's RBLC search did not yield any results to identify SO_2 controls applied to hog fuel or wet bark combustion. The permit applicant must search for additional controls beyond "good combustion practices" and supplement the permit application with the results of those efforts, proposing source-specific BACT requirements for the SO_2 emissions.

F. State-BACT Determinations Must be Included for the Missing Emitting Units and Emission Sources.

As discussed above, there are emissions and emission units that are not in the permit application. State-BACT analyses must be prepared for all of these and included in a supplemental permit application.

---

[90] Permit Application at 24.
[91] *Id.*
[92] *Id.* at 24.

G. State-BACT Emission Limitations are Continuous Requirements and All Operating Scenarios Must Have State-BACT Determinations.

The emission limitations established through the State-BACT analysis must be met continuously.[93] Despite these requirements, as discussed below, the permit application includes numerous alternative operating scenarios and the applicant fails to include proposed State-BACT emission limitations or work practices for these various scenarios. Thus, the permit application is incomplete.

First, the permit application does not include a proposed State-BACT analysis for the planned startups. It appears there was email correspondence from the permit applicant to ORCAA on these emissions, but that information is not available to the public. While ORCAA staff evaluated the permit applicant's emissions calculations and concurs with its assessment, the public cannot independently review that information. Though ORCAA explains it proposes startup constraints consistent with the cold startup descriptions provided by permit applicant, the public cannot access the adequacy of what ORCAA proposed without access to the underlying analysis.[94] Moreover, because the State-BACT emission limitations must be met continuously, the proposed pellet mill cannot be exempted from the State-BACT opacity limits, as is proposed.[95]

Second, during planned shutdowns, hot gases from both the furnace and dryer will be emitted through the emergency bypass stacks for these units until they are sufficiently cooled.[96] Alternative State-BACT emission limitations are not proposed during these events. The Preliminary Determination notes that it is "ORCAA's understanding" that the permit applicant "anticipates only two shutdowns of the furnace each year but assumed 10 for the air impacts analysis."[97] It is unclear what was assumed as inputs for the modeling for these events, as the modeling protocol was not disclosed as part of the public comment materials.

Third, during malfunctions and emergencies, the furnace automatically aborts to the furnace bypass stack in the event of a malfunction or emergency situation, like loss of power or failure of a critical piece of equipment.[98] Likewise, the dryer system automatically aborts to the dryer bypass stack due to similar events.[99] Whenever there is an abort, the furnace automatically switches to idle mode and emissions are exhausted through the bypass stack.[100] During malfunctions and emergencies, air emissions from the drying system may emit uncontrolled from the bypass stacks and exhaust through either of the bypass stacks is presumed to be in excess of

---

[93] *See* ORCAA Rule 1.4 Definitions "'Emission standard' and 'emission limitation' means a requirement established under the FCAA or chapter 70.94 RCW [this chapter of Washington State law was recodified to 70A.15 RCW[93]] which limits the quantity, rate, or concentration of emissions of air contaminants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure *continuous emission reduction* and any design, equipment work practice, or operational standard promulgated under the FCAA or chapter 70.94 RCW."
[94] Preliminary Determination at 8.
[95] Preliminary Determination at 9.
[96] Preliminary Determination at 9.
[97] Preliminary Determination at 10.
[98] Preliminary Determination at 10.
[99] Preliminary Determination at 10.
[100] Preliminary Determination at 10.

the pollutant mass rate limits established in the approval order.[101] The permit applicant must not be excused from State-BACT requirements during these operations.

Fourth, the proposed pellet mill will also operate in a feedstock interruption mode, which is described as an idle-mode that may be triggered by a reduction or interruption of feedstock material to the dryer. Apparently, the permit applicant asserted in a communication with ORCAA that the furnace, dryer, dry hammer mills, and pellet coolers will all be exhausted through their respective air pollution control systems when there are feedstock interruptions,[102] but those communications were not made available as part of this public comment opportunity.

V. The Proposed Conditions of Approval Authorize Bypass of the Air Pollution Controls, Unlawfully Excusing the Proposed Pellet Mill from Continuous Compliance with Case-by-Case Maximum Achievable Control Technology (MACT).

Because the permit applicant intends to construct a major source of HAPS, a case-by-case MACT determination is necessary. The permit applicant has thus far proposed RTOs and RCOs to destruct the HAPs and achieve at least 95% and 96.3% destruction of VOCs. Unfortunately, the draft permit improperly allows the permit applicant to bypass air pollution controls that are required as MACT during periods of startup, shutdown and otherwise "as necessary," apparently referring to malfunctions ("SSM exemptions").[103]

These SSM exemptions are unlawful because they excuse the plant from continuous compliance with otherwise applicable emission limitations under Clean Air Act section 112. As explained by the D.C. Circuit in *Sierra Club v. EPA*, 551 F.3d 1019, 1027 (D.C. Cir. 2008), an emission limitation established under section 112 must be "continuous," and therefore, a source cannot be exempted from compliance at any point. Specifically, the court found that a MACT standard under section 112 is an "emission standard," and Clean Air Act section 302(k) defines "emission limitation" and "emission standard" as "a requirement established by the State or the Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis." *Id.* at 1021 (quoting 42 U.S.C. § 7602(k)); *see also* Clean Air Act § 112(g)(2)(B), 42 U.S.C. § 7412(g)(2) (providing that no new source may be constructed "unless the Administrator (or the State) determines that the maximum achievable control technology emission limitation under this section for new sources will be met," and instructing that if the Administrator has not established such emission limitation, it shall be established on a case-by-case basis). ORCAA's proposal to allow for bypass of the RTOs during periods of SSM is exactly the type of exemption from section 112 standards that the D.C. Circuit found to be unlawful. ORCAA must eliminate this unlawful exemption and ensure that the permit applicant is required to comply with section-112 standards at all times.

Additionally, ORCAA cannot excuse compliance with the numerical MACT limits by implementing a work practice standard. Under the plain language of the Act, work practice standards may only be implemented in two instances:

[101] Preliminary Determination at 10.
[102] Preliminary Determination at 10.
[103] Recommended Conditions of Approval, ¶¶ 9, 10 at 37-38.

A) When pollutants "cannot be emitted through a conveyance designed and constructed to emit or capture such pollutant;" or
B) When "the application of measurement methodology to a particular class of sources is not practicable due to technological and economic limitations."

42 U.S.C. § 7412(h)(1) and (2).The permit applicant has not demonstrated that it cannot route its emissions through a stack or measure those emissions during SSM events. Nor is it likely the permit applicant could do so. By the permit applicant's own admission, during startup and shutdown it will continue to vent emissions through a stack. Additionally, the permit applicant has not claimed that it would be infeasible to measure emissions while operating the bypass stacks. In fact, in a permit application for another pellet mill, that company states explicitly that emissions associated with bypass events "were calculated based on stack testing data from comparable Enviva facilities."[104]

VI. The Permit Applicant Must Prepare and Submit a Permit Application to the Department of Ecology for PSD BACT for CO and CO_2e Emissions.

Once all stack and fugitive emissions estimates have been obtained through detailed engineering analysis of each emissions unit using the best available data or estimating technique, which as discussed above has not been done, the next step is to compare the potential emissions of each of the pollutants from the proposed pellet mill to the 100 TPY PSD major source threshold. Moreover, the potential to emit of CO is greater than 250 TPY. Because the Proposed Pellet Plant is classified as a major source because of the estimated CO emissions, the entire source is classified as a major source.

Furthermore, because the CO emissions (and any other pollutants) trigger the PSD major source permitting requirements, the proposed pellet mill must also evaluate whether the proposed CO_2e emissions trigger the major source PSD requirements. CO_2e emissions from the proposed pellet mill are estimated at 163,592, which exceeds the PSD major source threshold of 100,000.[105] Therefore, the proposed pellet mill is subject to CO_2e BACT for the units with CO_2e emissions (*i.e.*, the Dry Hammer Mill and Pellet Cooler, and the Drying Line). The permit applicant must prepare and submit PSD BACT determinations to the Washington State Department of Ecology.

VII. The Permit Application Contains Deficient and Inaccurate Ambient Air Modeling.

A. The Permit Applicant Must Correct the Missing and Inaccurate Information and Rerun the AERMOD Model Using the Current Model Version.

Once the corrections to the inaccurate and missing emission estimates are made, the air dispersion model inputs must incorporate the changes to the criteria pollutants and the model

[104] Enviva Pellets Lucedale, Application for Initial State Permit to Construct, at 3.7.2 and 3.7.3. at 9 (Sept. 2018) (Attachment EE).
[105] Permit Application, Appendix C, Table C-1 at PDF 3.

must be rerun. Additionally, the permit applicant used version v22112 of AERMOD.[106] That version is outdated—the current EPA-approved version of AERMOD is v23132,[107] which must be used when the model is rerun for the proposed pellet mill. Notably, the current regulatory version of AERMOD will assist with evaluation of emissions from the marine vessels.[108]

Furthermore, the modeling protocol documents must be made available to the public. Much of the detailed information about the modeling analysis is not available to the public. For example, the Preliminary Determination notes that it is "ORCAA's understanding" that the permit applicant "anticipates only two shutdowns of the furnace each year but assumed 10 for the air impacts analysis."[109] It is unclear what was assumed as emission inputs in the modeling for these events, as the modeling protocol was not disclosed as part of the public comment materials.

B. Ambient Air Background Concentration Data Used Does Not Represent Current Conditions.

The Clean Air Act and implementing regulations establish a program for PSD permit applicant collection and submission of twelve months of ambient air quality monitoring data, for the year preceding the date of permit application, showing pollutant concentrations at the site of the proposed facility and in areas that may be affected by emissions from that facility.[110] These data may then be used, in conjunction with other information, to demonstrate the proposed facility's compliance with the NAAQS and PSD increments.[111] The permit applicant needs to collect ambient air quality measurements documenting baseline conditions representative of the current air quality at the project site, or otherwise demonstrate that it meets the applicable monitoring exemptions under the applicable regulations.[112] The permit applicant used ambient air quality estimations that fail to document current conditions.[113] The background concentration information was obtained from Idaho, which is described as "modeled and monitoring data from July 2014 through June 2017."[114] That data contains estimated values, is between six and nine

years old, and does not represent current background ambient monitoring conditions. A permit applicant cannot substitute ambient data unless it is deemed "sufficiently representative of air quality in the targeted area — in terms of the sufficiency of the monitoring locales selected and the quality and currentness of the monitoring data — to legitimately be substituted for site-specific data."[115] The permit applicant has not complied with the baseline monitoring requirements because it has relied upon data which is out of date and no longer representative of baseline air quality conditions.

C. The Permit Application Fails to Include Modeling Runs for the Range of Operating Conditions.

Ambient impacts were estimated based on continuous operation and maximum PTE for all pollutants evaluated,[116] but the proposed pellet mill does not plan to operate in that manner. Other foreseeable operating scenarios include "cold" startup,[117] planned shutdowns,[118] and idle mode.[119] Additionally, based on email correspondence – which were not included in the materials available for public review – the permit applicant also plans bypass events where emission control technology is not in use.[120] For example, for the drying line, the vendor information includes a heat energy system with an emergency exhaust stack for bypass events.[121] Documentation provided by the permit applicant via email of emission estimates during the range of foreseeable operating scenarios (including the bypass events) was not included in the materials made available during this public comment period.[122] Thus, there is no way for the public to assess assertions that maximum PTE for all pollutants were evaluated and modeled.

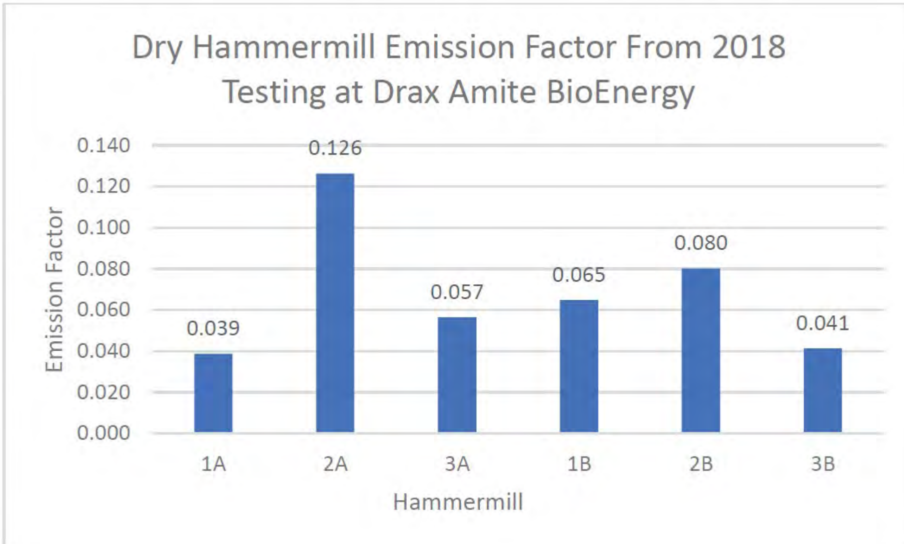
VIII. The Draft Approval Order's Terms and Conditions are Insufficient to Ensure Compliance with the Clean Air Act.

A. The Final Approval Order Must Contain When and How Often Stack Testing is Required.

The recommended conditions of approval fail to specify when and how often the permit applicant must conduct the initial and periodic stack tests in order to demonstrate compliance with the emission limits for PM10 (filterable and condensable), VOCs, CO, NOx, and HCl.[123] The recommended conditions fail to include testing for PM and PM2.5, which must also be added. The approval order must require simultaneous NOx and CO stack testing, otherwise the owner/operator can tune to reduce one and then the other.

Although we appreciate that ORCAA has specific test methods, the current compliance testing requirements are insufficient to ensure that the proposed pellet mill is in continuing compliance with its emission limits. In order to demonstrate continuous compliance, the conditions of approval must require both initial and periodic stack testing.[124] Emissions at wood pellet plants are highly variable, meaning that stack testing at a facility may indicate compliance one year and non-compliance the next. In fact, emissions from wood pellet plants have been shown to vary by more than 100% from one year to the next. For example, testing just a year apart on pellet coolers at a Georgia pellet plant produced an emission factor that was twice as high as the initial compliance testing, with no modification or other operating changes apparently responsible.[125] Additionally, where pellet plants have tested multiple identical units at the same time, those tests have shown a large variability in emissions. The Drax Amite wood pellet plant in Gloster, Mississippi, tested all six of its hammermills for VOC emissions,[126] and the results are below:

[123] Preliminary Determination, at 35, (Recommended Conditions of Approval ¶ 5).
[124] *See e.g., supra* n.14 (State-BACT continuous requirement); *see also supra* n.15.
[125] Compare August 28, 2014, stack tests on the pellet coolers at Hazlehurst Wood Pellets in Georgia (producing an emission factor of 0.30 lb/ODT), with testing at the same plant conducted on December 16, 2015 (producing an emission factor of 0.62 lb/ODT) (test excerpts at Attachment HH).
[126] Letter from Keith W. Turner, legal counsel for Amite Bioenergy, to Tim Aultman, Environmental Compliance & Enforcement Division, MDEQ (Nov. 5, 2018) (Attachment II).



These results highlight the variability even between identical units tested simultaneously. For example, the test for hammermill 2A demonstrated VOC emissions that were vastly higher than emissions from hammermill 1A, with no design or operational distinction responsible. In the present context, this graph shows how two consecutive tests could readily show emissions that are significantly lower than worst case emissions when the reality is that outside of those two tests emissions are much higher on average.

In order to demonstrate continuing compliance with its emission limits, the conditions of approval must subject the proposed pellet mill to annual compliance testing, with the initial compliance test occurring no later than 180 days after the initial start-up after the facility's construction and without the possibility of less frequent testing.[127] As a preliminary matter, ORCAA should incorporate a firm deadline for initial compliance testing into the conditions of approval as an enforceable condition, rather than setting such deadline at a later time, which would not be subject to public review and enforcement. ORCAA must also, at a minimum, amend the proposed conditions of approval to require annual source testing. North Carolina's Department of Environmental Quality decided to require annual stack testing—without the possibility of less frequent testing—at three Enviva plants undergoing modifications.[128] There is no reason why ORCAA should not require the same from the permit applicant for the proposed pellet mill.

---

Finally, ORCAA must include requirements to test not only the emission rate but the destruction efficiencies of the RTOs and RCOs. As discussed above, ORCAA must establish case-by-case MACT limits that are expressed as 95% VOC destruction for the dryer RTO, as well as 96% VOC destruction for the RCO. Merely testing the outlet of the RTO/RCO will not demonstrate whether the units are meeting the MACT limits. Instead, ORCAA must require the permit applicant to test both the inlets and outlets of these units in order to ensure compliance with the MACT limits.

B. The Approval Conditions Must Include Detailed Reporting Requirements.

The proposed approval conditions require recording many data points directly related to emissions, such as pellet production, dryer and green hammermill throughputs, start-up, shut-down, and malfunction occurrences, and control device parameters. However, they only require the permit applicant to report a selective minimum of this data to ORCAA.[129] Complete reporting is crucial to effective public oversight. It is difficult or downright impossible for members of the public to access this information without a reporting requirement, and the lack of access to these records seriously hinders citizen enforcement, which is a key component of the Clean Air Act. Given the documented history in this industry of numerous, serious exceedances in recent years, public oversight is especially important.[130] Accordingly, ORCAA must amend the conditional approval conditions to require the permit applicant to report the data points in its semi-annual reports.

Moreover, there are several important data points, including the emissions calculations and the facility's actual emissions of relevant criteria pollutants and hazardous air pollutants, as well as the facility's wood feedstock mix, which are completely excluded from both the recordkeeping and reporting requirements. In order for the emission limits to be considered enforceable, they must be accompanied by monitoring, recordkeeping, and reporting sufficient to ensure and verify compliance at all times.[131]

Finally, ORCAA must specifically include a requirement to monitor and report the heat input of the facility's furnaces in order to ensure compliance with the facility's NOx emission limits. As discussed above, complying with the wood pellet production limit and related monitoring is insufficient to ensure NOx emissions are met. ORCAA must remedy this by requiring monitoring, recordkeeping, and reporting of the heat input values and correlated NOx emissions.

(Attachment NN).

C. ORCAA Must Remove the Provisions that Provide for Director's Discretion.

Several provisions in the Recommended Conditions of Approval give ORCAA the authority to approve alternate or equivalent test methods that are not EPA-approved test methods.[132] ORCAA's proposal does not explain what criteria and process it would use to approve all the alternative methods allowed under the proposed conditions. ORCAA's alteration or elimination of EPA-required test methods can have no effect for purposes of federal law unless and until EPA ratifies those alternatives, including provisions for public notice and comment. Moreover, Section 113 of the Act allows EPA to enforce against "any requirement or prohibition of an applicable implementation plan or permit" and any "requirement or prohibition of any rule, order, waiver or permit promulgated, issued, or approved under [the Act]."[133] It is unclear whether an ORCAA approved alternative method using the proposed provisions would allow for EPA enforcement. Similar concerns are present for citizen suits under section 304.[134] ORCAA must remove these provisions.

D. ORCAA Must Require Implementation of Source-Specific Fugitive Dust Requirements.

Wood pellet plants generate a lot of fugitive dust, *i.e.*, airborne particulate matter. In fact, one of the most common air pollution complaints raised by residents of communities where wood pellet plants are located is the large amount of fugitive dust that escapes into surrounding neighborhoods.[135] For example, in 2017 Mississippi's Department of Environmental Quality issued a Notice of Violation to the Enviva plant in Amory, describing "multiple complaints over the past year pertaining to sawdust and smoke leaving the [Enviva Amory] facility impacting neighboring properties and vehicles."[136] A local alderman described the impacts on residents of his ward, who said "are wheezing, coughing and constantly washing dust of their vehicles generated by the Enviva pellet plant."[137] Additionally, residents living near Enviva's Northampton, North Carolina plant expressed frustration over dust, with one resident who lives across the street from the plant complaining about dust coating his car and house: "I have to wash [my house] every two to three months, my vehicle every two to three days."[138] Considering

[138] North Carolina DEQ, Enviva Northampton Public Hearing Audio, at 29:04 (dust complaint by Anthony Robinson) (Aug. 20, 2019), *available at* https://deq.nc.gov/about/divisions/air-quality/air-quality-permitting/wood-

the fact that the owner/operator of the proposed pellet mill does not have a track record in this industry, ORCAA should take a proactive stance to protect those living nearby from fugitive dust, those working and attending school at the three schools nearby the proposed pellet mill, as well as the airshed of the nearby airport.

Major sources of fugitive dust at wood pellet plants include wood handling, wood storage piles, conveyor transfer points, yard dust, haul road dust, and engine exhaust.[139] Health problems associated with exposure to particulate matter pollution primarily involve damage to the lungs and respiratory system due to inhalation. Specifically, the inhalation of dust particles can irritate the eyes, nose, and throat; cause respiratory distress, including coughing, difficulty breathing, and chest tightness; increase the severity of bronchitis, asthma, and emphysema; cause heart attacks and aggravate heart disease; and lead to premature death in individuals with serious lung or heart disease.[140] When exposed repeatedly over a longer time period, fugitive dust exposure can lead to severe illness such as cancer.[141] In addition to affecting human health, fugitive dust reduces visibility, affects surface water, reduces plant growth, and can be a nuisance.

The proposed conditional approval merely includes a provision requiring the permit applicant to have a "dust prevention plan," which is one of the eight plans required in the draft approval order.[142] Thus, there are no conditions for the public to review and comment on or enforce that will resolve the fugitive dust issues that come from operation of a wood pellet plant. To address these concerns and provide for the protection of nearby communities, ORCAA must amend the proposed conditional approval conditions to include actual stringent requirements tailored to wood pellet operations in order to prevent fugitive dust emissions from becoming airborne. These include requiring windbreaks or enclosed structures for storage piles, minimizing drop heights and transfer points, and watering or coverings where necessary.

E. The Opacity Monitoring is Not Effective to Detect and Remedy Excess Emissions.

The proposed approval conditions contain one method to monitor visible emissions in order to detect excess particulate matter emissions: the facility is required to conduct Method 9 tests for the drying line and pellet mill.

The requirement fails to specify when and how frequently testing must be conducted, so the provisions are vague and unenforceable. Additionally, testing requirements must be periodic because merely requiring initial compliance testing, and no Method 9 observation on any of the other units, would be insufficient to ensure compliance with the opacity limits. Visible emissions

---

pellet-industry-permitting-actions-and; *see id.* at 2:02:19 (dust complaint by Sybaleen Auston) (discussing her family's history of COPD, asthma, and allergies, and stating that "[w]e deal with enough—the air we're breathing, the traffic from the trucks, the grit, dirt on the cars, homes"), 2:35:23 (dust complaint by Richard Harding) (discussing his health issues and stating, "I cannot deal with dust [from the plant]").

[141] Stelte, *supra* n.40, at 6.

[142] Preliminary Determination, at 39-40, (Recommended Conditions of Approval ¶ 13).

are generally caused by malfunctions and poor operating practices; these issues are least likely to occur when the facility has been aware of the date of stack testing and been able to optimize operations in advance. Finally, nothing in the proposed approval order requires any Method 9 observations at any time for any unit other than the RTO and RCO.

In short, nothing in the proposed approval order requires this facility to take any specific measures to determine the degree of opacity and compliance with the 20% opacity limits. Merely requiring vague compliance by including the test method is not an effective or enforceable way to limit visible emissions and comply with the opacity standards.

ORCAA must require visible emissions monitoring that at least requires daily monitoring consistent with Method 9 that determines the degree of opacity and whether or not the facility is complying with the opacity limits. In particular, we encourage ORCAA to follow the method established by Georgia in the permit condition for a wood pellet mill set out below:[143]

[143] Georgia EPD, Draft Part 70 Operating Permit No. 2499-161-0023-V-02-4 for Hazlehurst Wood Pellets, at Condition 5.2.8 at 12-13 (Sept. 2019) (Attachment TT).

5.2.8 The Permittee shall perform daily checks of visible emissions from Log Storage/Handling, Debarking/Screening, Chipper, and Chip Piles (WOOD); Green Hammermills (GHM1&2); Furnace/Dryer RTO stack (S1), and the Dry Hammermill/Press/Cooler RCO stack (S2) while the underlying process equipment is operating at the normal, expected operating rate using the procedures below, except when atmospheric conditions or sun positioning prevent any opportunity to perform a VE check. The Permittee shall retain a record in a daily visible emissions (VE) log suitable for inspection or submittal.
[391-3-1-.02(6)(b)1]

a. Determine, in accordance with the procedures specified in paragraph d of this condition, if visible emissions are present at the discharge point to the atmosphere and record the results in the daily VE log. For sources that exhibit visible emissions, the Permittee shall comply with paragraph b of this condition.

b. For each check where a stack is determined to be emitting visible emissions, a qualified observer shall determine whether the emissions equal or exceed a 20% opacity action level, using the procedure specified in paragraph d of this condition. For the purposes of this condition a qualified observer is one that has met the certification requirements of EPA Method 9 – *Visual Determination of the Opacity of Emissions from Stationary Sources*. Also, this determination shall cover a period of six minutes. The results shall be recorded in the daily VE log. For sources that exhibit visible emissions of greater than or equal to the opacity action level of 20%, the Permittee shall comply with paragraph c of this condition.

c. For each occurrence that requires action in accordance with paragraph b of this condition, the Permittee shall determine the cause of the visible emissions and correct the problem in the most expedient manner possible. The Permittee shall note the cause of the visible emissions, raw material feed rate, and any other pertinent operating parameters as well as the corrective action taken, in the maintenance log.

d. The person performing the determination shall stand at a distance of at least three stack heights, which is sufficient to provide a clear view of the plume against a contrasting background with the sun in the 140 degree sector at his/her back. Consistent with this requirement, the determination shall be made from a position such that the line of vision is approximately perpendicular to the plume direction. Only one plume shall be in the line of sight at any time when multiple stacks are in proximity to each other.

F. The Proposed Approval Conditions Are Utterly Devoid of a Mechanism to Monitor Facility-Wide Emissions and Compliance with PTE Limits.

The proposed approval conditions contain conditions that include facility-wide annual limits.[144] Nothing in the draft approval order, however, explicitly requires the permit applicant to monitor its emissions or explain how the company shall do so. For instance, the conditions are silent on what emission factors the permit applicant shall use and which sources must be included in the plantwide calculation. In order to be enforceable, PTE limits such as those in the proposed approval conditions must be accompanied by appropriate monitoring, recordkeeping, and reporting such that compliance can be ascertained at any time.[145] While source testing and parametric monitoring are necessary aspects of such monitoring, they do nothing to monitor emissions on a rolling basis.

[144] Preliminary Determination, at 36, (Recommended Conditions of Approval ¶ 7).
[145] *In the Matter of Orange Recycling & Ethanol Prod. Facility, Pencor-Masada Oxynol,* LLC, Order on Petition No. II-2001-05 (April 8, 2002), at 7, *available at* https://www.epa.gov/sites/production/files/2015-08/documents/masada-2_decision2001.pdf.

EPA has explained the underlying principle behind the monitoring that must accompany practically enforceable PTE limits:

> In order to be considered practically enforceable, an emissions limit must be accompanied by terms and conditions that require a source to effectively constrain its operations so as to not exceed the relevant emissions threshold. <u>These terms and conditions must also be sufficient</u> to enable regulators and citizens to determine whether the limit has been exceeded and, if so, to take appropriate enforcement action.[146]

Without including an enumeration of the specific algorithms and emission factors the permit applicant shall use to monitor its emissions in between stack tests, the proposed conditions do not "enable regulators and citizens to determine whether" the facility is complying with the emission limits. Specifically, it is not clear whether the permit applicant will include emissions from insignificant activities (as is required by law[147]), or how the permit applicant must quantify emissions from sources like the handling and storage operations, for which there is no requirement to track throughput or emissions.

IX. ORCAA Cannot Rely on the Project's Invalid Determination of Non-Significance to Meet its SEPA Obligations.

On July 25, 2023, the City of Hoquiam issued a Determination of Non-Significance ("DNS") for PNWRE's proposal to build its industrial wood pellet facility, a decision that exempted the proposal from full review under the State Environmental Policy Act ("SEPA"), RCW 43.21C. The PNWRE DNS review was limited to the immediate environmental impacts of constructing and operating the facility; it is deeply flawed in at least two major respects: (1) it contains serious errors even in its limited calculations with respect to air pollution emissions at the facility, including greenhouse gases, VOCs, and HAPs, and (2) it fails to conduct a lifecycle greenhouse gas analysis of the direct and indirect greenhouse gas impacts of producing, transporting, and burning the wood pellets.

A. Legal Requirements.

SEPA "sets forth a state policy of protection, restoration and enhancement of the environment." *Polygon Corp. v. City of Seattle,* 90 Wn.2d 59, 63 (1978); RCW 43.21C.010. SEPA's policies and goals overlay and add to existing authorizations of all branches of government. RCW 43.21C.060. The purpose of an Environmental Impact Statement ("EIS") is to ensure that SEPA's policies are an integral part of the actions of state and local government such that the EIS is actually used by, and informs the decision of, those government agencies. WAC 197-11-400. "The primary function of an EIS is to identify adverse impacts to enable the

---

[146] *Id.* (<u>emphasis added</u>); *see also In re Piedmont Green Power, LLC*, Order on Petition No. IV-2015-2, at 14 (Dec. 13, 2016), *available at* https://www.epa.gov/sites/production/files/2016-12/documents/piedmont_response2015.pdf.
[147] The definition of PTE does not make any exceptions for emissions deemed insignificant. 40 C.F.R. § 52.21(b)(4). In determining compliance with PTE limits, sources such as the proposed pellet mill must include all non-fugitive emissions.

decision-maker to ascertain whether they require either mitigation or denial of the proposal." *Victoria Tower P'ship v. City of Seattle,* 59 Wn. App. 592, 601 (1990).

SEPA and its implementing regulations explicitly require consideration of direct and indirect climate impacts. *See* RCW 43.21C.030(f) (directing agencies to "recognize the world-wide and long-range character of environmental problems"). Under SEPA, an agency must consider both the direct and "indirect" impacts of its decision. WAC 197-11-060(4)(d) ("Impacts include those effects resulting from growth caused by a proposal, as well as the likelihood that the present proposal will serve as a precedent for future actions."). "In assessing the significance of an impact, a lead agency shall not limit its consideration of a proposal's impacts only to those aspects within its jurisdiction, including local or state boundaries." WAC 197-11-060(4)(b); *Cheney v. City of Mountlake Terrace*, 87 Wn.2d 338, 344 (1976) ("Implicit in the statue is the requirement that the decision makers consider more than what might be the narrow, limited environmental impact of the immediate pending action. The agency cannot close its eyes to the ultimate probable environmental consequences of its current action.") For projects involving the transportation or use of fuels like wood pellets, SEPA (like its federal counterpart, NEPA) must consider the lifecycle impacts of producing, transporting, and using such fuels.[148] *Columbia Riverkeeper v. Cowlitz Cty.*, 2017 WL 10573749, at *7-10 (SHB Sept. 15, 2017) (EIS for methanol project invalid for failing to consider lifecycle GHG emissions); WAC 197-11-444(1)(b)(iii) (listing "climate" among elements of environment to be considered in SEPA).

B. The DNS Air Emission Calculations Are Wrong.

As discussed throughout these comments, the air emission calculations in the Application are wrong in numerous and significant ways. These same calculation errors and omissions are reflected in the DNS, leading to a major under-calculation of air emissions. These errors render the DNS invalid, and ORCAA must undertake a new and full environmental review before it considers the requested construction permit.

C. The DNS Did Not Disclose and Consider All Climate Impacts From Greenhouse Gas Emissions.

PNWRE failed to review all direct and indirect greenhouse gas emissions in its SEPA Checklist. NOC Application, Appendix A. The SEPA Checklist arrives at a total greenhouse gas emission estimate of 163,592 tons CO_{2e} annually. NOC Application Table 1. The calculations do not include truck emissions to and from wood sources, marine vessel transportation emissions to and from ports in Japan and Asia, and the ultimate burning of the fuel in industrial power plants.

This failure to calculate and consider the full lifecycle greenhouse gas emissions violates SEPA, and ORCAA cannot validly rely on such a flawed analysis. Because the DNS fails to account for the total expected greenhouse gas emissions caused by the PNWRE proposal, and because those emissions will have a significant and detrimental environmental impact, the DNS is invalid, and ORCCA cannot rely on it to issue the requested Notice of Construction Application.

---

[148] NEPA and its implementing case law are used in Washington to discern the meaning of SEPA. *Kucer v. State Dep't of Transp.*, 140 Wn.2d 200, 215-16 (2000).

D. ORCAA Must Deny the NOC Application and Undertake Its Own Full SEPA Review of the Project's Air Emissions.

ORCAA cannot rely on this invalid DNR to meet its own SEPA obligations. Instead, ORCAA must deny the NOC Application and conduct its own SEPA review in an EIS that validly reviews the significant air pollution caused by this project, including all VOCs, HAPs, and greenhouse gas lifecycle emissions.

This would not be the first time that a Washington Clean Air Agency has needed to undertake its own analysis to comply with SEPA. Recently, the Puget Sound Clean Air Agency ("PSCAA") initiated and completed its own supplemental environmental review for a proposed liquefied natural gas terminal in Tacoma because the final EIS for that project did not consider lifecycle greenhouse gas emissions. *See* https://pscleanair.gov/636/PSE---LNG-Facility-Tacoma. PSCAA used the supplemental EIS in its review of the NOC Application. ORCAA must take similar steps here to comply with SEPA.

Conclusion

In short, ORCAA cannot validly finalize the proposed Approval Order. To issue an Approval Order with the recommended conditions of approval as proposed would not only be unlawful under the authority granted under the EPA-approved SIP and the federal Clean Air Act, but would conflict with the State's requirements for assessment and control of hazardous air pollutants. As discussed in these comments, the permit application is materially incomplete because the following are missing: the required PSD applicability determination for classification as a fuel conversion plant; and accounting for VOC and CO emissions from the five wood pellet storage silos. The permit application also includes a woefully inadequate estimate for HAPs, which must be revised, and a case-by-case MACT determination conducted. Furthermore, there are numerous emission units and emission sources missing from the permit application. The permit application fails to address the Act's regional haze requirements. Critically, the permit application's State-BACT determinations are flawed and incomplete. Those flawed determinations do not reflect State-BACT requirements.

Moreover, when the facility-wide potential to emit calculations are corrected and the missing units are added, the proposed pellet mill triggers major source PSD for several pollutants (at both the 100 TPY and 250 TPY thresholds). Based on the revised facility-wide potential to emit estimates and additional comments, the proposed pellet mill would be:

- A major source of HAPs (and required to conduct a case-by-case Maximum Achievable Control Technology analysis and determination)
- Trigger PSD major source requirements for CO emissions (at both the 100 TPY and 250 TPY thresholds)
- Trigger PSD major source requirements for VOCs (at the 100 TPY threshold)
- Trigger PSD major source requirements for NOx (at the 100 tpy threshold)
- Trigger PSD major source requirements for PM (at the 100 tpy threshold)

Since the proposed pellet mill appears to be a major stationary source and subject to the requirements of the PSD permit program, ORCAA's issuance of the proposed approval order would be contrary to the Congressional purposes of the PSD program to:

- Protect health and welfare;
- Preserve and protect the air quality in Washington's national parks;
- Insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources; and
- Assure that any decision to permit increased air pollution is made only after careful evaluation of all the consequences of such a decision.

Therefore, ORCAA must either deny the request for construction and withdraw its proposed Approval Order or require that the permit applicant submit a full and complete application addressing the myriad defects providing all required analysis and documentation. Should ORCAA (or Washington Department of Ecology) repropose an approval order, it must disclose all of the underlying information to the public.

NOTICE OF CONSTRUCTION
PRELIMINARY DETERMINATION TO APPROVE

Olympic Region Clean Air Agency

Issued to:	**Pacific Northwest Renewable Energy, LLC**	**County:**	**Grays Harbor**
Location:	**411 Moon Island Road, Hoquiam**	**Source:**	**926**
		RC:	**OP1**
Application #:	**23NOC1606**	**File:**	**432**
Prepared on:	**November 30, 2023**		

1. Summary

Pacific Northwest Renewable Energy (PNWRE) seeks approval from Olympic Region Clean Air Agency (ORCAA) to construct a new wood pellet manufacturing facility at 411 Moon Island Road in Hoquiam, Washington. The proposed facility would emit air pollution from combustion of woody biomass and wood processing activities and, therefore, triggers approval by ORCAA through an air permit application prior to commencement of construction. PNWRE submitted an air permit application to ORCAA, which was determined complete on September 11, 2023. ORCAA staff reviewed PNWRE's application and concluded that the proposed facility meets criteria for approval in Washington and, therefore, may be conditionally approved. Recommended conditions of approval are detailed in Section 16 of this Preliminary Determination.

2. Regulatory Background

Pursuant to the Washington Clean Air Act under chapter 70A.15 of the Revised Code of Washington, ORCAA's Rule 6.1 and the Washington State Implementation Plan under 40 CFR part 52.2470(c)[1] require New Source Review (NSR) for new stationary sources of air pollution (referred to as new sources) in ORCAA's jurisdiction. NSR is also required prior to installing, replacing, or substantially altering any air pollution control technology. NSR generally refers to the process of evaluating air quality impacts and the likelihood of compliance with applicable air regulations and standards. NSR and approval of an air permit by ORCAA is required prior to commencing construction or modification of any new source or prior to installing, replacing, or substantially altering air pollution control technology. The goal of NSR is to assure compliance with applicable air regulations and standards, including equipment performance standards and ambient air quality standards.

[1] A State Implementation Plan (SIP) is a collection of regulations and documents used by a state, territory, or local air district to implement, maintain, and enforce the National Ambient Air Quality Standards, or NAAQS, and to fulfill other requirements of the federal Clean Air Act. The Clean Air Act requires the EPA to review and approve all SIPs. ORCAA's SIP was last approved by EPA in 1995.

NSR is initiated by a project proponent submitting an air permit application referred to as a Notice of Construction (NOC) application[2], which provides ORCAA information on the proposed project of sufficient detail to characterize air impacts. NOC applications are posted on ORCAA's website and may undergo a public notice and comment period if requested by the public or if emissions increases trigger an automatic public notice. Approval of a NOC in an attainment or unclassifiable area[3] is contingent on verifying a proposed project meets the following criteria from ORCAA's Rule 6.1 and the Washington State Implementation Plan under 40 CFR part 52.2470(c), Table 6:

1. ***Performance Standards*** – The new stationary source will likely comply with applicable air-performance standards such as federal new source performance standards (NSPS), national emission standards for hazardous air pollutants (NESHAPs), or any performance standards adopted under chapter 70A.15 RCW;
2. ***BACT*** – The new stationary source will employ "Best Available Control Technology" (BACT) to control all air pollutants emitted;
3. **RACT** – Replaced or substantially altered air pollution control technology meets the standard of "Reasonably Available Control Technology" (RACT) as defined in ORCAA Rule 1.4;
4. ***Ambient Air Quality*** – Emissions from the new stationary source will not cause or contribute to a violation of any ambient air quality standard;
5. ***Federal Air Permitting Requirements*** – The new stationary source secures all applicable federal air permits that may apply; and,
6. ***Air Toxics*** – If there are increases in toxic air pollutant (TAP) emissions, the requirements of Washington's Controls for New Sources of Toxic Air Pollutants under Chapter 173-460 WAC are met.

In this case, PNWRE is proposing to construct a new "greenfield" wood pellet manufacturing facility in Hoquiam, Washington. The proposed facility would rely on combustion of woody biomass as the primary source of heat, which results in air pollutant emissions. It would also include wood processing activities that generate dust. At the production rates proposed by PNWRE, air emission rates from both activities are significant and trigger the requirement to secure ORCAA's approval through a NOC application prior to commencement of construction.

---

[2] There are two categories of NOC applications: Notice of Construction (NOC) and Notice of Construction Revision (NOR). NOCs are required for new or modified sources, new control technology, replacing an existing stationary source or control technology, and substantially altering control technology. NORs are required when an owner or operator requests a revision to an existing air permit issued by ORCAA.

[3] Unclassified area or "attainment area" means an area that has not otherwise been designated by EPA as nonattainment with ambient air quality standards for a particular regulated pollutant. Attainment area means any geographic area in which levels of a given criteria air pollutant (e.g., ozone, carbon monoxide, PM_{10}, $PM_{2.5}$, and nitrogen dioxide) meet the health-based National Ambient Air Quality Standards (NAAQS) for that pollutant. An area may be an attainment area for one pollutant and a nonattainment area for others.

3. Application Background

- Application received: July 20, 2023
- SEPA lead agency: City of Hoquiam
- SEPA determination: Determination of Non-Significance, #SEPA 2023-02, July 24th, 2023
- 1st Application addendum received: 8/11/2023 (requested 8/4/2023)
- 2nd Application addendum received: 9/6/2023 (requested 8/25/2023)
- Application declared complete: 9/11/2023
- Notification that natural gas will not be used as startup fuel: 9/27/2023
- 3rd Application addendum received: 10/25/2023 (requested 10/3/2023)

4. Description of Proposed Facility

PNWRE's NOC application thoroughly describes the proposed wood pellet manufacturing facility including equipment, operations, emissions units and air impacts. The following is a brief description of the facility and is intended as an overview.

4.1 Proposed Location

The proposed wood pellet manufacturing facility will be located on an approximately 60-acre parcel in the city of Hoquiam, Washington. The facility is designed to produce, store, and export up to 440,800 short tons per year (TPY) of wood pellets and is intended to operate at least 8,000 hours per year. The proposed location is adjacent to the Willis Enterprises Moon Island Chip Mill (Willis Enterprises) and near Terminal 3 at the Port of Grays Harbor.

Figure 1: Proposed Location

* Imagery ©2018 Google, Maps data ©2018 Google
** Annotated by ORCAA

4.2 Ambient Air Quality

ORCAA works cooperatively with the Washington State Department of Ecology (Ecology) and the regional United States Environmental Protection Agency (EPA) to measure criteria ambient air pollutants, meteorological parameters, and other air-related data. ORCAA is also a member of the Washington Air Monitoring Work Group, which makes recommendations to Washington Air Quality Managers Group regarding air monitoring programs, including ambient air monitoring site locations. ORCAA currently operates and maintains air monitoring equipment for measurement of three of the six criteria pollutants in various locations in its jurisdiction: particulate matter ($PM_{2.5}$), ozone (O_3), and carbon monoxide (CO).

ORCAA does not maintain any permanent monitors in Hoquiam but does operate a $PM_{2.5}$ monitor in nearby Aberdeen, WA. A temporary federal reference method (FRM) $PM_{2.5}$ monitor was installed at Harbor High School in Aberdeen between August 18, 2002, and December 29, 2003. No violations of the daily or annual $PM_{2.5}$ NAAQS were recorded during this time. As a permanent FRM was not installed in Aberdeen, the region is officially considered “unclassified” with regards to $PM_{2.5}$ attainment status. A nephelometer has been used to monitor $PM_{2.5}$ at Harbor High School in Aberdeen for the past 20 years. Nephelometer based $PM_{2.5}$ was verified by the previously mentioned FRM data during the period when both monitors were collocated in Aberdeen.

Because of the absence of FRM monitoring, Grays Harbor County is officially considered “unclassified” with respect to the National Ambient Air Quality Standards (NAAQS). However, based on the number and size of air pollution sources and other monitoring data, ambient air quality in Hoquiam and Aberdeen is assumed to be generally good. Areas that are unclassified with respect to the NAAQS are regulated the same way as areas officially classified as “attainment.”

4.3 Facility Overview

The facility is designed with three truck tippers; a chips cleaning line; two wet hammer mills; one hog fuel furnace and dryer; four dry hammer mills; 12 pellet mills; five wood pellet storage silos; and a covered conveyor system to deliver wood pellets to the existing Willis Enterprises conveyance system and ship loadout facility. Air pollution control systems are proposed for all point sources of air emissions. Descriptions of stationary sources of air emissions and air pollution controls proposed are summarized in the following table. The proposed emergency generator, Source ID GEN-01, will be less than 500 horsepower and therefore is categorically exempt from New Source Review per ORCAA Rule 6.1(c)(28)(ii). It is included in the table below for informational purposes only.

Table 1: Emissions Sources

Emission Source ID	Emission Source	Exhaust Rate (cfm)	Fugitive or Point?	Air Pollution Controls
TD-01	Truck Dumper – White Wood	N/A	Fugitive	Dust Control Plan: • 10 miles per hour (mph) speed limit for all mobile vehicles • Applying water where needed via water truck or other means • Using a vacuum truck as needed
TD-02	Truck Dumper – Chips			
TD-03	Truck Dumper – Hog Fuel			
SP-01	Storage Pile – White Wood

EP-15	Truck Loadout	N/A	Fugitive	Silo Filter and shrouded dump chute
GEN-01	Emergency Generator (<500 HP)[1]	N/A	Point	Tier 4

[1] Categorically exempt from New Source Review per ORCAA Rule 6.1(c)(28)(ii).

4.4 Raw Materials Processing

Raw materials for pellet production and fuel for the furnace will be delivered to the facility via truck and include:

- Forest Residuals consisting of chipped woody biomass from logging operations (referred to as "ground chips").
- Mill residuals consisting of sawdust and shavings (referred to as "white wood").
- Biomass fuel ("referred to as hog fuel"), which is an unrefined mix of coarse chips of bark and wood fiber used for fuel.

Trucks delivering raw materials will be emptied via gravity in dedicated truck tippers. The proposed facility includes 3 truck tippers. The biomass will empty into the yard where front-end loaders will move the material to outdoor storage piles. Approximately 1.7 acres will be dedicated to outdoor storage of fuel and raw material for wood pellet manufacturing. Front-end loaders will transfer raw materials and biomass fuel to dedicated walking-floor bins. A radial stacker/reclaimer system may be installed, which would eliminate fugitive dust and mobile source emissions from front-end loaders.

To minimize dust emissions from vehicle traffic in the yard, PNWRE proposes to implement a dust control plan. The plan will include a 10 miles per hour (mph) posted speed limit for all vehicles and heavy equipment, regularly applying water on road surfaces via water trucks or other means, and using a vacuum truck as needed. The walking floor bins are designed to move the materials to the next phase in their processing. The facility is designed with 3 walking floor bins, each dedicated to a specific raw material stream. From this point onward, all raw material handing processes are fully enclosed.

The walking floor bin for ground chips empties to the chip cleaning line. The chip cleaning line uses a series of scalper rolls to remove dirt, sand and other impurities from the ground chips. The chip cleaning line will also classify the chips by size. The smallest sizes, or fines, will be routed to the dryer feeding system, while the intermediate fraction will be sent to the wet hammer mills for size reduction. Overs are reclaimed and recycled. The chip cleaning line will be enclosed and equipped with a dust capture system that will exhaust through a cyclo-filter dust control unit. Cyclo-filter units are essentially cyclone separator units equipped with an integral fabric filter baghouse to remove particulate from the exhaust. PNWRE's application states that the cyclo-filters proposed for the facility will be capable of controlling particulate emissions down to 0.0044 grains per standard cubic foot of air (gr/scf).

The white wood walking floor bin will discharge to a disc screen that separates larger pieces for further sizing in the wet hammer mills. PNWRE expects the white wood material stream to be relatively free of dust and contaminants. No dust control system is proposed for the disc screen. The screened white wood will be sent to the dryer via conveyor while overs will be sent to wet hammer mills for further size reduction. The white wood disc screening unit is considered a point source of fugitive particulate emissions.

Hog fuel will be off-loaded in its own dedicated truck tipper and then transported via front end loader to a hog fuel pile, which will be uncovered and in the open. Front end loaders will also be used to move the hog fuel from the pile onto the hog fuel walking floor bin. Traffic-generated dust from front end loaders was accounted for in the review of air quality impacts. The hog fuel walking floor will transport hog fuel to the furnace fuel feed conveyor that empties to the furnace fuel metering bin.

4.5 Wet Hammer Mills

The proposed facility includes two wet hammer mills operating in parallel. They are referred to as "wet hammer mills" because they process materials upstream of the dryer. The purpose of the wet hammer mills is to reduce the size of the chips so the material can be more easily dried and milled into pellets. The wet hammer mills will be enclosed and airborne dust emissions will be captured by a pneumatic system and routed to dedicated cyclo-filters for particulate emissions control. The cyclo-filters serving the wet hammer mills will be capable of controlling particulate emissions down to 0.0044 grains per standard cubic foot of air (gr/scf).

4.6 Drying Line

The drying line includes the biomass furnace, drum dryer, and emissions control system. The furnace will combust hog fuel to provide heat for the dryer and will have a maximum heat input capacity of 164.81 million British thermal units per hour (MMBtu/hr), which is roughly 25.57 short tons per hour of hog fuel as received. Hog fuel will consist of ground forest slash from logging and forest management operations and hog fuel from local mill operations.

Wet raw materials will be staged in a metering bin before being fed to the drum dryer inlet. Hot flue gas from the furnace will be routed through the drum dryer to dry, by direct contact, the raw material from approximately 45 percent moisture to a target 10 percent final moisture. Dried material will then be conveyed pneumatically from the drum dryer discharge through a pair of high-efficiency cyclones operating in parallel that will separate the dried wood material from the moisture-rich exhaust gas stream. The dried material will then be conveyed pneumatically to a dry-product intermediate-storage silo.

The emissions control system for the drying line will consist of dual cyclones followed by a Wet Electrostatic Precipitator (WESP), and finally a Regenerative Thermal Oxidizer (RTO). The purpose of the dual cyclones is simply to separate the dried material stream from the wet exhaust. The WESP is a high efficiency particulate removal device and expected to remove upwards of 98% of the particulate matter (PM) from the exhaust gas stream. The RTO is a secondary combustion unit used to destroy organic gases through oxidation.

4.7 Furnace

The proposed biomass furnace is designed with four primary combustion zones to enable combustion of high moisture content fuel. Zone 1 is designed to dry out the fuel, with combustion occurring in the following zones. PNWRE claims this design accommodates the moisture in the biomass fuel, making a fuel pile cover unnecessary. The combustion chamber will have four zones of overlapping, moving grates. The primary combustion air enters the fuel bed from the under-fire air zone through slots between the grate bars. The combustion chamber is refractory lined. The chamber is designed with the top as a secondary combustion chamber. The furnace will also have a second, secondary combustion chamber to enable final combustion of remaining combustible gases from the Furnace.

The furnace will exhaust to the drum dryer and is designed to provide process heat at 752 F. After passing through the drum dryer, exhaust gases will pass through the pollution control system consisting of dual cyclones, a wet Electrostatic Precipitator (ESP), and finally, a Regenerative Thermal Oxidizer (RTO). Therefore, during normal operations, emissions from the furnace will ultimately exhaust through the RTO stack.

Ash will drop through the grates to four separate ash hoppers in the primary combustion chamber and a single ash hopper in the secondary combustion chamber. Ash hoppers will drop to a “submerged” ash conveyor that provides an air lock from the furnace. The ash conveyor drag chain will move ash to an enclosed ash storage bin.

4.8 Dryer Line Operating Scenarios

4.8.1 Normal, Steady-State Operation

During normal steady-state operation at design capacity of the facility, the drying line will exhaust through the WESP and RTO, and the pellet lines will exhaust through baghouses or cyclo-filters and the Regenerative Catalytic Oxidizer (RCO). Operating the drying line at design capacity (164.81 MMBtu/hr) will require roughly 23.2 metric tons per hour (mt/h) of hog fuel as received and produce dried material for roughly 51.1 mt/hr of pellet product.

The dryer system will have two emergency bypass stacks: One for the furnace and a separate stack for the dryer. When used, exhaust and emissions from these stacks bypass the air pollution control system (WESP + RTO) and are emitted directly to the atmosphere at approximately 50 feet above grade. The purpose of the bypass stacks is to provide for safe operation and temperature control during start-ups, shutdowns and unplanned malfunction and emergency events. Temperature control enables more gradual heating and cooling of the furnace refractory during these events, which is essential for assuring the integrity and long life of the refractory as well as other furnace and dryer components. Also, ability to control temperature provides a means to maintain refractory heat during minor malfunction events, thereby avoiding the need for a cold start.

4.8.2 Planned Startups

Planned startups are referred to as "cold startups" because they are initiated when the dryer system (furnace + drum dryer) has been shut down and has cooled to a temperature that requires gradual heating to safely bring the system up to operating temperatures. This is necessary to avoid thermally shocking and damaging the dryer system. The furnace bypass stack is open when combustion in the furnace is initiated, thereby bypassing both the drum dryer and the air pollution control system. PNWRE stated in an email correspondence to ORCAA that exhaust bypassing the air pollution control system during a cold startup will last only approximately 30 minutes during a normal cold startup, and that they anticipate no more than ten cold startups per year. Based on these constraints, and a reduced initial heat rate to the furnace of approximately 15% of the maximum furnace heat input rate (~ 25 MMBtu/hr), emissions rates were determined by PNWRE to be less than those during normal, steady state operations. ORCAA staff evaluated PNWRE's emissions calculations and concurs with this assessment. However, to assure startup emissions do not exceed these bounds in the future, ORCAA imposed startup constraints consistent with the cold startup descriptions provided by PNWRE.

ORCAA's understanding is that cold startup of the furnace will be initiated using approximately 25 pounds of dry wood, which will be augmented with approximately 15 gallons of diesel. The diesel is used as an accelerant. The clean/dry wood is placed on a bed of dry wood chips on the furnace grate, and is ignited using the diesel to help accelerate the combustion. The fire is manually ignited and allowed to burn while exhausting from the emergency bypass stack. During this time, the flue gas connection to the dryer is closed and the dryer ID fan runs at minimum speed with the drum turning and empty without material. After approximately 30 minutes, normal biomass fuel input to the furnace is initiated, the emergency stack of the furnace is closed, and the flue gas connection to the dryer is opened. By this time, the dryer system's air pollution controls (WESP and RTO) will be fully operational. Therefore, uncontrolled emissions through the bypass stack are only expected to last for 30 minutes during a normal cold startup. However, optimal combustion of the fuel is not achieved until the primary and secondary air in the furnace are fully functioning. Once a temperature of approximately 300° C (570° F) is reached, primary and secondary combustion air fans start operation at a low rate and then are gradually increased. From this point in the cold startup sequence, temperatures within the combustion chamber are increased in steps of approximately 120° F per hour until the normal fuel input rate is reached. The air ratio between primary and secondary combustion air are then adjusted until the working/operating temperature is achieved. PNWRE expects approximately 14 hours from cold start-up to achieving normal operating temperatures. However, bypass of the air pollution control system is only expected to last 30 minutes during the entire 14-hour cold startup period.

PNWRE does not expect the total duration of cold startup bypass (Exhaust bypassing the air pollution control systems during cold startups) to exceed 5 hours per year (10 startups @ 30 minutes per). Use of diesel during startups is expected to be less than 15 gallons per startup, and no more than 150 gallons per year. A propane torch may also be used to ignite the biomass during startups. Air emissions rates from combustion of wood and diesel during startups were quantified by PNWRE's Environmental consultant and found to be less than emissions rates during normal, steady state operations. Emissions from the bypass stack during a cold startup are likely to exhibit opacity and, therefore, BACT opacity limits imposed on the dryer system exempt emissions from the bypass stacks during cold startups. However, ORCAA's general opacity standard of 20% (ORCAA Rule 8.2) applies at all times including startup and shutdown as does the State's general opacity standard of 20% (WAC 173-400-040).

4.8.3 Planned Shutdowns

Planned shutdown from full production mode to a cold system takes about 14 hours. PNWRE stated in an email correspondence that air pollution control systems will be fully operational during a planned shutdown. Shutdowns are initiated by stopping fuel flow to the furnace fuel hopper. Actual fuel feed to the furnace stops after fuel hopper is emptied. Simultaneously with stopping fuel feed to the furnace, material input to the dryer system is ramped down until material infeed is completely stopped. It takes less than 30 minutes to empty the entire drum of material. The dryer system temperature will be controlled by a substitute cooling load (water injection into the drum). Until the fuel on the furnace grate is completely combusted, the furnace and dryer will exhaust through the air pollution control system consisting of the WESP and RTO. Only after fuel is completely combusted on the grate, primary and secondary combustion fans will be stopped and the flue gas connection to the dryer closed. As the combustion chamber cools down, hot gases will be exhausted through the emergency bypass stack of the furnace.

Cool down of the furnace is conducted at a rate of approx. 120° F per hour. Simultaneously, the dryer system ID fan will continue to run until the dryer system is cooled down. At this stage of the shutdown sequence, because neither fuel is being combusted nor material is being dried, hot gases from both the furnace and dryer will be emitted through the emergency bypass stacks for these units until they are sufficiently cooled. Therefore, during a planned shut-down, air pollution control systems for the drying system will be fully operational for the duration of time air pollution is being generated. Likewise, the RCO will be fully operational while air emissions are being generated by the hammer mills and pellet coolers during a planned shutdown. ORCAA's understanding is that PNWRE anticipates only two shutdowns of the furnace each year but assumed 10 for the air impacts analysis.

4.8.4 Malfunctions and Emergencies

The furnace automatically aborts to the furnace bypass stack in the event of a malfunction or emergency situation like loss of power or failure of a critical piece of equipment. Likewise, the dryer system automatically aborts to the dryer bypass stack due to similar events. Aborts and exhausting through either or both of the bypass stacks may be triggered by failsafe interlocks associated with the furnace, dryer, emissions control systems, or utility supply systems. Typically interlocks divert flue gas to both bypass stacks in the event of loss of utilities (electricity, water, compressed air or fuel), when monitoring conditions exceed safe operating ranges (temperature, pressure, flowrate) or in the event of a spark detection within the wood drying system and flue gas treatment areas. Whenever there is an abort, the furnace automatically switches to idle mode and emissions are exhausted through the bypass stack. Simultaneously, fuel feed to the furnace is reduced to the idle mode heat rate. During malfunctions and emergencies, air emissions from the drying system may emit uncontrolled through the bypass stacks. However, other than during planned startups and shutdowns of the drying system, exhaust through either of the bypass stacks is presumed to be in excess of the pollutant mass rate limits established in the air permit.

4.8.5 Feedstock Interruptions

Idle-mode may also be triggered by a reduction or interruption of feedstock material to the dryer. During these occurrences, idle-mode is triggered as a means to reduce the heat rate to the dryer in order to avoid excessive dryer temperatures and damage to the drying system. Also, in addition to preventing damage to the drying system, idle-mode avoids completely shutting down the furnace when feedstock input to the dryer is interrupted. Idle mode is initiated by reducing or stopping fuel feed into the furnace. The dryer system temperatures are reduced by substitute load (assumed water injection). Until feedstock input is resumed, the system continues to operate at a reduced heat rate. PNWRE stated in a communication with ORCAA that the furnace, dryer, dry hammer mills and pellet coolers will all be exhausted through their respective air pollution control systems when there are feedstock interruptions.

4.9 Pellet Mill

Dried material is then transferred by conveyor to into a dry-product intermediate-storage silo. The purpose of the intermediate-storage silo is to allow the dried material moisture content to homogenize; This helps provide a consistent raw material moisture content for the pelletizing process. The residency time of the dried materials in the intermediate-storage silo is approximately 2 hours and 50 minutes. The intermediate storage silo is passively vented through fabric filters.

A chain conveyor will be used to transfer dried material from the bottom of the intermediate-storage silo to four dry hammer mills operating in parallel. The dry hammer mills then mill the dried material into the desired size and consistency for pelletizing. Each dry hammer mill will exhaust through a cyclo-filter for recovering product and controlling particulate emissions. Exhaust streams from each dry hammer mill cyclo-filter will then be combined with exhaust streams from the pelletizing line and passed through a RCO for destruction of Volatile Organic Compounds (VOC) before emitting to the atmosphere. The RCO functions like an RTO to destroy VOC; however, the RCO uses a catalyst material rather than a ceramic material to achieve oxidation, and therefore can achieve efficient VOC destruction at lower temperatures.

Dried, milled material from the dry hammer mills and associated cyclo-filters will empty onto a chain conveyor which then conveys the milled product to a dry product intermediate-storage silo. The purpose of the dry intermediate-storage silo is to provide additional retention time for achieving homogenous moisture content, which is a key factor for achieving the desired quality in the final product. The intermediate-storage silo will be passively vented through a particulate filter.

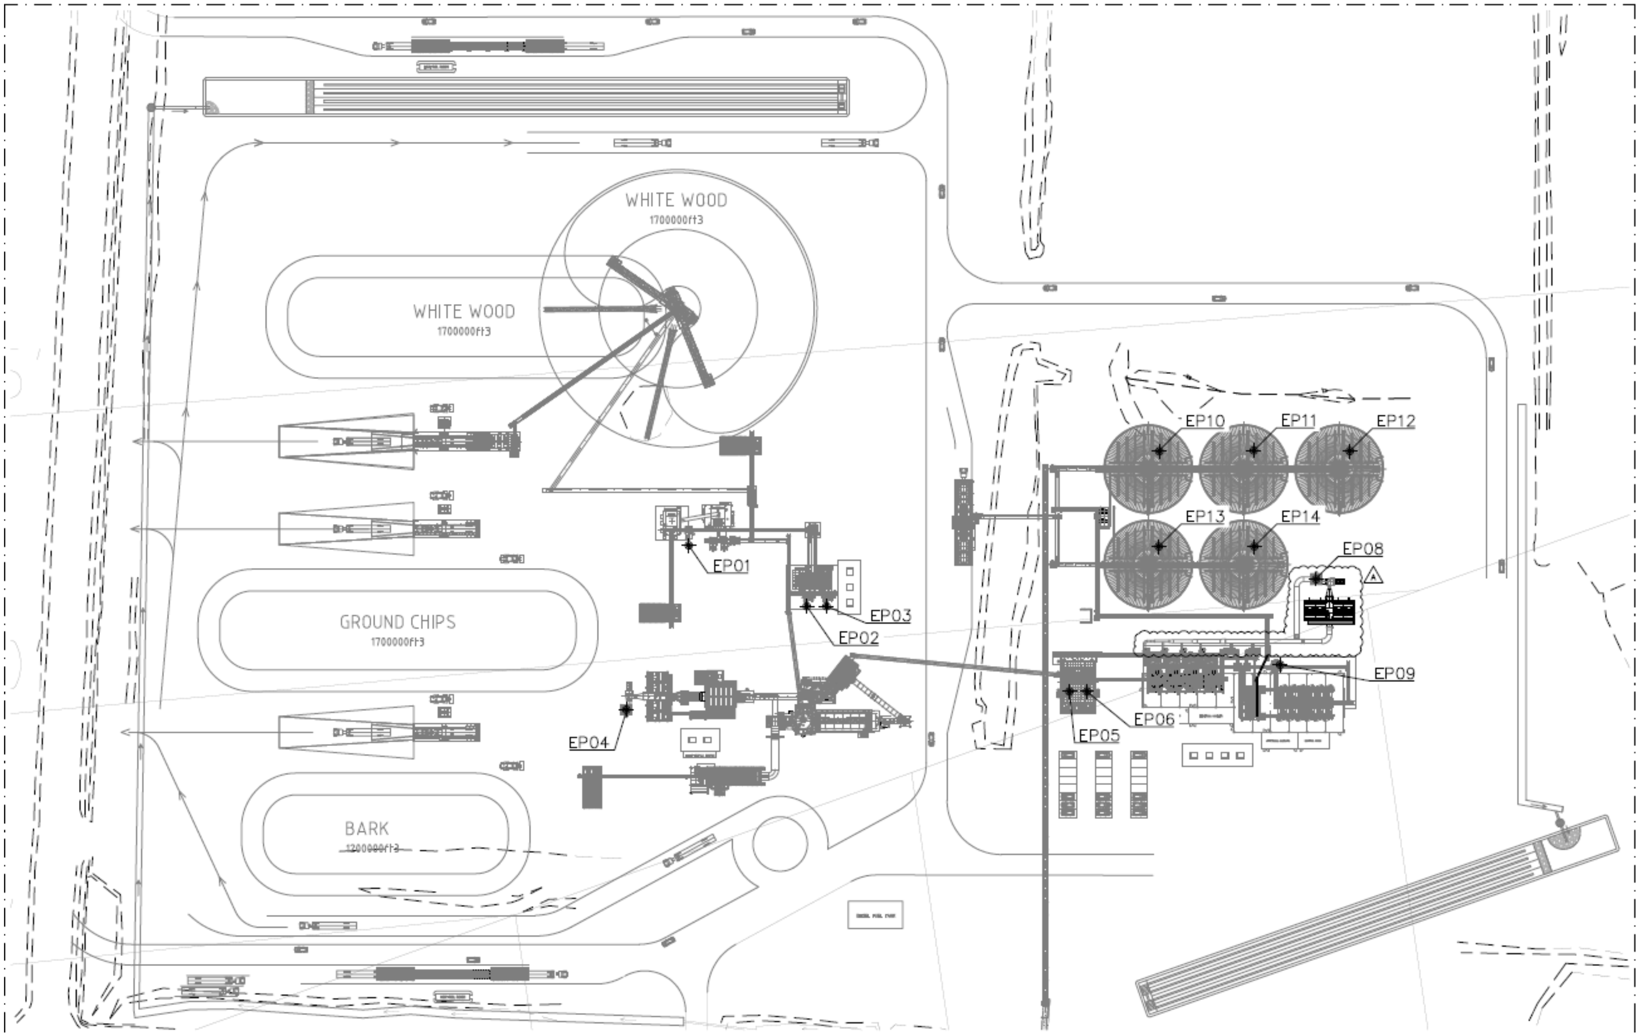
A chain conveyor will then transport the dried, milled material from the outlet of the intermediate-storage silo to the pellet mill hoppers, which independently feed the pellet mills. PNWRE proposes two pellet lines consisting of six pellet mills each, for a total of 12 pellet mills. In each pellet mill, rollers push the material through the holes of a die plate. Knives on the exterior of the die plate cut the wood pellets from the plate once the pellets achieve the required length. The temperature of a freshly produced pellet is around 200 degrees Fahrenheit (°F). Therefore, the two pellet lines will discharge into pellet coolers where the material will flow countercurrent to a stream of ambient air. The airflow reduces the temperature of the wood pellets at the point of pellet discharge. Each pellet cooler will be equipped with either a baghouse or cyclo-filter to remove dust from the exhaust stream before it goes to the RCO. The exhaust streams from the two pellet cooler baghouses will then be combined with the exhaust streams from the dry hammer mills and passed through the RCO for control of VOC before being emitted to the atmosphere.

4.10 Pellet Silos and Loadout

Cooled pellets will be conveyed from the pellet coolers to one of five pellet silos. The total combined capacity of the pellet silos is approximately 60,000 short tons. The silos will utilize aeration fans and venting to maintain low pellet temperature for final shipment. An automated enclosed conveyor will draw pellets from the silos evenly according to loading schedules and transport them via enclosed conveyor to the neighboring Willis Enterprises' existing conveyors and marine vessel loadout facilities. Willis Enterprises operates under an RC2-class ORCAA registration (source number 2112, file number 647). The existing conveyors and vessel loadout facilities owned by Willis Enterprises are under a separate air permit and already registered with ORCAA.

PNWRE will also have the ability to deliver pellets via a truck unloading system; however, this system would be used only in special circumstances. PNWRE proposes no more than 10 loaded trucks per day and 32,000 tons per year of truck loadout utilization.

Figure 2: General Facility Layout



* Figure from page 3 of PNWRE NOC application

5. Air Pollutant Emissions

Air pollutant emissions evaluated through this permitting action included Criteria Air Pollutants, Hazardous Air Pollutants (HAP), Toxic Air Pollutants (TAP) and Greenhouse Gases (GHG). Criteria Air Pollutants are air pollutants that have established National Ambient Air Quality Standards (NAAQS). EPA established and periodically reevaluates and updates NAAQS for six of the most common air pollutants— carbon monoxide, lead, ground-level ozone, particulate matter, nitrogen dioxide, and sulfur dioxide— these are known as “criteria” air pollutants (or simply “criteria pollutants”). Based on ambient monitoring throughout the nation, areas are ranked in terms of whether or not the NAAQS are maintained. It is important to note that ground-level ozone is not an air pollutant directly emitted, but is created via photo-chemical reactions in the atmosphere involving volatile organic compounds (VOCs) and nitrogen oxides (NOx). Therefore, ozone is not included in any of the tables below because it is not directly emitted. However, ground-level ozone precursors (NOx and VOC) are quantified and included in the tables below.

HAP are those pollutants that are known or suspected by the EPA to cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental effects. There are 188 air pollutants that are regulated as HAP under the Clean Air Act. Facilities that have the potential to emit 10 tons or more per year of any single HAP or 25 tons per year or more of any combination of HAPs are regulated as “Major Sources” of HAP and subject to the Title V Air Operating Permit program. It is important to note that HAPs emitted as solids are a subset of and reflected in the PM, PM10 and PM2.5 emissions rates shown in the tables below. Likewise, HAP emitted as volatile gases are reflected in the in the VOC emissions rates shown below.

TAP, also known “air toxics,” are specific air pollutants regulated by Washington because they are known or suspected by the Department of Ecology to cause cancer or other serious health effects. Washington State regulates TAP through a State-wide regulation titled CONTROLS FOR NEW SOURCES OF TOXIC AIR POLLUTANTS, which is under Chapter 173-460 of the Washington Administrative Code (Washington Air Toxics Regulation). It is important to note that the list of TAP regulated by Washington contains more than 350 chemical compounds and substances. Most but not all of the federally listed HAPs are also listed and regulated as TAPs in Washington. However, there are 40 HAPs that are not listed as TAP. Emissions of individual TAPs were provided in PNWRE’s application. Section 12 addresses compliance with the Washington Air Toxics Regulation.

A comprehensive Potential to Emit analysis for the proposed facility was provided in PNWRE’s NOC application. The emissions inventory accounts for both point sources of emissions (stacks and equipment) and area sources of emissions (material piles, material handling, haul roads). All foreseeable operating scenarios were accounted for such as startup, shutdown, and “idle mode,” as well as normal, steady-state operation. Emissions estimates for normal operations were calculated based on fuel and production rates at maximum capacity for each operating scenario and assuming no down time.

5.1 Emissions During Normal Operations

ORCAA staff reviewed PNWRE's emissions calculations including verifying emissions factors, conversions, assumptions and equations used to calculate emissions from individual point and area sources. ORCAA staff concluded that PNWRE's emission estimates reflect maximum potential to emit of the facility and are appropriate for making regulatory determinations and estimating ambient air quality impacts. Therefore, the emissions rates and facility-wide emissions provided in PNWRE's NOC application were used in confirming applicability of relevant air regulations, evaluating projected air impacts, and establishing emissions limits.

Table 2 provides a Potential to Emit (PTE) summary for the proposed facility in terms of tons of pollutants emitted annually. PTE represents the highest amount an air pollutant could be emitted at the maximum design rates of each emissions source and assuming continuous operation. PTE estimates were used in determining applicability of relevant performance standards and air regulatory programs such as the Title V Air Operating Permits (Title V) and Prevention of Significant Determination (PSD) permitting programs. To ensure long term protection of air quality, PTE estimates were converted to annual emissions limits and included in the proposed conditions of approval detailed in section 16.

Table 3 provides a summary of emissions rates for criteria pollutant emissions and Greenhouse Gases (GHG) in terms of pounds per hour for each source. It is important to note that Hazardous Air Pollutants (HAP) and Toxic Air Pollutants (TAP) emissions rates are shown for normal, steady-state operations, and for potential alternative operating scenarios. Emission rates for normal, steady-state operations reflect the maximum hourly PTE with air emissions control systems fully functioning. To ensure that the performance of air pollution control systems do not degrade over time, emission rates for normal operations were converted to commensurate emission limits as appropriate, and included in the recommended conditions of approval detailed in section 16.

5.2 Startup Emissions Rates

Startup of the drying system will require exhausting emissions uncontrolled from the furnace bypass stack. PNWRE stated in their application that two cold start-ups are anticipated per year. However, the air quality analysis provided in the application conservatively assumes 10, 30-minute startups per year. The objective for startups is to gradually bring the furnace up to normal operating temperatures using clean startup fuels.

PNWRE stated in their application that startup of the furnace will be initiated using approximately 25 pounds of dry wood, which will be augmented with approximately 15 gallons of diesel and ignited using propane torches. The diesel is used as an accelerant. The clean/dry wood is placed on a bed of dry wood chips on the furnace grate, soaked with diesel and ignited using propane to help accelerate the combustion. The fire is manually ignited using propane torches and allowed to burn while exhausting from the emergency bypass stack. During this time, the flue gas connection to the dryer is closed and the dryer ID fan runs at minimum rpm with the drum turning and empty without material.

Table 2. Facility-Wide Potential Annual Emissions (tons per year (tpy))

Pollutant	Class	Point-Sources (tpy)	Area-Sources (tpy)	Facility-Wide Total (tpy)	Title V Major?	PSD Major?
PM	Criteria[a]	108	32	140	N/A	No
PM_{10}	Criteria[a]	88	10	98	No	No
$PM_{2.5}$	Criteria[a]	71	1	72	No	No
NO_X	Criteria[a]	230	Not emitted	230	Yes	No
CO	Criteria[a]	185	Not emitted	185	Yes	No
VOC[d]	Criteria[a]	67	Not emitted	67	No	No
SO_2	Criteria[a]	18	Not emitted	18	No	No
Lead	Criteria[a]	< 0.1 lbs/yr	Not emitted	< 0.1 lbs/yr	No	No
CO_2e	GHG[e]	163,592	Not emitted	163,592	N/A	No
Total HAP	Total HAP[b]	1.32	Not emitted	1.32	No	N/A
Formaldehyde (Highest individual HAP/TAP)	HAP[b] TAP[c]	0.31	Not emitted	0.31	No	N/A

Table Notes:

[a] EPA has established national ambient air quality standards (NAAQS) for six of the most common air pollutants—carbon monoxide, lead, ground-level ozone, particulate matter, nitrogen dioxide, and sulfur dioxide—known as "criteria" air pollutants (or simply "criteria pollutants").

[b] HAP means Hazardous Air Pollutant. Hazardous Air Pollutants are those known to cause cancer and other serious health impacts and are regulated under the federal Clean Air Act. HAPs that are solids when emitted are reflected in the PM, PM_{10} and $PM_{2.5}$ annual emissions. HAP emitted as volatile organic compounds are reflected in the in the VOC annual emissions.

[c] TAP means any toxic air pollutant regulated in Washington and listed in WAC 173-460-150.

[d] VOC is regulated as a Criteria Air Pollutant because it is a precursor to Ground Level Ozone (O_3)

[e] GHG means Green House Gas. GHG are shown in terms of Carbon Dioxide Equivalents.

[f] Table acronyms: CO = carbon monoxide; CO_2e = carbon dioxide equivalent; HAP = hazardous air pollutant; N/A = not applicable; NO_x = nitrogen oxides; PM = particulate matter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; PSD = Prevention of Significant Deterioration; PTE = potential to emit; SO_2 = sulfur dioxide; TPY = tons per year; VOC = volatile organic compound

Table Notes:

[a] Fugitive, refers to fugitive sources of emissions and means air pollution emitted to that is not captured and is not emitted through a stack or vent. Examples of fugitive emissions include, but are not limited to, road dust from vehicle traffic, wind-blown dust from piles of materials, and volatiles that escape capture or containment systems like emission from leaks.

[b] Point, refers to point sources of emissions and means air pollution that is captured and emitted to the ambient air through a stack or vent.

[c] Table acronyms: TD = Truck Dumpers; SP = Storage Piles; VEH = Vehicle Traffic; EP = Emission Point; LO = Load Out; RCO =Regenerative Catalytic Oxidizer

[d]Pollutant acronyms: CO = carbon monoxide; CO_2e = carbon dioxide equivalent; NO_x = nitrogen oxides; PM = particulate matter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; VOC = volatile organic compound;

After approximately 30 minutes, normal biomass fuel input to the furnace is initiated, the emergency stack of the furnace is closed, and the flue gas connection to the dryer is opened. By this time, the dryer system air pollution controls (WESP and RTO) will be fully operational. Therefore, uncontrolled emissions through the bypass stack are only expected to last for 30 minutes during a normal cold startup. Startup continues from this point forward in the startup sequence with air pollution controls functional. However, optimal combustion of the fuel is not achieved until the primary and secondary air are fully functioning.

Once a temperature of approx. 300° C (570° F) is reached, primary and secondary combustion air fans start operation at a low rate and then are gradually increased. From this point in the cold startup sequence, temperatures within the combustion chamber are increased in steps of approximately 120° F per hour until the normal fuel input rate is reached. The air ratio between primary and secondary combustion air are then adjusted until the working/operating temperature is achieved. From cold start-up to operating temperature, PNWRE expects a cold startup to take about 14 hours.

Startup emission rate estimates are shown in Table 4 and were based on emissions factors from EPA's latest edition of Compilation of Air Pollutant Emissions Factors (AP-42). Startup emission rates from wood combustion were based on EPA AP-42 Chapter 1.10 Residential Wood Stoves utilizing emission factors for conventional stoves. Conventional stoves are enclosed wood-burning heaters that operate without catalytic combustors and have no emission reduction technology or design features. This scenario is similar to the piles of burning wood pieces within the enclosed furnace. Startup emission rates from diesel fuel used as an accelerant were based on EPA AP-42 Chapter 1.3 using emission factors for distillate oil-fired boilers and assuming ultra-low sulfur diesel.

Table 4. Uncontrolled Startup Emissions Rates (pounds per hour (lb/hr))

Sources	PM	PM_{10}	$PM_{2.5}$	NO_x	CO	VOC	SO_2	CO_2e
Drying Line (Furnace & Dryer)[a] EP-03	0.84	0.84	0.84	0.67	5.92	1.34	0.03	784

Table Notes:
[a] Includes uncontrolled emissions from combustion of dry wood and diesel for the initial 30-minutes during a cold startup.

5.3 Shutdown Emission Rates

Shut down from full production mode to a cold system takes about 14 hours. PNWRE stated in their application that air pollution control systems will be fully operational during a planned shutdown while fuel is still being combusted on the furnace grates. Shutdowns are initiated by stopping fuel flow to the furnace fuel hopper. Actual fuel feed to the furnace stops after fuel hopper is emptied. Simultaneously with stopping fuel feed to the furnace, material input to the dryer system is ramped down until material infeed is completely stopped. It takes less than 30 minutes to empty the entire drum of material. The dryer system temperature will be controlled by a substitute cooling load (water injection into the drum). Until the fuel on the furnace grate is completely combusted, the furnace and dryer will exhaust through the air pollution control system consisting of the cyclones, WESP and RTO. Only after fuel is completely combusted on the grate, primary and secondary combustion fans will be stopped and the flue gas connection to the dryer closed. As the combustion chamber cools down, hot gases will be exhausted through the emergency bypass stack of the furnace.

Cool down of the furnace is conducted at a rate of approx. 120^o F per hour. Simultaneously, the dryer system ID fan will continue to run until the dryer system is cooled down. At this stage of the shutdown sequence, because neither fuel is being combusted nor material is being dried, hot gases from both the furnace and dryer will be emitted through the emergency bypass stacks for these units until they are sufficiently cooled. Therefore, during a planned shut-down, air pollution control systems will be fully operational for the duration of time air pollution is being generated. Likewise, the RCO will be fully operational while air emissions are being generated by the hammer mills and pellet coolers during a planned shutdown.

6. Administrative Requirements for NOC Applications

NOC applications are subject to filing fees according to ORCAA Rule 3.3(b) and may incur additional NOC processing fees at an hourly rate according to ORCAA Rule 3.3(c). Applicable NOC filing fees for PNRE's NOC application were paid prior to ORCAA commencing processing of the application. Additional NOC processing fees may apply and will be determined and assessed prior to issuing a Final Determination and the Approval Order (a.k.a.: Air Permit).

NOC applications are subject to a 15-day public notice and an opportunity to request a 30-day public comment period. Public notice of PNRE's NOC application was posted on ORCAA's website on July 25, 2023. The time period for filing comments on the application and requests for a public comment period expired on August 9, 2023.

There were no requests for a public comment hearing during the application noticing period. However, the NOC application is subject to a mandatory public comment period per ORCAA Rule 6.1.3(b) as the proposed facility would cause a significant net increase in emissions of several air contaminants. Per ORCAA regulations, a public hearing may be scheduled if requested during the public comment period. However, anticipating a high level of public interest on the case, PNWRE proactively requested ORCAA to schedule a Public Hearing. Therefore, ORCAA will schedule and issue public notice for a public hearing after a preliminary determination has been made.

7. SEPA Review

The State Environmental Policy Act (SEPA) under Chapter 197-11 WAC is intended to provide information to agencies, applicants, and the public to encourage the development of environmentally sound proposals. The goal of SEPA is to assure that significant impacts are mitigated.

The City of Hoquiam served as the Lead Agency for this project and issued a Determination of Non-Significance (DNS) on July 25, 2023. The DNS lists an Air Permit issued by ORCAA as one of the permits required. Other permits listed in the DNS include:

- Department of Ecology – National Pollutant Discharge Elimination System Construction Stormwater Permit and Industrial Stormwater Permit
- FAA – Clearance Letter

- City of Hoquiam Building Permit
- City of Hoquiam Critical Areas Review
- Port of Grays Harbor – Approval of Operation Agreement and Lease Agreement

8. Criteria for Approval

ORCAA's Rule 6.1 and the Washington State Implementation Plan under 40 CFR part 52.2470(c), Table 6, establish the following general criteria for approving new stationary sources and modifications to existing stationary sources of air pollution in ORCAA's region:

1. ***Performance Standards -*** Any new stationary source or modification will likely comply with applicable air-performance standards such as the federal new source performance standards (NSPS), national emission standards for hazardous air pollutants (NESHAPs), and any performance standards adopted under chapter 70A.15 RCW;
2. ***BACT -*** The new or modified stationary source is controlled to a level that meets the standard of "Best Available Control Technology" (BACT);
3. ***Ambient Air Quality –*** Any increase in air emissions will not cause or contribute to violation of any ambient air quality standard;
4. ***Federal Air Permitting Requirements –*** All applicable federal air permits, if required, are secured;
5. ***Washington Air Toxics Regulations -*** If there are increases in toxic air pollutant (TAP) emissions, the requirements of Washington's Controls for New Sources of Toxic Air Pollutants under Chapter 173-460 WAC are met; and,
6. ***Public Outreach –*** Public notice and comment requirements in ORCAA's regulations and the Washington State Implementation Plan under 40 CFR part 52.2470(c), Table 6 are met.

The following sections provide more detail on each criterion.

9. Applicable Performance Standards (Summary)

ORCAA's Rule 6.1.4(a)(1) and the Washington State Implementation Plan under 40 CFR part 52.2470(c), Table 6, require a finding that any new or modified stationary source will likely comply with applicable state, federal and local performance standards for air emissions including emission standards adopted under chapter 70A.15 RCW, emissions standard of ORCAA, and federal emission standards including New Source Performance Standards (NSPS), National Emission Standards for Hazardous Air Pollutants (NESHAP), and National Emission Standards for Hazardous Air Pollutants for Source Categories (MACT standards). The performance standards in Table 5 were determined applicable to the new wood pellet manufacturing facility. The performance standards in Table 6 were determined relevant to the proposed wood pellet manufacturing facility, but inapplicable. A comprehensive list of applicable performance standards that apply to all stationary sources of air pollution to be located at the facility, as well as general air regulations and standards that apply, are included in the Appendix.

Table 5: General Requirements, Prohibitions, and Performance Standards

Title Citation	Brief Description (Consult rule/regulation for specific requirements)	discussion/determination
Air Operating Permit Program Chapter 173-401 WAC; ORCAA Rule 5.1	All sources subject to this regulation must have a permit to operate that assures compliance by the source with all applicable requirements. While chapter 173-401 WAC does not impose substantive new requirements, it does require that fees be imposed on sources and that certain procedural measures be adopted especially with respect to compliance.	The facility is projected to emit greater than 100 tons per year of NO_x and CO, which makes the facility a “major source” and subject to the Title V Air Operating Permit program.
Operating Permit Fees ORCAA Rule 3.2	Requires all facilities subject to the Air Operating Program to pay an annual fee to cover ORCAA’s costs of administering the program.	The facility is projected to emit greater than 100 tons per year of NO_x and CO, which makes the facility a “major source” and subject to the Title V Air Operating Permit program.
Interference or Obstruction ORCAA Rule 7.1	Prohibits willfully interfering with or obstructing the Executive Director or any Agency employee in performing any lawful duty.	Applies generally to all air pollution sources
False or Misleading Statements ORCAA Rule 7.2	Prohibits any person from willfully making a false or misleading statement to the Board or its representative as to any matter within the jurisdiction of the Board.	Applies generally to all air pollution sources
Unlawful Reproduction or Alteration of Documents ORCAA Rule 7.3	Prohibits reproducing or altering, or causing to be reproduced or altered, any order, registration certificate or other paper issued by the Agency if the purpose of such reproduction or alteration is to evade or violate any provision of these Regulations or any other law.	Applies generally to all air pollution sources
Display of Orders and Certificates ORCAA Rule 7.4	Any order or registration certificate required to be obtained by these Regulations shall be available on the premises designated on the order or certificate. In the event that the Agency requires order or registration certificate to be displayed, it shall be posted. No person shall mutilate, obstruct, or remove any order or registration certificate unless authorized to do so by the Board or the Executive Director.	Applies generally to all air pollution sources
RACT Requirement WAC 173-400-040(1)(c) ORCAA Rule 8.3	All emissions units are required to use reasonably available control technology (RACT).	Applies generally to all air pollution sources
Visible Emissions WAC 173-400-040(2) ORCAA Rule 8.2(a)	Prohibits emissions with opacity of greater than 20% for more than three (3) minutes in any one hour.	Applies generally to all air pollution sources
Sulfur Dioxide WAC 173-400-040(7)	No person shall cause or allow the emission from any emissions unit in excess of one thousand ppm of sulfur dioxide on a dry basis, corrected to seven percent oxygen for combustion sources, and based	Applies generally to all air pollution sources

Title Citation	Brief Description (Consult rule/regulation for specific requirements)	discussion/determination
	on the average of any period of sixty consecutive minutes.	
Control Equipment Maintenance and Repair ORCAA Rule 8.8	ORCAA Rule 8.8 requires that all air contaminant sources keep any process and/or air pollution control equipment in good operating condition and repair.	Applies generally to all air pollution sources
Fallout WAC 173-400-040(3) ORCAA Rule 8.3(e)	Prohibits particulate emissions from any source to be deposited, beyond the property under direct control of the owner or operator of the source, in sufficient quantity to interfere unreasonably with the use and enjoyment of the property upon which the material was deposited.	Applies generally to all air pollution sources
Fugitive Emissions WAC 173-400-040(4)(a) ORCAA Rule 8.3(c)	The owner or operator of any emissions unit engaging in materials handling, construction, demolition, or other operation which is a source of fugitive emission shall take reasonable precautions to prevent the release of air contaminants from the operation.	Applies generally to all air pollution sources
Odor WAC 173-400-040(5) ORCAA Rule 8.5	ORCAA Rule 8.5 contains general requirements for controlling odors and a general prohibition of odors that unreasonably interfere with the use or enjoyment of a person’s property.	Applies generally to all air pollution sources
Emissions Detrimental to Persons or Property WAC 173-400-040(6) ORCAA Rule 7.6	Prohibits causing or allowing the emission of any air contaminant from any source if it is detrimental to the health, safety, or welfare of any person, or causes damage to property or business.	Applies generally to all air pollution sources
Concealment and Masking WAC 173-400-040(8) ORCAA Rule 7.5	Prohibits installation or use of any device or means to conceal or mask emissions of an air contaminant, which causes detriment to health, safety, or welfare of any person, or causes damage to property or business.	Applies generally to all air pollution sources
Fugitive Dust WAC 173-400-040(9)	The owner or operator of a source or activity that generates fugitive dust must take reasonable precautions to prevent that fugitive dust from becoming airborne and must maintain and operate the source to minimize emissions.	Applies generally to all air pollution sources
Excess Emissions Provisions WAC 173-400-107; WAC 173-400-108 ORCAA 8.7	Requires excess emissions be reported to the Agency as soon as possible and within 24 hours and establishes criteria qualifying excess emissions as unavoidable.	Applies generally to all air pollution sources
Record Keeping and Reporting. ORCAA Rule 8.11	Requires the following: 1. Maintenance of records on the nature and amounts of emissions and other related information as deemed necessary by ORCAA; 2. Reporting of emissions to ORCAA upon request.	Applies generally to all air pollution sources
Emission Standards for Combustion and Incineration units	Prohibits emissions from any combustion unit in excess of 0.1 grain/dscf. EPA test methods from 40 CFR Part 60 Appendix A shall be used should demonstration of compliance be required.	The furnace, RTO and RCO are combustion units and subject to the limit of these rules.

Title Citation	Brief Description (Consult rule/regulation for specific requirements)	discussion/determination
WAC 173-400-050(1) ORCAA Rule 8.3(a)	Measured concentrations for combustion and incineration units shall be adjusted for volumes corrected to seven percent oxygen, except when the permitting authority determines that an alternate oxygen correction factor is more representative of normal operations.	
Emission standards for general process units. WAC 173-400-060 ORCAA Rule 8.3(a)	Prohibits emissions from any process unit in excess of 0.1 grain/dscf. EPA test methods from 40 CFR Appendix A shall be used should demonstration of compliance be required.	The performance standards of these rules apply to all baghouses, cyclo-filters and other general process units proposed for the facility.
Washington State Reporting of Emissions of Greenhouse Gases Chapter 173-441 WAC	This rule establishes mandatory greenhouse gas (GHG) reporting requirements for owners and operators of certain facilities that directly emit GHG as well as for certain suppliers and electric power entities. For suppliers, the GHGs reported are the quantity that would be emitted from the complete combustion or oxidation of the products supplied.	Based on PNWRE's GHG potential to emit estimates and a strong likelihood that the facility will operate continuously, actual emissions will likely exceed the 10,000 metric tons CO2e or more per calendar year threshold. Therefore, reporting GHG per Chapter 173-441 WAC will likely be required.
Standards of Performance for Stationary Compression Ignition Internal Combustion Engines 40 CFR 60 Subpart IIII	This New Source Performance Standard (NSPS) applies to manufacturers, owners, and operations of certain stationary compression-ignition (CI) internal combustion engines (ICEs).	PNWRE is proposing to operate a CI ICE emergency generator. Therefore, NSPS IIII is applicable to the CI ICE at the facility. PNWRE proposes to operate the CI ICE as an emergency engine as defined in this regulation and comply with the applicable performance standards.
National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines 40 CFR Part 63, Subpart ZZZZ	Subpart ZZZZ establishes national emission limitations and operating limitations for hazardous air pollutants (HAP) emitted from stationary reciprocating internal combustion engines (RICE) located at major and area sources of HAP emissions.	The proposed facility will include one diesel-fired emergency generator that meets the applicability criteria of this regulation.

Table 6: Inapplicable Requirements, Prohibitions, and Performance Standards

Regulation Title Citation	Applicability Criteria	Basis
Registration ORCAA Regulation 4	Requires facilities that are minor sources of emissions to register annually with ORCAA and pay annual registration fees.	PNWRE will be a major source of air pollution and subject to the Title V Air Operating Permit (AOP) program
Annual Registration Fees ORCAA Rule 3.1	Requires payment of annual registration fees to ORCAA based in part on air pollutants emitted during the previous year.	PNWRE will be a major source of air pollution and subject to the Title V Air Operating Permit (AOP) program
Initial Notification ORCAA Rule 4.3(a)&(b); 4.3(f)	Requires facilities subject to registration to register by submitting an initial notification with the information in ORCAA Rule 4.3(b) within 30 days from: 1) Commencement of operation of any new or recommissioned stationary source; 2) Change in ownership of existing registered stationary source. The notification must be signed by the owner or operator or by the agent appointed by the owner.	PNWRE will be a major source of air pollution and subject to the Title V Air Operating Permit (AOP) program
Administrative Change Notification ORCAA Rule 4.3(e); 4.3(f)	Requires facilities to notify ORCAA of any changes to administrative information within 30 days from the change taking place including, but not limited to, contact names, address, phone numbers, and permanent shut down or decommissioning of a stationary source. The notification must be signed by the owner or operator or by the agent appointed by the owner.	PNWRE will be a major source of air pollution and subject to the Title V Air Operating Permit (AOP) program
Annual and/or Periodic Reports ORCAA Rule 4.3(c)&(d); 4.3(f)	Requires stationary sources to submit reports with information directly related to the registration program when requested by the Agency within 30 days of receipt of the request. The submittal must be signed by the owner or operator or by the agent appointed by the owner.	PNWRE will be a major source of air pollution and subject to the Title V Air Operating Permit (AOP) program
Emission Standards for Combustion and Incineration units – Incinerators WAC 173-400-050(2)	For any incinerator, no person shall cause or allow emissions in excess of one hundred ppm of total carbonyls as measured by Source Test Method 14 procedures in Source Test Manual - Procedures for Compliance Testing, state of Washington, department of ecology, as of September 20, 2004, on file at ecology. "Incinerator" means a furnace used primarily for the thermal destruction of waste.	The biomass combusted in the furnace is a fuel and not regulated as a waste. Therefore, this rule does not apply.
Commercial and industrial solid waste incineration units WAC 173-400-050(4)	This rule applies to commercial and industrial solid waste incineration units constructed on or before November 30, 1999. A commercial and industrial solid waste incineration unit that commenced construction on or before November 30, 1999, that meets the applicability requirements in 40 C.F.R. 62.14510, must comply with the requirements in 40 C.F.R. Part 62, Subpart GGG (in effect on the date in WAC 173-400-025).	PNWRE's biomass furnace is not regulated as an incinerator because the biomass fuel is not classified as a solid waste. Therefore, this rule does not apply.

Other waste wood burners WAC 173-400-070(5)	This rule applies to waste wood burners and incorporates by reference federal standards for Commercial and Industrial Solid Waste Incineration units (CISWI) under 40 CFR Part 60 Subpart CCCC and 40 CFR Part 62 Subpart III. For purposes of this rule, "Waste wood" means, "… wood pieces or particles generated as a by-product or waste from the manufacturing of wood products…"	This rule does not apply because the biomass combusted in the proposed furnace does is not "waste wood," but will be purchased and combusted as a fuel to produce heat for a manufacturing process.
Standards of Performance for Industrial-Commercial-Institutional Steam Generating Units 40 CFR 60 Subpart Db	The affected facility to which this subpart applies is each steam generating unit that commences construction, modification, or reconstruction after June 19, 1984, and that has a heat input capacity from fuels combusted in the steam generating unit of greater than 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/hr).	Although the heat rate of the furnace exceeds 100 MMBtu/hr, by definition, the furnace is not a steam generating unit. Therefore, the performance standards under this subpart do not apply.
Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units 40 CFR Part 60 Subpart Dc	The affected facility to which this subpart applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/h)) or less, but greater than or equal to 2.9 MW (10 MMBtu/h).	The heat rate of the furnace exceeds 100 MMBtu/hr and is, therefore, outside the applicability slot of this performance standard. Also, by definition, the furnace is not a steam generating unit. Therefore, the performance standards under this subpart do not apply.
Standards of Performance for Commercial and Industrial Solid Waste Incineration Units 40 CFR Part 60 Subpart CCCC	This subpart establishes new source performance standards for commercial and industrial solid waste incineration units (CISWIs) and air curtain incinerators (ACIs). Commercial and industrial solid waste incineration unit (CISWI) means any distinct operating unit of any commercial or industrial facility that combusts, or has combusted in the preceding 6 months, any solid waste as that term is defined in 40 CFR part 241.	Per §241.2, traditional fuels that have not been discarded are not solid wastes, including cellulosic biomass (virgin wood). The traditional fuels definition further states that clean cellulosic biomass, defined in §241.2 to include forest-derived biomass such as bark and hogged fuel, is a fuel product. Therefore, the proposed fuel for the furnace is not solid waste and the furnace is not a CISWI.
National Emission Standards for Hazardous Air Pollutants: Plywood and Composite Wood Products 40 CFR Part 63 Subpart DDDD	This subpart establishes national compliance options, operating requirements, and work practice requirements for hazardous air pollutants (HAP) emitted from plywood and composite wood products (PCWP) manufacturing facilities. Plywood and composite wood products (PCWP) manufacturing facility means a facility that manufactures plywood and/or composite wood products by bonding wood material (fibers, particles, strands, veneers, etc.) or agricultural fiber, generally with resin under heat and pressure, to form a panel, engineered wood product, or other product defined in § 63.2292.	The PNWRE facility will be an area source of HAP emissions. Therefore, 40 CFR Part 63 Subpart DDDD does not apply.

National Emission Standards for Hazardous Air Pollutants for Major Sources: Industrial, Commercial, and Institutional Boilers and Process Heaters 40 CFR Part 63 Subpart DDDDD	This subpart establishes national emission limitations and work practice standards for hazardous air pollutants (HAP) emitted from industrial, commercial, and institutional boilers and process heaters located at major sources of HAP.	The PNWRE facility will be an area source of HAP emissions. Therefore, the proposed facility is not subject to 40 CFR Part 63 Subpart DDDDD.
National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers Area Sources 40 CFR Part 63, Subpart JJJJJJ	This subpart applies to industrial, commercial, or institutional boilers that are located at, or part of, an area source of hazardous air pollutants (HAP). A “boiler” is defined an enclosed device using controlled flame combustion in which water is heated to recover thermal energy in the form of steam and/or hot water.	The PNWRE facility will be an “Area Source” of HAP emissions. However, the facility does not include any boilers. Therefore, the performance standards under 40 CFR Part 63 Subpart JJJJJJ do not apply.
National Emission Standards for Hazardous Air Pollutants for Wood Preserving Area Sources 40 CFR Part 63 Subpart QQQQQQ	This subpart applies to wood preserving operations that are Area Sources of HAP emissions. Wood preserving is defined as means the pressure or thermal impregnation of chemicals into wood to provide effective long-term resistance to attack by fungi, bacteria, insects, and marine borers.	The PNWRE facility will not use any wood preservatives in the production of wood pellets. Therefore, the standards in Subpart QQQQQQ do not apply.
Federal- MANDATORY GREENHOUSE GAS REPORTING 40 CFR Part 98	This part establishes mandatory greenhouse gas (GHG) reporting requirements for owners and operators of certain facilities that directly emit GHG as well as for certain suppliers.	PNWRE will not emit GHG above the threshold requiring federal reporting. This determination relies on “netting out” biogenic CO2e emissions from combustion of biomass.

10. Best Available Control Technology (BACT)

ORCAA Rule 6.1.4(a)(2) and the Washington State Implementation Plan under 40 CFR part 52.2470(c), Table 6, require the finding that a new source or modification to an existing source of air pollution in an attainment or unclassifiable area will employ best available control technology for all pollutants (BACT) not previously emitted or whose emissions would increase as a result of the new source or modification.

New sources of air pollution and modifications to existing sources of air pollution are required to use BACT to control all pollutants not previously emitted, or those for which emissions would increase as a result of the new source or modification. BACT is defined in WAC 173-400-030 as, *“an emission limitation based on the maximum degree of reduction for each air pollutant subject to regulation under chapter 70A.15 RCW emitted from or which results from any new or modified stationary source, which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of each pollutant.”*

PNWRE's original NOC application and subsequent application addendums describe air pollution control technology proposed for all point, area, and fugitive sources of air emissions, and the expected level of control. The emissions levels and control efficiencies proposed meet ORCAA's presumed BACT control levels. These BACT levels may be assured through commensurate emissions limits established in the air permit issued by ORCAA, which is staff's recommendation. Air pollution control technologies and measures proposed and corresponding controlled emissions levels are described in the following table.

Table 7: BACT Summary

Emission Source ID	Emission Source	Air Pollution Control Technology & Methods	BACT Emissions Level
TD-01	Truck Dumper – White Wood	Dust Control Plan: • 10 miles per hour (mph) speed limit for all mobile vehicles • Applying water where needed • Using a vacuum truck as needed	General Opacity Standards
TD-02	Truck Dumper – Chips		
TD-03	Truck Dumper – Hog Fuel		
SP-01	Storage Pile – White Wood		
SP-02	Storage Pile – Chips		
SP-03	Storage Pile – Hog Fuel		
VEH-01	Vehicle Traffic – Trucks		
VEH-02	Vehicle Traffic – Front End Loaders		
EP-01.1	Chip Cleaning Line	Cyclo-filter	0.0044 gr/scf 0% opacity
EP-01.2	White Wood Disc Screening	Clean/wet feedstock	General Opacity Standards
EP-01.3	Hog Fuel Feed	Clean/wet feedstock	General Opacity Standards
EP-02	Wet Hammer Mill 1	Cyclo-filter	0.0044 gr/scf 0% opacity
EP-03	Wet Hammer Mill 2	Cyclo-filter	0.0044 gr/scf 0% opacity
EP-04	Drying Line (furnace, drum dryer)	Cyclones (2 units in parallel) WESP RTO	PM_{10}: 8.0 lbs/hr (filterable + condensable) NOx: 53 lbs/hr CO: 42 lbs/hr VOC: 7 lbs/hr HCl: 0.028 lbs/hr Hg: 0.0006 lbs/hr 5% opacity
EP-05	Dry Product Intermediate Storage 1	Silo Filters	0% opacity 98+ % filter efficiency
EP-06	Dry Product Intermediate Storage 2		
EP-07	Dry Hammer Mills (HM, 4 units)	Baghouse or Cyclo-filter (for each dry HM) Baghouse or Cyclo-filter (per each pellet cooler) RCO (serving exhaust from all)	PM_{10}: 2.0 lbs/hr (filterable + condensable) VOC: 8.6 lbs/hr 5% opacity
EP-08	Pelletizers (12 units) Pellet Coolers (2 units)		
EP-09	Milled Dry Product Intermediate Storage	Silo Filter	0% opacity 98+ % filter efficiency
EP-10	Pellet Storage Silo #1	Silo Filters	0% opacity 98+ % filter efficiency
EP-11	Pellet Storage Silo #2		
EP-12	Pellet Storage Silo #3		
EP-13	Pellet Storage Silo #4		
EP-14	Pellet Storage Silo #5		
EP-15	Truck Loadout	Silo Filter and shrouded dump	5% opacity 98+ % filter efficiency

11. Ambient Impact Analysis (Criteria Pollutants)

ORCAA's Rule 6.1.4(a)(3) and the Washington State Implementation Plan under 40 CFR part 52.2470(c), Table 6, require emissions from any new stationary source or modification not delay the attainment date of an area not in attainment, nor cause or contribute to a violation of any National Ambient Air Quality Standard (NAAQS).

PNWRE provided an Ambient Air Quality Analysis (AAQA) in their NOC application, which compares estimated maximum ground-level concentrations of regulated pollutants to the NAAQS for each regulated pollutant. PNWRE's NOC application includes a comprehensive description of the air dispersion modeling analysis performed. PNWRE relied on the AERMOD air dispersion model (Version 22112) to estimate ground-level concentrations. Ambient impacts were estimated based continuous operation and maximum Potential to Emit (PTE) for all pollutants evaluated. ORCAA staff reviewed PNWRE's AAQA, the emissions and other model input parameters, modeling methods, meteorological data, and background ambient air quality data used. Staff concluded that PNWRE's AAQA conservatively estimates ground-level impacts, and that results from the analysis are appropriate for comparing with the NAAQS. Results from PNWRE's analysis shown in the table below sufficiently demonstrates that emissions from the new facility will not cause or contribute to a violation of any Ambient Air Quality Standard (AAQS), which meets this approval criteria.

Table 8: Impacts Compared to NAAQS

Pollutant	Averaging Period	Modeled	Background	Total Impact	NAAQS	Exceeds NAAQS? (Yes/No)
PM_{10} (μg/m³)	24-hour	79.8	42.1	122	150	No
$PM_{2.5}$ (μg/m3)	24-hour	11.6	12.5	24.1	35	No
	Annual	3.86	5.1	8.96	12	No
NO_2 (ppb)	1-hour	68.6	15.1	83.7	100	No
	Annual	0.818	2.6	3.42	53	No
CO (ppm)	1-hour	0.381	1.04	1.42	35	No
	8-hour	0.0809	0.69	0.771	9	No
SO_2	Not modeled – Emissions less than significant emissions rates					
Lead	Not modeled – Emissions less than significant emissions rates					

12. Ambient Impact Analysis (Toxic Air Pollutants)

Washington's regulation titled Controls for New Sources of Toxic Air Pollutants (Air Toxics Rule) under Chapter 173-460 of the Washington Administrative Code applies to new stationary sources of Toxic Air Pollutants (TAP), including modifications to existing emissions units that increase TAP. The purpose of the Air Toxics Rule is to, "… maintain such levels of air quality as will protect human health and safety." The TAPs covered under the Air Toxics Rule include carcinogens and non-carcinogens

The Air Toxics Rule has two independent requirements for new sources and modifications that increase TAP emissions above de-minimis levels:

1) **tBACT:** The new or modified emission units must use Best Available Control Technology to control TAP emissions (WAC 173-460-040(3)(a)).

2) **Ambient Impact:** The NOC application must demonstrate that any increase in TAP from the new or modified emission units are sufficiently low to protect human health and safety from potential carcinogenic and/or other toxic effects (WAC 173-460-070).

12.1 tBACT

The tBACT requirement applies to any new or modified emission units that triggers the Air Toxics Rule (results in a TAP increase above de-minimis levels), regardless of facility-wide or "net" TAP emissions. The term tBACT means Best Available Control Technology, as that term is defined in WAC 173-400-030, but applied to control of TAP (see BACT definition in Section 10).

Staff's conclusion is that the BACT emissions levels described above for particulate and VOC emissions meets the tBACT requirement for TAP emitted as particulate and TAP emitted as VOC, respectively. These tBACT levels may be assured through the VOC and PM_{10} emissions limits established in the air permit issued by ORCAA, which is staff's recommendation.

12.2 Ambient Impact Review

The Air Toxics Rule provides a multi-tiered, screening approach under WAC 173-460-080 to assess health impacts and demonstrate compliance with the ambient impact requirement under WAC 173-460-070, which is that TAP increases must be sufficiently low to protect human health and safety from potential carcinogenic and/or other toxic effects.

The "First Tier Review" (Tier 1 Review) is a two-step process. First, the emissions increase of each TAP is compared to its unique Small Quantity Emission Rate (SQER). SQERs are listed for each TAP under WAC 173-460-150. An SQER is the level of emissions of a TAP below which dispersion modeling is not required to demonstrate compliance with the ambient impact requirement. TAP emissions increases used in this first step must be based on the maximum potential to emit considering control or reduction in emissions achievable using the air pollution control technology or methods proposed to meet the tBACT requirement. Any TAP with an increase below its SQER can be presumed to be in compliance with the ambient impact requirement. If this is the outcome, further analysis is not required for that TAP. However, TAPs with emissions increases above their SQER must undergo the second step of the Tier 1 Review.

The second step of the Tier 1 Review requires evaluating TAP impacts against Acceptable Source Impact Levels (ASIL) and is referred to as an ASIL Analysis. An ASIL is the adopted health-based concentration for a TAP below which can be presumed as meeting the ambient impact requirement of WAC 173-460-070. ASILs are provided for each TAP under WAC 173-460-150. An ASIL analysis typically involves using an ambient air dispersion model to estimate ambient concentrations resulting from TAP emissions increases and considering air dispersion and local meteorological characteristics of the source. If the modeled impact of the increase in emissions of a TAP does not exceed its corresponding ASIL, the ambient impact requirement of WAC 173-460-070 may be considered met and the First Tier Review is completed for that TAP.

Emissions rates used to support an ASIL Analysis must be based on the maximum potential to emit considering control or reduction in emissions achievable using the air pollution control technology or methods proposed to meet the tBACT requirement. In addition, the Air Toxics Rule allows TAP reductions from existing emission units not subject to review to be subtracted or “netted out” from TAP increases, provided the reductions are included in the approval order as enforceable voluntary emission limits and meet all the requirements of WAC 173-460-071. These requirements include:

(1) The voluntary emissions reductions must be enforceable through a regulatory order issued by the air permitting agency.
(2) The approval order enforcing the voluntary emissions reductions must include monitoring, recordkeeping, and reporting requirements sufficient to ensure the reductions are maintained.
(3) The agency’s preliminary determination to approve the voluntary emissions reductions are subject to a 30-day public notice and comment period and opportunity for a public hearing.

For pollutants with ambient concentrations found to be greater than their ASIL, a “Second Tier Review” (Tier 2 Review) by the Washington Department of Ecology (Ecology) is required. An application for a Tier 2 Review by Ecology is referred to a Tier 2 petition. Tier 2 petitions must include a Health Impacts Assessment (HRA) and estimated ambient TAP impacts based on refined air dispersion modeling. Ecology will not act on a Tier 2 petition unless a written preliminary determination on the NOC application for the new or modified TAP source and a draft approval order have been completed by the local agency with jurisdiction. Ecology’s review and approval of a Tier 2 petition is contingent on a finding that TAP impacts meet the ambient impact requirement of WAC 173-460-070 that increases in TAP emissions are sufficiently low to protect human health and safety from potential carcinogenic and/or other toxic effects. If Ecology recommends denial of a Tier 2 petition, the permitting authority may not approve the project. The applicant then has the option of submitting a petition for a “Third Tier Review” (Tier 3 Review) by Ecology and a request for a risk management decision.

PNWRE conducted a Tier 1 Review of TAP according to the methods prescribed in Washington’s Air Toxics Rule. The Tier 1 review was based continuous operation and maximum PTE for all TAP emitted. PTE for most of the TAP expected to be emitted are below their respective SQER level and, therefore, do not require modeling for demonstrating compliance with the ambient impact requirement. Several TAP were found to be emitted above their respective SQER level. For these TAP, PNWRE applied the same modeling methodology as described above to estimate ground level impacts. Staff reviewed this analysis including PTE emission rate estimates, model input parameters, modeling methods, and meteorological data. Staff concluded that PNWRE’s ASIL analysis conservatively estimates ground-level TAP impacts, and that results from the analysis are appropriate for comparing with ASILs for each TAP evaluated. Results demonstrate that TAP emissions from the new facility will be sufficiently low to protect human health and safety from potential carcinogenic and/or other toxic effects, which meets this approval criteria.

Table 9: ASIL Analysis

TAP Name	Averaging Period	ASIL ($\mu g/m^3$)	Projected Impact ($\mu g/m^3$)	Pass Tier 1 (Yes/No)
12-Dimethylbenz(a) anthracene	year	8.50E-06	1.42E-08	Yes
Acetaldehyde	year	3.70E-01	8.58E-03	Yes
Acrolein	24-hr	3.50E-01	4.09E-02	Yes
Benzene	year	1.30E-01	1.03E-02	Yes
Formaldehyde	year	1.70E-01	1.33E-02	Yes
Arsenic	year	3.00E-04	6.21E-06	Yes
Beryllium	year	4.20E-04	3.12E-07	Yes
Cadmium	year	2.40E-04	1.89E-06	Yes

Nickel	year	3.80E-03	1.05E-05	Yes

13. Requirements for Major Stationary Sources and Major Modifications to Major Stationary Sources

Projects that are major stationary sources and major modifications to major stationary sources as defined in 40 CFR 52.21(b) may be subject to permitting requirements under WAC 173-400-700 through 173-400-860.

Based on the facility's PTE, the pellet manufacturing facility proposed by PNWRE is not a "Major Stationary Source" as defined in 40 CFR 52.21(b) and not subject to the permitting program required by WAC 173-400-700 through WAC 173-400-860. Therefore, these permitting requirements do not apply. This conclusion will be assured through annual limits.

14. Title V Air Operating Permit (AOP) Implications

The State of Washington program pursuant to Title V of the federal Clean Air Act is governed under Chapter 173-401 WAC, the Washington Air Operating Permit Program. Chapter 173-401 WAC requires existing major stationary sources to operate in compliance with an approved Air Operating Permit (AOP). Major stationary sources are those stationary sources with a potential to emit which is greater than 100 tons per year of any criteria pollutant, greater than 10 tons per year of any hazardous air pollutants (HAP), or greater than 25 tons per year of any combination of HAP.

Based on the facility's PTE, the pellet manufacturing facility proposed by PNWRE is a "Major Stationary Source" as defined in Chapter 173-401 WAC. Specifically, the facility will be a major source of both NO_x and CO. Therefore, the facility will be subject to Title V of the federal Clean Air Act and will be required to submit a Title V Air Operating Permit (AOP) application within twelve months after commencing operation.

15. Environmental Justice Considerations

EPA defines Environmental Justice (EJ) as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. The purpose of an EJ review in conjunction with an air permitting action is to ensure no group of people bear a disproportionate share of the negative environmental consequences as the result of the permitting action. Further, ORCAA strives to engage the affected community effectively and meaningfully regarding the permitting action, and to ensure compliance with obligations pursuant to Title VI of the Civil Rights Act.

With respect to factoring EJ into air permitting decisions, EPA Region 10 expects air agencies to:

- Identify overburdened communities;
- Engage with communities;
- Evaluate cumulative impacts; and,
- Use available authority to minimize emissions.

However, EPA Region 10 does not expect air agencies to use the Clean Air Act's authorities to address existing disproportional impacts to communities when implementing New Source Review in areas that are "attainment/unclassifiable" with respect to meeting the NAAQS.

The following subsections describe how these expectations from EPA Region 10 were met.

15.1 Identify Overburdened Communities

The initial step in an EJ review is to identify any affected populations or communities of concern and to identify whether they are disproportionally impacted.

ORCAA used EPA's environmental justice screening and mapping tool, EJScreen, to answer this first part of this question. An EJScreen Community Report was generated for Grays Harbor County. The Community Report estimates a minority population of 31%, with approximately 8% of the total population speaking Spanish and 1% speaking another non-English language at home. All demographic indicators were below the 80th percentile for the nation. Likewise, the Community Report indicates that Grays Harbor County is below the 80th percentile for all environmental indicators. Environmental indicators above the 80th percentile is an indication that a community is already disproportionately impacted. Therefore, ORCAA staff's conclusion is that the project impact area does not include any preexisting, overburdened communities. A copy of the Community Report with more detailed information will be filed as part of the supporting documentation for the project.

Pre-existing air quality impacts were evaluated based on ambient air quality monitoring data and designation of the area with respect to maintaining compliance with the NAAQS. If air quality in a geographic area meets or is cleaner than a national standard based on ambient air monitoring data, it is called an attainment area and designated "attainment/unclassifiable." Areas may also be presumed "attainment/unclassifiable" based on population density and air pollutant emissions being below certain thresholds. For this case, the project impact area and Grays Harbor County as a whole is designated "attainment/unclassifiable." Therefore, there are no preexisting nonattainment issues identified within the County. Furthermore, the ambient air quality analysis provided in PNWRE's application demonstrates that air emissions will not cause or contribute to any exceedance of a NAAQS. Therefore, ORCAA staff's conclusion is that there are no indications of any existing disproportional impacts to communities of concern within the project impact area.

15.2 Engage with Communities

A public hearing will be conducted on ORCAA's Preliminary Determination to approve PNWRE's application to construct the new pellet mill. ORCAA's current public noticing and outreach policies and procedures are sufficient to effectively provide notice for the public hearing and meaningfully engage with the community surrounding the proposed project site and include:

- Issuing a press release of the Public Notice.
- Posting the Public Notice, application, and ORCAA's Preliminary Determination on ORCAA's web site.
- Post Hard Copies – Post hard copies of the Public Notice and ORCAA's Preliminary Determination at a local location near the project site. For this case, copies will be posted at the nearest library, Hoquiam Timberland Library located at 420, 7th St. in Hoquiam.
- Emailing the Public Notice to environmental agencies, local tribal nations, organizations and advocacy groups, and persons and entities who have expressed interest in the case.

After the public hearing and considering all comments submitted on the case, ORCAA will prepare a written Responsiveness Summary. The Responsiveness summary will include a description of ORCAA's Final Determination as well as responses to questions and comments received during the comment period and public hearing. ORCAA's Responsiveness Summary will be forwarded to all persons and entities who submitted comments during the comment period and public hearing.

15.3 Evaluate Cumulative Impacts

The air permitting action for this case did not trigger a cumulative impacts analysis under either the Clean Air Act or the Washington Clean Air Act. However, with respect to air impacts alone, results from the Ambient Air Quality Analysis included in PNWRE's application do reflect background ambient concentrations for each criteria air pollutant evaluated. Also, the modeling protocol specified that air emissions from existing and planned facilities within the project impact area should be included in the analysis. However, because of the proposed location of new pellet mill, it was determined by PNWRE's environmental consultant that impacts of emissions from existing sources of air pollution are already reflected in the background concentrations used. Therefore, emissions from nearby sources of air pollution were not explicitly modeled. PNWRE's environmental consultant also determined that planned sources in the Grays Harbor area are not likely to cause significant impacts within the project impact area. Therefore, the air analysis can be considered a cumulative analysis with respect to the NAAQS.

15.4 Use Available Authority to Minimize Emissions

As described elsewhere in this report, ORCAA applied existing New Source Review authorities provided under the Clean Air Act and the Washington Clean Air Act to minimize emissions from the proposed new pellet mill. Principally among these authorities is the requirement to use BACT for controlling emissions. The BACT requirement was applied and corresponding BACT emissions limits are included in the air permit.

16. Recommended Conditions of Approval

The following conditions of approval were determined necessary for assuring compliance with applicable air regulations and standards and protecting air quality. Recommended conditions of approval will become effective once the Approval Order is issued:

1. **Approved Equipment.** The new wood pellet manufacturing facility as described in Notice of Construction application No. 23NOC1606, application addendums, and the associated Final Determination is approved for construction and operation subject to conditions in this Order of Approval.
   [Regulatory Basis: ORCAA Rule 6.1(a); ORCAA Rule 6.1.2(l); 40 CFR Part 52.2470(c), Table 6]

2. **Preapproval Required.** Prior approval by ORCAA may be required for the following as specified in ORCAA Rule 6.1:
   a) Construction, installation, or establishment of any stationary source;
   b) Modification to any existing stationary source;
   c) Replacement or substantial alteration of emission control technology installed on an existing stationary source; or,
   d) Deviations from the approved plans, drawings, data, and specifications of the stationary sources listed in the following table:

Source ID	Approved Stationary Sources	Approved Control Technologies and Measures
TD-01	Truck Dumper – White Wood (75' Back-On Truck Dump Platform)	Dust control plan
TD-02	Truck Dumper – Chips (75' Back-On Truck Dump Platform)	Dust control plan

[Regulatory Basis: ORCAA Rule 6.1(a); ORCAA Rule 6.1.2(l); WAC 173-400-110(2); WAC 173-400-111(10)]

3. **Cyclo-filters and Baghouses.** In addition to applicable general emissions limits and standards, the following limits and standards apply to all cyclo-filters and baghouses emitting directly to the ambient air:
   a) Cyclo-filters and baghouses must be operating whenever the pellet plant is operating.
   b) All cyclo-filters and baghouses must be equipped with a working manometer to read pressure drop across the filters.
   c) Visible emissions must not exceed 0% opacity as measured in accordance with EPA 40 CFR Part 60 Appendix A Method 9.
   d) Total filterable emissions must not exceed 0.004 grains per standard cubic feet, 1-hour average, measured in accordance with EPA Method 5 in Appendix A to 40 CFR Part 60, or an alternative method approved by ORCAA.
   e) Baghouses and Cyclo-filters must exhaust through a vertical stack that provides suitable conditions for stack testing per Method 5.

   [Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

4. **Silo Vents.** In addition to applicable general emissions limits and standards, the following limits and standards apply to all silo vents:
   a) Silo vents must be equipped with suitable filters capable of at least 98% filtration efficiency for the size range of particles emitted.
   b) Filter efficiency must be confirmed and documented by appropriate certification and/or guarantees provided by the filter manufacturer.

c) Visible emissions from any silo vent must not exceed 0% opacity as measured in accordance with EPA 40 CFR Part 60 Appendix A Method 9.

[Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

5. **Drying Line.** In addition to applicable general emissions limits and standards, the following limits and standards apply to emissions from the drying line (furnace and drum dryer):
   a) Emissions from the RTO stack must not exceed the following limits:

Pollutant	Limit	Reference Test Methods
PM_{10} (filterable + condensable)	12.7 lbs/hr, 1-hr ave	EPA Methods 1-4, 5, 201, or 201A, plus EPA Reference Method 202 from 40 CFR Part 60 Appendix A-1, or equivalent methods agreed to in advance by ORCAA. Use of EPA Reference Method 5 assumes all filterable particulate is PM10.
NO_x	53 lbs/hr, 1-hr ave	EPA Methods 1-4, and 20 from 40 CFR Part 60 Appendix A, or an equivalent method agreed to in advance by ORCAA.
CO	42 lbs/hr, 1-hr ave	EPA Methods 1-4, and 10 from 40 CFR Part 60 Appendix, or an equivalent method agreed to in advance by ORCAA.
VOC (Per EPA's Wood Products Protocol 1)	8.92 lbs/hr, 1-hr ave	EPA Method 1-4, and 25A from 40 CFR Part 60 Appendix A, or equivalent method agreed to in advance by ORCAA. Concurrent testing for both methanol and formaldehyde. VOC must be determined using EPA Method OTM-26 (see condition 8). Formaldehyde and methanol testing methods (or equivalent methods agreed to in advance by ORCAA): • Methanol: EPA Method 308 or 320 from 40 CFR Part 63 Appendix A or NCASI method CI/WP-98.01 • Formaldehyde: EPA Method 316 or 320 from 40 CFR Part 63 Appendix A or NCASI Method CI/WP-98.01
HCl	0.028 lbs/hr, 1-hr ave	EPA Methods 1-4, and 26 or 26A (M26 or M26A) from 40 CFR part 60, appendix A–8.
Hg	0.0006 lbs/hr, 1-hr ave	EPA Methods 1-4, and 29, 30A, or 30B from 40 CFR Part 60, appendix A-8. For Method 29, collect a minimum of 4 dscm per run; for Method 30A or Method 30B, collect a minimum sample as specified in the method; for ASTM D6784 collect a minimum of 4 dscm.
Opacity	5%, 6-minute average	EPA Method 9 from 40 CFR Part 60 Appendix A.

   b) At all times, except during startup as allowed by condition 9, emissions from the furnace and dryer must exhaust through the air pollution control system consisting of the pair of cyclones, Wet Electrostatic Precipitator (WESP) and Regenerative Thermal Oxidizer (RTO).
   c) The WESP must be equipped with a means to continuously monitor and record VDC and mADC of each WESP field.
   d) The cake produced by the WESP decanter centrifuge must be properly disposed of and must not be recycled back into the furnace fuel feed system or in the pellet feedstock.
   e) All combustion chambers of the RTO must be equipped with thermocouples to continuously measure and record combustion chamber temperature.
   f) Except as provided by conditions 9 and 10, emissions exhausting through either the furnace or dryer bypass stacks are presumed to be in violation of the limits and standards of this condition.

   [Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

6. **Pellet Mill.** In addition to applicable general emissions limits and standards, the following limits and standards apply to emissions from the dry hammer mills, pelletizers and pellet coolers:

a) At all times, exhaust from the dry hammer mills must exhaust through their respective baghouses and the Regenerative Catalytic Oxidizer (RCO).
b) At all times, emissions from the pellet coolers must exhaust through their respective baghouses and the RCO.
c) All baghouses must be equipped with a working manometer to read pressure drop across the filters.
d) All combustion chambers of the RCO must be equipped with thermocouples to continuously measure and record combustion chamber temperature directly after the catalyst bed.
e) Emissions from the RCO stack must not exceed the following limits:

Pollutant	Limit	Reference Test Methods
PM_{10} (filterable + condensable)	2.0 lbs/hr, 1-hr ave	EPA Methods 1-4, 5, 201, or 201A, plus EPA Reference Method 202 from 40 CFR Part 60 Appendix A-1, or equivalent methods agreed to in advance by ORCAA. Use of EPA Reference Method 5 assumes all filterable particulate is PM10.
VOC (Per EPA's Wood Products Protocol 1)	8.6 lbs/hr, 1-hr ave	EPA Method 1-4, and 25A from 40 CFR Part 60 Appendix A, or equivalent method agreed to in advance by ORCAA. Concurrent testing for both methanol and formaldehyde. VOC must be determined using EPA Method OTM-26 (see condition 8). Formaldehyde and methanol testing methods (or equivalent methods agreed to in advance by ORCAA): • Methanol: EPA Method 308 or 320 from 40 CFR Part 63 Appendix A or NCASI method CI/WP-98.01 • Formaldehyde: EPA Method 316 or 320 from 40 CFR Part 63 Appendix A or NCASI Method CI/WP-98.01
Opacity	5%, 6-minute average	EPA Method 9 from 40 CFR Part 60 Appendix A.

[Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

7. **Facility-wide Annual Emissions Limits.** Facility-wide annual emissions must not exceed the following limits in terms of tons per consecutive 12-month period:

Pollutant	Facility-Wide Limit (tons/12-month period)	Compliance Determination Methods
PM_{10} (filterable + condensable)	98	Compliance determined by calculating tons of each pollutant based on ORCAA-approved emissions factors and the actual fuels combusted, tons of pellets produced, and operating schedule over the previous 12-month period according to condition 8.
NOx	230	
CO	185	
$VOC_{\text{as propane}}$	67	

[Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

8. **Monitoring Facility-Wide Emissions.** Compliance with facility-wide annual emissions must be determined monthly by calculating facility-wide total tons of each pollutant for the previous 12-consecutive month period as follows:
   a) For the drying line:
      i) PM10 and VOC emissions must be calculated based on emission factors in terms of pounds per oven dried ton of pellets (lb/ODT) determined through source testing, times the actual tons of pellets produced, or an alternative method of calculation approved by ORCAA. Emissions factors must be updated with each required source test.

ii) VOC emissions must be determined using EPA's Interim VOC Measurement Protocol for the Wood Products Industry – July 2007 (otherwise known as Other Test Method 26 or OTM-26) and includes quantification of the individual contributions of methanol and formaldehyde. VOC emissions calculated using this method are referred to as "WPP1 VOC".

iii) NOx and CO emissions must be determined using data from the NOx and CO continuous emission rate monitoring systems (CERMS) required by condition 11.

iv) Emissions from the dryer line during any period when pellets are not produced such as, but not limited to, startup, shutdown, and idle mode, must be included in the facility-wide total emissions.

b) For the pellet mill:

i) Emissions of NOx, CO, PM10 and VOC must be calculated based on emission factors in terms of pounds per oven dried ton of pellets produced (lb/ODT) determined through source testing, times the actual tons of pellets produced, or an alternative method of calculation approved by ORCAA. Emissions factors must be updated with each required source test.

ii) VOC emissions must be determined using EPA's Interim VOC Measurement Protocol for the Wood Products Industry – July 2007 (otherwise known as Other Test Method 26 or OTM-26) and includes quantification of the individual contributions of methanol and formaldehyde. VOC emissions calculated using this method are referred to as "WPP1 VOC".

iii) Emissions from the dryer line and pellet mill during any periods when pellets are not produced such as, but not limited to, startup, shutdown, and idle mode, must be included in the facility-wide total emissions.

c) PM10 emissions from process units (baghouses, cyclo-filters, silo vents) must be calculated based on 0.004 grains per standard cubic feet, and each unit's exhaust rate and the hours they operated, or an alternative method of calculation approved by ORCAA.

d) PM10 emissions from road dust created by traffic (front end loaders and trucks) must be calculated based on equations from AP-42 Section 13.2.2 and vehicle miles traveled at the facility by front end loaders and haul truck, or an alternative method of calculation approved by ORCAA.

e) PM10 emissions from process fugitive sources (truck dumpers, storage piles, chip screening) must be calculated based on equations from Particulate Matter Potential to Emit Emissions Factors for Activities at Sawmills, Excluding Boilers, Located in Pacific Northwest Indian Country (EPA Region 10, May 8, 2014) and actual production over the 12-month period, or an alternative method of calculation approved by ORCAA.

[Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

9. **Furnace/Dryer Startups.** In addition to applicable general emissions limits and standards, the following requirements apply to operation of the furnace and drum dryer during startups:

a) Cold startup must be initiated using clean, dry fuels including dry wood and ultra-low sulfur diesel.

b) Furnace exhaust during a startup may bypass the drying line air pollution control system through the furnace bypass stack provided:

  i) Bypass of the air pollution control system (cyclones, WESP, RTO) does not exceed 30 minutes during any single startup;
  ii) The number of startups that bypass the air pollution control systems and exhaust through the furnace bypass stack does not exceed 10 startups per each 12-month period;
  iii) Operation of the air pollution control system including the WESP and RTO are initiated so that these units are fully functional and ready to accept emissions from the furnace and dryer as soon as possible after a startup is initiated;
  iv) Exhausting through the air pollution control system is initiated as soon as possible after a startup is initiated.

c) A sufficient amount of clean dry fuel must be maintained at all times to minimize emissions during startups.

[Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

10. **Furnace/Dryer Planned Shutdowns.** In addition to applicable general emissions limits and standards, the following requirements apply to operation of the furnace and drum dryer during planned shutdowns:
    a) The air pollution control system must be fully functioning during a planned shutdown;
    b) Exhaust of hot gases through the furnace bypass stack during a planned shutdown may commence once there is no combustion occurring on the furnace grates;
    c) Exhaust of hot gases through the dryer bypass stack during a planned shutdown may commence once there is no combustion on the furnace grates and no material remaining in the drum dryer.

    [Regulatory Basis: ORCAA Rule 6.1.4(a)(2); WAC 173-400-113(2); WAC 173-460-040(3)]

11. **Dryer Line Emissions Monitoring.** Ongoing compliance with the drying line NOx and CO limits in condition 5a must be continuously monitored using continuous emission rate monitoring systems (CERMS) for measuring NOx and CO pollutant mass rates in lb/hr.
    a) The NOx and CO CERMS must meet applicable requirements from 40 CFR Part 60, Appendix B.
    b) The NOx and CO CERMS must meet applicable procedures and requirements from 40 CFR Part 60, Appendix F, including requirements and schedules for Relative Accuracy Test Audits (RATA).

    [Regulatory Basis: ORCAA Rule 6.1.4(a)(2)]

12. **Performance Testing.** The following requirements apply to performance testing including RATA of the NOx and CO CERMS:
    a) Performance testing must be conducted consistent with an ORCAA approved test plan.
    b) A test plan must be submitted to ORCAA for approval at least 45 days prior to conducting a required performance test.
    c) The test plan must describe:
       i) Air emissions test methods;
       ii) Target operating conditions for testing;
       iii) Performance indicators that will be monitored during the testing; and,
       iv) Methods for calculating emissions factors.

d) Performance testing must be conducted during operating conditions with highest emissions unless otherwise approved by ORCAA.
e) Compliance with each emissions limit must be determined from the average of three separate 1-hour test runs unless otherwise approved by ORCAA.
f) A test report must be submitted to ORCAA within 60-days of conducting any performance test.
g) The test report must include for each test run:
    i) The concentrations and pollutant mass rates in pounds per hour for each pollutant measured;
    ii) Emissions factors in terms of pounds of pollutant per oven dry ton of pellets produced;
    iii) The rate of pellet production;
    iv) Key operating indicators of the source and pollution control technology.
h) Performance testing of the RTO and RCO to demonstrate compliance with emissions limits and determine emissions factors must be completed within 180-days of commencing operation of the facility and repeated on a 5-year schedule thereafter.
i) RATA of the NOx and CO CERMS must be conducted concurrently with any required performance test of the RTO and according to the requirements from 40 CFR Part 60, Appendix F.
j) Testing for formaldehyde and methanol must be conducted concurrently with VOC testing.

[Regulatory Basis: ORCAA Rule 6.1.4(a)(2)]

13. **Operation and Maintenance Plan.** The owner or operator must devise and implement an operation and maintenance plan (O&M Plan) to minimize emissions from all sources and modes of operation at the facility. The O&M Plan must be submitted to ORCAA for approval within the first six months from commencement of operation of the facility. The O&M Plan must include, but is not limited to, the following elements:
    a) Dust prevention plan describing company policies for vehicle speed limits, application of dust suppressants to haul roads, minimizing material drop heights, surveying the facility for fugitive dust; procedures for minimizing for fugitives during truck loading; and minimizing visible dust during feedstock and fuel dumps;
    b) Cyclo-filter maintenance plan that describes how acceptable operating pressure drop ranges will be determined and applied, how and when cyclo-filters will be inspected, and how filters will be maintained;
    c) WESP maintenance plan that describes how acceptable performance indicators will be determined, how quality of flush water will be maintained, how centrifuge cake will be disposed of, and detailed startup and shutdown procedures;
    d) RTO maintenance plan that describes how RTO performance will be monitored, when thermocouples will be changed out, and detailed startup and shutdown procedures;
    e) RCO maintenance plan that describes how RCO performance will be monitored, how performance of the catalyst will be monitored and maintained, and detailed startup and shutdown procedures;
    f) Detailed startup and shutdown procedures for the furnace and dryer;
    g) How proper combustion in the furnace will be monitored and maintained;

h) Plan describing the means and methods for monitoring time emissions bypass air pollution control systems for both the dryer line and pellet mill.

[Regulatory Basis: ORCAA Rule 6.1.4(a)(2)]

14. **Emissions Inventory.** On an annual basis, the owner or operator must complete and submit to ORCAA an annual emissions inventory (inventory) of all regulated pollutants from all emissions units. Actual emissions must be based on actual operating data and ORCAA approved emission factors. The inventory must be accompanied by all associated calculations and data and must be certified by a Responsible Official as defined under WAC 173-401-200(27) as being true and accurate.
[Regulatory Basis: ORCAA Rule 8.11]

15. **Required Records.** The following records must be kept and made available when requested:
    a) The O&M plan required by condition 13;
    b) Manufacturer specifications for all cyclo-filters and baghouses as built identifying design air flow rates, pressure drops, and filtering efficiencies;
    c) Manufacturer specified or certified filtering efficiency for all silo vent filters;
    d) The number of truck dumps per day;
    e) Tons of pellets produced per day;
    f) Combustion chamber temperatures of the RTO and RCO;
    g) WESP KVA and MA of each of the three WESP fields;
    h) Number of occurrences, duration for each occurrence, and reason for emitting through either the furnace or drum dryer bypass stacks;
    i) The amount of diesel and clean, dry wood used during each cold startup;
    j) Daily record of the operating pressure drop across each baghouse and cyclo-filter;
    k) Monthly record of emissions calculations to demonstrate compliance with the emissions limits in condition 7; and,
    l) NOx and CO CERMS certification and quality assurance records.

    [Regulatory Basis: ORCAA Rule 8.11]

16. **Required Notifications, Reports and Applications.** The following notifications, reports, and applications must be submitted to ORCAA by the deadline specified:
    a) Any updates or revisions to the O&M plan required by condition 13 must be submitted to ORCAA for approval prior to implementing them;
    b) Notification by phone or email message of any complaint as soon as possible but in no case later than 24 hours of receiving the complaint;
    c) Title V Air Operating Permit (AOP) application within 12 months from commencing operation of the facility;
    d) Notification by phone or email of any emissions through the furnace or drum dryer bypass stacks as soon as possible but in no case later than 24 hours from initiation of the event;
    e) Notification of any excess emissions determined through the NOx or CO CERMS as soon as possible but in no case later than 24 hours from the beginning of each event; and,
    f) Performance testing results within 45-days of conducting any performance test.

    [Regulatory Basis: WAC 173-401-500; ORCAA Rule 8.11; ORCAA Rule 8.7; ORCAA Rule 5.1]

17. Preliminary Determination to Approve

This Final Determination documents ORCAA staff's determinations with respect to the applicable criteria of approval in ORCAA Rule 6.1 and the Washington State Implementation Plan under 40 CFR part 52.2470(c), Table 6. ORCAA staff recommends approval of PNWRE's proposal to construct a new wood pellet manufacturing facility, provided the conditions identified in Section 16 of this Preliminary Determination are implemented through an enforceable Order of Approval (AKA: Air Permit). Emissions calculations, modeling summary and other data supporting this Preliminary Determination are provided in the permit application.

~ end of section ~

Applicable General Performance Standards that apply to Pacific Northwest Renewable Energy (PNWRE) in Hoquiam, Washington

Title Citation	Brief Description (Consult rule/regulation for specific requirements)	Applies to
False or Misleading Statements ORCAA Rule 7.2	Prohibits any person from willfully making a false or misleading statement to the Board or its representative as to any matter within the jurisdiction of the Board.	Applies generally to all air pollution sources
Unlawful Reproduction or Alteration of Documents ORCAA Rule 7.3	Prohibits reproducing or altering, or causing to be reproduced or altered, any order, registration certificate or other paper issued by the Agency if the purpose of such reproduction or alteration is to evade or violate any provision of these Regulations or any other law.	Applies generally to all air pollution sources
Display of Orders and Certificates ORCAA Rule 7.4	Any order or registration certificate required to be obtained by these Regulations shall be available on the premises designated on the order or certificate. In the event that the Agency requires order or registration certificate to be displayed, it shall be posted. No person shall mutilate, obstruct, or remove any order or registration certificate unless authorized to do so by the Board or the Executive Director.	The Approval Order issued in conjunction with this NOC approval must be retained on site.
General Requirements WAC 173-400-040(1)(c) ORCAA Rule 8.3	All emissions units are required to use reasonably available control technology (RACT).	Applies generally to all air pollution sources.
Visible Emissions WAC 173-400-040(2) ORCAA Rule 8.2(a)	Prohibits emissions with opacity of greater than 20% for more than three (3) minutes in any one hour.	Applies generally to all air pollution sources
Sulfur Dioxide WAC 173-400-040(7)	No person shall cause or allow the emission from any emissions unit in excess of one thousand ppm of sulfur dioxide on a dry basis, corrected to seven percent oxygen for combustion sources, and based on the average of any period of sixty consecutive minutes.	Applies generally to facilities that emit Sulfur Dioxide.
Control Equipment Maintenance and Repair ORCAA Rule 8.8	ORCAA Rule 8.8 requires that all air contaminant sources keep any process and/or air pollution control equipment in good operating condition and repair.	Applies generally to all air pollution control devices.
Fallout WAC 173-400-040(3) ORCAA Rule 8.3(e)	Prohibits particulate emissions from any source to be deposited, beyond the property under direct control of the owner or operator of the source, in sufficient quantity to interfere unreasonably with the use and enjoyment of the property upon which the material was deposited.	Applies generally to all air pollution sources.
Fugitive Emissions WAC 173-400-040(4)(a)	The owner or operator of any emissions unit engaging in materials handling, construction, demolition, or other operation which is a source of fugitive emission shall take reasonable precautions to prevent the release of air contaminants from the operation.	Applies generally to any activity that results in fugitive emissions.

Title **Citation**	**Brief Description** **(Consult rule/regulation for specific requirements)**	**Applies to**
ORCAA Rule 8.3(c)		
Odor WAC 173-400-040(5) ORCAA Rule 8.5	ORCAA Rule 8.5 contains general requirements for controlling odors and a general prohibition of odors that unreasonably interfere with the use or enjoyment of a person's property.	Applies generally to all air pollution sources.
Emissions Detrimental to Persons or Property WAC 173-400-040(6) ORCAA Rule 7.6	Prohibits causing or allowing the emission of any air contaminant from any source if it is detrimental to the health, safety, or welfare of any person, or causes damage to property or business.	Applies generally to all air pollution sources
Concealment and Masking WAC 173-400-040(8) ORCAA Rule 7.5	Prohibits installation or use of any device or means to conceal or mask emissions of an air contaminant, which causes detriment to health, safety, or welfare of any person, or causes damage to property or business.	Applies generally to all air pollution sources
Fugitive Dust WAC 173-400-040(9)	The owner or operator of a source or activity that generates fugitive dust must take reasonable precautions to prevent that fugitive dust from becoming airborne and must maintain and operate the source to minimize emissions.	Applies to any activity that results in fugitive dust.
Particulate Standards for Process units ORCAA Rule 8.3(a) WAC 173-400-060	Prohibits emissions from any process unit in excess of 0.1 grain/dscf. EPA test methods from 40 CFR Appendix A shall be used should demonstration of compliance be required.	Applies to generally to all stationary process units that exhaust to the atmosphere.
Particulate Standards for Combustion Units ORCAA Rule 8.3(a) WAC 173-400-050(1)	Prohibits emissions from any combustion unit in excess of 0.1 grain/dscf. EPA test methods from 40 CFR Part 60 Appendix A shall be used should demonstration of compliance be required.	Applies generally to all stationary combustion units that exhaust to the atmosphere.
Excess Emissions Provisions WAC 173-400-107; WAC 173-400-108 ORCAA 8.7	Requires excess emissions be reported to the Agency as soon as possible and within 24 hours and establishes criteria qualifying excess emissions as unavoidable.	Applies generally to all air pollution sources
Record Keeping and Reporting. ORCAA Rule 8.11	Requires the following: 1. Maintenance of records on the nature and amounts of emissions and other related information as deemed necessary by ORCAA; 2. Reporting of emissions to ORCAA upon request.	Required of all facilities registered with ORCAA.

RE: Completeness Determination for ADP Application CO-1057 dated August 25, 2022

Dear Danny Phipps:

Pinnacle Renewable Holdings (USA) Inc., branded as part of Drax (Drax) submitted an Air Discharge Permit (ADP) application (the Application) to the Southwest Clean Air Agency (SWCAA) in July 2022 for a new greenfield wood pellet processing facility in Longview, WA (the Facility). This letter includes information on the following items: (a) a summary of major changes to the Facility's design from that represented in the Application;(b) a summary of emission calculations and modeling changes;(c) a response to the August 25, 2022 SWCCA completeness determination letter for ADP Application CO-1057; and (d) responses to questions posed during a September 9, 2022 call between SWCAA, Drax, and Trinity Consultants. The completeness determination letter and relevant SWCAA correspondence can be found in Attachment 1.

SUMMARY OF PROCESS CHANGES

Abort Stacks

The dryer and furnace each have separate abort stacks prior to any control devices, herein referred to as the dryer abort stack and furnace abort stack. The only time the dryer abort stack will be used is during upset conditions (i.e., power outages, when the wet electrostatic precipitator (WESP) is in fault mode) and will not operate more than four hours in a day. The furnace abort stack is prior to the dryer and will be used during upset conditions (i.e., when the temperature or pressure gets too high in the furnace) and during a low idle state when the dryer is not operating. The furnace and dryer abort stacks will not be used during startup or shutdown events unless there is an upset condition as previously described. Emission calculations now include emissions that will be released from each of these two stacks.

Hammermills and Pelletizers

Instead of the cyclones described in the Application, the particulate matter (PM) emissions from the pelletizers will be controlled by a baghouse; the exhaust from the baghouse will be routed to the regenerative catalytic oxidizer (RCO). Additionally, exhaust from the hammermills will be routed to a baghouse (as originally described in the Application) and then to the same RCO as the pelletizers in order to control PM and VOC emissions, respectively. Pelletizer and hammermill VOC, hazardous air pollutant (HAP), and Washington toxic air pollutant (TAP) emission factors are obtained from stack test results from the Drax facility in Gloster, MS (ABE Facility). Maximum emission factors in pounds per oven dried ton (lbs/ODT) are obtained from 2018 and 2021 stack testing at the ABE Facility. The stack tests used as the basis for the emission factors are provided in Attachment 2 of this letter. The ABE Facility routes emissions from both the hammermills and pelletizers to an RCO, similar to the Facility. The emission factors are divided by 2 to represent half of the RCO emissions for the hammermills and pelletizers. A 25% safety factor has been applied to the emission factors for conservatism.

Emergency Engines

The emergency engines will be installed with diesel particulate filters (DPFs) that will provide at least 90% control of diesel particulate matter. In the Application, Drax proposed that the engines would operate a maximum of 200 hours per year (hrs/yr) of operation. Drax is now proposing that the engines operate a maximum of 125 hrs/yr. These changes are reflected in the updated emission calculations in Attachment 2.

SUMMARY OF EMISSION CALCULATION AND MODELING CHANGES

A summary of changes made to the emission calculations between the Application submittal and current submittal is provided below. Updated emission calculations for the Facility are provided in Attachment 2.

- HAP/TAP and VOC emissions from the hammermills and pelletizers were updated to use stack test data from a representative site, the ABE Facility in Gloster, MS. Additionally, HAP/TAP emissions from the dryer use stack test data from the ABE Facility to supplement the AP-42 factors used in the Application. A safety factor of 25% is applied to the emission factors for conservatism. This resulted in additional HAP/TAP being included in the emission calculations.
- Emission calculations for the dryer abort, furnace abort, and furnace idle scenarios were added.
  - The calculations for these scenarios assume the same emission factor basis as normal operation, without controls. Emission factors for criteria pollutants are back calculated using the manufacturer's guarantee of control efficiency and the manufacturer's controlled emission factors. Emission factors for HAPs/TAPs are determined from AP-42 Section 1.6 – Wood Residue Combustion and the stack testing completed in Gloster, MS.
  - Hours of operation for the dryer and furnace abort stacks are based on the following:
    - Dryer Abort = 50 hrs/yr or 4 hours/day at maximum heat input;
    - Furnace Abort (upset conditions) = 360 hrs/yr or 24 hours/day at maximum heat input; and
    - Furnace Abort (idle conditions) = 500 hrs/yr or 24 hours/day at 50% heat input.
- Emissions of SO_2 from the combustion of wood residuals were added to the dryer emission calculations using the emission factors from AP-42 Section 1.6-Wood Residue Combustion at hourly capacity.
- An updated dryer vendor guarantee was provided to Drax after the Application submittal. The following changes were made and are reflected in the emission calculations in Attachment 2 and vendor guarantee in Attachment 3:
  - Emission factors for CO and NO_X were updated to 42 pounds per hour (lbs/hr) and 52 lbs/hr respectively;
  - The heat input for the regenerative thermal oxidizer (RTO) was updated to 8.8 million British thermal units (MMBtu/hr); and
  - The heat input for the RCO was updated to 2.2 MMBtu/hr.
- Emission factors for particulate matter associated with the emergency engines were updated to use the Tier II EPA standards (0.20 g/kW-hr) for nonroad compression-ignition engines. Additionally, the fire pump and generator will be controlled by a diesel particulate filter able to achieve at least 90% particulate control. Use of these units will be limited to 125 hrs/yr.
- TAP emissions from the Facility are compared to both the 1998 and 2019 TAP rules[1] to determine pollutants required to show compliance with the acceptable source impact level (ASIL). Pollutants, on

[1] WAC 173-460

either TAP list, are modeled if (a) emission rates are above the SQER or (b) if there is an assigned ASIL, but no assigned SQER for a given pollutant (1998 rule only).[2]

The air dispersion model incorporated the above emission rate changes. Additionally, the following updates were made. Updated model input files are provided in Attachment 4.

- New emission points for the dryer abort, furnace abort, and furnace idle were added to the air dispersion models.[3] Emissions from these sources and the emergency fire pump and generator are modeled in addition to the normal operating scenario with continuous operation (8,760 hrs/yr). For modeled short term results there are several available scenarios detailed below. Results are detailed for the highest modeled concentration from any given scenario. All scenarios assume the emergency fire pump and generator are operating at the same time as a given scenario for conservatism.
  - Normal – furnace exhaust is routed to the dryer, control devices associated with the dryer are operating, and all units are at full capacity.
  - FRNA – dryer is not operational (removal of source RTO), furnace is operating at maximum heat input and emissions are routed through the furnace abort stack.
  - FRNI – dryer is not operational (removal of source RTO), furnace is operating at 50% of maximum heat input and emissions are routed through the furnace abort stack.
  - RD – furnace is not operational (removal of source RTO), dryer is operating at maximum throughput and emissions are routed through the dryer abort stack. The dryer abort stack is limited to four hours of operation per day.
  - RD & FRN – emissions from dryer and furnace are routed to individual abort stacks, each at 100% capacity. The dryer abort stack is limited to four hours of operation per day.
  - Emissions from both the dryer and furnace abort stacks are included in the criteria pollutant and TAP models.
- With the addition of SO_2 emissions from wood combustion, a 1-hr SO_2 model was added to show compliance with the NAAQS.
- The inventory of TAPs modeled to show compliance with the ASIL expanded with the update to include the 2019 rule and the additional TAP emissions detailed in the previous section. All model results show compliance with the 2019 TAP rule.

---

[2] This TAP analysis methodology is based on guidance from Danny Phipps (SWCAA) via email communication on February 3, 2023.

[3] Stack parameters (height and diameter) for the dryer and furnace abort stacks were obtained from Drax personnel via email communication on December 1, 2022. All other dispersion parameters were obtained from the dryer island mass balances included in Attachment 3.

AUGUST 25, 2022 SWCAA LETTER

The August 25, 2022 SWCAA letter is included in Attachment 1 of this letter. SWCAA's requests are provided in **bold text** while Drax's responses are in normal text.

1. **<u>Hammermill TAP Emissions</u>. In the submitted application Trinity stated that toxic air pollutant (TAP) emission factors with an EPA rating of C, D, or E were not evaluated. For this reason, TAP emissions for the Hammermills were not included as part of the application. The potential to emit for the Hammermills for volatile organic compounds (VOC) was calculated to be 151.91 tons per year. Based on the character of these emissions, it is likely that TAPs are emitted and Drax must produce an estimate of these emissions and perform the associated modeling.**

   Hammermill TAP emissions have been included in the updated emission calculations for the Facility. As discussed previously, emission factors from the ABE Facility are used to calculate emission estimates for the hammermill. Because these emissions are now being routed to the RCO, total annual VOC emissions are estimated to be 17.57 tons per year (tpy). These changes are reflected in the updated emission calculations in Attachment 2 and air dispersion modeling files in Attachment 4.

2. **<u>Best Available Control Technology (BACT) Analysis for the Rotary Dryer</u>. Trinity stated that the only reasonable control option for nitrogen oxides (NO_X) is good combustion controls/practices. More detail needs to be provided as to why additional controls for NO_X are not cost effective.**

   Drax will install and operate low NO_X burners on the furnace/rotary dryer. A low NO_X burner is a demonstrated control technology in pellet manufacturing facilities and is technically feasible for NO_x control. As such, the proposed burners will be classified as low NO_x burners and will constitute BACT for the dryer's NO_x emissions. A guarantee from the dryer vendor is included in Attachment 3.

   Please find below an updated top-down NO_X BACT analysis for the furnace/rotary dryer.

BACT Analysis for NO_X Emissions

Step 1: Identify All Available Control Technologies

NO_x emissions result primarily from thermal NO_X formation from nitrogen and oxygen in the combustion air. An RBLC search was performed to identify NO_X control technologies. The following technologies were identified for use on dryers of similar capacity to Drax's proposed dryer (≥100 MMBtu/hr):

- Low NO_x Burner (LNB)
- Good Combustion Controls/Practices

Drax considers these technologies to be available for the dryer.

Step 2: Eliminate Technically Infeasible Options

A LNB is a demonstrated control technology in pellet manufacturing facilities; as such, it is technically feasible for NO_x control.

Step 3: Rank Remaining Control Technologies by Effectiveness

The following control technologies are available and feasible to control NO_x emissions from the dryer:

1. LNB
2. Good Combustion Practices

Drax proposes LNB as BACT for the furnace/rotary dryer's NO_x emissions.

3. **<u>Alterative Operating Scenarios</u>. It is the understanding of SWCAA that in some cases, an electrostatic precipitator (ESP) cannot be utilized immediately upon startup. If the ESP is not actively controlling emissions, it is presumed that the regenerative thermal oxidizer (RTO) must be bypassed as well. Drax must come up with an estimate of the length of the startup period and emission factors must be provided for the startup period. Drax must also provide some assurance that ambient air quality standards will not be violated during this period. If there are similar alternative operating scenarios, they must be identified as well.**

   Before the dryer can be started and run, the WESP and RTO must be available. The WESP and RTO will function while the dryer is started up, such that PM and VOC emissions are controlled before exhausting to the atmosphere. Similarly, the WESP and RTO will operate during shutdown of the dryer. Additional information is included in a letter from the dryer vendor in Attachment 3.

4. **<u>Wood Species</u>. Emissions can vary dramatically based on the wood species burned. SWCAA requests information about what wood species will be burned at the processing facility, and how the wood species will impact emissions.**

   Drax will predominantly burn the wood species Spruce-Pine-Fir (SPF). The potential criteria pollutant emissions of the dryer are based on vendor guarantees, with the exception of SO_2, which is based on an emission factor from EPA's AP-42 and is not specific to the species of wood burned. SPF-specific emission factors could not be found for HAP/TAP emissions from a dryer comparable to Drax's proposed dryer for the Facility. AP-42 biomass combustion HAP/TAP emission factors are used. HAP/TAP emission factors from Drax's Gloster, MS facility were incorporated to supplement the AP-42 factors and are expected to be the most representative emission factors available.

5. **<u>Fugitive Emissions</u>. In the application, the truck tipper that processes wet material is assumed to have zero fugitive emissions and the ship loadout is estimated to have negligible emissions. SWCAA requests additional details including video of other facilities or descriptions of process enclosure which assure that these emissions will be minimal.**

   Please refer to the video for the truck tipper at the following link: BRUKS - Keystone Drive-over Truck Dumper Showcase Video.

   Refer to the emission calculations in Table C-8 as provided in Attachment 2 of this letter for quantified ship loadout emissions. The ship loadout system will use a Cleveland Cascade spout with a skirt to minimize fugitive emissions from loading pellets into ships.

6. **<u>BACT for particulate matter (PM) control at the Pelletizer</u>. Pelletizing potential PM emissions are estimated assuming an emission rate of 0.005 gr/dscf. This is considered BACT for dust collectors, however in this case a scrubber is used. Drax must provide analysis or a manufacturers guarantee demonstrating that the scrubber will meet the proposed emission standards.**

As described in the "Summary of Process Changes" section above, Drax proposes a baghouse to control PM emissions from the pelletizers rather than the cyclones described in the Application.

Among technically feasible options, Drax ranked the following technologies for further review: baghouse, WESP, dry ESP, scrubber, and cyclone. Baghouses, WESPs, and dry ESPs can generally be designed with control efficiencies up to 99.9% for PM emissions, while scrubbers can reach 95%.[4,5,6,7] Cyclones are primarily used to control particulate matter greater than 10 micrometers; accordingly, the control efficiencies are as follows: 90% for PM and PM_{10}, 40% for $PM_{2.5}$.[8] As such, cyclones alone are not considered BACT for control of particulate emissions from Pelletizers.

Due to its equally as high control efficiency as the other control technologies, Drax proposes the use of a baghouse as BACT for the pelletizer's PM emissions. Based on the BACT determination for dust collectors, use of a baghouse will achieve a limit of 0.005 gr/dscf.

7. <u>Operating Parameters</u>. The application does not specify essential operating parameters of the emission control devices. The following information, at minimum, must be provided:

a) Operating parameters for the cyclone scrubber that controls the pelletizer:

1. The minimum water recirculation rate; and

2. The maximum differential pressure.

b) Operating parameters for baghouses that control the truck tipper and the hammermills:

1. The maximum differential pressure.

c) Operating parameters for the ESP that controls the rotary dryer:

1. the minimum current level in each ESP field;

2. the minimum secondary voltage in each ESP field;

3. the minimum spark rate in each ESP field;

4. the minimum outlet temperature.

Drax will utilize a baghouse instead of a cyclone scrubber for control of the pelletizer emissions. The maximum differential pressure of the hammermill, pelletizer, and truck tipper baghouses are unknown as of the date of this letter.

Operating parameters of the ESP for the rotary dryer are as follows:

1. Minimum current level in each ESP field of 800 Milliampere (mA)
2. Minimum secondary voltage in each ESP field of 50 kilovolts (kV)
3. Minimum spark rate in each ESP field of 20 sparks per minute
4. Minimum outlet temperature of 160 •F

[7] EPA, *Air Pollution Control Technology Fact Sheet, Packed-Bed/Packed-Tower Wet Scrubber*, EPA-452/F-03-015. (https://www3.epa.gov/ttncatc1/dir1/fpack.pdf)

[8] EPA, *Air Pollution Control Technology Fact Sheet, Cyclones*, EPA-452/F-03-005 (https://www3.epa.gov/ttnchie1/mkb/documents/fcyclon.pdf)

8. **<u>Sulfur dioxide (SO_2) Emissions</u>. No sulfur dioxide emissions are estimated for wood combustion. Drax must provide as estimate of sulfur dioxide emissions or provide data or rational explaining why this is not necessary.**

   SO_2 emissions for wood combustion at the furnace have been included using emission factors from AP-42 Table 1.6-2 for Wood Residue Combustion. These changes are reflected in the updated emission calculations in Attachment 2.

9. **<u>Design Criteria for Control Equipment.</u> More information is required regarding the design criteria of the ESP and the cyclone scrubber. The information provided in the application is not sufficient for SWCAA to evaluate whether the designed equipment can control emissions at the expected level. For each piece of control equipment on site Drax must provide the following information:**
   a) Make and model;
   b) Maximum rated load/capacity;
   c) Operating parameters associated with the equipment;
   d) Height, diameter, flow, and configuration of the ambient discharge point; and
   e) Manufacturer's control efficiency guarantees for relevant pollutants.

   Design criteria is included for each control device in the table below:

Table 1. Control Device Design Criteria

Control Device	Make and Model	Maximum Rated Load/ Capacity	Associated Operating Parameters	Height, Diameter, Flow, and Configuration of Discharge	Manufacturer's Control Efficiency Guarantees
RCO	TBD. 120,000 acfm RCO.	2.2 MMBtu/hr	Temperature: 120°F Particulate: ≤115 mg/Nm^3 Humidity: ≥5 vol% Gas Pressure: 20-40 psig	Height: 60 ft Diameter: 72 in Exhaust Stack	VOC: ≥94%
Hammermill Baghouse	Allied/Air-Cure 544RF12W	44,200 acfm	TBD	Height (above ground): 60 ft Diameter: 6.56 ft Flow: 19.7 ft/sec Exhaust Stack	PM: ≤0.005 gr/dscf
Pelletizer Baghouse	Allied/Air-Cure 544RF12W	76,000 acfm	TBD	Height (above ground): 60 ft Diameter: 6.56 ft Flow: 19.7 ft/sec Exhaust Stack	PM: ≤0.005 gr/dscf
Truck Tipper Baghouse	Donaldson Torit 200RP	27,700 acfm	TBD	Height (above ground): 41.7 ft Diameter: 2.99 ft Flow: 65.4 ft/sec	PM: ≤0.002 gr/dscf

Control Device	Make and Model	Maximum Rated Load/ Capacity	Associated Operating Parameters	Height, Diameter, Flow, and Configuration of Discharge	Manufacturer's Control Efficiency Guarantees
				Exhaust Stack	
WESP	TSI-WESP-936		Pressure: ±25" w.c. pH: 6-8 *See Question 7 for remaining parameters*	Centrifuge, routed to RTO Exhaust Stack	PM (front-half): ≥95%
RTO	TSI-RTO-4 CAN-11'x34;	8.8 MMBtu/hr	Gas Pressure: 20-40 psig Temperature: ≥1500°F Residence Time: ≥0.5 sec	Height: 60 ft Diameter: 90 in Exhaust Stack	VOC: ≥95%; PM (back-half): ≥95%

10. <u>Binding Agent</u>. The application does not cite the use of any binding agent in the pelletizing process. If binding agents are used in the process, Drax must submit chemical constituent data for each binding agent and provide an estimate of associated pollutant emissions.

There will not be any binding agent used in the pelletizing process.

11. <u>VOC Emissions from Stockpile Storage</u>. Drax estimated PM emissions from stockpile storage, however wood products can also produce VOCs. Drax must provide an estimate of VOC emissions from these stockpiles and provide a plan for minimizing these emissions.

Per a September 9, 2022 SWCAA email, it was determined that additional information was needed to ensure that odors from stockpiles would be minimized. The stockpiles will be on site for a continual rollover basis. Drax will target to maintain a half-month's supply necessary to operate the plant. At some points in the year (notably, winter and spring), Drax will increase this volume to address supply risks – potentially up to one month. Across its facilities, Drax typically only measures the temperatures of its grind piles on an as-needed basis to address concerns. Drax does not plan to measure pH.

12. <u>Compliance Assurance Monitoring</u>. The application describes emission units that have a control device and emit over 100 ton of a pollutant, prior to the control unit. These units meet the criteria under 40 cfr part 64 and a plan must be provided for continuous compliance assurance.

Per 40 CFR 64.5(b) and if applicable to the emission units at the facility, Compliance Assurance Monitoring (CAM) requirements are to be submitted as part of a Title V renewal application. Drax will evaluate applicability of the CAM requirements in the initial Title V application for the Facility.

SWCAA QUESTIONS FROM 9/9/2022 CONFERENCE CALL

SWCAA's questions from the September 9, 2022 conference call are provided in **bold text** while Drax's responses are in normal text.

1. **Did Drax evaluate the feasibility of installing a scrubber to control PM emissions from the hammermills?**

   Baghouses can generally be designed with control efficiencies up to 99.9% for PM emissions, while scrubbers can reach 95%.[9,10] To achieve the best available control efficiency, Drax is proposing the installation of a baghouse to control PM from the hammermills. The baghouse will achieve a grain loading limit of 0.005 gr/dscf.

2. **Would Drax prefer a large testing event every five years, or to test a smaller number of emission units each year?**

   Drax prefers to conduct a single testing event every five years.

~~~~~~~

If you have any questions or comments about the information presented in this letter, please do not hesitate to call me at 253.867.5600 x4804.

Sincerely,

RE: Completeness Determination for ADP Application CO-1057

Dear Mr. Kooy:

The Southwest Clean Air Agency (SWCAA) has received your Air Discharge Permit (ADP) application to install and operate a wood pellet processing facility, submitted by Trinity Consultants on your behalf. This application has been designated as ADP Application CO-1057.

SWCAA has determined, after review, that the application is incomplete under SWCAA 400-110(2). Additional information is needed before SWCAA can continue processing the application. Please provide the following no later than **September 30, 2022**:

- Hammermill TAP Emissions. In the submitted application Trinity stated that toxic air pollutant (TAP) emission factors with an EPA rating of C, D, or E were not evaluated. For this reason, TAP emissions for the Hammermills were not included as part of the application. The potential to emit for the Hammermills for volatile organic compounds (VOC) was calculated to be 151.91 tons per year. Based on the character of these emissions, it is likely that TAPs are emitted and Drax must produce an estimate of these emissions and perform the associated modeling.
- Best Available Control Technology (BACT) Analysis for the Rotary Dryer. Trinity stated that the only reasonable control option for nitrogen oxides (NO_x) is good combustion controls/practices. More detail needs to be provided as to why additional controls for NO_x are not cost effective.
- Alterative Operating Scenarios. It is the understanding of SWCAA that in some cases, an electrostatic precipitator (ESP) cannot be utilized immediately upon startup. If the ESP is not actively controlling emissions, it is presumed that the regenerative thermal oxidizer (RTO) must be bypassed as well. Drax must come up with an estimate of the length of the startup period and emission factors must be provided for the startup period. Drax must also provide some assurance that ambient air quality standards will not be violated during this period. If there are similar alternative operating scenarios, they must be identified as well.
- Wood Species. Emissions can vary dramatically based on the wood species burned. SWCAA requests information about what wood species will be burned at the processing facility, and how the wood species will impact emissions.
- Fugitive Emissions. In the application, the truck tipper that processes wet material is assumed to have zero fugitive emissions and the ship loadout is estimated to have negligible emissions. SWCAA requests additional details including video of other facilities or descriptions of process enclosure which assure that these emissions will be minimal.
- BACT for particulate matter (PM) control at the Pelletetizer. Pelletizing potential PM emissions are estimated assuming an emission rate of 0.005 gr/dscf. This is considered BACT for dust collectors, however in this case a scrubber is used. Drax must provide analysis or a

manufacturers guarantee demonstrating that the scrubber will meet the proposed emission standards.

- Operating Parameters. The application does not specify essential operating parameters of the emission control devices. The following information, at minimum, must be provided:
  a) Operating parameters for the cyclone scrubber that controls the pelletizer:
     1. The minimum water recirculation rate; and
     2. The maximum differential pressure.
  b) Operating parameters for baghouses that control the truck tipper and the hammermills:
     1. The maximum differential pressure.
  c) Operating parameters for the ESP that controls the rotary dryer:
     1. the minimum current level in each ESP field;
     2. the minimum secondary voltage in each ESP field;
     3. the minimum spark rate in each ESP field;
     4. the minimum outlet temperature.
- Sulfur dioxide (SO_2) Emissions. No sulfur dioxide emissions are estimated for wood combustion. Drax must provide as estimate of sulfur dioxide emissions or provide data or rational explaining why this is not necessary.
- Design Criteria for Control Equipment. More information is required regarding the design criteria of the ESP and the cyclone scrubber. The information provided in the application is not sufficient for SWCAA to evaluate whether the designed equipment can control emissions at the expected level. For each piece of control equipment on site Drax must provide the following information:
  a) Make and model;
  b) Maximum rated load/capacity;
  c) Operating parameters associate with the equipment;
  d) Height, diameter, flow, and configuration of the ambient discharge point; and
  e) Manufacturer's control efficiency guarantees for relevant pollutants.
- Binding Agent. The application does not cite the use of any binding agent in the pelletizing process. If binding agents are used in the process, Drax must submit chemical constituent data for each binding agent and provide an estimate of associated pollutant emissions.
- VOC Emissions from Stockpile Storage. Drax estimated PM emissions from stockpile storage, however wood products can also produce VOCs. Drax must provide an estimate of VOC emissions from these stockpiles and provide a plan for minimizing these emissions.
- Compliance Assurance Monitoring. The application describes emission units that have a control device and emit over 100 ton of a pollutant, prior to the control unit. These units meet the criteria under 40 cfr part 64 and a plan must be provided for continuous compliance assurance.

Should additional time for preparation of the above items be needed, SWCAA will grant any reasonable request. Please note that SWCAA may still request additional information to clarifying the application during the forthcoming permitting process. If you need further assistance or have any questions on this matter, please contact me at (360) 574-3058 ext. 124.

Sincerely,

Danny Phipps
Air Quality Engineer I

Good afternoon Jennifer,

My answers are below in Red. Let me know if you need further clarification beyond what it written below.

Thanks,

Danny Phipps, PE

Subject: Drax Longview 2019 TAP Rule

Danny,

We completed a full comparison of TAP emissions from the Drax Longview site to the 2019 TAP rule and we are able to get all pollutants to pass the SQER/ASIL using the 2019 TAP rule. We just wanted to get confirmation from you on how we should proceed with the TAP comparison:

- Were you able to get confirmation that it is acceptable to compare to the 2019 SQERs and ASILs instead of or in addition to the 1998 thresholds? If so:
    - Should we use the 1998 rule and compare to the 2019 ASIL for pollutants which exceed the 1998 ASIL but have a higher ASIL in the 2019 rule? Or
    - Should we compare all TAP to the 2019 rule thresholds?

If a TAP is not listed in the 2019 rule, but it is in the 1998 list, then use the 1998 standard. For all other pollutants the 2019 ASIL should be used. Make a note of those that exceed the 1998 standard. In the technical support document of the permit I will reference the conversation with Gary Palcisko and the letter that was issued for Sierra Pacific.

Also, just a few miscellaneous items:

- Regarding modeling of emergency engines, would you agree that it is appropriate to model only projected operating hours for testing and maintenance, rather than using the PTE estimate of 200 hrs/yr (which includes emergency hours of operation)?

The PTE estimate should be used as it considers both estimated emergency usage and the operation and maintenance time.

- We wanted to follow-up on whether we can annualize emissions from the abort stacks for short-term modeling purposes.

Since those scenarios amount to almost 1,000 hours and are planned we have decided that it would not be appropriate to average them over the course of the year. Please model those as short term emissions (not annualized).

Please let us know if you have any questions.

Thank you,

Jennifer

Updated Potential Emission Calculations and Stack Test Data

Table C-1a. Input Values

Total Pellet Throughput [1]	450,000	ODMT/yr
Hourly Pellet Throughput [1]	62	ODMT/hr
Total Dryer Throughput	450,000	ODMT/yr
Max Hourly Dryer Throughput [1]	62	ODMT/hr
Total Hammermill Throughput	450,000	ODMT/yr
Max Hourly Hammermill Throughput [1]	75	ODMT/hr
Total Pellet Cooler Throughput	450,000	ODMT/yr
Max Hourly Pellet Cooler Throughput [1]	75	ODMT/hr
Facility Operating Hours	8,760	hrs/yr
Controlled Hammermill VOC Emission Factor[3]	0.071	lb/ODT
Controlled Pellet Cooler VOC Emission Factor[3]	0.071	lb/ODT
RTO VOC Control Efficiency for Rotary Dryer	95%	
RTO CO Control Efficiency for Rotary Dryer	0%	
RCO VOC Control Efficiency for Pellet Cooler and Hammermill	95%	
RCO CO Control Efficiency for Pellet Cooler and Hammermill	0%	

[1] Maximum throughputs were provided to Trinity Consultants in process flow diagram on 12/21/2021.

[2] RTO and RCO control efficiencies per manufacturer specification sheets.

[3] Emission factors obtained from the Drax facility in Gloster, MS (ABE) stack testing. Maximum emission factors in lbs/ODT obtained from 2018 and 2021 stack testing. The ABE facility routes emissions from both the hammermill and pelletizer to the RCO similar to the proposed Longview facility. The emission factors are divided by 2 to represent half of the RCO emissions for each piece of equipment. A 25% safety factor has been included for conservatism.

																								Total HAP (tpy)	48.90						
																								Maximum Single HAP (tpy)	22.55						

[1] The SQER for each TAP is obtained from the 1998 and 2019 WAC 173-460 TAP lists.

[2] Chromium III and II are conservatively assumed to each be equal to the total chromium emissions, since the oxidation state of the emitted chromium compounds is not known.

[3] Dioxin and furan emissions are quantified using a toxic equivalency (TEQ) factor and considered as one TAP under the 1998 rule. The sum of these pollutant emissions are compared to the ASIL in the 1998 TAP rule in accordance with WAC 173-460-050(4)(b) adopted by SWCAA. Under the 2019 TAP rule, dioxins and furans are considered separate pollutants. Emissions are calculated separately and compared to the 2019 TAP rule. Pollutants reported individually have not been adjusted to 2,3,7,8 TCDD Eqv.

[4] Polyaromatic hydrocarbon (PAH) emissions for TAP consideration are quantified as the following PAHs and are considered as one TAP equivalent in potency to benzo(a)pyrene: benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indenol(1,2,3-cd)pyrene, benzo(a)pyrene. The sum of these pollutant emissions are then compared to the ASIL 1998 TAP rule in accordance with WAC 173-460-050(4)(c) adopted by SWCAA. Since the TAP equivalent potency is not provided, it is assumed that it equals 1.

Table C-3a. Biomass Rotary Dryer Operating Parameters

Parameter	Value	Units
Max Hourly Throughput	68.3	ODT/hr
Max Annual Throughput	496,040	ODT/yr
Maximum Heat Input	187.7	MMBtu/hr
Wood and Wood Residuals Heating Value[1]	17.48	MMBtu/ODT
Maximum Annual Operation	8,760	hr/yr

[1] Wood and wood residuals heating value provided in 40 CFR Appendix Table C-1 to Subpart C of Part 98.

Table C-3b. Biomass Rotary Dryer Potential Emissions - Criteria Pollutants

Pollutant	Maximum Hourly Emissions[1] (lb/hr)	Potential Annual Emissions (tpy)
PM	5.00	21.90
PM_{10}	5.00	21.90
$PM_{2.5}$	5.00	21.90
SO_2 [2]	4.69	20.55
NO_X	52.00	227.76
VOC	15.00	65.70
CO	42.00	183.96

[1] Hourly emission rates from the RTO stack are obtained from vendor guarantees provided by TSI on September 9th, 2022.

[2] SO_2 emissions estimated using AP-42 Table 1.6-2 for Wood Residue Combustion. Emission factor is given in lb/MMBtu and converted to lbs/hr using the maximum heat input of the furnace.

Table C-3c. Biomass Rotary Dryer Potential Emissions - GHG

Fuel	Wood Drying CO_2 Emission Factor [1] (lb/ODT)	CO_2 Emissions (tpy)
Wood & wood residuals	720	178,574

[1] Wood drying emission factors for CO_2 are from AP-42 Table 10.6.1-2.

Table C-3d. Biomass Rotary Dryer Potential Emissions - HAP/TAP

Pollutant	CAS #	HAP?	TAP?	Biomass Combustion Emission Factor[1] (lb/MMBtu)	ABE Stack Test Factors[2] (lb/ODT)	Maximum Hourly Emissions[3,4] (lb/hr)	Potential Annual Emissions[3,4] (tpy)

						Total HAP	**22.88**
						Maximum Individual HAP	**9.29**

[1] Emission factors for biomass (wood residue) combustion are uncontrolled and from AP-42, Section 1.6 (Wood Residue Combustion), Tables 1.6-3 and 1.6-4. Pollutants with an emission factor rating of C, D, or E are not included.

[2] Emission factors obtained from Drax ABE facility in Gloster, MS stack testing. Maximum emission factors in lbs/ODT from 2018 and 2021 stack testing. A 25% safety factor has been included for conservatism.

[3] Organic TAP are controlled by RTO. Control efficiency is provided by LDX Solutions for VOC compounds as: 95%

[4] TAP emitted as PM are controlled by WESP. A minimum control efficiency according to an EPA Air Pollution Control Technology Fact Sheet on WESP is: 95%

Because mercury is a liquid at ambient temperature, it is not emitted in the form of PM. Therefore, it is uncontrolled.

[5] Dioxin and furan emissions apply a toxic equivalency (TEQ) factor obtained from the 72 FR 26545 in accordance with the 1998 TAP rule WAC 173-460-050(4)(b) adopted by SWCAA. Emissions shown in this table are expressed as an equivalent emissions of 2,3,7,8 TCDD. https://www.govinfo.gov/content/pkg/FR-2007-05-10/pdf/E7-9015.pdf

Octachlorodibenzo-p-dioxins TEQ: 0.0003

Pentachlorodibenzo-p-dioxins TEQ: 1

[6] Because the emission factor for "Chromium, Total" has an "A" rating and it is likely that a portion is in the form of hexavalent chromium, it conservative to use the emission factor for "Chromium, Hexavalent" even though it has a "C" rating.

Table C-4a. RTO Burner Operating Parameters

Parameter		Units
Unit Heat Input	8.8	MMBtu/hr
Natural Gas Heating Value[1]	1,020	MMBtu/MMscf
Annual Operation	8,760	hr/yr
Potential Annual Fuel Usage[2]	75.6	MMscf/yr

[1] Natural Gas HHV is the average from the range listed in AP-42, Section 1.4.

[2] Potential Annual Fuel Usage calculated as follows:
Annual Fuel Usage (MMscf/yr) = Heat Input (MMBtu/hr) / Natural Gas HHV (MMBtu/MMscf) x Annual Operation (hr/yr)

Table C-4b. RTO Potential Emissions - Criteria Pollutants

Pollutant[1]	Natural Gas Uncontrolled Emission Factor (lb/MMscf)	Maximum Hourly Emissions (lb/hr)	Potential Annual Emissions (tpy)
Total PM	--	--	--
PM_{10}	--	--	--
$PM_{2.5}$	--	--	--

NO_X	--	--	--
VOC	--	--	--
CO	--	--	--
CH_4	2.3	1.98E-02	8.69E-02
N_2O	2.2	1.90E-02	8.31E-02
CO_2	120,000	1035	4535
CO_2e[2]	120,713	1041	4562

[1] Uncontrolled emission factors for natural gas combustion from AP-42, Section 1.4 - Natural Gas Combustion, Table 1.4-1, 1.4-2, 1.4-3, and 1.4-4. Emissions for CO, NO_X, VOC, and PM from the RTO are included in the dryer calculations.

[2] Global warming potential (GWP) for CH_4 is 25 and N_2O is 298 for estimating CO_2e emissions (40 CFR 98, Subpart A, Table A-1, effective January 1, 2014).

Table C-4c. RTO Potential Emissions - HAP/TAP

Pollutant	CAS #	HAP?	TAP?	Natural Gas Uncontrolled Emission Factor[1] (lb/MMscf)	Maximum Hourly Emissions [2] (lb/hr)	Potential Annual Emissions [2] (tpy)
Benzene	71-43-2	Yes	Yes	2.10E-03	1.81E-05	7.94E-05
Formaldehyde	50-00-0	Yes	Yes	7.50E-02	6.47E-04	2.83E-03
					Total HAP	**2.91E-03**
					Maximum Individual HAP	**2.83E-03**

[1] Uncontrolled emission factors for natural gas combustion from AP-42, Section 1.4 - Natural Gas Combustion, Table 1.4-1, 1.4-2, 1.4-3, and 1.4-4. Pollutants with an emission factor rating of C, D, or E are not included.

Table C-5a. RCO Burner Operating Parameters

Parameter		Units
Unit Heat Input	2.2	MMBtu/hr
Natural Gas Heating Value[1]	1,020	MMBtu/MMscf
Annual Operation	8,760	hr/yr
Potential Annual Fuel Usage[2]	18.9	MMscf/yr

[1] Natural Gas HHV is the average from the range listed in AP-42, Section 1.4.

[2] Potential Annual Fuel Usage calculated as follows:
Annual Fuel Usage (MMscf/yr) = Heat Input (MMBtu/hr) / Natural Gas HHV (MMBtu/MMscf) x Number of Burners x Annual Operation (hr/yr)

Table C-5b. RCO Potential Emissions - Criteria Pollutants

Pollutant	Natural Gas Uncontrolled Emission Factor[1] (lb/MMscf)	Maximum Hourly Emissions (lb/hr)	Potential Annual Emissions (tpy)
Total PM	7.6	0.02	0.07
PM_{10}	7.6	0.02	0.07
$PM_{2.5}$	7.6	0.02	0.07
SO_2	0.6	1.29E-03	5.67E-03
NO_X	100	0.22	0.94
VOC	5.5	0.01	0.05
CO	84	0.18	0.79
CH_4	2.3	4.96E-03	0.02
N_2O	2.2	4.75E-03	0.02
CO_2	120,000	259	1134
CO_2e[2]	120,713	260	1140

[1] PM is equal to the sum of PM (condensable) and PM (filterable). PM_{10} and $PM_{2.5}$ are conservatively assumed to be equivalent to PM.

[2] Global warming potential (GWP) for CH_4 is 25 and N_2O is 298 for estimating CO_2e emissions (40 CFR 98, Subpart A, Table A-1, effective January 1, 2014).

Table C-5c. RCO Potential Emissions - HAP/TAP

Pollutant	CAS #	HAP?	TAP?	Natural Gas Uncontrolled Emission Factor[1] (lb/MMscf)	Maximum Hourly Emissions [2] (lb/hr)	Potential Annual Emissions [2] (tpy)
Benzene	71-43-2	Yes	Yes	2.10E-03	4.53E-06	1.98E-05
Formaldehyde	50-00-0	Yes	Yes	7.50E-02	1.62E-04	7.09E-04
					Total HAP	**7.28E-04**
					Maximum Individual HAP	**7.09E-04**

[1] Uncontrolled emission factors for natural gas combustion from AP-42, Section 1.4 - Natural Gas Combustion, Table 1.4-1, 1.4-2, 1.4-3, and 1.4-4. Pollutants with an emission factor rating of C, D, or E are not included.

Table C-6a. Hammermill Potential Emissions - VOC

EU ID	Emission Unit	Control Device	Potential Hourly Throughput (ODT/hr)	Potential Annual Throughput (ODT/yr)	Controlled VOC Emission Factor[1] (lb/ODT)	Potential Controlled VOC Emissions[2] (tpy)
HM1	Hammermill No. 1	RCO	82.67	496,040	7.09E-02	17.57
HM2	Hammermill No. 2					
HM3	Hammermill No. 3					
HM4	Hammermill No. 4					
					Total Emissions	**17.57**

[1] The hammermill VOC emission factor is the average value from 2013/2014 engineering testing performed on the Dry Classizizer units at the Pinnacle Aliceville facility (formerly Westervelt Aliceville). A 25% safety factor has been included for conservatism.

[2] Potential Emissions (tpy) = Emission Factor (lb/short ton) x Potential Annual Throughput (tpy) / 2000 (lb/short ton)

Table C-6b. Hammermill Potential Emissions - PM

EU ID	Emission Unit	Control Device	Potential Operation[1]	Exit Temperature	Exhaust Flow Rate[2]		Loading Rate[3]	Total PM[4]		Total PM_{10}[4,5]		Total $PM_{2.5}$[4,5]	
			(hr/yr)	(°F)	(acfm)	(scfm)	(gr./dscf)	(lb/hr)	(tpy)	(lb/hr)	(tpy)	(lb/hr)	(tpy)
HM1	Hammermill No. 1	Baghouse	8,760	122	44,200	40,074	0.005	1.72	7.52	1.72	7.52	1.72	7.52
HM2	Hammermill No. 2												
HM3	Hammermill No. 3												
HM4	Hammermill No. 4												
							Total Emissions	**1.72**	**7.52**	**1.72**	**7.52**	**1.72**	**7.52**

[1] Potential operation assumed to be continuous.

[2] Exhaust flow rate (scfm) estimated for all hammermills. Exhaust flow converted to acfm assuming 50°C exhaust temperatures at 1 atm, with standard temperature of 68 °F.

[3] The grain loading rate is based on the BACT determination for dust collectors.

[4] Emissions of PM and PM_{10} are assumed to be equal to emissions of $PM_{2.5}$. These emissions are included as a conservative measure, as all of the particulate matter emitted is expected to be less than 2.5 microns.

[5] Potential hourly PM emissions (lb/hr) = Exhaust Grain Loading Rate (gr./dscf) x Exhaust Air Flow Rate (dscf/min) x (60 min/hr) x (lb/7,000 gr.)

Table C-6c. Hammermill Potential Emissions - HAP/TAP

Pollutant	CAS #	HAP?	TAP?	ABE Stack Test Factors[1] (lb/ODT)	Maximum Hourly Emissions (lb/hr)	Potential Annual Emissions (tpy)
Acetaldehyde	75-07-0	Yes	Yes	2.18E-03	1.80E-01	5.41E-01
Acrolein	107-02-8	Yes	Yes	8.18E-04	6.76E-02	2.03E-01

PSS1	Pellet Storage Silo 1	248,020	2.7E-04	1.3E-04	1.9E-05	3.55E-02	1.68E-02	2.54E-03
PSS2	Pellet Storage Silo 2	248,020	2.7E-04	1.3E-04	1.9E-05	3.55E-02	1.68E-02	2.54E-03
SLS	Ship Loadout System	496,040	2.7E-04	1.3E-04	1.9E-05	7.10E-02	3.35E-02	5.07E-03

[1] Total throughput at the facility is quantified in ODT/yr. To represent as-processed throughput weight, the value is adjusted based on moisture content specific to the process associated with the emission unit. All throughput will either go through the biosizer or a scalper so emissions from these process units are only quantified once.

[2] Emissions calculated using emission factor determined according to AP-42 Section 13.2.4 for aggregate handling and storage piles.

E (lb/ton) = $k\ (0.0032) \times (U/5)^{1.3}/(M/2)^{1.4}$

0.74 = k, PM size multiplier

0.35 = k, PM_{10} size multiplier

0.053 = k, $PM_{2.5}$ size multiplier

2.54 = U, mean wind speed (m/s) (average from 2007-2015) in Longview

50 = M, estimate for moisture content (%) of incoming material as described in manufacturer's proposal for RTO operation

6 = M, estimate for moisture content (%) of dry chips

5 = M, estimate for moisture content (%) of dry, finished product

[3] The VOC emission factor for chip storage in EPA AP-42 10.6.3, Table 10.6.3-7 is listed as "no data available"; therefore emissions are not quantified.

Table C-9. Paved Road Potential Emissions - PM

Paved Truck Route	PM Emission Factor, E [1] (lb/VMT)	PM_{10} Emission Factor, E [1] (lb/VMT)	$PM_{2.5}$ Emission Factor, E [1] (lb/VMT)	Maximum Loads Per Hour [2]	Maximum Loads Per Year [2]	Truck Route Maximum Round Trip Distance (mi)	Vehicle Miles Traveled per Hour (VMT/hr)	Vehicle Miles Traveled per Year (VMT/yr)	PM Emissions [3] (tpy)	PM_{10} Emissions [3] (tpy)	$PM_{2.5}$ Emissions [3] (tpy)
Between wet material stockpiles and process drop point	0.25	0.049	0.012	24.8	180,000	0.124	3.1	22,369	2.39	0.48	0.12

[1] Emission factor E is calculated according to AP-42 Section 13.2.1 for emissions from paved roads, equation 1:

E (lbs/VMT) = Paved Road Emission Factor, [$k * (sL)^{0.91} * (W)^{1.02}$]
0.011 = k, PM size multiplier (lb/VMT) from AP-42 Table 13.2.1-1.
0.0022 = k, PM_{10} size multiplier (lb/VMT) from AP-42 Table 13.2.1-1.
0.00054 = k, $PM_{2.5}$ size multiplier (lb/VMT) from AP-42 Table 13.2.1-1.

1.1 = sL, roadway surface silt loading (g/m^2) AP-42 13.2.1, Table 13-2.1-3. The silt loading value for corn wet mills is used because the wet material stockpile is expected to store materials with a similar texture and moisture content.
19.26 = W, average truck weight (tons)

[2] Vehicles per hour and vehicles per year are based on truck capacity and pile throughput values:

Truck Capacity: 5.51 tons
Max Hourly Throughput: 137 tons/hr
Max Annual Throughput: 992,080 tons/yr

[3] Emissions account for natural mitigation due to precipitation according to AP-42 Section 13.2.1 equation 2:

Annual emissions (tpy) = E * (1-P/4N)*[VMT/yr]/[lb/ton]
185.8 = P, mean number of days per year with measurable precipitation for Longview station, NOAA National Centers for Environmental Information 1981-2010 Climate Normals data
365 = N, number of days in period for annual rainfall mitigation effect

[4] Truck weight and vehicle capacity were provided to by Drax to Trinity via email on March 6, 2020.

Truck Weight: 33000 lb
Vehicle Capacity: 5 ODMT

Table C-10a. Material Handling Potential Emissions - PM

Pile	Throughput [1] (tons/hr)	(tons/yr)	PM Emissions [2] (lb/hr)	(tpy)	PM_{10} Emissions [2] (lb/hr)	(tpy)	$PM_{2.5}$ Emissions [2] (lb/hr)	(tpy)
Wet Material Stockpiles	137	992,080	1.48E-03	5.37E-03	7.00E-04	2.54E-03	1.06E-04	3.85E-04

[1] Maximum pile throughput is based on a total pellet production rate of 62 metric tonnes per hour and 450,000 metric tonnes per year, scaled by a factor of 2 to account for the additional weight of the material being stored wet.

[2] Emissions calculated using emission factor determined according to AP-42 Section 13.2.4 for aggregate handling and storage piles.

$E\ (lb/VMT) = k\ (0.0032) \times (U/5)^{1.3}/(M/2)^{1.4}$

0.74 = k, PM size multiplier
0.35 = k, PM_{10} size multiplier
0.053 = k, $PM_{2.5}$ size multiplier
2.54 = U, mean wind speed (m/s) (average from 2007-2015) in Longview
50 = M, estimate for moisture content (%) of incoming material as described in manufacturer's proposal for RTO operation

Table C-10b. Pile Wind Erosion Potential Emissions - PM

Pile	Area [1] (acres)	PM Emissions [2] (lb/hr)	(tpy)	PM_{10} Emissions [3] (lb/hr)	(tpy)	$PM_{2.5}$ Emissions [3] (lb/hr)	(tpy)
Wet Material Stockpiles	2.52	0.08	0.37	0.040	0.18	0.0061	0.027

[1] The wet material stockpiles are located on the north side of the facility in a conical shape. There will be two wet fiber storage piles and one hog storage pile. The three piles are expected to have similar dimensions. The pile diameters and heights were provided by Drax in a call on 3/7/2022.

[2] PM Emissions are calculated using emission factors determined according to Equation 2-12 from the EPA document "Fugitive Dust Background Document and Technical Information Document for Best Available Control Measures" dated 9/1992.

$e_{TSP}\ (lb/acre\text{-}day) = 1.7 * (s/1.5) * [\ (365\text{-}p) / 235\ ] * (f/15)$

1 = s, silt content
185.8 = p, number of days with ≥ 0.01 in. precipitation per year
14.01 = f, percentage of time that the unobstructed wind speed exceeds 5.4 m/s (12 mph) at the mean pile height

[3] PM_{10} and $PM_{2.5}$ emissions are determined based on PM emissions using the ratios of the particle size multipliers for each particle size provided for Equation 1 in AP-42 Section 13.2.4.

Table C-12. Truck Tipping Potential Emissions - PM

EU ID	Emission Unit	Control Device	Potential Operation[1] (hr/yr)	Exit Temperature (°F)	Exhaust Flow Rate[2] (acfm)	Exhaust Flow Rate[2] (scfm)	Loading Rate[3] (gr./dscf)	Total PM[4] (lb/hr)	Total PM[4] (tpy)	Total PM_{10}[4,5] (lb/hr)	Total PM_{10}[4,5] (tpy)	Total $PM_{2.5}$[4,5] (lb/hr)	Total $PM_{2.5}$[4,5] (tpy)
BAG2	Truck Tipper	Baghouse	8,760	150	27,700	23,961	0.002	0.41	1.80	0.41	1.80	0.41	1.80
							Total Emissions	**0.41**	**1.80**	**0.41**	**1.80**	**0.41**	**1.80**

[1] Potential operation assumed to be continuous.

[2] Exhaust flow converted to scfm assuming 150°F exhaust temperatures at 1 atm, with standard temperature of 68°F.

[3] Exit temperature, exhaust flow rate, and loading rate obtained from vendor guarantee.

[4] Emissions of PM and PM_{10} are assumed to be equal to emissions of $PM_{2.5}$. These emissions are included as a conservative measure, as all of the particulate matter emitted is expected to be less than 2.5 microns.

[5] Potential hourly PM emissions (lb/hr) = Exhaust Grain Loading Rate (gr/dscf) x Exhaust Air Flow Rate (dscf/min) x (60 min/hr) x (lb/7,000 gr.)

Table C-11a. ULSD-Fired Emergency Engines Operating Parameters

EU ID	Emission Unit	Potential Operation (hr/yr)	Rated Engine Capacity (bhp)	(bkw)
ENG1	625 kW Emergency Generator	125	838	625
FWP1	164 kW Fire Pump Engine	125	220	164

Table C-11b. ULSD-Fired Emergency Engines Potential Emissions - Criteria Pollutants

Pollutant	Diesel Industrial Engines AP-42 Emission Factor[1]	Large Stationary Diesel Engines AP-42 Emission Factor[1]	FWP1 Emissions[2,3,4]		ENG1 Emissions[2,3,4]	
	(lb/MMBtu)	(lb/MMBtu)	(lb/hr)	(tpy)	(lb/hr)	(tpy)
Total PM	--	--	7.23E-03	4.52E-04	0.03	1.72E-03
Total PM_{10}	--	--	7.23E-03	4.52E-04	0.03	1.72E-03
Total $PM_{2.5}$	--	--	7.23E-03	4.52E-04	0.03	1.72E-03
SO_2	0.29	1.52E-03	0.45	0.03	0.01	5.55E-04
NO_X	4.41	3.20	6.79	0.42	18.77	1.17
VOC	0.36	0.09	0.55	0.03	0.53	0.03
CO	0.95	0.85	1.46	0.09	4.99	0.31
CO_2e[5]	165.20	165.60	254.41	15.90	971.39	60.71

[1] Emission factors for diesel industrial engines from AP-42, Table 3.3-1. Emission factors for large stationary diesel engines from AP-42, Table 3.4-1 and Table 3.4-2. HAP/TAP Pollutants with an emission factor rating of C, D, or E are not included.

[2] PM emissions for both units are estimated using Tier II EPA standards (0.20 g/kW-hr) for nonroad compression-ignition engines. Factors are given in units of g/kW-hr and are converted to lb/hr.

[3] An example of annual emissions calculations are shown below:

Emission Factor (lb/MMBtu) x Fuel Factor (MMBtu/bhp-hr) x Rated Capacity (bhp) x Annual Operation (hr/yr) / 2,000 (lb/ton)

Fuel Factor (MMBtu/bhp-hr) = 0.007

[4] Diesel particulate filters will be added to each emergency engine and will provide the following control efficiency for particulate matter: 90%

[5] CO_2 and CH_4 emission factors are from AP-42, Table 3.3-1. N_2O emission factor is from 40 CFR 98, Subpart C, Table C-2. Global warming potential (GWP) for CH_4 is 25 and N_2O is 298 for estimating CO_2e emissions (40 CFR 98, Subpart A, Table A-1).

Table C-13a. Biomass Rotary Dryer Abort Parameters

Parameter	Value	Units
Max Hourly Throughput	68.3	ODT/hr
Maximum Heat Input[1]	187.7	MMBtu/hr
Wood and Wood Residuals Heating Value[2]	17.48	MMBtu/ODT
Maximum Annual Operation	50	hr/yr

[1] Dryer abort heat input is assumed to be 100% of the maximum heat input for the unit.

[2] Wood and wood residuals heating value provided in 40 CFR Appendix Table C-1 to Subpart C of Part 98.

Table C-13b. Biomass Rotary Dryer Abort Potential Emissions - Criteria Pollutants

Pollutant	Maximum Hourly Emissions[1] (lb/hr)	Potential Annual Emissions (tpy)
PM	100.00	2.50
PM_{10}	100.00	2.50
$PM_{2.5}$	100.00	2.50
SO_2 [2]	4.69	0.12
NO_X	52.00	1.30
VOC	300.00	7.50
CO	42.00	1.05

[1] Hourly emission rates from the RTO stack are obtained from vendor guarantees provided by TSI on September 9th, 2022. Uncontrolled emissions for PM and VOC are backcalculated using the control efficiencies of the WESP and RTO provided by TSI.

WESP PM control efficiency:	95%
RTO VOC control efficiency:	95%

[2] SO_2 emissions estimated using AP-42 Table 1.6-2 for Wood Residue Combustion. Emission factor is given in lb/MMBtu and converted to lbs/hr using the maximum heat input of the furnace.

Table C-13c. Biomass Rotary Dryer Abort Potential Emissions - GHG

Fuel	Wood Drying CO_2 Emission Factor [1] (lb/ODT)	CO_2 Emissions (tpy)
Wood & wood residuals	720	1,230

[1] Wood drying emission factors for CO_2 are from AP-42 Table 10.6.1-2.

Table C-13d. Biomass Rotary Dryer Abort Potential Emissions - HAP/TAP

Pollutant	CAS #	HAP?	TAP?	Biomass Combustion Emission Factor[1] (lb/MMBtu)	ABE Stack Test Factors[2] (lb/ODT)	Maximum Hourly Emissions (lb/hr)	Potential Annual Emissions (tpy)

[1] Emission factors for biomass (wood residue) combustion are uncontrolled and from AP-42, Section 1.6 (Wood Residue Combustion), Tables 1.6-3 and 1.6-4. Pollutants with an emission factor rating of C, D, or E are not included.

[2] Emission factors obtained from Drax ABE facility in Gloster, MS stack testing. Maximum emission factors in lbs/ODT from 2018 and 2021 stack testing. A 25% safety factor has been included for conservatism. Uncontrolled TAP emissions in the form of VOC are backcalculated using the control efficiencies of the RTO provided by TSI.

Control efficiency is provided by LDX Solutions for VOC compounds as: 95%

[3] Dioxin and furan emissions apply a toxic equivalency (TEQ) factor obtained from the 72 FR 26545 in accordance with the 1998 TAP rule WAC 173-460-050(4)(b) adopted by SWCAA. Emissions shown in this table are expressed as an equivalent emissions of 2,3,7,8 TCDD. https://www.govinfo.gov/content/pkg/FR-2007-05-10/pdf/E7-9015.pdf

Octachlorodibenzo-p-dioxins TEQ: 0.0003
Pentachlorodibenzo-p-dioxins TEQ: 1

[4] Because the emission factor for "Chromium, Total" has an "A" rating and it is likely that a portion is in the form of hexavalent chromium, it conservative to use the emission factor for "Chromium, Hexavalent" even though it has a "C" rating.

Table C-14a. Biomass Furnace Abort Parameters

Parameter	Value	Units
Maximum Heat Input[1]	187.7	MMBtu/hr
Maximum Annual Operation	360	hr/yr

[1] Furnace abort heat input is assumed to be 100% of the maximum heat input for the unit.

Table C-14b. Biomass Furnace Abort Potential Emissions - Criteria Pollutants

Pollutant	Emission Factors[1] (lb/MMBtu)	Maximum Hourly Emissions (lb/hr)	Potential Annual Emissions (tpy)
CO	0.60	112.62	20.27

Dryer Vendor Guarantee Letter

Drax September 9th, 2022
Monticello, Washington State

RE: Dryer Island Equipment Emissions

Drax will build a Pellet Plant located in Monticello, Washington State. The Pellet Plant will require a Dryer Island to dry wet-woody-biomass. The TSI Dryer Island consists of four (4) major pieces of equipment:

1) The Heat Energy System that burns wet-woody-biomass to generate heat for the Dryer System for the purpose of evaporating water from the wet-woody-biomass
    a. During the combustion process the Heat Energy System will generate primarily 'fuel-bound' NOx; fuel-bound NOx is generated from nitrogen that is present in the fuel itself
    b. The Heat Energy System will not generate much thermal NOx; thermal NOx is generated when heat within the system exceeds 2100°F and nitrogen from combustion air itself starts to turn into NOx
        i. The Heat Energy System will not exceed 1850°F operating temperature and thus generating thermal NOx to any meaningful levels will not occur
    c. A Heat Energy System that does not generate thermal NOx is considered a low-NOx Burner, since only NOx generated is from the fuel itself, which is inevitable; the only possible control a Burner has to control NOx is to control amount of thermal NOx
2) Before the Dryer Island can be started and run the WESP & the RTO must be available
    a. Therefore, the WESP & the RTO are always running when Dryer Island is starting up and flue gasses from the Dryer Island are cleaned from Particulate and VOCs prior to being exhausted to atmosphere
3) During shutdown of the Dryer Island the WESP and the RTO are running and still cleaning the flue gas from the Particulate and the VOCs prior to being exhausted to atmosphere
4) If during Dryer Island operations there is an upset operating condition the system will abort gasses to atmosphere via the Furnace Abort Stack and the Dryer System Abort Stack
    a. During this time feed to the Furnace and the Dryer System is stopped; therefore, the Furnace combustion is aborted and the Dryer System operations are slowly brought to a stop by aborting material to the Fire Dump

PROJECT REQUIREMENTS

- **Site Information**
  - Location: Washington State
  - Maximum Ambient Temperature (°F): 120
  - Minimum Ambient Temperature (°F): 20
  - Design based on Average Ambient Temperature (°F): 60
  - Site elevation above sea level: ≤50 feet

- **Dryer Island Design Conditions**
  - Incoming Biomass Moisture Content wet-weight-basis: ≤50.0%
  - Finished Biomass Moisture Content wet-weight-basis: 6.0%
    - 90% within ±1.0% of the target range
    - 95% within ±2.0% of the target range
    - 98% within ±3.0% of the target range
    - Below is a pie-chart representation of finished biomass moisture content characteristics

  -
  -
  - Wet-Woody-Biomass: 80% sawdust/shavings with up to 20% chips
    - Chips characteristics:
      - 100% will pass ¾" square mesh screen
  - Chip Density: 18 to 22 lbs/cuft (wet)
    - TSI estimates this density; density to be verified prior to project start and if needed a price adjustment will be made
    - Prior to order the Buyer needs to supply TSI with a 5-gallon sample for laboratory testing to be performed by TSI
  - Fuel Density: 12 to 22 lbs/cuft (OD)
    - TSI estimates this density; density to be verified prior to project start and if needed a price adjustment will be made
    - Prior to order the Buyer needs to supply TSI with a 5-gallon sample

for laboratory testing to be performed by TSI

- Fuel Moisture Content wet weight-basis: 40% to 50%
- Fuel Higher Heating Value: 7,800 Btu/lb to 8,600 Btu/lb
- Fuel required sizing:
    - 100% <6"
    - 90% <4"
    - 70% >2"
    - 25% <1"
    - 15% <1/2"
- Species: 100% Softwoods, 100% Hardwoods, and any mix in-between
- RTO Gas Pressure required (psig): 20 to 40
    - Minimum 15 psig at full flow

- **Regenerative Catalytic Oxidizer (RCO) Design Conditions**
    - There are two (2) options offered:
        - ≤120,000 ACFM
            - VOC (lbs/hr): 260
        - ≤76,500 ACFM
            - VOC (lbs/hr): 220
    - Temperature (°F): 120
    - Particulate (mg/Nm3): ≤115
    - Humidity (% by volume): ≥5
    - RCO Gas Pressure required (psig): 20 to 40
        - Minimum 15 psig at full flow

Client: Drax **Location: Monticello, WA**

EQUIPMENT SPECIFICATION – DRYER ISLAND

- **Heat Energy System**
  - Quantity: One (1)
  - Size: **80m2 Grate**
  - Fuel Moisture (wet-weight-basis): 35% minimum to 55% maximum
  - Number of Combustion Chambers: Two (2) - primary & secondary
  - Number of Wet-Ash Conveyors: Two (2)
  - Metering Bin capacity: Twenty (20) minutes
  - Abort Stack: included
  - Control Devices: Included
  - Deluge Nozzles: Included
  - Drives: Direct-coupled
  - Structural Steel support & access: Included
  - Structural Steel support & access finish: Painted
  - Scope of supply start: Metering Bin
    - Buyer responsible for feeding fuel into the Metering Bin
  - Scope of supply end: Wet Ash Conveyor discharge
    - Buyer responsible for supplying ash bin

- **Dryer System**
  - Quantity: One (1)
  - Dryer Drum Size: **Ø23' by 100' long** (nominal)
    - The Dryer Drum comprises nine (9) 10' long sections that are bolted together
    - Inlet to Outlet Seal nominal length is 100'
  - Hot Gas Isolation Gate: Included
  - Blending Duct Isolation Gate: Included
  - Metering Bin capacity: Forty-five (45) minutes
  - Infeed Airlock type: Feeder type (knife tipped)
  - Cyclone Airlock type: Feeder type (knife tipped)
  - Quantity of Cyclones: Two (2)
  - Cyclone Construction: ½" thick T1 for body/cone & 3/16" thick for hood
  - Quantity of Cyclone Airlocks: two (2)
  - Ductwork Expansion Joints: corrugated Stainless-Steel
  - Double-Ductwork: Included
    - Primary Double-Duct Heat Source: Air-Air Heat Exchanger
    - Backup Double-Duct Heat Source: Electrical Heater
  - ID Fan: 900 RPM
    - 900 RPM ID Fan provides for lower noise and is less susceptible to vibrations
    - Lower wear and maintenance
    - Materials of construction: Stainless-Steel for housing with Carbon-Steel external stiffeners; Carbon-Steel for shaft & wheel
  - ID Fan Expansion Joints: corrugated Stainless-Steel
  - Abort Stack: Included
  - Control Devices: Included
  - Explosion Panels: Included (NFPA certified)
  - Deluge Nozzles: Included

- Drives: Direct-coupled
- Structural Steel support & access: Included
- Structural Steel support & access finish: Painted
- Scope of supply start: Metering Bin
    - Buyer responsible for feeding chips into the Metering Bin
- Scope of supply end: Collection Screw
    - Buyer responsible for receiving dried chips from the Collection Screw

- **WESP**
    - Quantity: One (1)
    - Number of Ø10" tubes: **936**
    - Number of Fields: Four (4)
    - Centrifuge: included
    - Control Devices: Included
    - Drives: Direct-coupled
    - Structural Steel support & access: Included
    - Structural Steel support & access finish: Painted
    - Scope of supply start: Quench-Duct
        - Quench-Duct connects to the Dryer System's Abort Stack
    - Scope of supply end: Centrifuge
        - Buyer responsible for receiving 'sludge' from the Centrifuge

- **RTO**
    - Quantity: One (1)
    - Four (4) CAN RTO
        - **Each CAN measures 11' wide by 34' long by 8' tall**
    - Number of Combustion Chambers: Two (2)
    - Heat Recovery Media and Internal Refractory quantities (total ft3):
        - Saddle Lexco: 1,320
        - Corpac (Flexo type-28): 2,640
        - Monolith LA10-32: 2,640
        - Monolith NT40: 2,640
        - Internal Refractory: 6,200
    - Projected Gas Consumption: 8.8 mmBTU/hr
        - Projected gas consumption is based on following emissions entering the RTO:
            - VOC (lbs/hr): ≥350
            - CO (lbs/hr): ≥100
            - HAPs (lbs/hr): ≥100
            - Condensable PM (lbs/hr): ≥200
    - FD Fan: 900 RPM
        - 900 RPM ID Fan provides for lower noise and is less susceptible to vibrations
        - Lower wear and maintenance
        - Stainless-Steel construction
    - Control Devices: Included
    - Drives: Direct-coupled
    - Structural Steel support & access: Included
    - Structural Steel support & access finish: Painted

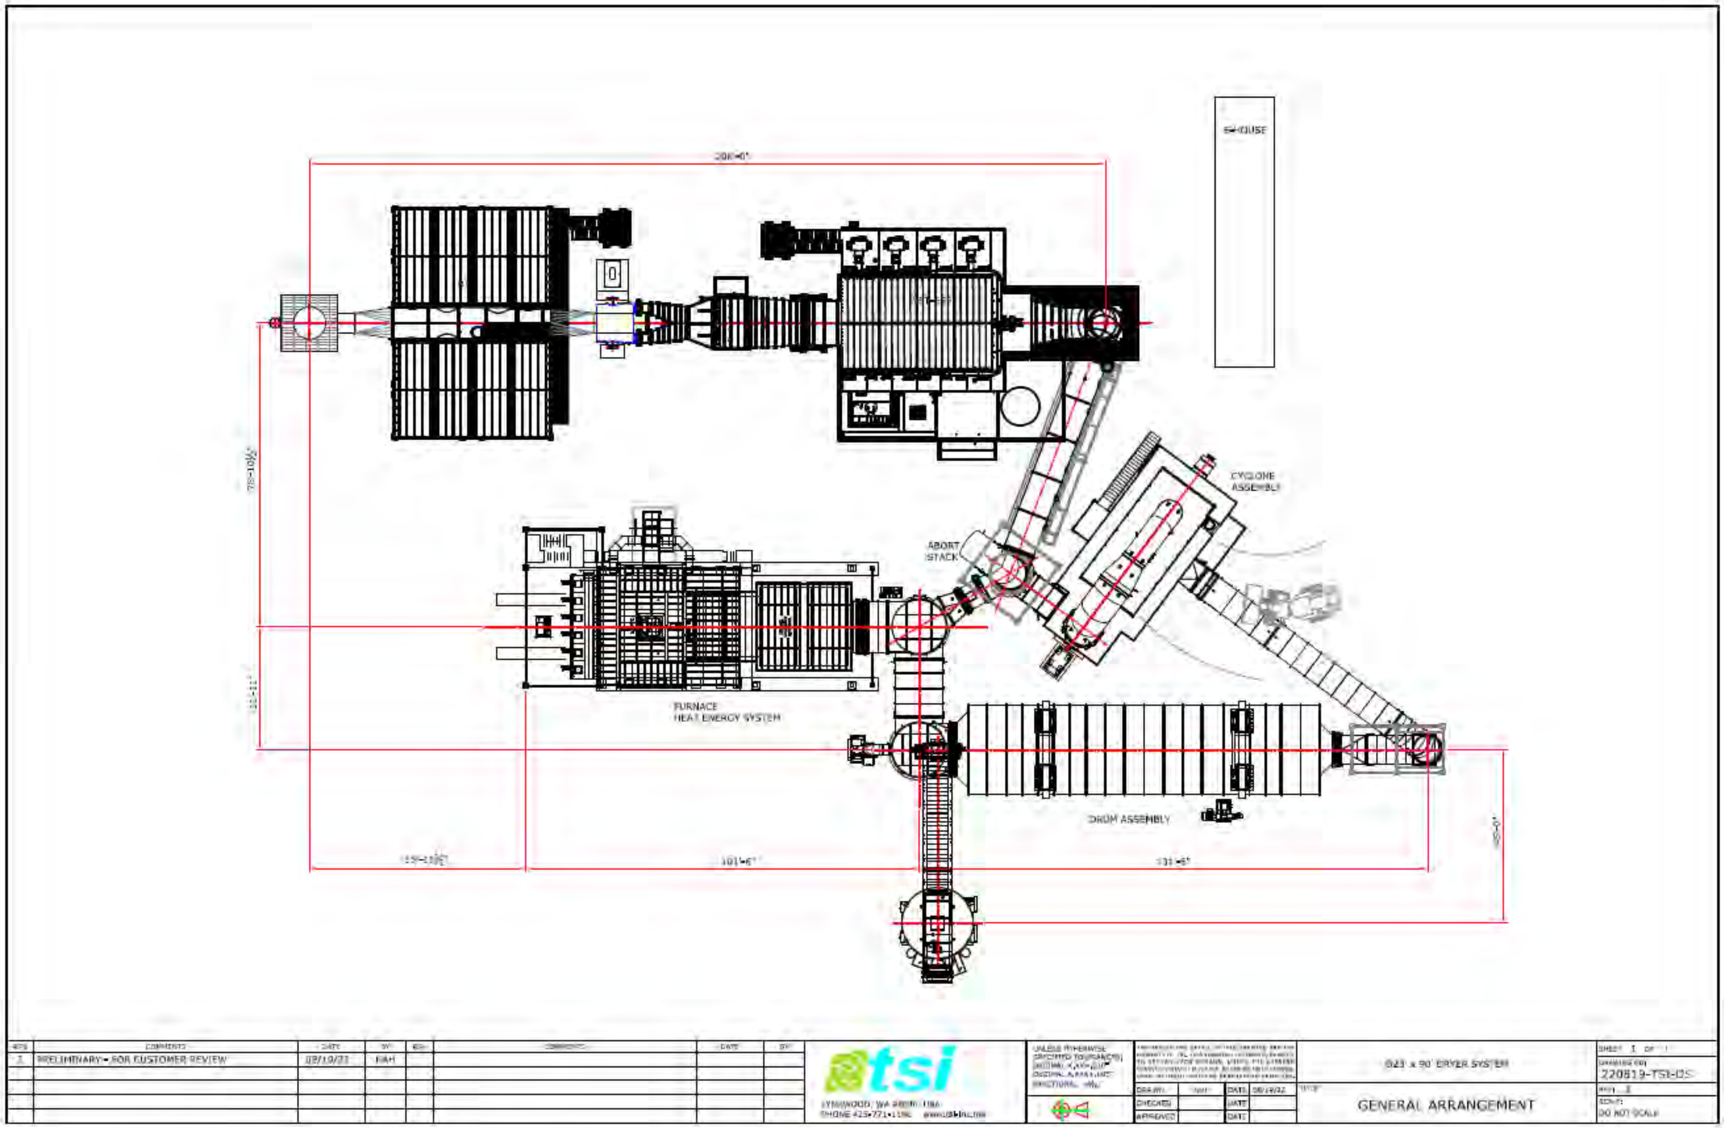
- Scope of supply start: Mist Eliminator Chamber
    - WESP discharge duct connects to the Mist Eliminator Chamber
- Scope of supply end: Exhaust Stack
    - Flue gas is exhausted to atmosphere via the Exhaust Stack
    - Height (ft): sixty (60)
    - Diameter (in): 90

EQUIPMENT SPECIFICATION – 120,000 ACFM RCO

- Four (4) CAN RCO
- **Each CAN measures 11’ wide by 26’ long by 8’ tall**
- Number of Combustion Chambers: Two (2)
- Heat Recovery Media and Internal Refractory quantities (total ft3):
  - Saddle Lexco: 1,000
  - Corpac (Flexo type-28): 2,000
  - Monolith LA10-32: 2,000
  - Monolith NT40: 2,000
  - Catalyst (6x6x4 blocks): 4,200
  - Internal Refractory: 5,400
- Projected Gas Consumption: 2.2 mmBTU/hr
  - Projected gas consumption is based on the following emissions entering the RTO:
    - VOC (lbs/hr): ≥260
    - Condensable PM (mg/Nm3): ≥115
- FD Fan: 900 RPM
  - 900 RPM ID Fan provides for lower noise and is less susceptible to vibrations
  - Lower wear and maintenance
  - Stainless-Steel construction
- Control Devices: Included
- Drives: Direct-coupled
- Structural Steel support & access: Included
- Structural Steel support & access finish: Painted
- Scope of supply start: Quench-Duct
  - Buyer responsible to connect Pelletizing Island flue gas to the Quench-Duct
  - Quench-Duct total length included (ft): 50
- Scope of supply end: Exhaust Stack
  - Flue gas is exhausted to atmosphere via the Exhaust Stack
  - Height (ft): sixty (60)
  - Diameter (in): 72

EQUIPMENT SPECIFICATION – 76,500 ACFM RCO (option)

- Two (2) CAN RCO
- **Each CAN measures 11' wide by 33' long by 8' tall**
- Number of Combustion Chambers: One (1)
- Heat Recovery Media and Internal Refractory quantities (total ft3):
    - Saddle Lexco: 640
    - Corpac (Flexo type-28): 1,280
    - Monolith LA10-32: 1,280
    - Monolith NT40: 1,280
    - Catalyst (6x6x4 blocks): 2,688
    - Internal Refractory: 3,200
- Projected Gas Consumption: 0.7 mmBTU/hr
    - Projected gas consumption is based on the following emissions entering the RTO:
        - VOC (lbs/hr): ≥220
        - Condensable PM (mg/Nm3): ≥115
- FD Fan: 900 RPM
    - 900 RPM ID Fan provides for lower noise and is less susceptible to vibrations
    - Lower wear and maintenance
    - Stainless-Steel construction
- Control Devices: Included
- Drives: Direct-coupled
- Scope of supply start: Quench-Duct
    - Buyer responsible to connect Pelletizing Island flue gas to the Quench-Duct
    - Quench-Duct total length included (ft): 50
- Scope of supply end: Exhaust Stack
    - Flue gas is exhausted to atmosphere via the Exhaust Stack
    - Height (ft): sixty (60)
    - Diameter (in): 60



DRYER ISLAND PRELIMINARY LAYOUT

EMISSIONS

- **Dryer Island**
  - Total Particulate (PM) (lbs/hr): ≤15 lbs/hr
  - Volatile Organic Compounds (VOC) (lbs/hr): ≤15 lbs/hr
  - Carbon Monoxide (CO) (lbs/hr): ≤42 lbs/hr
  - Nitrogen Oxide (NOx) (lbs/hr): ≤52 lbs/hr

- **RCO – 120,000 ACFM**
  - Total Particulate (PM) (lbs/hr): ≤14 lbs/hr
  - Volatile Organic Compounds (VOC) (lbs/hr): ≤13 lbs/hr or ≥95% destruction efficiency
  - Carbon Monoxide (CO) (lbs/hr): ≤14 lbs/hr
  - Nitrogen Oxide (NOx) (lbs/hr): ≤5 lbs/hr

- **RCO – 76,500 ACFM** (option instead of the 120,000 ACFM RCO)
  - Total Particulate (PM) (lbs/hr): ≤11 lbs/hr
  - Volatile Organic Compounds (VOC) (lbs/hr): ≤11 lbs/hr or ≥95% destruction efficiency
  - Carbon Monoxide (CO) (lbs/hr): ≤12 lbs/hr
  - Nitrogen Oxide (NOx) (lbs/hr): ≤4 lbs/hr

Notes:

- *Show above are projected emissions from the Dryer Island RTO Exhaust Stack*
- *Emissions measured via USEPA approved testing methods; emissions based on above noted design criteria & guaranteed production rates*
- *NOx emissions for Dryer Island are based on fuel nitrogen level at 0.22% bone dry basis*
  - *Higher nitrogen content within fuel will result in higher NOx emissions*

PROPOSAL SUMMARY

This Proposal is for a complete Dryer Island. The Dryer Island consists of one (1) Heat Energy System, one (1) Dyer System, one (1) Wet Electrostatic Precipitator (WESP), and one (1) Regenerative Thermal Oxidizer (RTO).

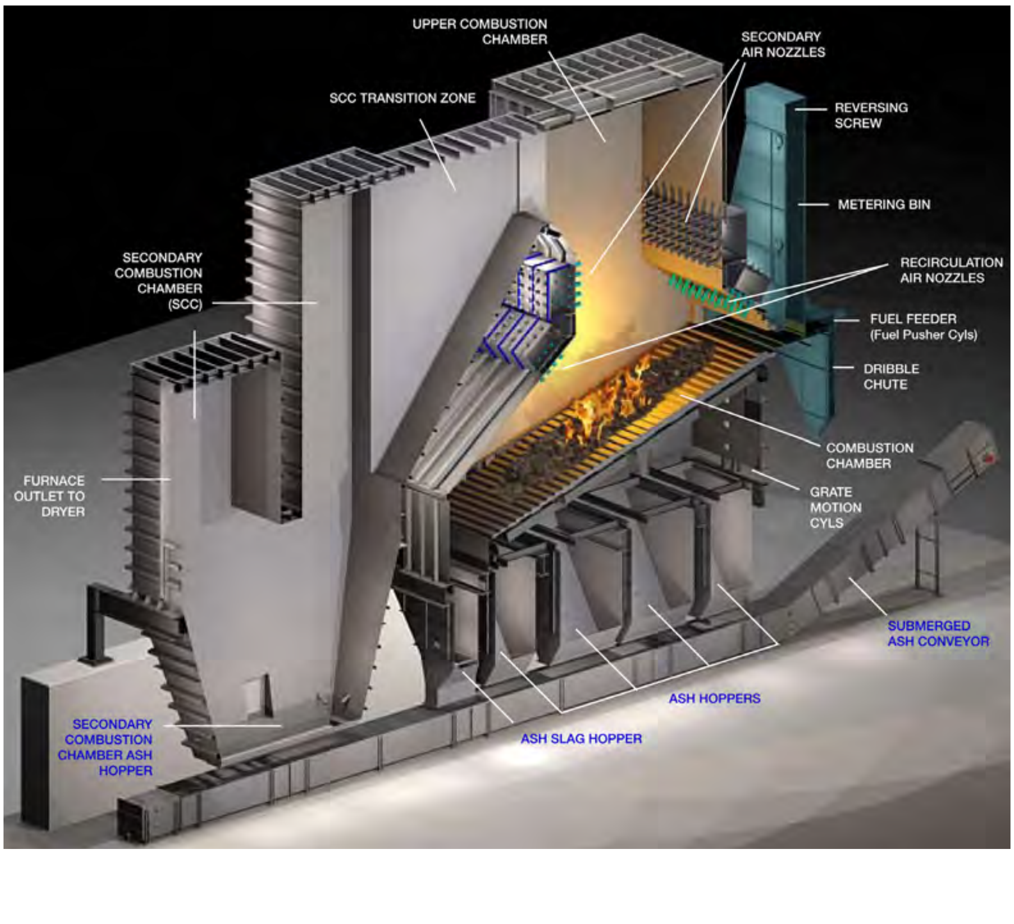
This Proposal also offers a Regenerative Catalytic Oxidizer (RCO) with a Disengagement Chamber located ahead of the RCO. The RCO treats flue gas from the Buyer's Pelletizing Island.

The following pages describe the purpose and operations of each unit.

Heat Energy System

The Heat Energy System receives wet fuel (bark or chips), combusts that fuel in an efficient manner, and delivers products of combustion to the Dryer System for purpose of drying wet-woody-biomass.

TSI Heat Energy System mechanical scope of supply begins immediately after the Buyer's fuel infeed conveyor to the Metering Bin. The bottom of the Metering Bin has hydraulic ram pushers that push fuel one the reciprocating grates, which are housed within the Primary Combustion Chamber. There are 4-zones of moving reciprocating grates. The 1st zone dries fuel to point of combustion; the 2nd and 3rd zones begin combustion; the 4th zone oscillates slowest to burn off most of the carbon before inorganics like ash and slag are discharged into the Wet Ash Conveyor. The Wet Ash Conveyor is sub-merged in water and provides an affective airlock that prevents ambient air leaking into the Heat Energy System. The Wet Ash Conveyor conveys ash and slag to a bin or bunker, provided by the Buyer, that is accessible via mobile equipment for periodic removal from the plant site. There are two combustion fans: the Primary Fan starts combustion and prevents grates from over-heating, while Secondary Fan completes combustion process in the Upper Combustion Chamber. Hot gas from the Upper Combustion Chamber enters the Secondary Combustion Chamber designed with a downward U-turn that will remove significant amount of fly ash and sparks from the gas stream prior to entry into the Dryer System. An Emergency Stack, which vents gases during upset conditions to atmosphere, is located on top of the Upper Combustion Chamber. The Combustion Chambers are lined with refractory and insulation materials.



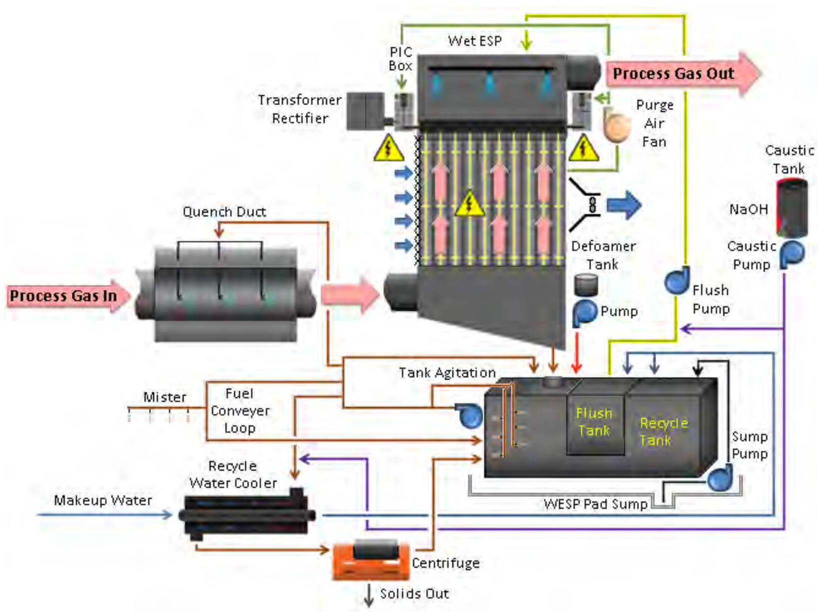
Dryer System

The Dryer System dries wet-woody-biomass to the moisture content required by the Buyer. TSI Dryer System mechanical scope of supply begins immediately after the Buyer's infeed to the Metering Bin. The Metering Bin stores and meters wet-material into the Dryer Drum via Infeed Airlock and Inlet Fitting. Hot Gas Ductwork connects the Heat Energy System to the Dryer System. Within the Hot Gas Ductwork are the Hot Gas Isolation Gate, the Dilution Bustle, and the Inlet Fitting. The Hot Gas Ductwork is lined with refractory and insulation materials. The Inlet Fitting processes mixed gas from the Dilution Bustle and the wet-woody-biomass into the Dryer Drum. The Dryer Drum is a 'convection-type' single-pass unit that is responsible for distributing and classifying each biomass particle to allow for its efficient drying. This is accomplished with utilization of a complex 'flighting system' within the Dryer Drum that has been perfected to an advanced stage. The Dryer Drum dries wet-woody-biomass to the required moisture content and exhausts flue-gas and dried biomass into the Material Duct. As dried biomass exits the Dryer Drum it is pneumatically conveyed via the Material Duct into the High Efficiency Cyclone(s). The High Efficiency Cyclone(s) removes dried biomass from the flue-gas stream, discharges dried biomass into Cyclone Airlock(s), and exhausts flue-gas stream out the top and into the Gas Duct towards the Induced Draft Fan (ID Fan). Dried biomass from the Cyclone Airlock(s) is received by the Collection Screw, which under normal operating conditions conveys dried biomass to the Buyer; during upset operating conditions the Collection Screw reverses direction and dumps material into the Buyer's Fire Dump. The ID Fan flow is controlled by a Variable Frequency Drive, which is governed by the pressure differential reading across the High Efficiency Cyclone(s). The temperature control at the outlet of the Drum is controlled by the Dilution Damper and this control loop ensures proper moisture content of the biomass. TSI Dryer Systems are equipped with advanced spark detects, temperature elements, and strategically positioned water deluge nozzles to enable water delivery throughout the system with and without the ID Fan running.

Wet Electrostatic Precipitator

The Wet Electrostatic Precipitator (WESP) removes particulate from the gas stream before the gas stream enters the Regenerative Thermal Oxidizer (RTO). There are two (2) types of particulates: the filterable ('front-half') particulate and condensable ('back-half') particulate. The WESP will remove ≥95% of the front-half particulate as well as any back-half particulate that condenses from the gas stream and into a water particle at temperature of 160°F to 180°F. Back-half particulate that doesn't condense will pass thru the WESP and burn-off within the RTO's combustion chamber.

Dryer flue-gas enters the WESP through the Quench-Duct, which includes recirculated water sprays that saturate the gas stream and condense some of the vaporous particulate. It also serves as a pre-filter by scrubbing out larger particulate and fiber carryover. The gas stream enters the bottom of the WESP through a common plenum and travels upward into parallel tube bundles. Each tube bundle is an array of Stainless-Steel collection tubes that have high voltage discharge electrodes suspended within them. The electrodes have a series of discs that create an intense electric field (Corona) when high voltage is applied. As the gas stream passes between the collection tubes and the discharge electrode, the suspended particles become negatively charged and are driven towards the grounded collection tube (precipitation). Each tube bundle is periodically and independently flushed with a dilute caustic solution to remove the particulate from the collection tube wall. The spent flush water flows by gravity into the recycle system via the recycle tank located underneath the WESP. This serves to make up the majority of the water that is evaporated in the quench duct. A portion of the recycle water is processed through a centrifuge to remove suspended solids. The solids are collected in a tote (by Buyer) for disposal (this is a non-toxic discharge that can be sent to a regular land fill). The collection tube walls stay wet, which aids in the cleaning process, by drawing ambient air across the exterior surface with small fans. This air cools the collection tubes and promotes condensation from the saturated gas stream on the inner surface. This condensation makes up the remainder of the balance of water evaporated in the quench duct. As the cleaned gas exits the tube bundle it passes through the electrode suspension grid into a common plenum and is then ducted down to grade level where it is directed to the RTO. The electrode grid is charged by a high voltage transformer rectifier and is suspended at external insulator boxes. The insulator boxes are purged using warm air from the tube bundle cooling air, thus keep the insulator dry and improving overall performance.



Regenerative Thermal Oxidizer

The Regenerative Thermal Oxidizer (RTO) receives particulate cleansed flue-gas from the WESP and combusts the uncondensed back-half Particulate (BHP), Volatile Organic Compounds (VOCs), Hazardous Air Pollutants (HAPs), and Carbon Monoxide (CO).

Cleansed flue-gas from the WESP first passes through the Mist Eliminator Chamber, which removes free water droplets. The flue-gas is then routed through a common duct manifold and into two of four Diverter Valves. The Diverter Valves enable the system to regularly reverse gas flow, which in combination with the heat recovery Media, provides an affective energy saving system. Flue-gas exits the inlet Diverter Valves and travels upward into the Hoppers. The Hoppers distribute gas into the inlet Heat Recovery Chambers, which contain Ceramic Media. This Media, which was heated from discharge gasses during the previous valve cycle, preheat flue-gas to approximately 1400^{o}F before the flue-gas enters the Combustion Chamber. The Combustion Chamber is maintained at a temperature of 1500°F by a Gas Burner. Within the Combustion Chamber hydrocarbons are converted to CO_2 and H_2O. Flue-gas exits through opposing heat recovery chambers, where the Media now acts as a heat sink and absorbs the thermal energy, cooling it to within 75°F to 100°F of the RTO inlet temperature, before discharging flue-gas into the Exhaust Stack. The Ceramic Media comes in a variety of types and specific selection depends on the application. The Diverter Valves continually reverse airflow based on a pre-programmed timer. By reversing the flow, the inlet chambers become the outlet chambers and vice versa. The chambers that have been heated by the exhausting flue-gas become a pre-heating media for the incoming flue-gas; while the chambers that have just been cooled by the incoming flue-gas can again be reheated by the exhausting gas. This heat recovery cycle makes the RTO ≥95% thermally efficient. Flue-gas is pushed through the RTO by a Forced Draft Fan (FD Fan) located between the Mist Eliminator Chamber and the RTO.

Regenerative Catalytic Oxidizer

The Regenerative Catalytic Oxidizer (RCO) receives flue gas from the Buyer's Pelletizing Island, which is laden with Volatile Organic Compounds (VOCs) and Particulate Matter (PM), combusts the VOCs and PM and exhausts cleansed gas stream to the atmosphere via the Exhaust Stack.

The Buyer's Pelletizing Island flue gas enters the Quench Duct where a series of water nozzles sprays the gas stream with recycled water, thus reducing dust emissions entering the Disengagement Chamber upstream of the RCO. The Disengagement Chamber removes ≥90% of the water droplets and particulate 60 micron and larger. The water is collected in a recycle tank at Disengagement Chamber bottom, from where it is pumped back to the Quench Duct. A slip stream of about 50 GPM is diverted to a centrifuge for particulate removal. Cleansed flue-gas from the Disengagement Chamber is routed through a common duct manifold and into two of four Diverter Valves. The Diverter Valves enable the system to regularly reverse gas flow, which in combination with the heat recovery Media, provides an affective energy saving system. Flue-gas exits the inlet Diverter Valves and travels upward into the Hoppers. The Hoppers distribute gas into the inlet Heat Recovery Chambers, which contain Ceramic Media. This Media, which was heated from discharge gasses during the previous valve cycle, preheat flue-gas to approximately 800ºF before the flue-gas enters the Burner Chamber. The Burner Chamber is maintained at a temperature of 850°F by a Gas Burner. Within the Catalytic Media itself is where the hydrocarbons are converted to CO_2 and H_2O. Flue-gas exits through opposing heat recovery chambers, where the Media now acts as a heat sink and absorbs the thermal energy, cooling it to within 35°F to 50°F of the RCO inlet temperature, before discharging flue-gas into the Exhaust Stack. The Ceramic Media comes in a variety of types and specific selection depends on the application. The Diverter Valves continually reverse airflow based on a pre-programmed timer. By reversing the flow, the inlet chambers become the outlet chambers and vice versa. The chambers that have been heated by the exhausting flue-gas become a pre-heating media for the incoming flue-gas; while the chambers that have just been cooled by the incoming flue-gas can again be reheated by the exhausting gas. This heat recovery cycle makes the RCO ≥95% thermally efficient. Flue-gas is pushed through the RCO by a Forced Draft Fan (FD Fan) located between the Disengagement Chamber and the RCO.

ITEM 01ENGINEERING

TSI engineers will work closely with the Buyer's engineer to properly lay-out the equipment, and to ensure proper interface with the Buyer's equipment upstream & downstream of the Dryer Island. As part of the Engineering package the Buyer will receive the following documents:

- Layouts
  - Plan view
  - Elevation views
- Foundation Load Drawings
- Motor List
- Device List
- Motor Location Drawings
- Device Location Drawings
- Fire Detection & Suppression Drawings
- Instrument Air Requirements
- PID Drawings
- Functional Description

ITEM 02 HEAT ENERGY SYSTEM

Shown below and on following pages are some of the major individual components that make up the Heat Energy System.

Flop Gate

The Flop Gate isolates fuel infeed equipment, like the conveyors, from the potential Furnace back-fires. The Flop Gate also eliminates air leakage into the Furnace during normal and upset operating conditions. The Flop Gate is located on top of the Metering Bin and it only opens when the Metering Bin fuel level reaches low level sensor. The Flop Gate blocks air (oxygen) from getting inside the Metering Bin during fuel feed upsets or when shutting down a Furnace which contributes to fires. It is operated pneumatically via pneumatic cylinders.

Flop Gate located on top of the Reversing Screw; the Reversing Screw is located on top of the Metering Bin

Reversing Screw

The Reversing Screw is located directly above the Metering Bin and directs fuel to both sides of the Metering Bin, thus ensuring even fuel distribution within the Metering Bin. It provides for even fuel feed onto the reciprocating grates, which is critical to ensuring proper fuel combustion. The Reversing Screw reverses direction based on low level sensors located on both sides at the bottom of the Metering Bin.

Reversing Screw

Metering Bin

The Metering Bin consists of fuel feed pushers that push fuel onto the 1st zone of the reciprocating grates located within the Primary Combustion Chamber. The Metering Bin holds fuel evenly with even density achieved due to the above-mentioned Reversing Screw, thus covering the entire grate area with fuel at a controlled fuel bed level. The complete grate area forms an active drying and combustion area. A double alarm system (level control furnace and level control fuel feeders) warns the Operator in case of interruptions of fuel supply. A gate valve and sprinkler system are installed for prevention of back burning into the Metering Bin.

Metering Bin
(Shown with Reversing Screw & Flop Gate located directly above it)

Reciprocating Grate Combustion Chamber

The Combustion Chamber constructed of a robust steel frame structure with moving and stationary grate frames. Reciprocating grate bars are carried by moving support frames. Stationary grate bars are supported by the structure frame. The reciprocating grate frames and grate bars are supported on ball bearings. There are four (4) zones of moving grates within the Furnace. Grates are fabricated from high heat resistant steel ASTM A297, Grade HD. Grates modulate from 10% to 100% and the Furnace has a 1:4 turndown ratio.

The grate bars are of high heat resistant alloy with cooling fins to prevent overheating; water cooling is not required. The grate bars are overlapping, thus preventing through fall of unburned fuel. A hydraulic power pack with pump operates the fuel feeders and grates.

The primary combustion air enters the fuel bed from the under-fire air zone through slots between the grate bars. The sides of the grate's assembly are cast steel side bars to protect the refractory of the furnace from abrasion by the moving grate bars.

The reciprocating grate bars are activated by hydraulic cylinders. The relative movement between stationary and moving grate bars causes the fuel to continually turn and convey along the grate to enhance the combustion process.

Complete Heat Energy System
(note: some items shown may not reflect actual that are offered within this Proposal)

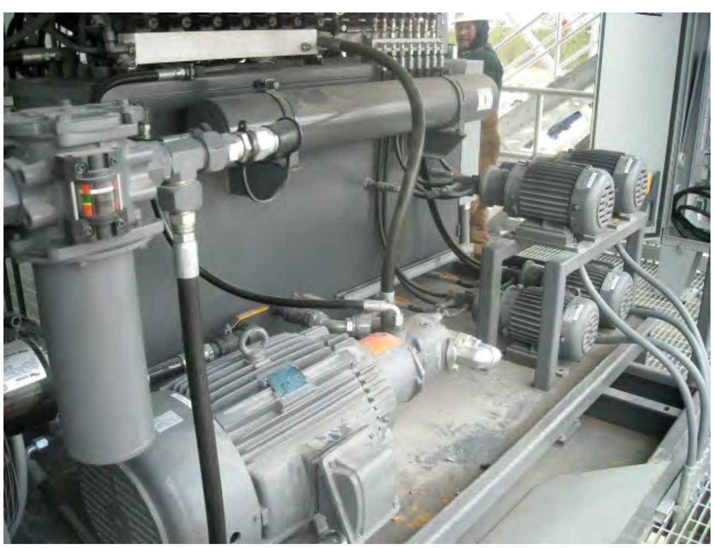
Hydraulic Power Pack

Hydraulics for ram feeder, shut off slide, grate cylinders, and the last grate section. Hydraulic Power Pack unit complete with one high-capacity hydraulic pump, complete with coupling, guard, three 4-way directional solenoid valves, tank trim, all components pre-piped, and mounted on a rigid tank.

Hydraulic Power Pack

Hydraulic Displacement Pumps

Hydraulic Displacement Pumps operate all four (4) grate sections of the Furnace and control the speed of the strokes based on firing rate and controlling the speed of the pumps. Each pump motor requires a variable frequency drive.



Hydraulic Displacement Pumps

Primary Air Fan

Forced draft fan with flanged inlet and outlet, inlet vane control damper, electric actuator with linkage and mounting bracket. The Primary Air Fan provides the primary combustion air into the under-fire air zones. Air is fed from under the grate bars and is controllable in each of the four sections.

Primary Air Fan (Under-fire Air)

Secondary Air Fan

Secondary Air Fan is a forced draft fan with flanged inlet and outlet, inlet vane control damper, electric actuator with linkage and mounting bracket. The Secondary Air Fan feeds the air over the fuel pile for complete combustion of fuel.

Secondary Air Fan (Over-fire Air)

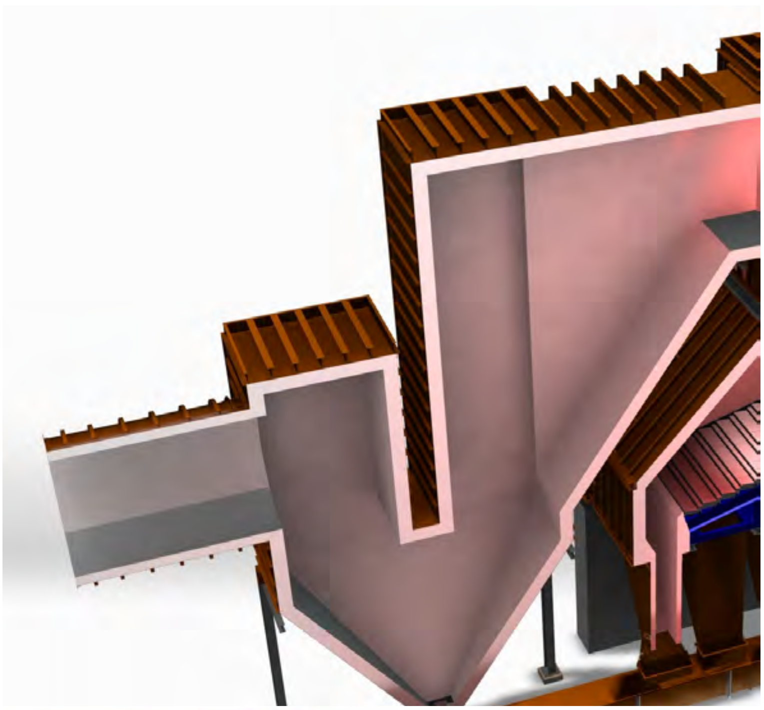
Casing and Combustion Air Ducts

Carbon-Steel construction for the complete chamber with external stiffening beams. Ducting for the Primary and Secondary Air Fans from the fans to the Furnace air boxes and headers.

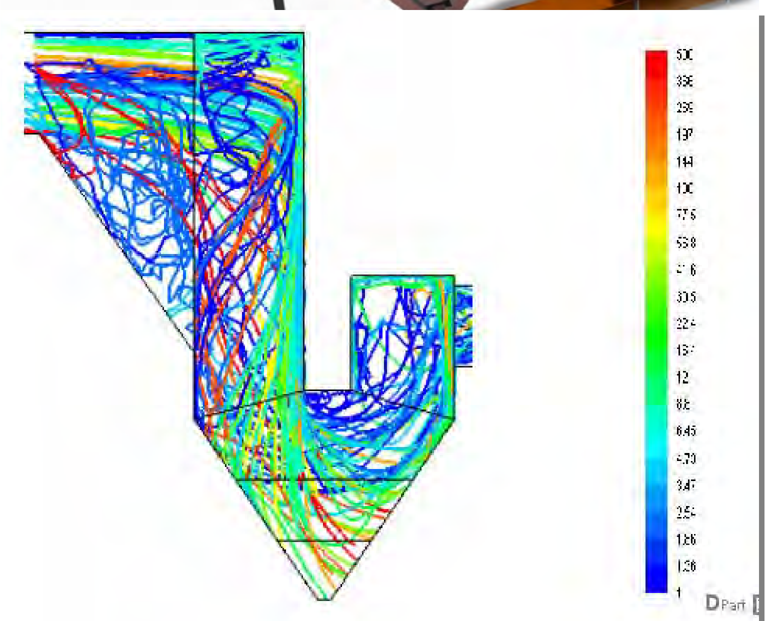
Furnace Ca sing & Combustion Air Ducts

Secondary Combustion Chamber

This chamber provides final combustion of the gases from the Furnace. The chamber also provides for mixing of the furnace gas with the Dryer System flue-gas. After mixing and blending, the gases are discharged to the Dryer ducting. The Chamber is refractory lined and includes a drop out chamber and flue-gas turn around design for maximum removal of fly ash in front of the Dryer. The chamber is designed with the top as a secondary combustion chamber to burn-out the carry over and the bottom as an ash drop-out in order to get clean burned-out gas that can be directly fed into the dryer.



Right: Secondary Combustion Chamber/Ash Dropout Chamber



CFD - Fluid modeling of Ash drop section.

Refractory

Internal refractory block insulation rated to 1900°F. Furnace material is plastic rated to 2700°F. Using low cement materials and installation to be done using shot-crete method. To be blown-in-place on site.

Note: Refractory design by TSI; supply/installation/cure-out offered under Refractory Works option below within this document.

Refractory shown with moving grates

Wet Ash Conveyor

The Wet Ash Conveyor of drag chain design, complete with gearbox and drive, collects ash from underneath the Heat Energy System's reciprocating grate as well as from the Secondary Combustion Chamber's ash drop out chute. The Wet Ash Conveyor is submerged in water and it provides an effective air lock to the Heat Energy System, thus preventing ambient air from infiltrating and making the Heat Energy System less energy efficient.

Typical Wet Ash Conveyor

Abort Stack

Mounted on top of the Furnace and includes a counter-weighted stack cap that is actuated via a pneumatic cylinder. The purpose of the Abort Stack is to open at high temperature and/or high pressure in the system as well as during plant power outages. It is fabricated from Carbon-Steel and refractory-lined for the first five (5) feet above the Furnace roof. The remainder of the stack is fabricated from Stainless-Steel. Stack cap is also refractory lined. During normal operating conditions the Abort Stack is kept closed via the pneumatic actuated damper; during a power outage when pneumatic air isn't available the stack-cap automatically opens due to the counter-weight.

Abort Stack

Video Camera and Monitor

An air-cooled video camera is provided at the rear end of the Furnace with a monitor to allow for visual inspection of the furnace combustion process from the operator Control Room.

Typical Grate fire

Control Devices

The following devices are supplied to control the Heat Energy System via PLC:

- Temperature Control Sensors
- Temperature Transmitters
- Zero Speed Switches
- Pressure Transmitters
- Proximity Switches (Capacitive and Inductive)
- Deluge Nozzles

Structural Steel

Purpose

To provide structural support for the Heat Energy System and to provide personnel access via stairs, ladders, and platforms.

Description

TSI supplies the support structures, stairs, ladders, and platforms from grade level as is typically required by the Heat Energy System. This includes access to areas requiring regular maintenance or monitoring by operating personnel. Stair access is provided to areas requiring maintenance on a daily or weekly basis; longer maintenance intervals will have ladder access. Client will have opportunity during system design to comment on access and add more if needed with an appropriate price adjustment.

Design Details

Assembly: Bolted and welded assembly.
Finish: Painted.

Typical Structural Steel (shown during construction)

ITEM 03 DRYER SYSTEM

Shown below and on following pages are some of the major individual components that make up the Dryer System.

Hot Gas Isolation Gate

Purpose

When activated, to hold back gasses generated by the Heat Energy System from entering the Dryer System, and together with the Blending Duct Isolation Gate, provide safe passage for plant maintenance personnel into the Dryer System.

Operation

The Hot Gas Isolation Gate is bolted between the Heat Energy System and the Blending Bustle. This gate together with the Blending Duct Isolation Gate enables plant personnel to seal off the Dryer System from the Heat Energy System. The Hot Gas Isolation Gate comprises a refractory lined housing assembly and a gate assembly that slides in the housing powered by two hydraulic cylinders. The gate center panel is a corrugated profile to allow for thermal expansion. The clearance between the frame of the gate and its housing is pressurized by a Seal Fan, to prevent leakage of hot gas into the Dryer System when the gate is in place, and thus enable for safe entry of plant personnel into the Dryer System.

Design Details

Materials of construction: Housing assembly is fabricated from Carbon-Steel plate for housing, with structural shapes for reinforcing; gate assembly is constructed from ¼” thick RA-253 reinforced floating structure.

Actuator: Twin hydraulic cylinders powered by a dedicated hydraulic power-pack and mounted external to the housing.

Seals: Seal fan.

Insulation: Two-layer refractory; low density layer with hard refractory face containing about 46% to 50% aluminum oxide.

Note: Refractory design by TSI; supply/installation/cure-out offered under Refractory Works option below within this document.

Blending

Purpose

To control the flow of Dryer System flue-gas back to the Dryer Drum via the Blending Bustle.

Operation

Blending consists of a duct that runs from the discharge of the ID Fan to the Blending Bustle; the Blending Bustle is located between the Hot Gas Isolation Gate and the Inlet Fitting. Within the duct is a Blend Damper that modulates the amount of flue-gas blended back to the Dryer Drum. This control loop modulates to hold the Dryer Drum outlet temperature set point, which determines the moisture content of the biomass exiting the Dryer Drum. The Blend Damper is operated automatically via the PLC Controls. Within the duct is also a Blending Duct Isolation Gate that together with the aforementioned Hot Gas Isolation Gate, when closed, provides safe passage for plant maintenance personnel into the Dryer System.

The Heat Energy System generates hot gas at about 1650°F. This temperature needs to be 'cooled' prior to contacting wet-woody-biomass within the Dryer Drum. One way to cool this temperature is to utilize ambient fresh air, which isn't energy efficient, and can impact significantly the production capacity of the Dryer System during cold weather. The preferred method of cooling the Heat Energy System's hot gas is with the warm humid Dryer System flue-gas.

The Dilution benefits are:

1) Year-round stable operations
2) Better product conditioning as 'warm humid' gas better dries woody biomass
3) Up to 50% lower gas flow and emissions to atmosphere or to the Emission Control Equipment
4) Up to 25% lower fuel consumption by the Heat Energy System

Blending Bustle

Purpose

To accept Blending gas and blend it back into the incoming hot gas stream generated by the Heat Energy System.

Operation

The Drying System is designed to recycle a portion of the spent gas back through the Dryer System. This has several advantages…

- The recycle gas is blended with the Heat Energy Systems hot gas to achieve optimal gas flow thru the Dryer System
- It reduces the overall oxygen level within the Dryer System thus making the system safer
- It increases the humidity of the gas stream thus increasing capacity of the gas to carry heat and facilitates the ability of the gas to transfer heat into the center of the wood chips without flash drying the surface
- It reduces volume of gas exhausted to atmosphere or emission control equipment
- It improves energy efficiency by about 25%

The design of the Blending Bustle is critical to good operation of the Dryer System. The re-entry point for the recycle gas is positioned as far away from the Dryer Drum Inlet as possible, giving the gasses time to mix before contacting wet-woody-biomass within the Dryer Drum. The design includes 'jetted-tubes' to create turbulence and promote gas mixing. By achieving well-blended gas ahead of the Dryer Drum inlet many problems associated with "hot streaks" in the gas can be avoided, thus minimizing emissions, fires, and improving quality of dried biomass.

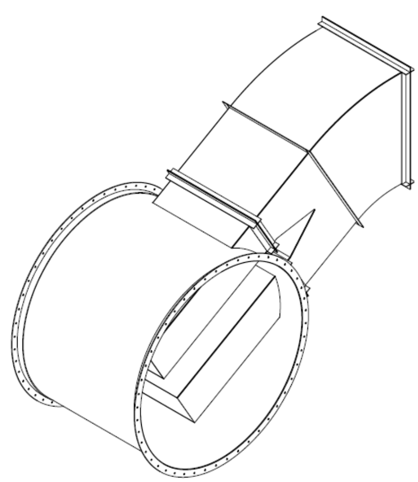
Design Details

Materials of construction for chamber: ¼" thick Carbon-Steel.
Materials of construction for jetted-tubes: ¼" thick 310-Stainless-Steel.
Insulation: Two-layer refractory; low density layer with hard refractory face containing about 40% aluminum oxide.

Note: Refractory design by TSI; supply/installation/cure-out offered under Refractory Works option below within this document.

.

3D view of the recycle duct connecting to the Dilution Bustle; shown within the Dilution Bustle are the 'jetted-tubes' that crate turbulence and promote gas mixing prior to Dryer Drum



Inlet Fitting

Purpose

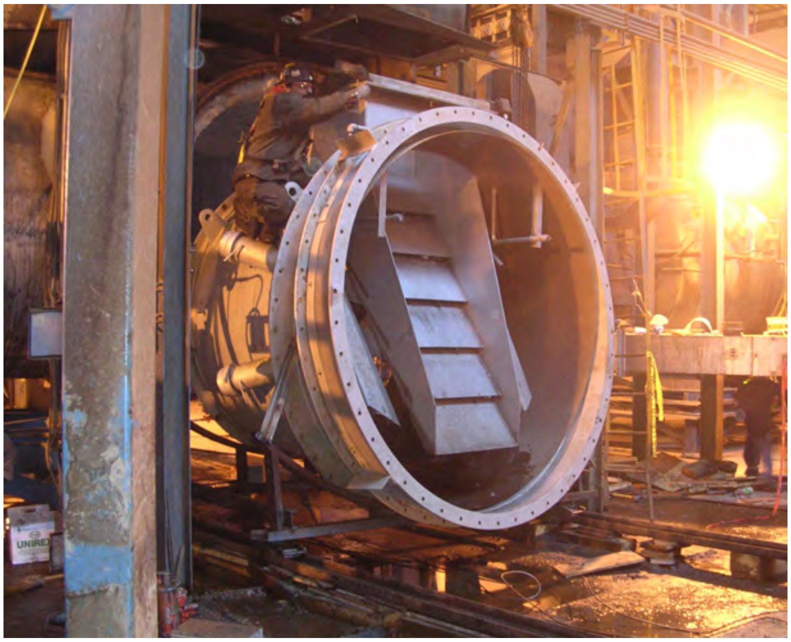
To act as a conduit for the transition of the homogeneous drying gas from the Blending Bustle into the Dryer Drum, and for the introduction of the wet-woody-biomass into the Dryer Drum.

Operation

The Inlet Fitting is a steel duct section with a flange mount for the Infeed Airlock, a louvered chute for the incoming material, tapped ports for injection nozzles, an access door, and a flange mount for the Dryer Drum Inlet Seal. The drying gas passes through the Inlet Fitting into the Dryer Drum. The louvered material chute angles down from the discharge of the Infeed Airlock through the gas stream delivering material into the throat of the Dryer Drum. The drying gas passes through the louvered chute also creating mixing turbulence. There are misting nozzles located within the Inlet Fitting; these provide the Dryer Operator with flexibility to simulate drying load.

Design Details

Materials of construction: ¼" thick Carbon-Steel.
Fittings: For pressure taps, cool-down or artificial load mist nozzles, and deluge nozzles as required by the fire suppression and system control schemes.
Insulation: Two-layer refractory; low density layer with hard refractory face containing about 40% aluminum oxide.
Note: Refractory design by TSI; supply/installation/cure-out offered under Refractory Works option below within this document.



Front view of the Inlet Fitting showing the louvered chute and cool-down nozzles

Purge Fan

Purpose

To purge combustible gas from the Dryer System in order to prevent explosions and fires.

Operation

During a power outage the fuel in the Heat Energy System will continue to smolder, as well as any 'pitch' buildup or biomass that may have accumulated within the Dryer System. This smoldering has the potential to fil up the Dryer System with combustible gas, which upon startup of the system, can cause an explosion due to fresh oxygen that is injected along with sparks coming from the Heat Energy System. To prevent this from occurring, the Purge Fan is connected to the Buyer's Back-up Power Generator and it turns on automatically when the main Dryer System ID Fan is offline. The Purge Fan injects fresh air into the system and purges any combustible gasses from the Dryer System via the Dryer System Abort Stack.

Purge Fan shown at grade level and with connecting duct to the Dryer System's Hot Gas Ductwork

Dilution Duct Isolation Gate

Purpose

To prevent hot gas entering the Dryer System back-wards via the dilution duct.

Operation

The Dilution Duct Isolation Gate is located in the dilution duct just prior to the Dilution Bustle. The Dilution Duct Isolation Gate is in the open position during normal operation. Under upset operating conditions and when the ID Fan stops, the Dilution Duct Isolation Gate will close and prevent hot gas from entering the back end of the Dryer System (the ID Fan, the Abort Stack, Cyclones, etc.). The Dilution Duct Isolation Gate comes equipped with a seal fan. The seal fan will pressurize the gate so hot gas cannot go around the metallic plate that make-up the Dilution Duct Isolation Gate. The seal fan will also purge free the dilution duct of potential for combustible gas buildup.

Design Details

Materials of construction: Housing assembly is fabricated from Carbon-Steel plate for housing, with structural shapes for reinforcing; gate assembly is constructed from ¼" thick Carbon-Steel reinforced floating structure.
Actuator: Twin hydraulic cylinders powered by a dedicated hydraulic power-pack and mounted external to the housing.
Seals: Seal fan.

Dilution Duct Isolation Gate just prior to the Dilution Bustle

Metering Bin

PURPOSE

To receive wet-woody-biomass from the Buyer, store that material, and meter wet material to the Conveyor.

OPERATION

The Metering Bin is located at grade level. The Buyer is responsible for feeding wet-woody-biomass into the Metering Bin; the Buyer is responsible for structurally supporting the Buyer's infeed conveyor due to Metering Bins structural inability to support the said infeed conveyor. The Metering Bin contains augers at bin bottom that are driven by variable frequency drives. These augers feed/meter biomass one the Conveyor. Above the augers is an agitator that distributes biomass evenly across the augers to ensure proper and constant feed.

DESIGN DETAILS

Materials of Construction: 3/16" thick Carbon-Steel for round silo; 304-Stainless-Steel for bottom ten (10) feet of the round silo contacting wet-woody-biomass; 304-Stainless-Steel base plate.

Augers: 3/8" thick 304-Stainless-Steel for housing and flights; 304-Stainless-Steel for pipe.

Rotor Discharge: 304-Stainless

Conveyor

Purpose

To receive wet-woody-biomass from the Metering Bin and convey that wet-woody-biomass into the Infeed Airlock.

Operation

The Conveyor receives wet-woody-biomass from the Metering Bin and conveys that biomass to the Infeed Airlock. The Conveyor is VFD driven and speeds up and slows down based on Metering Bin feed rate.

DESIGN DETAILS

Type: Drag-Chain design.
Drive: Direct coupled electric motor with gear reducer.
Materials of construction: Stainless-Steel for sides and top plate; bottom plate AR400; flights AR400.
Capacity: 300,000 lbs/hr @ 50% moisture content.
Fittings: To receive a speed switch.

Typical Drag-Chain Conveyor

Infeed Airlock

Purpose

To receive wet-woody-biomass from the Conveyor and discharge it onto the louvered chute of the Inlet Fitting.

Operation

The Infeed Airlock comprises a formed machined steel body with a rotating vane. The vane has eight pockets with knife tips. The design loading is based on achieving the optimum balance between minimizing the introduction of ambient air into the system and creating a maximum, non-plugging load in each pocket.

DESIGN DETAILS

Type: Eight-pocket, rotating vane; low-leakage, knife type.
Drive: Direct coupled electric motor with gear reducer.
Materials of construction: Carbon-Steel body with Brass tips.
Fittings: To receive a speed switch that monitors the rotation of the airlock.

Feeder-type Airlock shown installed and operating with direct coupled drive

Dryer Drum

Purpose

To receive wet-woody-biomass and drying gas, expose wet-woody-biomass to the drying gas in an efficient manner, and discharge flue-gas and dried material into the material duct.

Operation

The Dryer Drum consists of three major subassemblies: the drum, the trunnions, and the drive.

The drum is a cylindrical structure formed of rolled mild steel plate, reinforced with structural section channel, tee, and angle ribs, and external bands. The drum rides on two full diameter forged tracks. Drum's interior is a network of lifting flights and baffles, designed to shower material across the drum's cross-section as it rotates and to regulate the forward movement of material through the drum. Around the circumference of the drum are mounted segmented chain teeth sets, on which a roller chain rides. Drum rotation is affected by an electric motor and a gear reducer.

Drum's tires are supported on four trunnion wheels, arranged in opposed pairs at the two track locations. Each trunnion is cast and machined from nodular iron, with shafts riding in split pillow-block spherical roller bearings. Rear trunnion wheels are flanged to fix the location of the drum.

Seals are located at both ends of the drum and are designed to limit ambient air infiltration. Seals are mounted to adapter-taper fittings to insure alignment. Drive chain, trunnions wheels, and tracks are lubricated. The drum is clad with a corrugated skin, which creates an air gap that acts as an effective insulator.

Shown Ø13'x60' long Dryer Drum
(inboard location of tracks for reduced stress on the shell, the reinforcing channels throughout, and oversized trunnion wheels & tracks for long service life)

Design Details

DRUM

Materials of construction: 3/8” thick A572-Grade 50 Carbon-Steel plate for drum wall, with formed and welded channel structural members to reinforce the high strength weldment, using ¾” angle iron flanges to connect the sections. Forged tires are machined for bolted connection to the drum sections.

Drum rotational drive: NEMA B electric motor and parallel-shaft gear reducer.

Drum backup drive: A backup drive is provided to rotate the Drum during power outage situations.

Typical Dryer Drum section – pictured during installation
(note the ‘open’ flighting within the Drum; the flighting promotes chip individualization so each particle moves thru the Drum at its own pace; the open design also provides for easier maintenance as maintenance personnel can walk thru the length of the Drum)

TRUNNIONS
Type: Flat/flanged couple; idling.
Materials of construction: ASTM grade 60 cast nodular iron for wheels, mounted on mild steel base weldment structures.
Bearings: Pillow blocks with split housings; spherical, self-aligning roller elements.

SEALS
Type: Fiberglass belt with spring steel plates for support.

INSULATION
Type: Galvanized corrugated sheet metal with air gap between sheet metal and drum shell; insulation is designed by TSI, supplied/installed by the Buyer.

LUBRICATION
Type: Oiler.

SAFETY GUARDS
Type: Track guards that cover drum's tracks and trunnion wheels.

Ductwork

Purpose

To convey dried biomass and spent gas from the Dyer Drum discharge to the High Efficiency Cyclone(s), and to convey spent gas from the High Efficiency Cyclone(s) discharge to the ID Fan, and from the ID Fan either to the Dilution Bustle and Exhaust Stack (or Wet Electrostatic Precipitator).

Operation

The Ductwork is made from rolled Carbon-Steel. There are two (2) types of ducts: the material duct that conveys both spent gas and dried biomass and gas duct that conveys spent gas only. The material duct runs from the Dryer Drum discharge to the High Efficiency Cyclone(s) inlet. The gas duct runs from the High Efficiency Cyclone(s) discharge to the ID Fan, and from the ID Fan to the Dilution Bustle and to the Exhaust Stack or the Wet Electrostatic Precipitator.

DESIGN DETAILS

Type: Rolled Carbon-Steel with flanged connections.
Materials of Construction: ¼" thick for material duct and 3/16" for gas duct.
Elbows within Material Duct: ½" thick T1.
Expansion Joints: Corrugated Stainless-Steel.

Typical corrugated Stainless-Steel Expansion Joints

Double-Duct

Purpose

To keep inner walls of the Ductwork's gas ducts hotter than the condensable temperature of the complex hydrocarbons that evaporate from biomass during the drying process, thus prevent 'pitch' buildup.

Operation

The Double-Duct keeps the 'inner' walls of the gas duct hotter than the condensable temperature of complex hydrocarbons that evaporate from biomass during the drying process. This prevents hydrocarbons from condensing onto the 'inner' walls of the gas duct, which is commonly in the industry referred to as 'pitch' buildup. Pitch buildup is prone to fires, explosions, and while it accumulates it gradually reduces production capability of the Dryer Island due to restricting gas flow. It is costly and time consuming to manually clean 'pitch' buildup. Double-Duct does not completely eliminate 'pitch' buildup and manual cleaning is still necessary but at reduced intervals. Double-Duct is heated via Air-to-Air Heat Exchanger and is backed up by an Electrical Heater.

Zones:

1) Gas duct from Cyclone(s) discharge to ID Fan inlet
2) Abort Stack from bottom level to Abort Damper

Design Details

Materials of Construction: 3/16" Carbon-Steel.

Typical double-duct; please note the inner duct and outer duct

High Efficiency Cyclone(s)

Purpose

To separate dried biomass from the flue-gas and deliver dried biomass into Cyclone Airlock(s).

Operation

The High Efficiency Cyclone(s) accepts flue-gas and dried biomass from the incoming material duct. The inlet geometry features a tangential transition to the tub section with inlet angle between material duct and transition of fifteen (15) degrees. The Cyclone bottom cone is a relatively shallow angle for better efficiency at removing smaller particulate from the flue-gas. At the exit of the cone there is an oversized vortex breaker with anti-spin baffles to effectively stop the cyclonic action of the dried biomass and to evenly distribute dried biomass into Cyclone Airlock pockets, thus minimizing the risk of plugging and wear on the tips of the Cyclone Airlock. Flue-gas is drawn from the top of the Cyclone and into the gas duct. Explosion relief panels are located on top of the Cyclone.

Design Details

Access: A door on the gas inlet and gas outlet of the Cyclone.

Explosion Panels: NFPA certified explosion panels located at top of each Cyclone.

Cyclones are positioned directly on top of the Buyer's Fire Dump; underneath each Cyclone is a Cyclone Airlock; under Cyclone Airlocks are Collection Screws that process biomass under normal operating conditions to Buyer's process conveyor; under upset operating conditions Collection Screws reverse direction to dump biomass to Buyer's Fire Dump.

Oversized vortex breakers underneath the Cyclones

Cyclone Airlock

Purpose

To receive dried biomass from the High Efficiency Cyclone and discharge dried biomass to the Collection Screw.

Operation

The Cyclone Airlock comprises a formed machined steel body with a rotating vane. The vane has eight pockets with knife tips. The design loading is based on achieving the optimum balance between minimizing the introduction of ambient air into the system and creating a maximum, non-plugging load in each pocket.

Note: each Cyclone has a dedicated Cyclone Airlock

Advantages

- Lower emissions (any ambient air leakage upwards through the Cyclone Airlock will lift particulate removed by the Cyclone and exhaust to the WESP)
- Lower WESP loading (lower dust loading onto the WESP will result in less maintenance)
- Lower Dryer System operating oxygen levels (any ambient air leaked into the Dryer System will result in higher operating oxygen levels, which is detrimental for fires and sparks)
- Lower maintenance (knife tips are typically adjusted once/year, whereas rubber tips need to be replaced at least twice/year)

Design Details

Type: Eight-pocket, rotating vane; low-leakage, knife type.
Drive: Direct coupled electric motor with gear reducer.
Materials of construction: Carbon-Steel body with Brass tips.
Fittings: To receive a speed switch that monitors the rotation.

Cyclone Airlock underneath the vortex breaker operating with a direct coupled drive

Collection Screw

Purpose

To collect dried biomass from the Cyclone Airlock(s), and process dried biomass to the Buyer's take-away conveyor during normal operating conditions or to the Buyer's Fire Dump during upset operating conditions.

Operation

The Collection Screw is located underneath the Cyclone Airlock(s) and receives dried biomass from the Cyclone Airlock(s). The Collection Screw conveys biomass to the Buyer's take-away conveyor during normal operating conditions. During upset operating conditions the Collection Screw will reverse direction and dump biomass directly into the Buyer's Fire Dump. The tower holding the Cyclone(s), Cyclone Airlock(s), and the Collection Screw, is located directly on top of the Buyer's Fire Dump.

Design Details

Drive: Direct coupled electric motor with gear reducer.
Materials of construction: ½" thick Carbon-Steel body with ½" thick Carbon-Steel for screw.

Shown in the picture is the entire assembly of the Cyclones, Cyclone Airlocks, and Collection Screw all located direction above the Buyer's Fire Dump.

ID Fan

Purpose

To provide the motive force and requisite pressures through the Dryer System.

Operation

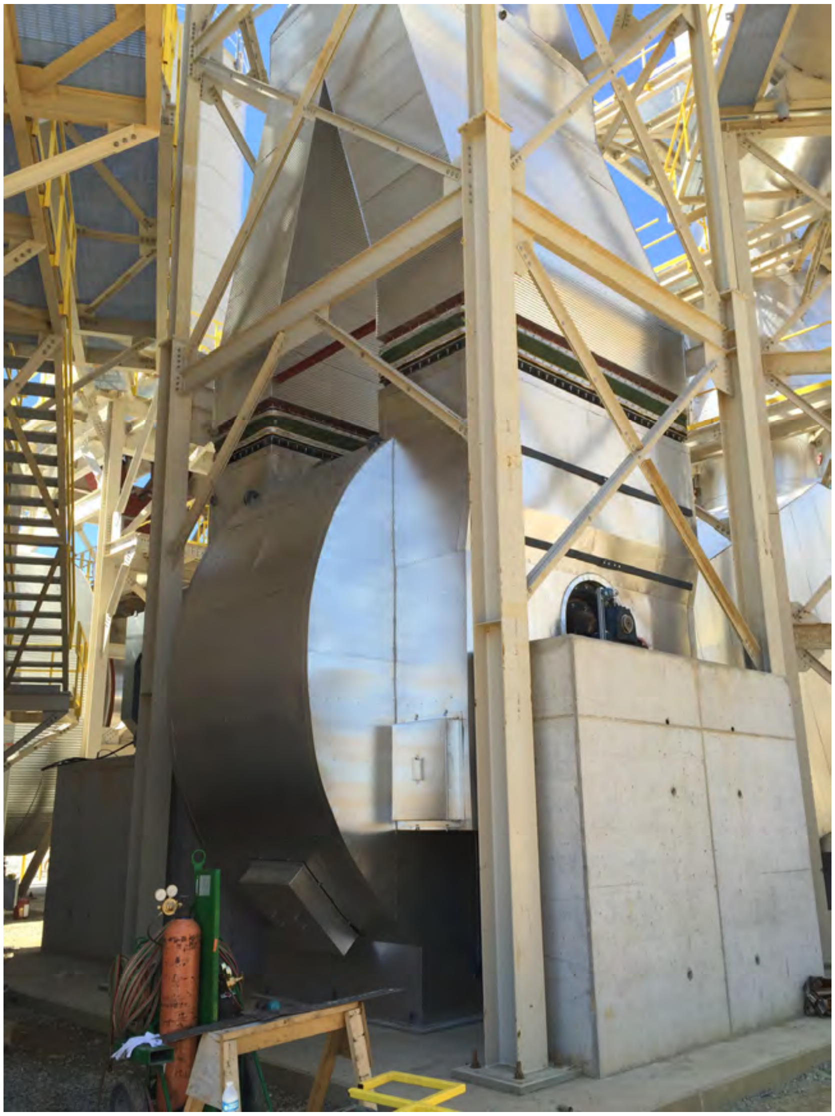
The ID Fan is positioned at grade level after the High Efficiency Cyclone and connects to Gas Ductwork on both the inlet and the outlet sides. It draws gas through the entire Dryer System prior to the inlet and then forces some gas back into the Dryer System via the Recycle Bustle and the reminder of the gas to the WESP. There are expansion joints located at both the inlet and the outlet of the ID Fan that accommodate for the thermal expansion of the Gas Ductwork, but also isolate the Ductwork from any potential vibrations originating with the ID Fan. The ID Fan flow is modulated via a Variable Frequency Drive and it is governed by the pressure differential reading across the High Efficiency Cyclones.

Design Details

Type: Single wheel, double inlet, single outlet, centrifugal, class IV.

Blade Shape: Radial Tip.

Access: Man-door for maintenance.



Typical ID Fan

Dilution & Stack Damper

Purpose

To control the flow of flue-gas to the Dilution Bustle or to the Pollution Control Equipment.

Design Details

Type: Opposed blade louver.
Actuator: BECK actuators.

Emergency Abort Stack

Purpose

To vent Dryer System flue-gas to atmosphere during upset operating conditions.

Operation

At times the Dryer System flue-gas will need to be aborted to atmosphere during upset operating conditions. The Emergency Abort Stack provides the ability to vent gases to atmosphere during upset operating conditions. The control damper is air actuated and is fail safe; if there is a power outage or air failure the Emergency Abort Stack will automatically open.

The Emergency Abort Stack is a 'free-standing-stack'.

Structural Steel

Purpose

To provide structural support for the Dryer System and to provide personnel access via stairs, ladders, and platforms.

Description

TSI supplies the support structures, stairs, ladders, and platforms from grade level as is typically required by the Dryer System. This includes access to areas requiring regular maintenance or monitoring by operating personnel. Stair access is provided to areas requiring maintenance on a daily or weekly basis; longer maintenance intervals will have ladder access. Client will have opportunity during system design to comment on access and add more if needed with an appropriate price adjustment.

Design Details

Assembly: Bolted and welded assembly.
Finish: Painted.

Typical Structural Steel (shown during construction)

Control Devices

Description

The following devices are included in order to control the Dryer System via PLC:

- Temperature Control Sensors
- Temperature Transmitters
- Pressure Transmitters
- Speed Switches
- Proximity Switches (Capacitive and Inductive)
- Plug Detectors
- Deluge Nozzles

Typical quick-disconnect removable nozzle

Spark Detection and Suppression

Purpose

To monitor the Dryer System for sparks and fires, and extinguish those sparks and fires.

Operation

The Spark Detection and Suppression monitors various locations within the TSI Dryer System. Deluge nozzles are linked to the spark detection devices and respond appropriately based on input. The deluge works in conjunction with the Collection Screw to abort material to the Buyer's Fire Dump. The Spark Detection and Suppression is integrated into the overall Dryer System controls with audible fire alarm, control panel display, and fire sequence relay.

Design Details

Type: Computerized spark detection and extinguishing system.

Suppression Equipment: Water suppression system complete with nozzles, valves, spark sensors, and control logic for automatic and manual operation; deluge valves are supplied that include Y-strainers to clean water from impurities, flow switches to indicate flow, ASCO solenoid valves to actuate flow, with manual by-pass.

Notes:

1) Fire detection & suppression by the Buyer.

2) TSI will supply Deluge Nozzles for the Dryer System with exception to the fast-acting suppression nozzles located between the Drum & Cyclone(s); Buyer responsible for supplying Deluge Valves (as described above complete with ASCO solenoid, manual by-pass, Y-strainers, and flow switches; heat tracing if required is by the Buyer) as specified by TSI along with pipework from Deluge Valves to the TSI supplied Deluge Nozzles (TSI will only supply Deluge Nozzles along with engineering drawings).

Typical Spare Detection Equipment at connecting chute

ITEM 04 WET ELECTROSTATIC PRECIPITATOR (WESP)

Shown below and on following pages are some of the major individual components that make up the WESP.

Required Water Quality for the WESP

The WESP utilizes water and a 50% solution of Sodium Hydroxide (NaOH) to flush out and clean the collection tubes. NaOH is injected directly into the flushing system to assist in the cleaning process. The NaOH injection will drive the pH of the flush water into the basic range (generally in the order of pH 10 – 12). The high pH is an essential element in maintaining clean surfaces within the WESP. By driving pH into basic range, $CaCO_3$ will precipitate out of the water causing buildup in the pump, piping, and nozzles. In order to mitigate the amount of hard water buildup in the system it is **required** that the incoming water hardness be at or below the level of "soft water". Below is a range that describes total water hardness.

- 0-60 ppm $CaCO_3$ – soft
- 60-120 ppm $CaCO_3$ – moderately hard
- 120-180 ppm $CaCO_3$ - hard
- >180 ppm $CaCO_3$ - very hard

Total water hardness of water delivered to the WESP should always remain below 60 to ensure trouble free operation.

The Water Treatment System is by the Buyer (below is WESP water requirement):

- pH: 6 – 8
- Conductivity (uS/cm): <1000
- COD (mg/l): <500
- Suspended Solids (mg/l): <100
- Water Hardness (°dh): <10 (preferably <5)
- Calcium (mg/l): <80 (preferably <40)
- Formaldehyde (mg/l): 0 (limit 10)
- Sulfates SO4: <100
- Chlorides (mg/l): <50

Required NaOH Quality for WESP

NaOH is manufactured with two distinct methods (Diaphragm and Membrane). Diaphragm grade caustic, while less expensive, has up to 100 times more-free NaCl in the solution. The introduction of NaCl can cause stress corrosion cracking as well as general corrosion on the internal surfaces of the wet ESP.

Membrane grade caustic has less NaCl. It is essential that the NaOH purchased for the WESP is membrane grade in order to prevent damage to the WESP. Additionally, because the recycle water is often sprayed back into the Heat Energy System, or the Dryer System, similar corrosion impacts might be realized there as well.

Quench-Duct

Purpose

The Quench-Duct sprays recycled water into the incoming Dryer System flue-gas stream, thereby saturating and cooling that gas stream to the wet-bulb temperature, and at same time removes larger particulate prior to the WESP.

Operation

The Quench-Duct is equipped with recycled water header, sprays, and nozzles to saturate the gas stream and scrub out larger front-half particulate (or filterable particulate) from the gas stream. Saturating the gas stream also allows the WESP to condense and remove some back-half particulate (or condensable particulate); back-half particulate that condenses at temperatures lower than the operating gas stream's wet-bulb temperature will not be captured by the WESP. Scrubbing the larger front-half particulate prior to the WESP allows the precipitator to operate cleaner and have higher efficiency for smaller front-half particulate.

Design Details

Design Pressure: ±25" w.c.
Materials of Construction: T-304L Stainless-Steel skin/piping/nozzles with Carbon-Steel externals.

Typical Inlet Quench Duct

Wet Electrostatic Precipitator

Purpose

The Wet Electrostatic Precipitator collects and removes fine particulate from the Dryer System flue-gas stream.

Design Details

Design Pressure: ±25” w.c.

Inlet Section:

- 3/16” thick T-304L Stainless-Steel internals with Carbon-Steel externals
- Flooded floor design which eliminates buildup on the bottom surface
- Turning vanes for even distribution of gas stream across tube sections

Collection Section:

- T-304L Stainless-Steel internals with Carbon-Steel externals
- 14-gauge x Ø10” collection tubes with ¼” thick tube sheet
- Carbon-Steel structural supports
- Carbon-Steel vane axial fans (one per tube bundle) to blow ambient air across the tube section, this promotes condensation on the internal surfaces of the collection tubes thus keeping the tube walls wet

Power Grid Housing:

- 3/16” thick T-304L Stainless-Steel internals with Carbon-Steel externals (stiffeners, brackets, etc.)
- T-304L Stainless-Steel flush header
- T-304L Stainless-Steel collection electrodes (rigid mast with concentric disk electrodes complete with triangular plate alignment mechanism for final alignment)
- T-304L Stainless-Steel power grid that is suspended from outboard porcelain insulators within Purged Insulator Compartments
- T-304L Stainless-Steel Purged Insulator Compartments with integrated purge air system (see further details in proposal), suspension bracket for high voltage insulator, and access hatch for easy access to each insulator.

Wet Electrostatic Precipitator

Power Grid and Discharge Electrodes

Flush Header within the Power Grid

High Voltage Power Supply

Purpose

The High Voltage Power Supply delivers DC rectified high voltage to the electrostatic fields of the WESP.

Description

The High Voltage Power Supply and its control panel are included. The Transformer Rectifier (T/R) will be located at the power grid level of the WESP and the control panel will be located in the owner supplied MCC room.

Design Details

Type: 3 phase, air cooled.
T/R: IP 65 (NEMA 4).
Control Panel: IP 54 (NEMA 12) to be located in the Dryer Island E-House.
Output Rating: 70 kV; as required milliamps.
Input Power: 460 V / 3-phase / 60 Hz.
High Voltage Transmission: Pipe in grounded duct.
Features: Control Panel with digital controller, KV and MA signal transmitters; remote start/stop function; grounding switch; key interlock system.

High Voltage Power Supply

Discharge Duct

Purpose

The Discharge Duct conveys particulate cleaned gas stream from top of the WESP to grade level to connect to the downstream RTO.

Description

The discharge duct will connect the top of the WESP to the RTO's Mist Eliminator Chamber located at grade level.

Design Details

Design Pressure: 25" w.c.
Discharge Duct: 3/16" thick T-304L Stainless-Steel internals with Carbon-Steel externals.

Discharge Duct shown

Quench Water Recycle

Purpose

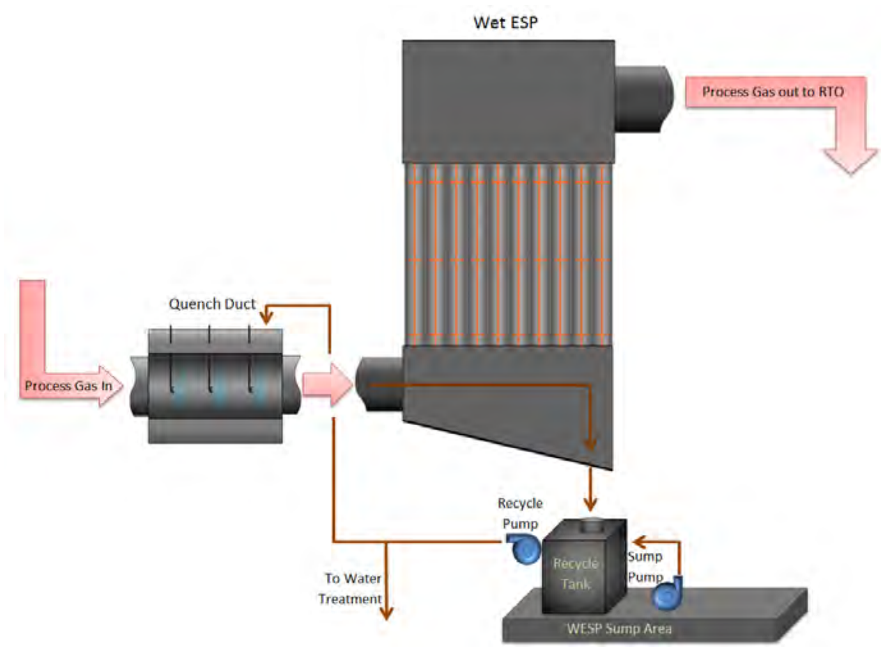
Quench Water Recycle delivers recycled water to the Quench-Duct and collects all water from the Wet Electrostatic Precipitator, including recycle water draining from the Quench Chamber and spent water and particulate from flushing of the WESP collection tubes.

Description

The Quench Water Recycle includes a recycle tank, a recycle pump, valves, strainers and all specialty fittings. The Quench Water Recycle periodically flushes independent electrical fields to wash away collected debris. Recycle water is sprayed (via the recycle pump) into the Quench Duct and spent recycle water will gravity drain back into the recycle tank located beneath the WESP. The Quench Water Recycle is controlled automatically by the Dryer Island PLC control system. Make up water requirements due to evaporation, or blow down, will be satisfied with flush water. PLC programming will control flush sequence based on recycle tank water level.

Design Details

Recycle Tank: Rectangular T-304L Stainless Steel tank with water dual jet agitation sprays.
Recycle Pump: ANSI centrifugal; T-316L Stainless Steel wet end.
Sump Pump: self-priming containment evacuation in the event of a spill.
Features: Includes all required nozzles, automatic and manual valves, and an oversized duplex strainer to prevent nozzles from plugging; piping and general fittings are to be supplied by the installation contractor.
Containment Area: Recycle tank is placed within a concrete curbed area to contain any spills from the tank, pumps, or strainers. The containment area is self-draining to a collection sump where the water can be pumped back into the recycle tank.



Flush

Purpose

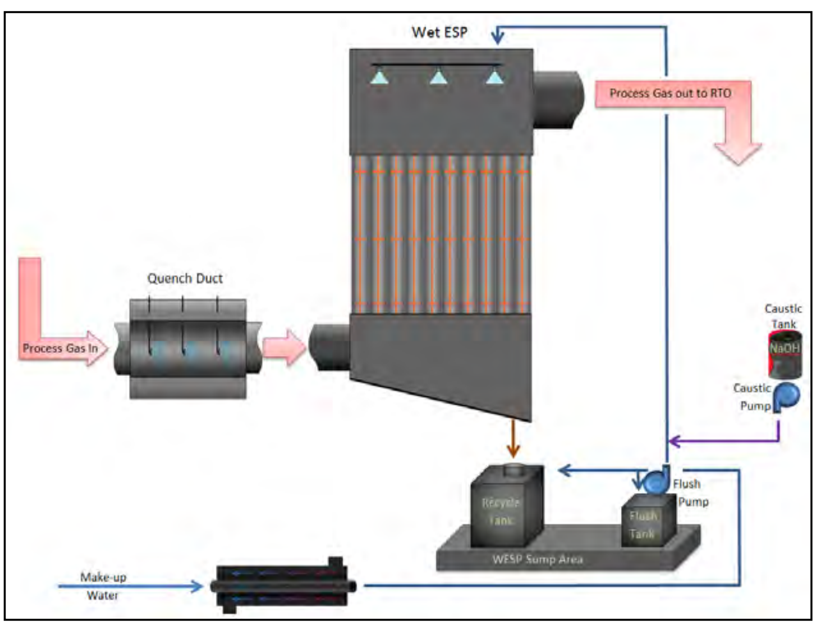
Flush delivers hot clean water to the collection tube of the WESP to rinse away collected particulate.

Description

Flush includes a flush tank (immersed within the recycle tank for heating purpose), a flush pump, valves, strainers, and all specialty fittings. Flush periodically flushes independent electrical fields to wash away collected debris. Flush is controlled by the PLC and is based on timers. A "pause" timer controls the time between flushes. A "duration" timer controls the duration of the Flush. If the recycle tank cannot accept Flush water the pause timer will be extended to allow evaporation to reduce the level of water within the tank. If the recycle tank is running low on water the pause timer will be advanced and trigger a Flush.

Design Details

Flush Tank: 2000 gallons immersed within the recycle-tank.
Flush Pump: Centrifugal style pump sized to deliver appropriate flow and head pressure to flush header and nozzles.
Nozzles: T-304L stainless steel maximum passage nozzles; arrangement insures proprietary overlapping pattern above each collection tube to guarantee adequate coverage to all tube surfaces.
Features: All required nozzles and internal headers are provided; one feed per WESP unit consisting of heated flush tank immersed in the recycle water for heat transfer purposes and a pump will be supplied; hot water with caustic added is more effective in removing sticky organic deposits from the collection tubes than cold water; piping and fittings are to be supplied by the installation contractor.



Typical Flush

Chemical Injection

Purpose

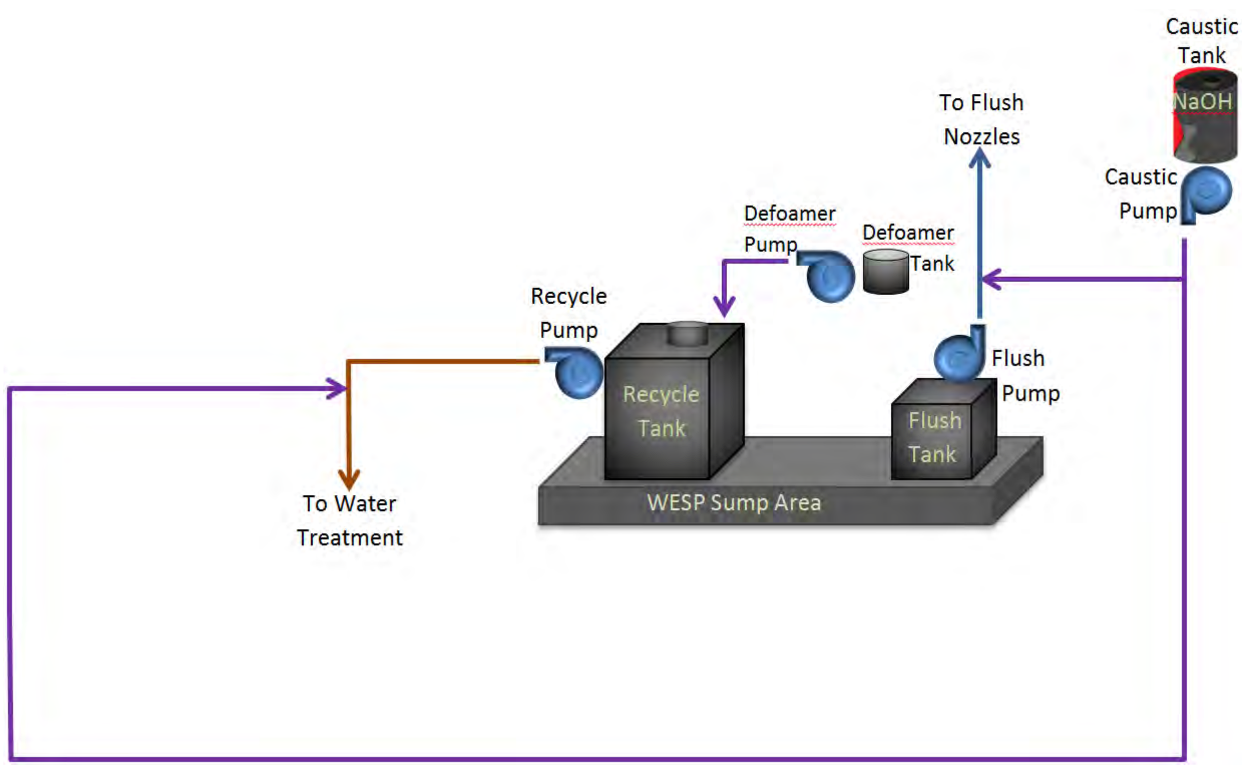
Chemical Injection delivers necessary chemicals (NaOH or Caustic and a defoaming agent) to the Recycle System and Flush System.

Description

The Chemical Injection is incorporated into the flush and recycle. Chemical Injection is designed to periodically inject sodium hydroxide (NaOH) directly into the flush water to aid in cleaning of the Wet ESP collection tubes. The flush and caustic systems will be controlled by the Dryer Island PLC. The Chemical Injection is also designed to inject a de-foaming agent into the water recirculation system to control foam when it occurs. The de-foaming system will be controlled at the PLC and also have the capability for manual control. The caustic and de-foaming system will be enclosed in a containment area. TSI will supply a Caustic Tank Pump that will receive and pump caustic from incoming trucks into the tank.

Design Details

NaOH Pump: Gear pump with 2 to 3 gallons per minute capacity (7.5 to 11.25 liters/minute).
De-foaming Pump: Gear pump with 2 to 3 gallons per minute capacity (7.5 to 11.25 liters/minute).
NaOH Tank: 6,500-gallon cross linked polyethylene with surface heaters.
De-foaming Agent: To be determined after startup; totes provided by chemical vendor.



Purge Air

Purpose

Purge Air delivers warm air to the insulator boxes to prevent contamination, which can cause arcing in the insulator boxes that will degrade WESP's performance, from the process gas stream.

Description

Purge Air includes a fan, heaters, and a duct network to deliver air to the insulator boxes. The fan will draw air from the outside surface of the tube section. Initially, electric resistance heaters located at each insulator box will be energized to supply the heat necessary to raise the temperature of the purge air. Once the WESP is warmed the heat will be gained from the tube section and the heaters will be de-energized.

Design Details

Fan: Centrifugal fan capable of supplying 1000 CFM per electrostatic power field
Heaters: Four (4) per power field; electric resistance 1.5 kW each

Purge Air Fan shown with connecting insulated ductwork

Decanter Centrifuge

Purpose

Decanter Centrifuge removes solids suspended in the process water, thus reducing concentration of solids in the water, therefore minimizing amount of water blow-down required by the WESP.

Description

The Decanter Centrifuge removes solids collected by the WESP. The Decanter Centrifuge is configured to treat a slipstream of up to 50 gallons per minute (187.5 liters/minute) of recycle water from the WESP. The cake produced by the Decanter Centrifuge is approximately 50% solids by weight; this discharge is typically land-filled. The centrate (cleaned water) gravity drains back to the recycle tank. A small blow-down stream of approximately two (2) gallons per minute (7.5 liters/minute) is necessary to control concentration of dissolved solids within WESP's water. The exact amount will be determined after start up based on dissolved solids level.

Design Details

Materials of Construction: 304L-Stainless-Steel for wetted parts.
Capacity: 50 gallons per minute (187.5 liters/minute).

Structural Steel

Purpose

To provide structural support for the WESP and to provide personnel access via stairs, ladders, and platforms.

Description

TSI supplies the support structures, stairs, ladders, and platforms from grade level as is typically required by the WESP. This includes access to areas requiring regular maintenance or monitoring by operating personnel. Stair access is provided to areas requiring maintenance on a daily or weekly basis; longer maintenance intervals will have ladder access. Client will have opportunity during system design to comment on access and add more if needed with an appropriate price adjustment.

Design Details

Assembly: Bolted and welded assembly.
Finish: Painted.

Piping Materials

Fresh Water Lines: threaded black iron
Chemical Lines (NaOH & Defoamer): Threaded black iron
Flush System Lines: Flanged black iron
Process Water Lines: Combination of flanged and threaded T-304 Stainless-Steel

Control Devices

Description

The following devices are included in order to control the WESP via PLC:

- Temperature Control Sensors
- Temperature Transmitters
- Zero Speed Switches
- Pressure Transmitters
- Proximity Switches (Capacitive and Inductive)
- Level Indicators
- PH Level Indicators

ITEM 05 REGENERATIVE THERMAL OXIDIZER (RTO)

Shown below and on following pages are some of the major individual components that make up the RTO.

Mist Eliminator Chamber

Purpose

To remove as much suspended water droplets from the gas stream as possible in order to minimize bed fouling and reduce heat requirement on the RTO burners.

Operation

The Mist Eliminator Chamber slows the incoming gas stream to required velocity to enable the mist eliminator modules to remove water droplets from the incoming gas stream. The modules are of chevron style. The mist eliminator modules are flushed routinely utilizing the WESP flush system and water drains back to the WESP sump.

Design Details

Materials of Construction: 3/16" thick 304-Stainless-Steel.
Operational Parameters: ±25" w.c. @ 150°F.
Access: One (1) access door on each side for internal inspection of both leading and trailing side of the modules.
Flush: Integrated into WESP Flush and includes leading edge and top-down flushing.

Mist Eliminator Chamber
(incoming gas stream from the left; discharge into the RTO to the right)

FD Fan

Purpose

To provide the motive force and requisite pressures through the WESP and the RTO.

Operation

The FD Fan is controlled by a variable frequency drive (VFD). The FD Fan modulates automatically via the PLC to maintain a static pressure set-point at the inlet to the WESP. The FD Fan induces gas flow thru the WESP and pushes gas flow thru the RTO.

Design Details

Materials of Construction: Stainless-Steel with external Carbon-Steel reinforcing structural members.

Design Conditions:

- Flow = Actual flow +10%
- Pressure = Actual Pressure +21%.

Bearings: Complete with vibration transmitters and temperature elements.

Expansion Joints: Stainless-Steel.

Inlet Manifold

Purpose

The Inlet Manifold distributes process gas to the Diverter Valves.

Design Details

Materials of Construction: 3/16” thick 304-Stainless-Steel.
Operational Parameters: ±25” w.c. @ 150°F.
Access: One (1) hinged and plug insulated access door for internal inspection.

Inlet and outlet manifold shown on either side of centered valve

Poppet Diverter Valves

Purpose

To control the flow direction of the flue-gas through the RTO media chambers.

Operation

The Poppet Diverter Valves are controlled by timers within the Programmable Logic Controller (PLC). At intervals of approximately three (3) minutes, pairs of Poppet Diverter Valves will simultaneously shift, reversing the flow direction of the process gas through the RTO. This allows the heat recovery beds to alternate between a heat source and a heat sink, thus allowing the RTO to recover approximately 95% of the thermal energy.

Design Details

Materials of Construction: 10-gauge 304-Stainless-Steel.
Operational Parameters: ±25” w.c. @ 150°F inlet and 250°F outlet.
Valve Trim Construction: Main-disk fabricated from 7-gauge thick Duplex-Stainless-Steel; support-disks fabricated from 10-gauge 304-Stainless-Steel; seat materials are 304-Stainless-Steel; seal arrangement is metal to metal sealing surfaces.
Access: One (1) hinged and plug insulated access door for internal inspection of valve and bottom side of the hopper.
Valve Actuation System: Parker 2A heavy duty pneumatic cylinder, adjustable end cushions at each end of travel; direct link with Parker linear alignment coupling, inductive proximity switches measuring actual valve shaft position, actuation time is 0.5 to 1.0 second full open to full close; each valve is pre-assembled and pre-wired to junction box.

Hopper Transitions

Purpose

The Hopper Transitions distribute flow evenly to the bottom surface of the heat recovery media.

Operation

The Hopper Transitions allow gasses exiting the Poppet Diverter Valve to slow down and spread out evenly across the bottom face of the media bed.

Design Details

Materials of Construction: 3/16” thick 304-Stainless-Steel.
Operational Parameters: ±25” w.c. @ 150°F inlet and 250°F outlet (excursions up to 600°F during bakeout).

Typical Hopper Transition

Heat Recovery Chamber

Purpose

To serve as a vessel for the heat recovery media.

Operation

The Heat Recovery Chamber houses the heat recovery media that enables the RTO to recover approximately 95% of the thermal energy. The Heat Recovery Chamber also houses the media support structure for the heat recovery media, sometimes referred to as the “cold face”.

Design Details

Materials of Construction: 3/16” thick 304L-Stainless-Steel reinforced outside with Carbon-Steel stiffeners.
Operational Parameters: ±25” w.c. @ 150°F inlet and 1500°F outlet; maximum operational temperature 1800°F.
Media Support Structure: Laser cut or high-def plasma slotted 316-Stainless-Steel plate (laser cutting or high-def plasma mitigates stress concentration due to cold working); maximum free passage of 70% open area; centered in Heat Recovery Chamber with no direct contact to outside walls; completely floating design to prevent stress concentrations while allowing for thermal expansion.
Access: Inspection access to the support structures is through the diverter valve; inspection access to top of heat recovery section is through combustion chamber access.
Note: Most vendors fabricate Heat Recovery Chamber from Carbon-Steel with mastic lining; when hot spots develop the mastic lining will burn off and leave the internal surfaces unprotected from oxidation long after hot spots are corrected; TSI fabricates Heat Recover Chambers from Stainless-Steel *to eliminate this potential issue.*

Media support beams
‘Norton Beam Style’

Combustion Chamber

Purpose

Emissions created by the Heat Energy System and the Dryer System, which were not removed by the WESP, are destroyed within the Combustion Chamber.

Operation

The Combustion Chamber houses a natural gas burner that regulates the internal temperatures of approximately 1500°F and greater. The Combustion Chamber is specifically designed to provide a minimum residence time of 0.5 seconds (along the flue-gas flow's "shortest path possible"). The combination of temperature and adequate residence time ensures that majority of the incoming hydrocarbons will be converted to CO_2 and H_2O. Volatile Organic Compounds (VOCs), Carbon Monoxide (CO), Hazardous Air Pollutants (HAPs), and Back-Half Particulate (BHP) are all destroyed within the Combustion Chamber.

Design Details

Materials of Construction: 3/16" thick 304-Stainless-Steel.
Operational Parameters: ±25" w.c.; normal operation 1500°F; maximum operational temperature 1800°F.
Access: One (1) access door on a davit in each combustion chamber.
Note: Most vendors fabricated Heat Recovery Chamber from Carbon-Steel with mastic lining; when hot spots develop the mastic lining will burn off and leave the internal surfaces unprotected from oxidation long after hot spots are corrected; TSI fabricates Heat Recover Chambers from Stainless-Steel *to eliminate this potential issue.*

Outlet Manifold

Purpose

The Outlet Manifold collects process gas from the RTO and delivers that process gas to the Exhaust Stack.

Design Details

Materials of Construction: 3/16” thick Carbon-Steel.
Operational Parameters: ±25” w.c. @ 450°F.
Access: One (1) hinged and plug insulated access door for internal inspection of outlet manifold.

Control Dampers

Purpose

The Control Dampers gas flow and fresh air flow thru the RTO.

Operation

There are three (3) control dampers within an RTO. They are the “blocking”, “fresh air”, and “bleed air” dampers. The blocking and fresh air dampers work together, isolating the RTO from the process gas, and allowing fresh air to enter the RTO. This is required during the burner ignition as well as the warm up cycle of the RTO, which must happen at a reduced airflow. When the blocking damper is closed the fresh air damper will be open and vice versa. The bleed air damper allows the discharge side of the RTO to vent during shutdown and outages; this serves as a vacuum break caused by the stack affect during those situations.

Design Details

Materials of Construction:

- Blocking: 304-Stainless-Steel butterfly valve with metal-to-metal seats and Carbon-Steel brackets and stiffeners; controlled by a pneumatic actuator.
- Fresh air: 304-Stainless-Steel butterfly valve with tadpole seats and Carbon-Steel brackets and stiffeners; controlled by a pneumatic actuator.
- Bleed air: Carbon-Steel with tadpole seats and Carbon-Steel brackets and stiffeners; controlled by a pneumatic actuator.

Exhaust Stack

Purpose

To exhaust treated process gas to atmosphere.

Design Details

Materials of Construction: Carbon-Steel.
Access: Sampling platform and ports at EPA required position, ladder from grade to platform, and will be free standing.

Internal Ceramic Refractory

Purpose

To protect the shell of the RTO from high internal temperatures

Operation

The Internal Ceramic Refractory is bolted to studs that are welded to the internal surface of the Heat Recovery and Combustion Chambers.

Design Details

Heat Recovery Sections: Minimum six (6) inch thick eight (8) pound density.
Combustion Chamber: Minimum eight (8) inch thick eight (8) pound density.
Type: Unifrax or equal; anchor-loc spun fiber ceramic modules.
Attachment Method: Welded/threaded stud; 304-Stainless-Steel.
Combustion Chamber Temperature: 1500°F.
Maximum Internal Temperature: 2200°F.
External Skin Temperature: ≤150°F at 70°F with 5 mph wind.

Heat Recovery Media

Purpose

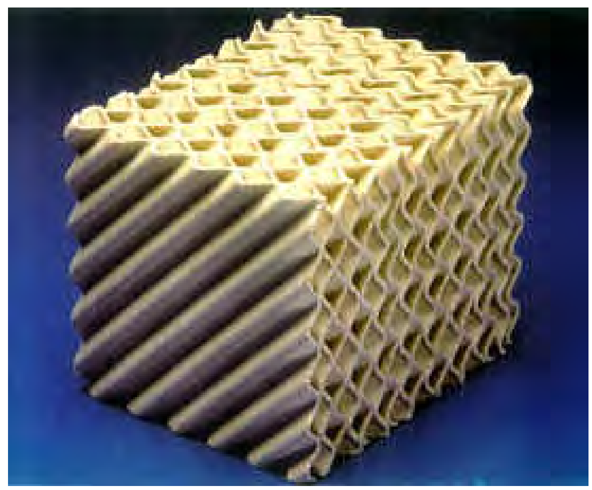
The Heat Recovery Media serves as the heat source and the heat sink to provide and store thermal energy provided by the burner system.

Operation

The Heat Recovery Media is cycled from the heat source to the heat sink by reversing the flow direction through the RTO. As “cool” process gas enters the “inlet” heat recovery bed the stored thermal energy is transferred and thus preheating the gas stream to within 100°F of the Combustion Chamber temperature. As hot process gas exits the Combustion Chamber the heat is transferred to the “outlet” heat recovery bed thus cooling gas stream to within 100°F of the actual gas stream inlet temperature into the RTO. Every three minutes the flow is reversed thus swapping inlet and outlet beds. The flow reversal is controlled by the Poppet Diverter Valves. There are many types of media available and below are some examples. Please see Equipment Specifications above for details on Heat Recover Media offered for this project.

Random Saddles

Corrugated



Monolith

Burner

Purpose

The Burner provides the necessary heat to maintain the Combustion Chamber temperature set-point.

Operation

Operating of the Burner is monitored by a microprocessor-based flame supervisory system manufactured by Honeywell. The flame supervisory system monitors all safety switches and ensures proper purge sequence during start-up. Once the Burner is lit and flame is proven, the supervisory system continues to monitor all safeties but the Burner control is handed to the PLC based control system. The Burner regulates to maintain Combustion Chamber's temperature set-point.

Design Details

Burners/Fuel Train/Flame supervisory:

- Burner - Maxon Kinemax burner
- Combustion Air Blower – Cincinnati or equal
- Fuel Train – Pre-piped and wired to junction box including (1 per RTO):
    - Maxon 5000 shutoff valves with position switches
    - Maxon Microratio (air/gas) proportioning valve with Beck actuator
    - United Electric low and high gas pressure switches
    - Pilot train
    - Scanner cooling air system pre piped
- Flame supervisory including:
    - Honeywell burner management
    - Honeywell UDC2000 high limit switches
    - Self-checking UV scanner
    - Dwyer pressure switches for proof of RTO and media bed minimum airflow

Structural Steel

Purpose

To provide structural support for the RTO and to provide personnel access via stairs, ladders and platforms.

Description

TSI supplies the support structures, stairs, ladders, and platforms from grade level as is typically required by the RTO. This includes access to areas requiring regular maintenance or monitoring by operating personnel. Typically, stair access is provided to areas requiring maintenance on a daily or weekly basis. Longer maintenance intervals will have ladder access.

Design Details

Assembly: Bolted and welded assembly.
Finish: Painted.

Control Devices

Description

The following devices are included in order to control the RTO via PLC:

- Temperature Control Sensors
- Temperature Transmitters
- Zero Speed Switches
- Pressure Transmitters
- Proximity Switches (Capacitive and Inductive)
- Flame Scanner(s)

ITEM 06 REGENERATIVE CATALYTIC OXIDIZER (RCO)

Shown below and on following pages are some of the major individual components that make up the RCO.

Quench-Duct

Purpose

The Quench-Duct sprays recycled water into the incoming Pelletizing Island flue-gas stream, thereby increasing the weight of the particles and allowing for their removal within the Disengagement Chamber.

Operation

The Quench-Duct is equipped with recycled water header, sprays, and nozzles to saturate the gas stream and scrub out larger front-half particulate from the gas stream. The Quench-Duct also increases weight of smaller particulate to enable for its removal within the Disengagement Chamber.

Design Details

Design Pressure: ±25” w.c.
Materials of Construction: T-304L Stainless-Steel skin/piping/nozzles with Carbon-Steel externals.

Disengagement Chamber

Purpose

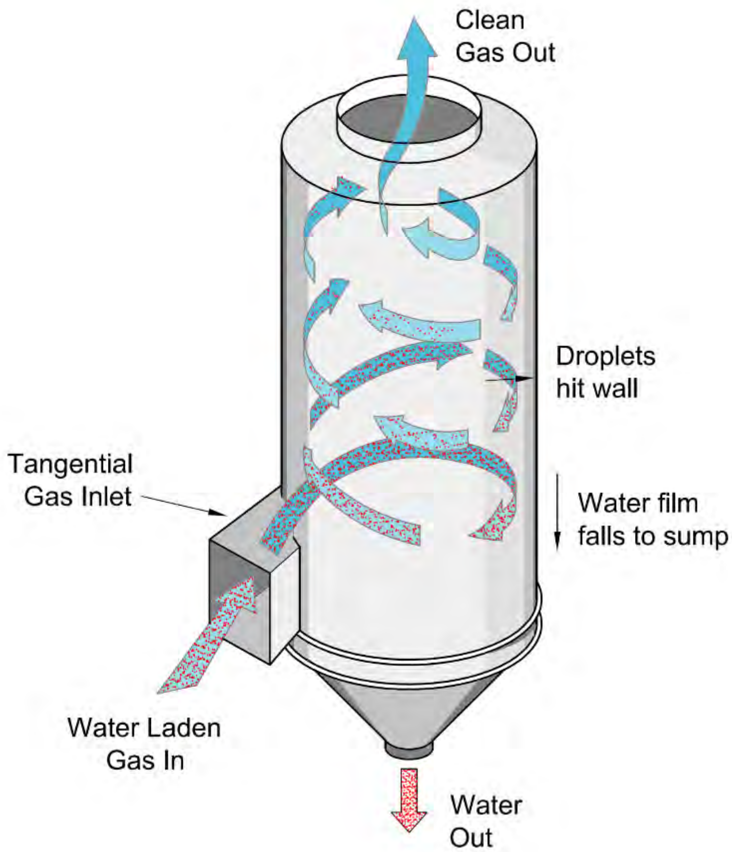
The Disengagement Chamber separates (by spinning out) water droplets and large dust particles from the gas stream prior to entry into the RCO.

Description

One Complete disengagement chamber will be provided. The units will be complete with a tangential inlet and integral cone bottom which will serve as a recycle tank for the recycle system.

Design Details

Materials of Construction: 304-Stainless-Steel.
Design Pressure: +/- 25” w.c.



Quench Water Recycle

Purpose

The Quench Water Recycle collects water from the Disengagement Chamber and delivers recycled water to the Quench-Duct.

Description

This Quench Water Recycle includes a recycle tank, a recycle pump, valves, strainers and all specialty fittings. Recycle water is sprayed via the recycle pump into the Quench-Duct and spent recycle water gravity drains back into the recycle tank. The Quench Water Recycle is controlled automatically by the PLC control system. Make up water requirements due to evaporation or blow down are satisfied with incoming fresh water.

Design Details

Recycle Tank: T-304L Stainless Steel, cone bottom.
Recycle Pump: ANSI centrifugal; T-316L Stainless Steel wet end.
Sump Pump: Self-priming containment evacuation in the event of a spill.
Features: Includes all required nozzles, automatic and manual valves, and an oversized duplex strainer to prevent nozzles from plugging; piping and general fittings are to be supplied by the installation contractor.
Containment Area: Recycle tank is placed within a concrete curbed area to contain any spills from the tank, pumps, or strainers. The containment area is self-draining to a collection sump where the water can be pumped back into the recycle tank.

Water Treatment

Purpose

Water Treatment manages levels of suspended and dissolved solids within the recycle tank.

Description

The Water Treatment consists of a decanter style Centrifuge for continuous removal of suspended particulate. Recycle water is routed to the Centrifuge where collected dust from the Disengagement Chamber is separated and emptied into a Buyer's tote. The Centrifuge minimizes amount of water blow-down required to maintain optimal levels of solids within the water, however some blow-down is still required. The blowdown water will be routed to the Furnace and Dryer System. By discharging a small amount of water, the dissolved solids are removed from Quench Water Recycle.

Design Details

Materials of Construction: 304L-Stainless-Steel for wetted parts.
Capacity: 50 gallons per minute (187.5 liters/minute).

FD Fan

Purpose

To provide the motive force and requisite pressures through the Quench-Duct, Disengagement Chamber, and the RCO.

Operation

The FD Fan is controlled by a variable frequency drive (VFD). The FD Fan modulates automatically via the PLC to maintain a static pressure set-point at the inlet to the Quench-Duct. The FD Fan induces gas flow thru the Quench-Duct and the Disengagement Chamber and pushes that gas flow thru the RCO.

Design Details

Materials of Construction: Stainless-Steel with external Carbon-Steel reinforcing structural members.
Design Conditions:

- Flow = Actual flow +10%
- Pressure = Actual Pressure +21%.

Bearings: Complete with vibration transmitters and temperature elements.
Expansion Joints: High temperature fabric.

Inlet Manifold

Purpose

The Inlet Manifold distributes process gas to the Diverter Valves.

Design Details

Materials of Construction: 3/16” thick 304-Stainless-Steel.
Operational Parameters: ±25” w.c. @ 150°F.
Access: One (1) hinged and plug insulated access door for internal inspection.

Inlet and outlet manifold shown on either side of centered valve

Poppet Diverter Valves

Purpose

To control the flow direction of the flue-gas through the RCO media chambers.

Operation

The Poppet Diverter Valves are controlled by timers within the Programmable Logic Controller (PLC). At intervals of approximately three (3) minutes, pairs of Poppet Diverter Valves will simultaneously shift, reversing the flow direction of the process gas through the RTO. This allows the heat recovery beds to alternate between a heat source and a heat sink, thus allowing the RCO to recover approximately 95% of the thermal energy.

Design Details

Materials of Construction: 10-gauge 304-Stainless-Steel.
Operational Parameters: ±25” w.c. @ 150°F inlet and 250°F outlet.
Valve Trim Construction: Main-disk fabricated from 7-gauge thick Duplex-Stainless-Steel; support-disks fabricated from 10-gauge 304-Stainless-Steel; seat materials are 304-Stainless-Steel; seal arrangement is metal to metal sealing surfaces.
Access: One (1) hinged and plug insulated access door for internal inspection of valve and bottom side of the hopper.
Valve Actuation System: Parker 2A heavy duty pneumatic cylinder, adjustable end cushions at each end of travel; direct link with Parker linear alignment coupling, inductive proximity switches measuring actual valve shaft position, actuation time is 0.5 to 1.0 second full open to full close; each valve is pre-assembled and pre-wired to junction box.

Hopper Transitions

Purpose

The Hopper Transitions distribute flow evenly to the bottom surface of the heat recovery media.

Operation

The Hopper Transitions allow gasses exiting the Poppet Diverter Valve to slow down and spread out evenly across the bottom face of the media bed.

Design Details

Materials of Construction: 3/16” thick 304-Stainless-Steel.
Operational Parameters: ±25” w.c. @ 150°F inlet and 250°F outlet (excursions up to 600°F during bakeout).

Typical Hopper Transition

Heat Recovery Chamber

Purpose

To serve as a vessel for the heat recovery media.

Operation

The Heat Recovery Chamber houses the heat recovery media that enables the RCO to recover approximately 95% of the thermal energy. The Heat Recovery Chamber also houses the media support structure for the heat recovery media, sometimes referred to as the “cold face”.

Design Details

Materials of Construction: 3/16” thick 304L-Stainless-Steel reinforced outside with Carbon-Steel stiffeners.

Operational Parameters: ±25” w.c. @ 120°F inlet and 750°F outlet; maximum operational temperature 1800°F.

Media Support Structure: Laser cut or high-def plasma slotted 304-Stainless-Steel plate (laser cutting or high-def plasma mitigates stress concentration due to cold working); maximum free passage of 70% open area; centered in Heat Recovery Chamber with no direct contact to outside walls; completely floating design to prevent stress concentrations while allowing for thermal expansion.

Access: Inspection access to the support structures is through the diverter valve; inspection access to top of heat recovery section is through combustion chamber access.

Note: Most vendors fabricate Heat Recovery Chamber from Carbon-Steel with mastic lining; when hot spots develop the mastic lining will burn off and leave the internal surfaces unprotected from oxidation long after hot spots are corrected; TSI fabricates Heat Recover Chambers from Stainless-Steel *to eliminate this potential issue.*

Media support beams
‘Norton Beam Style’

Burner Chamber

Purpose

The Burner Chamber maintains temperature of about 800°F within the catalyst media.

Operation

The Burner Chamber houses the natural gas burner that maintains internal temperatures off 850°F or greater. At this temperature the Burner Chamber typically is able to maintain a temperature of about 800°F within the catalyst media, within which incoming hydrocarbons will convert to CO_2 and H_2O.

Design Details

Materials of Construction: 3/16" thick 304-Stainless-Steel.
Operational Parameters: ±25" w.c.; normal operation 850°F; maximum operational temperature 1800°F.
Access: One (1) access door on a davit in each combustion chamber.
Note: Most vendors fabricated Heat Recovery Chamber from Carbon-Steel with mastic lining; when hot spots develop the mastic lining will burn off and leave the internal surfaces unprotected from oxidation long after hot spots are corrected; TSI fabricates Heat Recover Chambers from Stainless-Steel *to eliminate this potential issue.*

Outlet Manifold

Purpose

The Outlet Manifold collects process gas from the RCO and delivers that process gas to the Exhaust Stack.

Design Details

Materials of Construction: 3/16” thick Carbon-Steel.
Operational Parameters: ±25” w.c. @ 450°F.
Access: One (1) hinged and plug insulated access door for internal inspection of outlet manifold.

Control Dampers

Purpose

The Control Dampers gas flow and fresh air flow thru the RCO.

Operation

There are three (3) control dampers within an RTO. They are the “blocking”, “fresh air”, and “bleed air” dampers. The blocking and fresh air dampers work together, isolating the RTO from the process gas, and allowing fresh air to enter the RTO. This is required during the burner ignition as well as the warm up cycle of the RTO, which must happen at a reduced airflow. When the blocking damper is closed the fresh air damper will be open and vice versa. The bleed air damper allows the discharge side of the RTO to vent during shutdown and outages; this serves as a vacuum break caused by the stack affect during those situations.

Design Details

Materials of Construction:

- Blocking: 304-Stainless-Steel butterfly valve with metal-to-metal seats and Carbon-Steel brackets and stiffeners; controlled by a pneumatic actuator.
- Fresh air: 304-Stainless-Steel butterfly valve with tadpole seats and Carbon-Steel brackets and stiffeners; controlled by a pneumatic actuator.
- Bleed air: Carbon-Steel with tadpole seats and Carbon-Steel brackets and stiffeners; controlled by a pneumatic actuator.

Exhaust Stack

Purpose

To exhaust treated process gas to atmosphere.

Design Details

Materials of Construction: Carbon-Steel.
Access: Sampling platform and ports at EPA required position, ladder from grade to platform, and will be free standing.

Internal Ceramic Refractory

Purpose

To protect the shell of the RCO from high internal temperatures

Operation

The Internal Ceramic Refractory is bolted to studs that are welded to the internal surface of the Heat Recovery and Combustion Chambers.

Design Details

Heat Recovery Sections: Minimum six (6) inch thick eight (8) pound density.
Combustion Chamber: Minimum eight (8) inch thick eight (8) pound density.
Type: Unifrax or equal; anchor-loc spun fiber ceramic modules.
Attachment Method: Welded/threaded stud; 304-Stainless-Steel.
Combustion Chamber Temperature: 850°F.
Maximum Internal Temperature: 2200°F.
External Skin Temperature: ≤150°F at 70°F with 5 mph wind.

Heat Recovery Media & Catalyst

Purpose

The Heat Recovery Media serves as the heat source and the heat sink to provide and store thermal energy provided by the burner system.

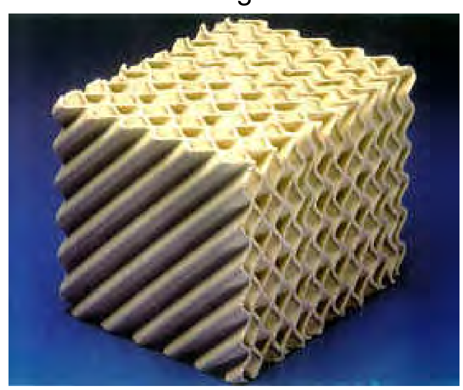
Operation

The Heat Recovery Media is cycled from the heat source to the heat sink by reversing the flow direction through the RCO. As “cool” process gas enters the “inlet” heat recovery bed the stored thermal energy is transferred and thus preheating the gas stream to within 50°F of the Combustion Chamber temperature. As hot process gas exits the Combustion Chamber the heat is transferred to the “outlet” heat recovery bed thus cooling gas stream to within 50°F of the actual gas stream inlet temperature into the RCO. Every three minutes the flow is reversed thus swapping inlet and outlet beds. The flow reversal is controlled by the Poppet Diverter Valves. There are many types of media available and below are some examples. Please see Equipment Specifications above for details on Heat Recover Media offered for this project.

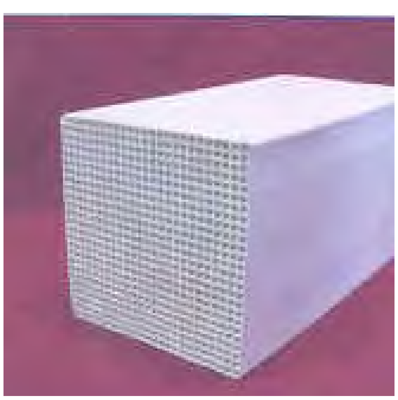
A layer (generally 4” thick) of precious metal catalyst will be added to the top of the media bed. Catalyst will allow the conversion of organic vapors to H_2O and CO_2 to occur at lower temperatures (generally around 800°F). The catalyst will be Applied Catalyst. It comes in 6”x6”x4” tall blocks similar to the monolith media yet coated with the precious metal.

Random Saddles

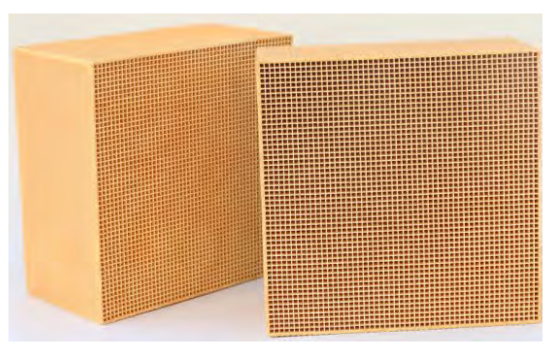
Corrugated



Monolith



Catalyst



Burner

Purpose

The Burner provides the necessary heat to maintain the Combustion Chamber temperature set-point.

Operation

Operating of the Burner is monitored by a microprocessor-based flame supervisory system manufactured by Honeywell. The flame supervisory system monitors all safety switches and ensures proper purge sequence during start-up. Once the Burner is lit and flame is proven, the supervisory system continues to monitor all safeties but the Burner control is handed to the PLC based control system. The Burner regulates to maintain Combustion Chamber's temperature set-point.

Design Details

Burners/Fuel Train/Flame supervisory:

- Burner - Maxon Kinemax burner
- Combustion Air Blower – Cincinnati or equal
- Fuel Train – Pre-piped and wired to junction box including (1 per RCO):
    - Maxon 5000 shutoff valves with position switches
    - Maxon Microratio (air/gas) proportioning valve with Beck actuator
    - United Electric low and high gas pressure switches
    - Pilot train
    - Scanner cooling air system pre piped
- Flame supervisory including:
    - Honeywell burner management
    - Honeywell UDC2000 high limit switches
    - Self-checking UV scanner
    - Dwyer pressure switches for proof of RCO and media bed minimum airflow

Structural Steel

Purpose

To provide structural support for the Quench-Duct, the Disengagement Chamber, and the RCO, and to provide personnel access via stairs, ladders and platforms.

Description

TSI supplies the support structures, stairs, ladders, and platforms from grade level as is typically required by the RCO. This includes access to areas requiring regular maintenance or monitoring by operating personnel. Typically, stair access is provided to areas requiring maintenance on a daily or weekly basis. Longer maintenance intervals will have ladder access.

Design Details

Assembly: Bolted and welded assembly.
Finish: Painted.

Control Devices

Description

The following devices are included in order to control the Quench-Duct, the Disengagement Chamber, and the RCO via PLC:

- Level Transmitters
- Temperature Control Sensors
- Temperature Transmitters
- Zero Speed Switches
- Pressure Transmitters
- Proximity Switches (Capacitive and Inductive)
- Flame Scanner(s)

ITEM 07 SYSTEM CONTROLS

PURPOSE

To provide for automatic operation of the Dryer Island and Pelletizing Island RCO.

OPERATION

Automatic operation of the equipment is controlled by four (4) PLCs (L83E programmable Logic Controller) and seven (7) Remote IO Cabinets. The operation of the equipment is monitored by the Operator via multiple HMI stations (Human Machine Interface) c/w monitors located in the Buyer's plant control room.

SCOPE OF SUPPLY

The scope of services covers one (1) Dryer Island that consists of a Heat Energy System, the Dryer System, the WESP, and the RTO; scope of services also covers one (1) RCO. The proposed Control System is based on L83E processor, Flex I/O, and Wonderware Intouch 2014 R2 C/w run time license. The following is the breakdown of scope of services:

- Drawing Lists
- PLC IO & Tag Assignment Lists
- IP Address Assignment Lists
- PLC to PLC Handshake List
- Utility and UPS Power Requirements
- Panel Location Drawings
- Design of Main processor PLC Cabinets and Remote I/O Field Panels
    - Panel Layout
    - I/O Schematics
- Coordination and interface with Burner Management System
- Coordination and interface with upstream and downstream PLC systems
- Control Cable List
- Final Record Drawings
- Control System Functional Requirement Document
- PLC Programming and HMI Development
    - PLC Inputs and Output signals.
    - Control Loops,
    - Drive Control Logic,
    - Interface as required between systems
    - PLC logic and documentation
    - Development of HMI screens
    - In-House Logic Testing
- PLC Network Diagram
- Quality Control
    - Review P&ID/Motor/Device Lists
    - PLC/HMI Testing FAT
    - Panel shop inspections and testing

- FAT & Post Fat Clean-up

- Commissioning Checkout
- Technical liaison with Pinnacle Pellets at TSI offices or offices in Vancouver, BC, Canada
- Attend weekly conference calls with all Stakeholders
- Four (4) main PLC panels: one (1) for the Heat Energy System, one (1) for the Dryer System, and one (1) for the WESP & RTO, and one (1) for the RCO
- Each main PLC panel located in Electrical Room, which has main CPU (1756-83E), communication modules and Flex IO modules.
- Seven (7) Remote Control Panels:
  - Two (2) for the Heat Energy System
  - Two (2) for the Dryer System
  - One (1) for the WESP
  - One (1) for the RTO
  - One (1) for the RCO
  - IO List, including interface with GreCon
  - Panel, Control Cable list
  - PLC Panel layout and BoM
  - IO Schematics and terminal layout.
- Control Narratives.
- PLC program (Studio 5000 Ver. 20).
- Master Alarm List.
- Two Wonderware Intouch HMI Runtime licences program (Wonderware InTouch 2014 R2).
- As-built.
- *Eighty (80) man-days for site service during commissioning & startup; two (2) programmers will be present on site; programming site service to be utilized at same time as Commissioning/Startup Site Service identified below with ITEM Site Service.*
- The current prevailing rate for programming staff is $2050/person/day and this includes all traveling and out of pocket expenses. A working day is calculated as up to ten (10) hours of onsite time. Travel days to and from site are each considered a working man-day.

DELIVERABLES

1. PLC Panel Fabrication drawings
2. Motor and Device List & Location
3. PIDs
4. Panel Location Drawings
5. PLC Panel IO Schematics
6. PLC IO List
7. IP Address list
8. PLC to PLC Handshake List
9. Control Cable List
10. Updated control narratives
11. PLC/HMI (Wonderware InTouch) Program & Configuration
12. FAT testing at Cogent Office.
13. Development of Commissioning Plan and Check sheets for PLC/HMI program and IO

14. Site Commissioning of PLC/HMI and IO
15. Final Record Drawings for PLC Panel Layout and IO Schematics

ASSUMPTIONS

- All Plant's PLC/HMI tag names based on TSI Numbering System
- PLC/HMI will be provided based on standard implemented at other Pellet Plants in North America
- Control Panel will be based on ControlLogix and Flex IO
- PLC panels will be provided similar to Standard PLC panels installed at other Pellet Plants in North America; each panel will have Flex IO (Rack, power supply, Ethernet adaptors).
- PLC Panel layout diagrams and IO Schematics will be similar to Standard PLC panels installed at other Pellet Plants in North America
- Motor Starters and Drives all come with EtherNet/IP interface.

BY OTHERS

- Fuel handling to the Heat Energy System's Metering Bin is by the Buyer
- Feedstock handling to the Dryer System's Metering Bin is by the Buyer
- Dry feedstock handling after the Dryer System's Collection Screw is by the Buyer
- The Buyer will provide main control room to accommodate TSI provided HMI stations

ITEM 08 SITE SERVICE

- The current prevailing rate for construction staff is $1450/person/day and this includes all traveling and out of pocket expenses. A working day is calculated as up to ten (10) hours of onsite time. Travel days to and from site are each considered a working man-day.
- The current prevailing rate for commissioning/startup/training staff is $1450/person/day and this includes all traveling and out of pocket expenses. A working day is calculated as up to ten (10) hours of onsite time. Travel days to and from site are each considered a working man-day.

Below is recommended Site Service:

- *Construction Site Service: three-hundred-ninety (390) total man-days*
    - *There are three-hundred-sixty (360) site-service man-days and thirty (30) travel days*
    - *Equipment installation starts from the time 1st equipment arrives to site until start of commissioning; TSI estimates this period will last six (6) months; TSI will require two (2) construction supervisors on site at the same time. During this time TSI crews will rotate. Travel days to and from site are each considered a working day*
    - *Down-days for weekends/holidays/weather/or any reasons not related to TSI are considered working days*

      Price: USD 565,500

- *Commissioning/Startup Site Service: Eighty-eight (88) total man-days*
    - *There are eighty (80) site-service man-days and eight (8) travel days*
    - *Two (2) TSI staff will be on site*
    - *Down-days for weekends/holidays/weather/or any reasons not related to TSI are considered working days*
    - *Start of commissioning site service is initiated by the Buyer; the Buyer must provide TSI with minimum four (4) week notice prior to the commissioning start date*

      Price: USD 127,600

- *24/7 Site Service post Commissioning: two-hundred (200) total man-days*
    - *There are one-hundred-eighty (180) site-service man-days and twenty (20) travel days*
    - *Two (2) TSI staff will be on site for 1st thirty (30) days per shift and one (1) TSI staff will be on site for 2nd thirty (30) days per shift*
        - *Total support is two (2) months*
    - *Down-days for weekends/holidays/weather/or any reasons not related to TSI are considered working days*
    - *Start of 24/7 Site Service will continue automatically following Commissioning Site Service*

      Price: USD 290,000

Notes:

1) *If additional working days are required by the Buyer, the Buyer can purchase those additional site service days at the rate shown above.*
2) *If the Buyer utilizes fewer site service days than the above, TSI will refund each fewer site service day to the Buyer at the rate shown above.*

ITEM 09 REFRACTORY WORKS

SCOPE

TSI offers to supply all manpower, lifting and hoisting equipment, and travel and living expenses, to install the refractory on the Heat Energy System and connecting hot gas ductwork between the Heat Energy System and Dryer Drum. TSI refractory installation crews will mobilize to site once Heat Energy System has been installed.

Items included in TSI installation package:

1) Heat Energy System refractory supply.
2) Heat Energy System refractory anchors supply.
3) Dryer System's hot gas ductwork refractory supply.
4) Dryer System's hot gas ductwork refractory anchor supply.
5) Heat Energy System anchor and refractory installation.
6) Dryer System hot gas ductwork anchor and refractory installation.
7) Heat Energy System refractory cure-out.
8) Dryer System refractory cure-out.
9) Refractory installation/cure-out 3rd party inspection.
10) Confined space area attendants and monitors.

Buyer's Responsibility:

1) Temporary electrical power supply and field wiring in the form of a 200 Amp 3-phase 480V power panel for welding machines and refractory cure-out equipment as well as a 110V power panel for electrical tools.
2) One (1) inch potable water line at 30 psi minimum stubbed at the installation area of refractory mixing.
3) Provide all weather and un-interrupted access to laydown areas for truck access, supplies, as well as storage of the same with suitable structure to support crane and forklift activity during inclement weather.
4) Installation of any equipment not listed above.
5) Winter package installation; the above installation is based on weather conditions at ≥6°C; if weather is <6°C then direct cost of additional items required (heaters/hoarding/fuel/etc.) will be borne by the Buyer with additional 10% added for processing; TSI will provide to Buyer the additional invoices due to winter installation.

Note: TSI and its sub-contractors are non-union; if unionized work is required then an adjustment to the price will be applied and paid by the Buyer.

ITEM 10 EQUIPMENT INSTALLATION

Items included in TSI installation package:

1) Receive and unload all TSI equipment; storage/laydown area must be next to Dryer Island (within 50' of the Dryer Island boundaries); if storage/laydown area is not near Dryer Island than appropriate adjustment to price will be made once full impact of storage/laydown area location is determined.
2) All mechanical and structural equipment installation relating to the following equipment:
    a. Heat Energy System
    b. Dryer System
    c. WESP
    d. RTO
    e. Disengagement Chamber/RCO
3) Dryer System Exhaust insulation supply and installation; 4" mineral wool with 0.034" embossed aluminum for cladding; the following equipment will be insulated:
    a. Material Ductwork from Drum discharge to Cyclones' inlet
    b. Cyclones
    c. Gas Ductwork from Cyclones' discharge to ID Fan
    d. ID Fan
    e. Process portion of the Abort Stack
    f. Dilution Ducts
4) RTO insulation supply & installation; 4" mineral wool with 0.034" embossed aluminum for cladding.
5) RCO insulation supply & installation; 4" mineral wool with 0.034" embossed aluminum for cladding.
6) RTO gas piping supply & installation; TSI will specify during engineering the location where Buyer must locate Natural Gas with lockable isolation valve; TSI will specify quantity & pressure at this location; TSI will supply piping & installation from this location to RTO Burner(s).
7) RCO gas piping supply & installation; TSI will specify during engineering the location where Buyer must locate Natural Gas with lockable isolation valve; TSI will specify quantity & pressure at this location; TSI will supply piping & installation from this location to RCO Burner(s).
8) WESP process piping supply & installation; typical USA process piping specification for Pellet Plants; Buyer to provide water stub-up with lockable isolation valve next the WESP as shown by TSI during the engineering phase of the project.
9) RCO Quench-Duct & Disengagement Chamber process piping supply & installation; typical USA process piping specification for Pellet Plants; Buyer to provide water stub-up with lockable isolation valve next the Disengagement Chamber as shown by TSI during the engineering phase of the project.
10) Dryer Island WESP & RCO Disengagement Chamber blow-down water to be piped overhead to Furnace/Dryer System.

11) Pneumatic instrument air lines supply & installation; the Buyer is required to provide and install the pneumatic air generator as per the Dryer Island & RCO equipment requirements; the location of this unit shell be within the boundaries of the Dryer Island as specified by TSI during the engineering phase of the project; from this generator TSI will supply & install all required pneumatic air lines to the Dryer Island & RCO devices.
12) Dryer Drum cladding insulation.
13) All hydraulic piping supply and installation and hydraulic oil supply.
14) Storage containers for all weather sensitive equipment supplied by TSI.
15) TSI will provide its own offices on site.
16) Mechanical installation of all TSI supplied devices.
17) Supply & install of all valves/piping/switches from the Buyer supplied stub-up pipe to the deluge nozzles located throughout the Heat Energy System and the Dryer System; this excludes if required the fast-acting spark detect piping; piping will be heat traced and insulated; during the engineering portion of this project TSI will specify location to the Buyer near the Furnace and near the Dryer System for the stub-up pipes; stub-ups supplied by the Buyer with manual shutoffs.

Shown above is the stub-up pipe with manual shutoff valve supplied & installed by the Buyer; above the manual valve is supplied and installed by TSI

Buyer's Responsibility:

1) Provide uninterrupted access to area of equipment installation, laydown areas, and connecting roads between these two areas as well as into the plant; any interruption during construction due to no fault of TSI (e.g. the Buyer shuts down the site due to another vendor's safety infractions, or any other reasons that prevent TSI from working uninterrupted or at lesser efficiency) will be paid by the Buyer; the price for this interruption can only be determined during construction period and once full scope of interruption is realized.
2) All underground & inground works to be completed prior to TSI installation crew's

installation start.

3) Supply & installation of spark detection (unless Buyer purchases this option from TSI shown within pricing pages).
4) Fire water piping supply & installation
5) Potable water and 100V power for TSI site office trailers.
6) Temporary electrical power supply and field wiring for 480V welding machines and 110V electrical tools.
7) Provide all weather and un-interrupted access to laydown areas for truck access, supplies, as well as storage of the same with suitable structure to support crane and forklift activity during inclement weather.
8) Toilets, washing area/ and drinking water.
9) Any prevention of site access for construction that prevents TSI installation crews from installing equipment.
10) Equipment lubrication supply and flushing
11) Provide all weather working surfaces around equipment erection area to provide safe access and working surfaces for cranes, man-lifts, and forklifts during inclement weather.
12) Creation and repair of roads, site drainage, lay down area, parking, and water service by the Buyer (TSI to hook up water service to its trailer; water hook up to be within reasonable proximity to TSI trailer).
13) Installation of any equipment not listed above.
14) Any Safety Coordinators if required are by the Buyer.

Note: TSI and its sub-contractors are non-union; if unionized work is required then an adjustment to the price will be applied and paid by the Buyer.

ITEM 11 ELECTRICAL WORKS

SCOPE

TSI offers to design, supply all manpower, lifting and hoisting equipment, and travel and living expenses, to electrically install and commission the Dryer Island and the RCO, and supply and install the E-House for the Dryer Island and the RCO. During first twenty (20) weeks of engineering TSI will determine the location of the E-House; this building will be located adjacent to the TSI Dryer Island. Deviation by Client from TSI drawings may result in an upcharge; this price impact will be determined once engineering is complete.

Electrical Works supply will be as per the TSI's North American Pellet Plant typical standards; deviation from these standards may reflect in change of price.

<u>Items included in TSI installation package:</u>

1) Electrical Engineering:
   a. Prefabricated steel electrical building (E-House)
   b. Power distribution gear (Panelboards, Transformers, Switchgear, etc.)
   c. Motor Control (MCCs and MV VFDs)
   d. All equipment within the E-House is installed, wired, and tested prior to shipment to the Buyer's plant site
      i. Medium Voltage equipment will be inspected and commissioned onsite prior to plant startup
   e. E-House comes complete with stairs & platforms, lighting, 32 tons of HVAC cooling, working desk, and power receptacles
   f. E-House is a two-piece unit that will ship separately and require reconnection at the plant site
      i. Section 1 will house the Low Voltage Gear (41'6" long by 15' wide)
      ii. Section 2 will house the Medium Voltage Gear (27' long by 15' wide)
      iii. Total E-House dimensions are 68'6" long by 15' wide
   g. Eaton Power Distribution Equipment is supplied (Eaton distribution panels, transformers, LV Switchboard, and MV Switchgear
   h. Rockwell Motor Control
      i. IntelliCENTER MCCs
      ii. Dryer System ID Fan, the RTO FD Fan, and the RCO FD Fan VFDs are PF7000 MV
      iii. Recommended spare parts are included
      iv. Rockwell commissioning services are included (5 days on-site)
   i. Diesel Backup Power Generator with Automatic Transfer Switch (ATS)
   j. Four (4) Transformer Rectifiers
   k. Power/Motor cable list
   l. Dryer Island and RCO Single Line Diagram and protection coordination and arc flash
   m. Control cable list
   n. Final Low Voltage distribution MCC review

o. Motor O/L and drive configuration reviews
p. Uninterrupted Power System & Distribution Panels
q. Electrical Distribution Panels
r. Cable Tray Layout
s. Heat loss calculations review on E-house
t. LDS requirements
u. BOP electrical requirements
v. MCC, motor schematics reviews

2) Prefabricated steel electrical building (E-House)
    a. Power distribution gear (Panelboards, Transformers, Switchgear, etc.)
    b. Motor Control (MCCs and MV VFDs)
    c. All equipment within the E-House is installed, wired, and tested prior to shipment to the Buyer's plant site
        i. Medium Voltage equipment will be inspected and commissioned onsite prior to plant startup
    d. E-House comes complete with stairs & platforms, lighting, 32 tons of HVAC cooling, working desk, and power receptacles
    e. E-House is a two-piece unit that will ship separately and require reconnection at the plant site
        i. Section 1 will house the Low Voltage Gear (41'6" long by 15' wide)
        ii. Section 2 will house the Medium Voltage Gear (27' long by 15' wide)
        iii. Total E-House dimensions are 68'6" long by 15' wide
    f. Eaton Power Distribution Equipment is supplied (Eaton distribution panels, transformers, LV Switchboard, and MV Switchgear
    g. Rockwell Motor Control
        i. IntelliCENTER MCCs
        ii. Dryer System ID Fan & RTO ID Fan VFDs are PF7000 MV
        iii. Recommended spare parts are included
        iv. Rockwell commissioning services are included (5 days on-site)
3) Diesel Backup Power Generator with Automatic Transfer Switch (ATS)
4) Four (4) Transformer Rectifiers
5) Integration/wiring of TSI supplied PLC enclosures
6) Supply and installation of network equipment for operator control room (CISCO compatible)
7) Supply and install all of the Dryer Island motors
8) TSI supplied starters will be installed in a prefabricated building in a fabrication shop, pre-wired and tested prior to shipping
9) Electrically install all motors, control devices, and wire all motors and control devices to the E-House
10) Network connections between HMI stations in main control room and PLC systems located in electrical room
11) Supply the Backup Power Generator with Automatic Transfer Switch
12) Install and wire the Backup Power Generator

13) Supply and install all necessary cable trays & junction boxes
14) Dryer Island lighting, power outlets, and welding outlets
15) Dryer Island emergency power stoppers supply/installation
16) Above ground lightning protection & grounding

Technical Specifications:

- Medium voltage switchgear (4160V) including feeders from main power distribution transformers
  - Eaton AMPGARD LBS Loadbreak Switch **or**
  - Eaton AMPGARD Main Breaker
- Low voltage power distribution center (480V) including feeders from main power distribution transformers
  - Eaton Pow-R Switchboard
- Low voltage MCC's including feeders from MCC to Motor c/w Ethernet/IP Interface
  - Allen-Bradley Centerline 2100
  - Motor starters (FVNR, FVR) c/w E300 Electronic Overload Relay
  - VFD – Rockwell – PF755 c/w line and load reactors
- MV VFDs will be standalone units, including feeders from MCC to Motor c/w Ethernet/IP Interface c/w Ethernet/IP Interface
  - Allen-Bradley PF6000
- UPS power supplies and associated transformers and panelboards
- Emergency power including generators, automatic transfer switches, associated distribution transformers and panelboards
- Panelboards and associated transformers for utilities
- Network Cabinets and Fiber Patch panels
- Low voltage Local Disconnect Switches for motors as indicated in motor list document
- 8 welding outlets
- PLC cabinets, local control panels, remote control panels as listed in panel list documents
- Power, control, data, and instrumentation tray cables, trays, wires and required miscellaneous hardware, as required for the completion of the entire installation of the drying island including electrical devices including sensors, instruments, actuators, solenoids, control and remote I/O panels, Ethernet.
- Supply and install all nameplates and/or safety signs (Arch Flash) as many as required by code regulations
- (power and data) all customer supplied PC's, monitors
- E-Stop stations and panels.
- Lighting Transformers and Panels
- Outdoor Lighting fixtures to provide process lighting for Dryer Island area.
- Outdoor Convenience Outlets (8) field mounted 120V convenience outlets.
- Heating and Ventilating Equipment for the electrical room / E-House
- One-(1) camera in the energy system for the purpose of viewing furnace fire
- Equipment bonding and connection to drying island loop

Prefabricated MCC Building shown next to Dryer Island

<u>Buyer's Responsibility:</u>

1) Temporary electrical power supply and field wiring for 480V welding machines and 110V electrical tools
2) Any Civil Works and underground works (underground conduits, underground lightning grid, and any other equipment underground)
3) Supply the Power Transformers and Power Disconnects for the E-House
4) Provide all weather and un-interrupted access to laydown areas for truck access, supplies, as well as storage of the same with suitable structure to support crane and forklift activity during inclement weather
5) Installation of any equipment not listed above
6) Primary Site Distribution
7) Main Power Distribution Transformers
8) Fire Alarm Systems
9) CCTV System
10) Power Factor Correction
11) Plant Lighting
12) Telephone system
13) Network cameras
14) Building fire alarm
15) Security gates
16) Main control room console

Note: TSI and its sub-contractors are non-union; if unionized work is required then an adjustment to the price will be applied and paid by the Buyer.

TSI: General Terms and Conditions

The following items are part of TSI's proposal. In accepting TSI's proposal the Buyer also accepts these terms and conditions. Should the proposal be modified in any way to meet the Buyer's requirements these terms and conditions will still apply unless specifically modified and agreed to by TSI.

Please note the following items are specifically excluded from TSI's scope of supply unless otherwise clearly specified in the body of the proposal:

1) Building and floor slabs, building lights, electrical fittings, fire walls, wall and roof penetrations etc.
2) Site preparation, equipment foundations, anchor bolts, conduits, and all related civil work (including any civil calculations if required)
3) Plant air, water, gas, temporary gas lines, and power during installation and start-up.
4) Control room, including any desk, furniture or environmental equipment.
5) Any local use or permit taxes or fees; any state or provincial taxes; any other taxes.
6) Any items of machinery or system components which are not specified in the contract scope of supply. Integration of buyer supplied items is the responsibility of the buyer.

In addition to the above exclusions, the following items are conditions of this proposal:

7) Design details as specified in the proposal may vary from completed project to accommodate updates or improvements in machine operation or construction; in such cases overall operational specification will not be negatively altered.
8) TSI does not warrant interface data provided by the Buyer, the Buyer's engineers or by other suppliers to the Buyer.
9) The Buyer is responsible for the costs of any tests required by the regulatory bodies.
10) TSI is not responsible for the cost of any performance tests or the costs of any subsequent tests if adjustments or modifications made to the equipment as a result of prior test results, whether or not TSI equipment was at fault. Performance tests may be required to set-up/tune the system.
11) TSI provides a limited warranty against defects in workmanship and materials for twelve (12) months from date of first use, or within twenty-four months within first installation of that part. Any parts replaced by TSI due to warranty will have the warranty extended on the replaced parts by another twelve (12) months. The cost of parts and shipping to site will be paid by TSI. Fitting on site of the replacement parts will be at the Buyer's expense. Additional charges for expedited shipping, if requested, will be at the Buyer's expense. This warranty specifically excludes tooling, consumable supplies, and wear items. It also excludes damage due to improper installation, use, or upset conditions not directly attributable to TSI equipment. Changing the operating settings or modifying the equipment without written TSI approval will invalidate the warranty.
12) Failure of the Buyer to pay according to the terms of the contract will invalidate the above warranty.
13) Chargeable equipment deficiencies that arise during installation or warranty claims should be documented and forwarded to TSI prior to remedial action and TSI should be given reasonable opportunity to either approve the remedy or otherwise make good the deficiency; failure by the Buyer to adhere to above requirement may invalidate TSI responsibility towards chargeable equipment deficiency.
14) TSI reserves the right to photograph and video the installed and operating equipment for use in future TSI marketing and promotional efforts.
15) Any information provided by TSI in the course of a project, including machine designs, operating software, and other parameters, remains the property of TSI and may not be divulged to any third party not directly involved with the TSI portion of the project without the written consent of TSI. Failure to observe this condition may result in damage to TSI's immediate and future business interests for which recompense will be sought.
16) Where written authority is required from TSI that written authority must come from the President of TSI unless other representatives have been nominated by TSI as part of the project.
17) TSI is not responsible for consequential losses or damages incurred as a result of equipment failure of improper operation.
18) The conditions set forth in this document (TSI: General Terms and Conditions) take precedence over other parts of documentation submitted by TSI. If there is a conflict between the body of a proposal and this document, the terms as specified in this document will apply.

ALERTS IN EFFECT

DISMISS

PARK CLOSURES

Hurricane Ridge Road Status 1/7, 5:00pm

Hurricane Ridge Road will be closed Monday 1/8/24 through Thursday 1/11/24. The road is scheduled to reopen on Friday 1/12/24, weather and road conditions permitting.

More (https://www.nps.gov/olym/planyourvisit/hurricane-ridge-in-winter.htm)

DANGER

Multiple Closures Due to Severe Incoming Weather

For visitor safety, the park has closed all campgrounds due to winter storm impacts, and visitors are strongly cautioned to closely monitor changing weather conditions when visiting the park. Closed areas will reopen when it is safe to do so.

More (https://forecast.weather.gov/MapClick.php?lat=48.0999&lon=-123.4264)

+ **3 more non-emergency alert notifications... (https://www.nps.gov/olym/planyourvisit/conditions.htm)**

Dismiss **View all alerts (https://www.nps.gov/olym/planyourvisit/conditions.htm)**

Environmental Factors

Environmental factors include everything that changes the local environment. This can include anything from natural forces like weather, **living park inhabitants (https://www.nps.gov/olym/learn/nature/environmentalfactors.htm#CP_JUMP_285470)**, or **human interactions (https://www.nps.gov/olym/learn/nature/environmentalfactors.htm#CP_JUMP_285479)** like non-biodegradable litter. Any time you visit the park, you have an influence!

Every experience you have with nature is uniquely yours. Even if you have been to the park every year, you can see the changes because the environment around us is constantly changing such as weather, time of year, time of day, death and new life, and more. These environmental factors can even vary based on the influence of individual **ecosystems and natural features (https://www.nps.gov/olym/learn/nature/naturalfeaturesandecosystems.htm)** around them. Enjoy the moments as they are, for they will never be exactly the same way again!

Clouds hang in a river valley below the snow-capped Olympic Mountains
NPS Photo

Some environmental changes are visible, such as a landslide caused by heavy rains. Other changes are not as easy to see. For example, some geologic change, like sediments becoming sedimentary rock, is too slow for the eye to see. Spending time in the park, one can find clues to the changes taking place right before us. While you may not be able to see a glacier move in real time, we witness the effects of these slow changes over time from climate change through studies and observation.

Natural Factors:

The landscapes of the National Park are in a state of constant change. As water, earth, wind, and fire work independently and together to shape and shift, there are a multitude of forces at work changing Olympic. Every moment of every day, the scenic details are being altered in ways both big and small. These are just a few examples of the many natural forces that are always shaping the land and influence ecosystems:

Water

One of the leading sources of change at Olympic National Park is water. Whether visitors are hiking to the river valleys and waterfalls or watching the waves along the coast, water is a driving force of nature throughout.

Sol Duc River flooding, 2006
NPS Photo

Erosion and Flooding

The many rivers are largely fed by annual snowmelt and rainfall, as well as the continual runoff from **glacial melt (https://www.nps.gov/olym/learn/nature/glaciers.htm)** coming from the high mountain peaks. Water erodes away the landscape, changing it as the flow follows the path of least resistance. As the waters gradually carve the banks along them, a phenomenon called 'river braiding' occurs. Channels of entertwined streams cut back and forth, widening the river valleys as they snake through. During the rainy season, typically November through March, the rivers swell with rain, often reaching well beyond their banks. This flooding brings with it fallen trees that are swept downstream or out to sea. Roads can even be at risk of being swept away, such as the Elwha road, whose bridges have been swept out before.

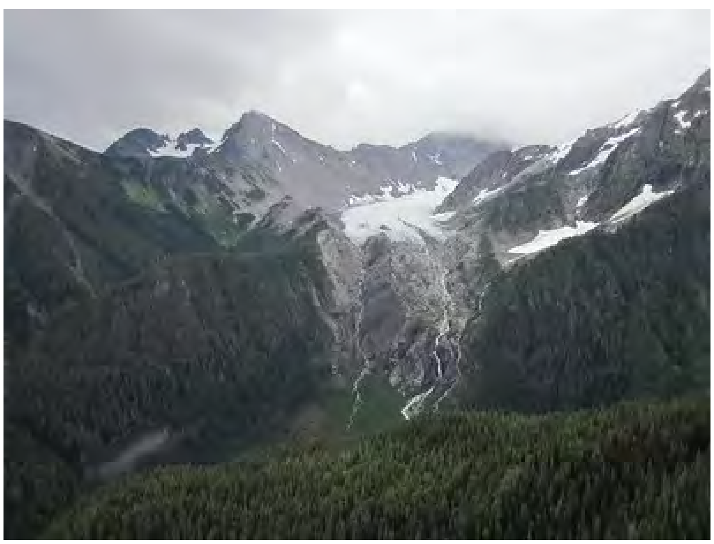
Tsunamis

While some changes occur over time, some can be much quicker. As you drive along the coast, you may see signs for a "Tsunami evacuation route" posted. Tsunamis are large, fast-moving waves. As the wave mass travels across the ocean, the wave and power behind it increases. Further out in the deep ocean, the waves can travel at 500 mph (800 kph). As it nears the shore, the wave condenses, slowing to 20-30 mph (30-50 kph), still faster than a human can run, but still containing the huge amount of power in what becomes a 10-100 ft (3-30 meter) tall wall of water as it hits land.

Today and Tomorrow

Changes will always be occuring throughout Olympic's waterways, but what will it look like in the future? Snowmelt is declining as temperatures increase. Glaciers are melting quickly. Rivers that flow heavily today may decline, leaving people and animals to adjust to a drier peninsula. The park studies **water quality (https://www.nps.gov/olym/learn/nature/waterquality.htm)** in order to ensure safety and understanding today and in the future.

Water is moving; changing. Rivers and glaciers carve out canyons and valleys. Ocean waves grind away cliff sides and create beaches of small rocks and shells. Water freezing in crevices splits cliffs into boulders and boulders into smaller rocks. Much of the natural beauty of the park is formed by water's nourishment. While parts of the peninsula lie in a rainshadow, the moss-laden rainforests found along the Hoh, Queets, and Quinault valleys accumulate an average of 138 inches of rainfall each year. Quenching the thirst of the forest allows for lush foliage to provide food and shelter for the wildlife of the park, as well as photo opportunities for visitors.



White Glacier receding, feeding the river valley below
NPS Photo

Earth

With mountain peaks, coastal spires, and literally everything in between, Olympic National Park is a geologic hub of yesterday, today, and tomorrow. The mountains are uplifting as the river valleys are being carved out. While much of geology moves too slowly to be witnessed in a single lifetime, some changes can occur in the blink of an eye. The changes can be drastic or minute, but every moment, this Earth and landscape are moving.

Subduction

The Olympic Peninsula lies in the subduction zone between two tectonic plates, the North American Plate and the Juan de Fuca Plate, where they converge. As one folds under, it pushes the Olympic Mountains higher. This action can shake the earth, causing Earthquakes, particularly to the South and the West in the Pacific Ocean. While earthquakes are rarely felt in the park, there is a faultline nearby, making them possible in the park and more common just a short distance away. Earthquakes shape and shift the earth on site. These are only one driving force of change! Some of these changes can cause residual damage as well.

Rock Slides

Tremors underneath the ground, as well as continual erosion, can cause sections of mountains to let go. When this happens, rock and debris may be sent cascading downhill in the form of a rock slide. Trees and trails can be swept away in an instance with nothing more than a bare scar left as a reminder of what once covered the hillside. When hiking along the hillsides of Olympic, remember to watch for loose ground and stay on trails to prevent erosion and stay safe.

Glaciers

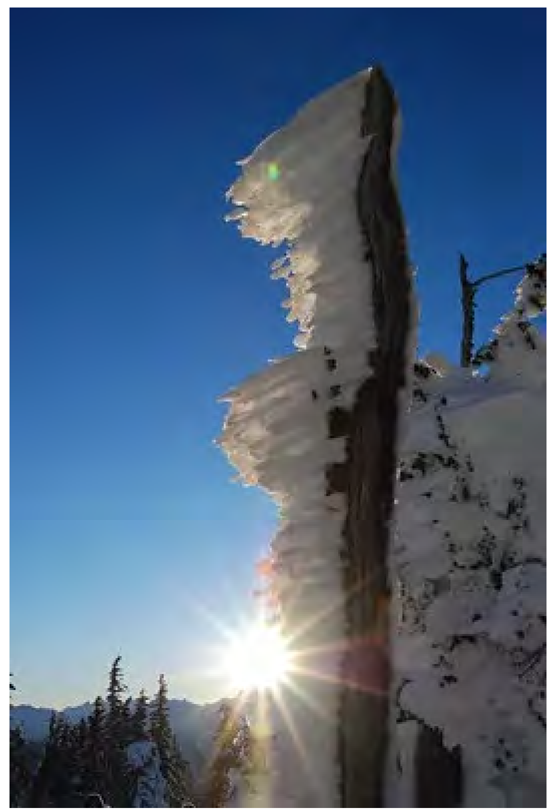
Glaciers in Olympic today are receding. As the force of these massive ice blocks moves over the land, it changes it. A glacier can grind the rock below its weight or leave behind debris from pebbles to erratics as large as a house. This constant glacial movement carves out valleys and rounds out saddles between peaks, leaving a noticeable mark on the land.

Today and Tomorrow

As mountains continue to rise and glaciers continue to recede, the shapes and figures of the geologic giants change each year. Visitors come from all around to witness the geology of Olympic. Whether it is for the snow-capped mountain peaks and rock spires that stand out against their backgrounds of open sky and ocean, or for the lush forests, ever influenced by the valleys and rocky soil, visitors witness the magic of influence from geologic change throughout the entire park. As you continue the journey of learning about the earth, remember to leave no stone unturned!

Wind

Can you picture the effects of wind? It may be a gentle breeze on your cheek, a gust that blows your hat off, or raging top-speed winds that can almost knock you to the ground. Wind can come in many forms, but will change the earth with every breath.



Rime ice on Hurricane Ridge on a sunny winter day
NPS Photo

Wind Storms

As the wind blows through the valleys, it can pick up strength. As more power is added, some gusts may become formidable forces that alter the land around them. Howling through the forests, the giant trees sway and bend with the winding wind. However, on occasion, these wind storms can be powerful enough to knock down lone trees or even entire swaths of forest, opening the dark floor to new beams of forgotten sunlight. Of course, no matter the devastating effects, the aftermath may allow for new growth to foster in an area once reigned by the giants of the forest.

Spreading Seeds and Other Things

Wind does not just destroy, but can help to spread life. Many plants rely on gusts to push their young seeds to new, fertile soil. This may even land atop a freshly fallen tree from a wind storm that can then become a nursery log as it nurtures the seeds from its nutrients. Wind is not only localized, but can carry with it stories in many forms. As fires rage even in other states, wind can carry the smoke across the region, clouding the skies and reducing air quality for miles.

Adapting to Wind

While wind can alter by destroying or creating, it can also alter by encouraging resistance through adaptations. One of the best examples is seen in the trees that can adapt to such a windy way of life. Some trees endure by bending to the wind's will and allowing their needles and branches to grow where the wind pushes them. Trees that are hundreds of years old may trick the eye as they stay low to the ground, their growth stunted, but their ability to keep from crashing down ever increased. These adaptations can be seen atop Hurricane Ridge, as the gnarled trunks of the evergreens have been twisted by the wind's might. There have been historic records of wind speeds reaching up to 80 mph (129 km/h), giving the ridge its name. With almost contant winds coming in from the ocean, coastal trees may adapt in a similar manner, becoming gnarled and twisted as they sway to the salty sea breeze.

Erosion

Wind may carry more than dust as it chips away and brings change to massive rocks that become smaller over time. This can be especially noticeable on the coastal shores as windswept sands blow past. When wind is contained or consistent, major erosion can be seen. From stripped rock faces to a gaping hole beneath a tree on the coast line, wind, often combined with other elements, can leave many a mark before blowing on by.

Today and Tomorrow

Wind presence and speed may vary by day, but its presence overall is a constant factor of change. As you return to the park or see photos over time, look for the changes that may be caused by the most fervent blows or the quietest whisper of the winds.

Mosses and lichen burning on a Red Alder
NPS Photo

Fire

Fire is a natural part of succession through ecosystems. Even in a rainforest, there is a dry season through the summer months where the land can become parched. Fire appears to scar the land, but, like all natural elements, it plays more than one role throughout the park.

A Forest Ablaze

After a fire ignites, it can smolder or spread with intensity. Many fires are started from lightning strikes. These are a natural occurance that changes the land. Some vegetation may get singed, while other plants may die from the heat and flames. Some plants have adaptations for fire resistence such as the Douglas Fir, whose extremely thick outer layer of bark can deter the flames from catching on its wood. While fire spreads, the smoke can be seen from miles away, allowing for onlookers to understand the current activity.

What Comes Next

Fire can cleanse an ecosystem, allowing for regeneration and regrowth on a now-blank canvas. Sun-loving trees will flourish in an open field and some flowers particularly love recently heated ground. What may have been old-growth stands can give way for a new generation of giants to begin their story and build a new forest home as they take visitors along with them.

Today and Tomorrow

Humans will always play a role. While many camping areas allow fires, not all do so be sure to plan ahead. Human-started fires have happened in the park, leaving unnatural scars in their wake. As these can spread rapidly, visitors are asked to fully extinguish any flame or ember before continuing to explore the ever-changing Olympics.

The Elements Together

Of course none of these natural factors are influencing the landscape alone. Erosion and deposition can come in many forms. Changes to the forest can come from fire, wind, or water changing course. No matter where you go in Olympic National Park or the world, the environment and its factors are interwoven, creating a tapestry that tells a story of the past, present, and, if you observe carefully, the future.

Plants and Animals

Roosevelt elk help some plants get sunlight by keeping others from growing too high or dense.
NPS Photo

Plants and animals are abundant throughout Olympic National Park, breathing color and life into every habitat. As they grow, they change their ecosystem along with themselves. Plants and animals will influence and can be influenced by each other, the geology and elements, and the people that visit.

Plants

Plants can change the park as they grow, and as they die. They provide shelter and food to animals, space for other plants like ferns and mosses, and nutrients even after death as nursery logs. Drift logs are washed in and out by the sea, changing the look and habitat of the coastline. The Olympic Peninsula is naturally a fertile landscape, however, not all species were originally here. **Nonnative plants (https://www.nps.gov/olym/learn/nature/nonnativespecies.htm)** have been brought in, both intentionally and by mistake. Some of these nonnatives can be **invasive (https://www.nps.gov/olym/learn/nature/invasiveplants.htm)**, as well, taking over the land that was once only home to the native foliage and blocking other species from thriving. Fungi, bacteria, and insects eat through dead plants, decomposing them and breaking down the nutrients. Elements can change plants from fire to windstorms. Plants can change the way these elements interact as well, from resisting the hot flames to blocking wind in dense forests. Plants like the old growth giants of the forest draw people to the park. Dense underbrush may naturally direct the designated trails that people are asked to stay on. The vibrant plants link the story of change through the Olympics with every twig and root.

Animals

Animals control and increase plant numbers and variety. Grazing deer and elk eat shrubbery, and their appetites greatly affect plant growth. If the number of large herbivores is too many, overgrazing may occur. Animals are also some of nature’s most useful seed dispersers and pollinators. Not only do insects like bees actively transfer pollen from one flower to the next, but birds and mammals will carry seeds unknowingly for miles, dispersing the undigestible ones in their droppings, which in turn provides ample fertilizer. Aside from the living foliage, animals change the habitat structure. As beavers construct their dams, the flow of rivers and streams are changed, often causing ponds and wetlands to develop, altering the aquatic landscape and allowing for different plants to move in. As animals roam, they make their mark on the land. Some animals dig dens, mark trees, roll in wallows on hillsides, make trails as they traverse, or build nests. Animals have been introduced and extirpated throughout Olympic's history, but they have always played a role in the changes of plants, geology, humans and other animals alike.

NPS staff and volunteers with coastal trash
NPS Photo

Human Effects:

The national parks are set aside for the benefit and enjoyment of the people as well as to preserve and protect the natural world. Within that balance, people play an important role. Humans influence their environment by simply being there. Any given moment in nature, a person may have a positive or negative affect on their surroundings. Throughout Olympic National Park, visitors can show their positive natural influence in many ways!

Utilizing Park Infrastructure

Park management is seen across the front country of Olympic. Roads, trails, and buidlings that people use and enjoy each day have an overall impact. Not only do they define where plants and animals can and cannot live, they direct visitors to specific parts of the landscape. Over 95% of Olympic National Park is designated **wilderness (https://www.nps.gov/olym/planyourvisit/wilderness.htm)**. As defined by the **1964 Wilderness Act (http://wilderness.org/article/wilderness-act)**, a wilderness is "...an area where the earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain." While visitors may not create the roads or buildings, people often have a say on proposed changes to the parks.

What can you do to help?
Throughout the park, there are many designated parking spaces. Plan ahead to see where RVs and trailers may be restricted. Park in designated areas rather than on plants or blocking roadways. Utilize established roads for access. Camp in designated areas only. Enjoy the many visitor centers, facilities, and exhibits throughout the park! As it can be a very busy park, remember to pack your patience.

Traversing on Trails

Olympic National Park sees over 3 million visitors on average. With over 600 miles of trails designed to explore and view fantastic sights, there are numerous opportunities to explore areas close to the roads or far in the backcountry. Visitors love to see all there is to see in Olympic. Please remember to leave as little impact when exploring these natural spaces to protect the landscape and prevent social trails.
What is a social trail? A trail that is not designated or controlled, but has become distinct due to continual use.
Why are they disliked? Social trails destroy important vegetation and habitat. They can also lead other hikers astray from the main trail. As social trails are not maintained, they may pose dangers like rough terrain, fallen trees, and erosion.

What can you do to help?
Stay on trails. If you explore in an area without trails, such as the backcountry or tidepools, be sure to follow **Leave-No-Trace (https://www.nps.gov/olym/planyourvisit/wilderness-leave-no-trace.htm)** principles by not creating or following a distinct trail that may destroy the vegetation. Plan ahead and look online or ask a ranger for trail suggestions.

Safe Wildlife Interactions

Wildlife watching is just one of the many ways to enjoy the park. Olympic has a variety of wildlife from the forest to the ocean that can be seen throughout the year. Stay safe and informed by learning more about **wildlife spotting tips and tricks (https://www.nps.gov/olym/planyourvisit/wildlife-viewing.htm)**. Some are elusive, and others quite common, but National Park wildlife is meant to be *wild*. Feeding human food to animals can make them dependent and less able to forage on their own. Once accustomed to humans, larger animals like deer or bears can become dangerous in their **search for food (https://www.nps.gov/olym/planyourvisit/wilderness-food-storage.htm)**. While visitors don't want to get too close, be sure to respect the homes of the animals. Making noise is a great way to be safe, but scaring wildlife with loud noises or altering their habitat can affect where and how they live.

What can you do to help?

Very few issues between people and animals occur in Olympic thanks to visitors following a few simple rules. Be sure to use designated bear wires and bear-proof canisters when backcountry camping. Pack out what you pack in. Never leave food unattended, and leave all scented items in the car overnight. Know which parts of the park are **pet-friendly (https://www.nps.gov/olym/planyourvisit/pets.htm)**.

Not Littering

When people come to the park, they may hope to see mountains, rivers, glaciers, forests and oceans. These natural views can be impeded by trash or remains of those that came before. Leaving evidence of your time in nature can impede people, animals, and vegetation alike for years. Non-natural items that get into the ocean may be out of reach from helping hands, creating a greater danger for sealife to swallow or get caught in. One of Olympic's best community efforts revolves around **coastal cleanups (https://www.nps.gov/olym/getinvolved/supportyourpark/coastal-cleanups.htm)**! With over 3 million visitors per year on average, Olympic and its visitors work hard to maintain a natural ecosystem.

What can you do to help?

After exploring the park, take any trash you have with you or deposit it in a bear-proof trash can. If you see trash, please help the park by picking it up or letting a ranger know. Generations of visitors will thank today's stewards that keep this park pristine.

Not Taking or Leaving

Litter can be anything not naturally occuring in the ecosystem. From trash, to invasive seeds, to painted rocks, to fires left smoldering, people can prevent many issues that can occur. Taking plants, animals, and even rocks or twigs from the park ecosystems can kill them, leave a lack of food or shelter for animals, and lessen the beauty of the diverse ecosystems for other visitors. Remeber that with millions of visitors each year, Olympic is for all to enjoy and may not last should every person leave with a piece of it.

What can you do to help?

Know before you go: Check your shoes for **Nonnative Species (https://www.nps.gov/olym/learn/nature/nonnativespecies.htm)** and **Invasive Plants (https://www.nps.gov/olym/learn/nature/invasiveplants.htm)** that can be carried in from other locations. Remember your camera! Taking photos is a fantastic way to remember your experience in the park and inspire others from your experiences.

After exploring the park, take any trash you have with you or deposit it in a bear-proof trash can. If you see trash, please help the park by picking it up or letting a ranger know.

Helping Here and at Home

Some larger impacts can be made over time. Aside from litter or damage one may see, other impacts can sometimes go unnoticed. Whether in the park or at home, people may use lights, make noise, and use tools. Light pollution is minimized in many areas with downward facing lighting fixtures and automated lights. Olympic has a large part of its landscape that is far from roads and other infrastructure where people and cars create sound, and the density of the park's lush forests dampens natural noises as well. Sounds can change visitor and animal behaviours alike. Helping to keep the wilderness wild comes in a variety of ways, including maintaining natural nightskies and soundscapes.

What can you do to help?
If you stop on a trail, a fun exercise is to close your eyes and listen, counting the number of individual sounds you can hear. How many are natural? How many are caused by people? Imagine being an animal hunting or hiding in the forest, needing your keen sense of hearing at all times. If you visit a national park, look up at the night sky. Does it look different from the skies in a city near your home? Now imagine being a bird or bug that travels using the stars. Where would it be more difficult? By reducing light emissions and turning off lights and electronics when not in use, people can collectively reduce the amount of light that clouds the night skies.

Reducing Carbon Footprints

People all have a carbon footprint left behind based on the amount they use and produce. Automobiles and industry put tons of carbon dioxide into the atmosphere that can eventually cause worldwide temperatures to rise and **glaciers to melt (https://www.nps.gov/olym/learn/nature/glaciers.htm)**.

What can you do to help?
Thinking ahead can help to reduce your carbon footprint. While there are many ways to reduce a footprint, in the park, one simple way is to not idle your car for long periods of time.

Having Positive Impacts to Water Quality

Chemical runoff, sedimentation, and accumulation of nitrogen in mountain lakes influence water quality in Olympic National Park. Olympic is known for its blue rivers and lakes, deep salty coastline, and clear natural springs.

What can you do to help?
People consist of up to 60% water. Water is crucial to all living things. Visitors can help to protect water sources by camping at least 200 feet from water sources and avoiding washing dishes in waterways.

Thank you for leaving a positive impact!
What can you do to continue to help?

No matter where you are, you can have a positive impact. Check out more ideas to get involved and help Olympic and other natural spaces:

- Park Clean-Ups (https://www.nps.gov/olym/getinvolved/supportyourpark/coastal-cleanups.htm)
- Volunteer (https://www.nps.gov/olym/getinvolved/volunteer.htm)
- Get Involved (https://www.nps.gov/olym/getinvolved/index.htm)
- Plan Ahead (https://www.nps.gov/olym/planyourvisit/index.htm)
- Become a Jr. Ranger (https://www.nps.gov/olym/learn/kidsyouth/beajuniorranger.htm)
- Learn more:
  - Leave-No-Trace (https://www.nps.gov/olym/planyourvisit/wilderness-leave-no-trace.htm)
  - Help Stop the Spread of Invasive Species (https://www.nps.gov/olym/planyourvisit/stopinvasives.htm)

DEFINITIONS

Volatile Organic Compounds (VOC)—As used in this test report, volatile organic compounds mean total hydrocarbons measured in accordance with U.S. EPA Method 25A measured on a propane basis minus methane.

Organic Hazardous Air Pollutants—As used in this test report, organic hazardous air pollutants include only (1) methanol, (2) formaldehyde, and (3) acetaldehyde.

ACRONYMS

CEM	Continuous Emission Monitor
CPM	Condensable Particulate Matter
DHEC	South Carolina Department of Health and Environmental Conservation
DHM	Dry Hammermill
EPA	U.S. Environmental Protection Agency
FID	Flame Ionization Detector
FTIR	Fourier Transform Infrared Spectroscopy
HAPS	Hazardous Air Pollutants
ODT	Oven Dried Tons
OHAPS	Organic Hazardous Air Pollutants
RCO	Recuperative Catalytic Oxidizer
RTO	Regenerative Thermal Oxidizer
VOC	Volatile Organic Compounds as defined by DHEC

UNITS OF MEASURE

ACFM	Actual cubic feet per minute
DSCFM	Dry standard cubic feet per minute
gr./DSCF	Grains per dry standard cubic foot
in.	Inches
in. w.c.	Inches of water column
ppm	Parts per million
ppmvd	Parts per million volume, dry basis
ppmvw	Parts per million volume, wet basis
Lbs./hour	Pounds per hour

STANDARD CONDITIONS

Pressure	29.92 inches of mercury
Temperature	68 degrees Fahrenheit

SIGNIFICANT DIGITS AND DATA ROUNDING

All emissions data are expressed in a maximum of three digits and usually in two digits. All subordinate calculations used in calculating emissions are conducted carrying a minimum of five digits and usually nine digits. Significant digit and data rounding procedures are consistent with EPA policy.

AIR EMISSION TEST REPORT
ENVIVA PELLETS GREENWOOD, LLC

1. SUMMARY

1.1 Purpose and Scope

This air emission test report summarizes the procedures and results compiled at the Enviva Pellets Greenwood, LLC (Enviva) dry hammermill (DHM) and dryer regenerative thermal oxidizer (RTO) on December 4-5, 2018, on the pellet cooler RCO 2 stack on January 16, 2019, and on the pellet cooler RCO 1 stack on March 7, 2019. The stack and control device numbering used in this test plan are consistent with South Carolina DHEC permit 1240-0133-CBr1 and R2 and the Test Protocol approved by South Carolina DHEC on November 27, 2018.

Section 1.2 of this report provides a summary of the test results and the process operating conditions during the tests. Section 1.3 includes a list of the Enviva personnel, the DHEC test observers, and the Air Control Techniques, P.C. personnel on-site. Section 2 provides a summary of the emission test methods and the four sampling locations—Stacks S1, S3, S5, and S6. Section 3 includes the complete test results. Quality assurance data compiled during the test program are provided in Section 4 and the appendices. The supporting data and quality assurance information for the three test programs are provided in Appendix I for the December 2018 tests, Appendix II for the January 2019 tests, and Appendix III for the March 2019 tests.

Prior to the start of this emission test program, Air Control Techniques, P.C. conducted Method 320-based validation tests. The results of these tests confirmed the accuracy of Methods 320 and 321 for the measurement of methanol, formaldehyde, acetaldehyde, and hydrogen chloride in both combustion gas streams and systems handling ambient air. The results of these tests are summarized in a separate test report submitted to the South Carolina DHEC.

1.2 Test Results Summary

Dryer RTO System—The dryer RTO system includes a rotary dryer, a large diameter cyclone, a wet electrostatic precipitator (WESP), and a RTO. This system includes a 100-inch diameter 75-foot high stack. This stack was tested using U.S. EPA Reference Methods 2, 3A, 4, 5, 7E, 10, 25A, 202, 320, and 321. The Method 5 and 202 sampling trains were combined into a single unit. Table 1-1 provides a summary of the three test runs.

Table 1-1. Stack S1, Dryer/RTO Air Emissions

Pollutant	Method	Pounds/Hour	Pounds/ODT
Filterable Particulate	5	0.35	0.0053
Condensable Particulate	202	1.5	0.023
Nitrogen Oxides as NO2	7E	18.5	0.28
Carbon Monoxide	10	9.9	0.15
Volatile Organic Compounds as Propane	25A	5.2	0.079
Methanol	320	0.0	0.0
Acetaldehyde	320	0.0	0.0
Formaldehyde	320	0.33	0.0050
Hydrogen Chloride	321	0.0	0.0

There were no quality assurance issues in these dryer stack tests. Prior to this test program, Air Control Techniques, P.C. conducted a set of validation tests that demonstrated the accuracy of Method 320 for the three organic hazardous air pollutants (HAPs) and Method 321 for hydrogen chloride in the RTO stack.

The production rates in the dryer system during the three test runs ranged from 64.1 to 67.0 ODT/hour. The wood being processed was 75% softwood, and the remainder hardwood. Supporting data can be found in Appendix IG.

Dry Hammermill System—The Dry Hammermill (DHM) system includes a set of five cyclo-filters equipped with PTFE membrane filter bags. This system includes a 62.5-inch diameter 60-foot high stack (S3). This stack was tested using U.S. EPA Reference Methods 2, 3A, 4, 5, 25A, 202, 320, and 321. The Method 5 and 202 sampling trains were combined into a single unit. There were three one-hour test runs using this set of EPA test methods. Table 1-2 provides a summary of the three test runs.

Table 1-2. Stack S3, DHM Air Emissions

Pollutant	Method	Pounds/Hour	Pounds/ODT
Filterable Particulate	5	8.7	0.13
Condensable Particulate	202	0.20	0.0031
Volatile Organic Compounds as Propane	25A	35.4	0.55
Methanol	320	0.32	0.0049
Acetaldehyde	320	0.0	0.0
Formaldehyde	320	0.015	0.00023
Hydrogen Chloride	321	0.015	0.00023

There were no quality assurance issues in these tests. However, testing personnel noted that some large clumps of particulate matter were occasionally passing upward through the stack. These large clumps of material appeared to be solids that had accumulated on an inner surface of the cyclo-filter outlet ducts and/or on the lower portions of the stack during previous system maintenance periods. This condition biased the filterable particulate matter emissions to higher-than-normal levels. Post-test evaluation of the dry hammermill operating data indicated that they were not operating normally, which contributed to the higher than normal particulate matter test results.

Prior to this test program, Air Control Techniques, P.C. conducted a set of 320 validation tests to demonstrate the accuracy of Method 320 for the three organic hazardous air pollutants (HAPs) and Method 321 for hydrogen chloride for a DHM source that inherently has high oxygen concentrations, low moisture levels, and modest VOC levels. The production rates in the dry hammermill system during the three test runs ranged from 64.7 to 65.5 ODT/hour. The wood being processed was 75% softwood, and the remainder was hardwood.

Pellet Cooler Systems—Enviva has 5 pellet coolers. Two of the pellet coolers systems exhaust to RCO 2 serving Stack S6 on the north side of the Pellet Cooler Building. Three of the pellet cooler systems exhaust to RCO 1 serving Stack S5.

RCO 2 was tested on January 16, 2019 after the bypass damper was fixed. RCO 2 and the pellet cooler systems operated normally during these tests with the exception of four short-duration process interruptions during Run 5. The first two runs were voided due to sampling train leaks caused by the difficulty of moving the large Method 5/Method 202 sampling train in a space-constrained and awkwardly placed sampling port. The lift was repositioned after the second run allowing the operator better access for handling the Method 5/202 sampling train. The samples from all five runs were analyzed, and the results for Runs 3 through 5 are reported in Table 1-3. Only Runs 3, 4 and 5, which had successful post-test leak checks are being reported to demonstrate compliance. The data from Runs 1 and 2 are included in Appendix IIA and are provided only for informational purposes.

Table 1-3. Stack S6, Pellet Cooler RCO 2 Air Emissions

Pollutant	Method	Pounds/Hour	Pounds/ODT
Filterable Particulate	5	0.22	0.0086
Condensable Particulate	202	0.10	0.0041
Nitrogen Oxides	7E	0.15	0.0063
Carbon Monoxide	10	0.10	0.042
Volatile Organic Compounds as Propane	25A	1.2	0.047
Methanol	320	0	0
Acetaldehyde	320	0	0
Formaldehyde	320	0.059	0.0025
Hydrogen Chloride	321	0	0

RCO 1 serving Pellet Coolers 1 through 9 on the south side of the Pellet Cooler Building was tested on March 7, 2019. This test followed modifications to an induced draft fan and damper to eliminate small bypass emissions. The results of the tests on Stack S5 on RCO 1 are summarized in Table 1-4.

Table 1-4. Stack S5, Pellet Cooler RCO 1 Air Emissions

Pollutant	Method	Pounds/Hour	Pounds/ODT
Filterable Particulate	5	0.14	0.0036
Condensable Particulate	202	0.18	0.0046
Nitrogen Oxides	7E	0.26	0.0064
Carbon Monoxide	10	2.4	0.059
Volatile Organic Compounds as Propane	25A	1.4	0.035
Methanol	320	0.01	0.00026
Acetaldehyde	320	0.0	0.0
Formaldehyde	320	0.0	0.0
Hydrogen Chloride	321	0.0	0.0

1.3 On-Site Test Program Personnel

The Enviva Pellets Greenwood, LLC (Greenwood) Project Managers for this testing project were Bruce Peterson, Joe Harrell, and Wayne Franklin. They supervised collection of all process data.

The Air Control Techniques, P.C. project manager for the dryer and dry hammermill tests was John Richards. The Air Control Techniques, P.C. project manager for the pellet cooler RCO 1 and RCO 2 test programs was David Goshaw. Addresses and phone numbers of these individuals are provided below.

2. TEST METHODS

2.1 Test Locations

Dryer/RTO Stack (S1)—The Dryer/RTO stack is shown in Figure 2-1. There are four ports spaced 90 degrees apart. Each of the ports is six inches diameter.

Figure 2-1. Dryer stack S1

Air Control Techniques, P.C. performed a stratification test at the Dryer Stack. The test results determined that that the gas stream was unstratified. Accordingly, the CEM probe was mounted at a point that matched the approximate mean concentration.

The gas flow rate was measured in accordance with Method 2. Twenty-four traverse points were used—six sampling points on each of four traverses. The gas moisture content was measured using Method 4. A Method 3A analyzer was used to measure the oxygen and carbon dioxide concentration.

Prior to the compliance test runs, the cyclonic flow angles were checked. The average cyclonic angle was 0.8 degrees—well below the maximum allowed angle of 20 degrees. The S1 sampling port locations satisfied EPA Method 1 criteria.

DHM Stack (S3)—There are five fabric filters serving the five hammermills. The effluent gas streams from the five fabric filters combine into a single manifold leading to a single stack, S3, shown in Figure 2-2.

Figure 2-2. Hammermill building and stack

Stack S3 is 62.5 inches in diameter. There are four ports spaced 90 degrees apart. Each of the ports is five inches in diameter. The stack discharge point is 1.09 stack diameters upstream of the sampling ports, and the closest downstream disturbance is 4.8 stack diameters. Twenty-four sampling points (6 each on four traverses) were used for the Method 5/202 particulate matter tests. Twenty-four sampling points was also used for the Method 2 gas velocity traverses.

The CEM probe was mounted in the approximate center of the stack. A Method 3A analyzer was used to measure the oxygen concentration for all emission measurements.

RCO Stacks—The vertical sections of the exit ducts for the north side and south side RCOs provided the best sampling locations. Two ports were installed 90-degrees apart at the locations shown in Figures 2-3 through 2-5. With these two ports, it was possible to fully traverse the RCO exit ducts.

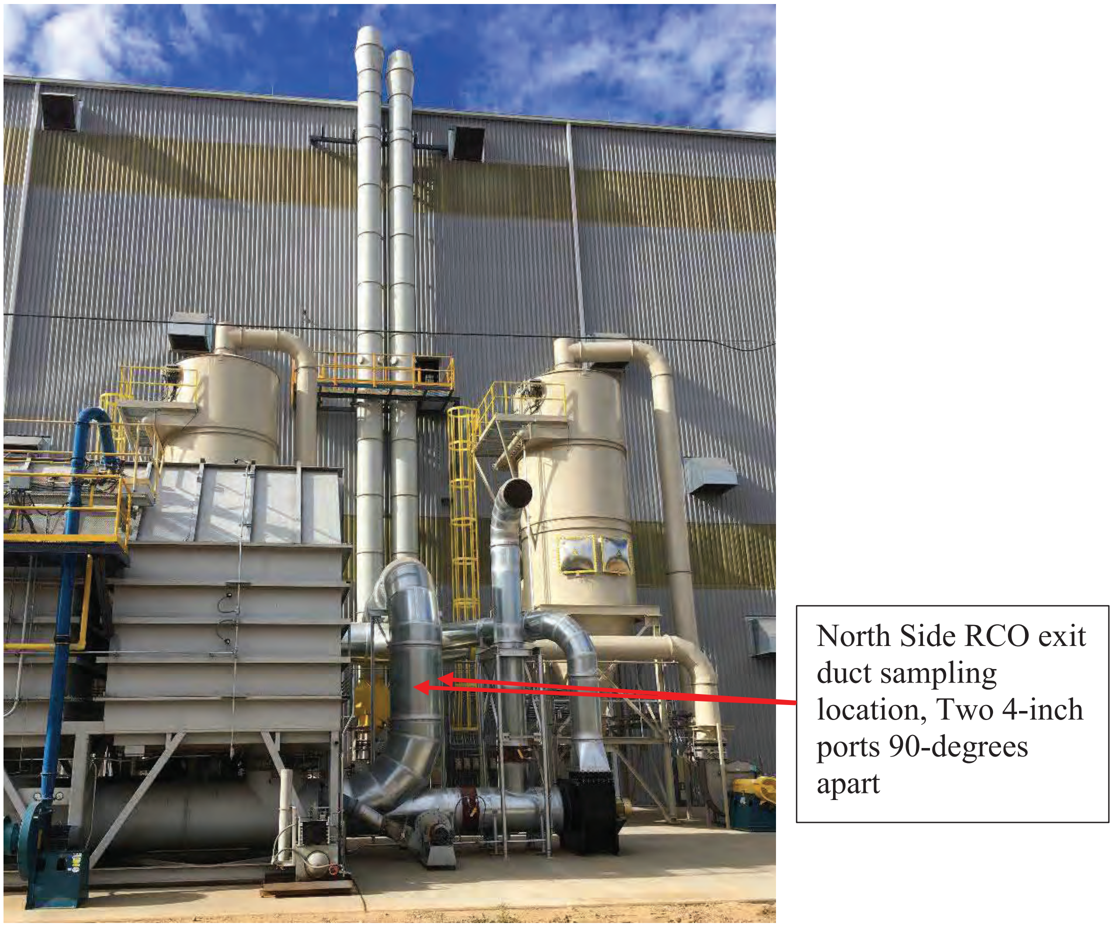

Figure 2-3. Vertical RCO 2 exit duct on the north side of the Pellet Cooler Building

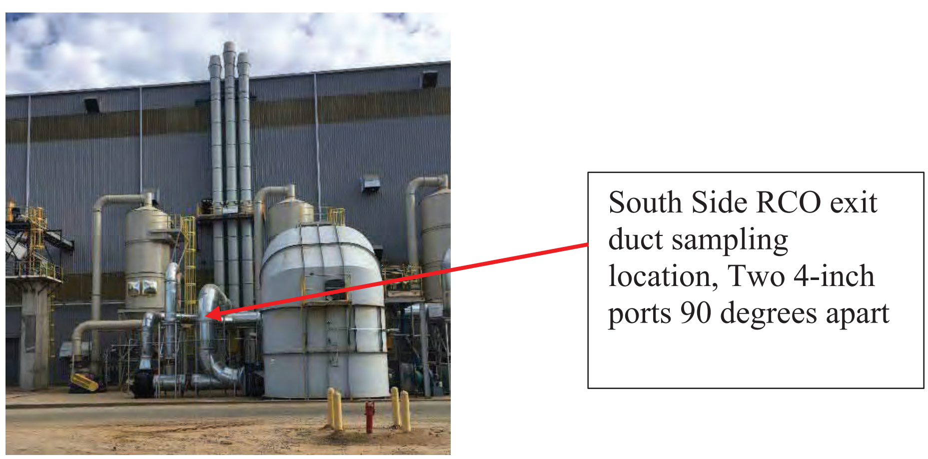

Figure 2-4. Vertical RCO 1 exit duct on the south side of the Pellet Cooler Building

The test crews at each of these two locations are shielded and sufficiently far from deflagration panels on the side walls of the fabric filters.

Due to the flow disturbances relatively close to the proposed sampling location, a total of 24 traverse points was used during the gas flow measurements.

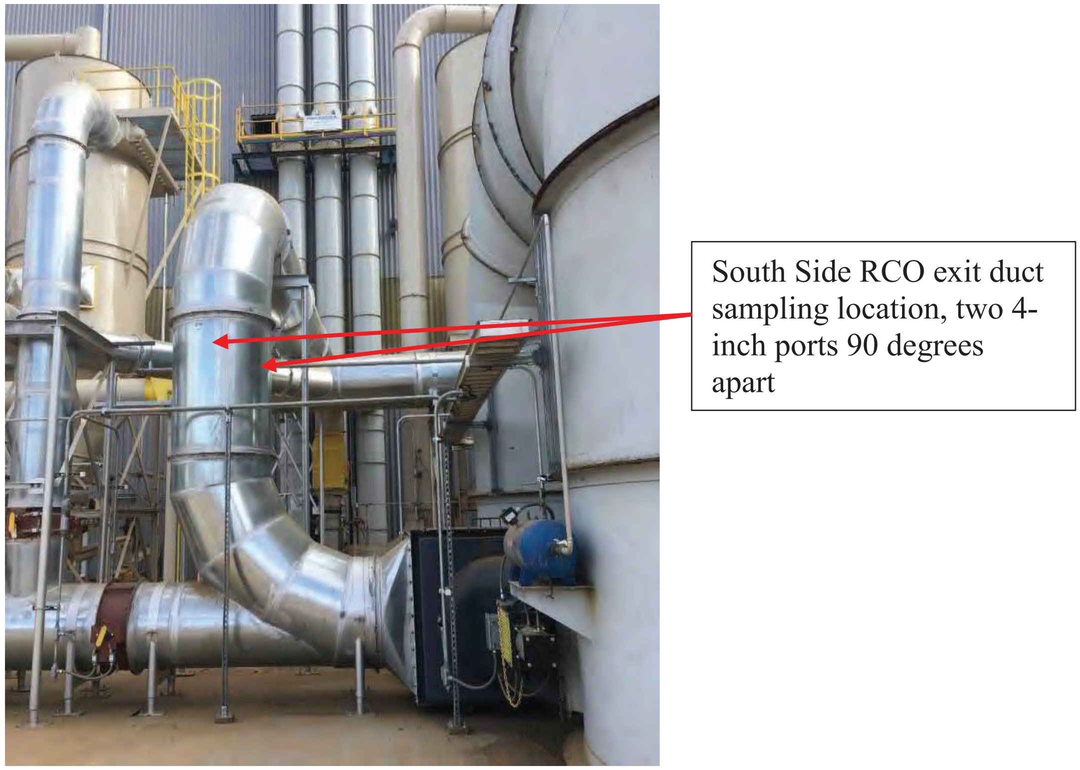

Figure 2-5. RCO 1 Exit Duct, South Side of the Pellet Cooler Building

2.2 Sampling Point Determination—EPA Method 1

The number and location of the traverse points used in the Method, 5/202 tests were determined according to the procedures outlined in U.S. EPA Reference Method 1. No traverse points were located within 1.0 inch of the stack wall.

2.3 Flue Gas Velocity and Volumetric Flow Rate—EPA Method 2

The flue gas velocity and volumetric flow rate during all of the emissions tests were determined according to the procedures outlined in U.S. EPA Reference Method 2. Velocity measurements were made using S-type Pitot tubes conforming to the geometric specifications outlined in Method 2. Accordingly, each Pitot tube was assigned a coefficient of 0.84. Velocity pressures were measured with fluid manometers. Effluent gas temperatures were measured with chromel-alumel thermocouples attached to digital readouts. A cyclonic flow check was performed at the sampling locations prior to testing.

2.4 Flue Gas Moisture Content—EPA Method 4

The flue gas moisture contents during each emissions test were determined in conjunction with each sampling train according to the sampling and analytical procedures outlined in EPA Method 4. The impingers were connected in series and contained reagents as listed in each of the method descriptions included in this protocol. The impingers were contained in an ice bath to assure condensation of the flue gas stream moisture. Any moisture that was not condensed in the impingers was captured in the silica gel; therefore, all moisture was weighed and entered into moisture content calculations.

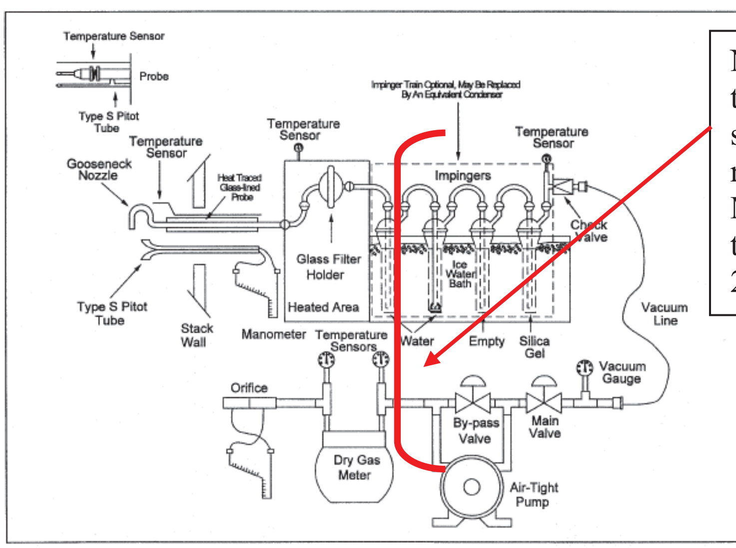
In addition to the Method 4 test results, Air Control Techniques, P.C. calculated the moisture content based on the average stack temperature at the sampling location. The calculated moisture content was compared with the measured value. The lower of the two moisture levels was used in the emission calculations.

2.5 Filterable and Condensable Particulate Matter—EPA Method 5 and Method 202

Air Control Techniques, P.C. used EPA Reference Methods 5 and 202 to determine filterable and condensable particulate matter emissions from the Dryer/RTO stack and from the Dry Hammermill stack. The testing was conducted in accordance with all applicable EPA sampling and quality assurance requirements. The test program consisted of a set of three one-hour test runs at both the Dryer/RTO Stack (S1) and the Dry Hammermill Stack (S3). The average of the three test runs at each source was computed.

Sample Collection—Samples were withdrawn isokinetically (100% ±10%) from the source using an EPA Method 5/202 sampling train. The duration of each test run was 60 minutes. The sampling train consisted of a stainless steel nozzle, a heated stainless steel lined probe with an S-type Pitot tube attached, a heated Method 5 filter, the Method 202 sampling train, and a metering console. The filterable particulate matter samples were collected on a glass fiber filter supported by a Teflon frit.

The Method 5 sampling train is shown in Figure 2-6. The four impingers used in the Method 4 moisture measurements were replaced with the Method 202 sampling train shown in Figure 2-7. A temperature sensor (not shown in Figure 2-3) was inserted into the filter housing in direct contact with the gas stream exiting the Method 5 filter.



Note: "Back half of the Method 5 sampling train was replaced with the Method 202 sampling train shown in Figure 2-7

Figure 2-6. Method 5 Sampling Train
(From Figure 5-1 of U.S. EPA Method 5, 40 CFR Part 60, Appendix A)

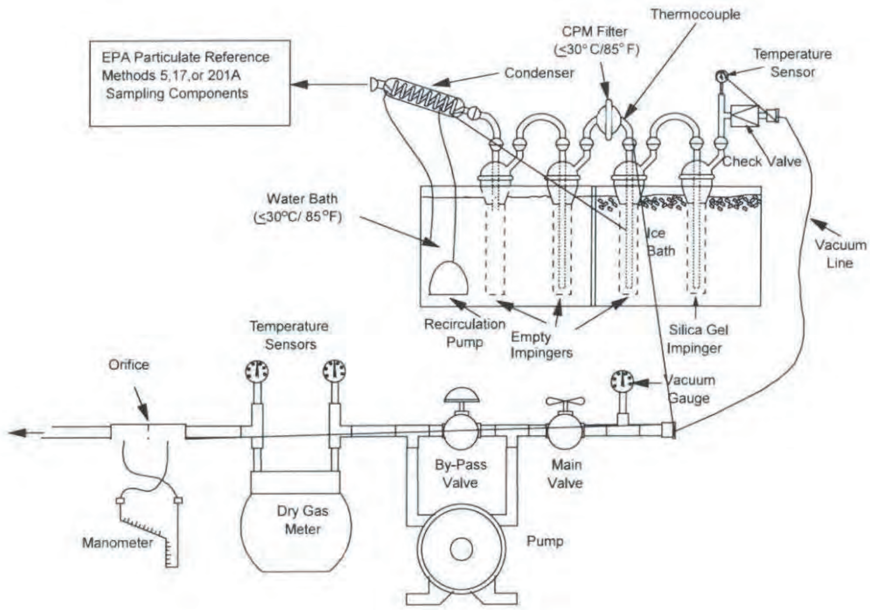


Figure 2-7. Method 202 Sampling Train Following the Method 5 Filter and Before Gas Stream Entry to the Main Valve and Dry Gas Meter

The EPA Method 202 sampling train included a water-cooled indirect heat exchanger, a knock-out impinger, an impinger that was initially dry, a Teflon membrane filter (CPM filter), and a pre-weighed silica gel impinger.

The initial knockout impinger and the initially dry impinger were maintained in a water bath at 65-85°F. The sample gas stream exiting the second impinger and entering the filter were at or below 85°F. Following each test run, the sampling train was purged with ultra-high purity nitrogen at a rate of 14 liters per minute for one hour to remove dissolved sulfur dioxide and other soluble gases.

Sample Recovery—The Method 5 filter was removed from the filter holder and placed in a uniquely identified petri dish. The petri dish was sealed for transport to the laboratory. Each impinger was weighed prior to and at the conclusion of each run. The weight gain due to moisture in the gas stream was summed and entered into moisture content calculations in accordance with EPA Reference Method 4. The nozzle, probe, and front half of the filter holder were rinsed and brushed with acetone and collected in a labeled glass jar.

The condenser, impingers, connecting glassware and front half of the CPM filter holder were rinsed with water and added to the collected purged water sample. All components were then rinsed with acetone and hexane and collected in a separate glass jar. The CPM filters were placed in uniquely identified petri dishes.

Sample Analysis - EPA Method 5 analytical procedures were used to analyze the filters and front-half acetone rinses for filterable particulate matter.

EPA Method 202 analytical procedures were used to analyze the back-half of the sampling train. The CPM filters were extracted with water and hexane. The inorganic extraction solvent rinses (water) were added to the collected water samples. The organic extraction solvent rinses (hexane) were added to the collected acetone/hexane rinse samples. The water samples were extracted with hexane, and the extraction solvent was combined with the acetone/hexane rinses. The organic fractions (acetone/hexane rinses and the hexane extraction solvent) were evaporated to dryness, desiccated, and weighted until consecutive weights agreed within ±0.5 mg. The inorganic fractions (water samples) were evaporated to near dryness and resuspended in 50 mL of deionized water. The sample was then titrated to a neutral pH using sodium hydroxide, evaporated to dryness, desiccated, and weighed until consecutive weights agree within ±0.5 mg. The total catch reported for each run was the sum of the organic and inorganic catches minus the field train blank catch weight or 2.0 mg, whichever was less.

As part of the Method 202 tests, Air Control Techniques, P.C. collected reagent blanks of the acetone, hexane, and deionized water used as rinse solvents. Air Control Techniques, P.C. also prepared and analyzed a field recovery blank and a proof blank. The field recovery blank and the proof blank were charged with 100 milliliters of degassed deionized water and assembled and recovered with components that had collected at least one test run.

2.6 Oxygen/Carbon Dioxide, Nitrogen Oxides, Carbon Monoxide, and Volatile Organic Compounds—EPA Methods 3A, 7E, 10, 18, and 25A

The sampling and analytical procedures for O_2/CO_2, CO, VOCs, and NOx at the Dryer/RTO Stack (S1) and for O2/CO2 and VOC at the Dry Hammermill Stack (S3) were conducted in accordance with EPA Methods 3A, 7E, 10, and 25A. The measurement system consisted of a sample acquisition system, the individual gas analyzers, and a data acquisition system (DAS).

The sample acquisition system included an in-stack probe, a heated out-of-stack glass mat filter for particulate matter removal, a condenser, and a sample line leading to the continuous emission monitors in the mobile laboratory. All components of the sample acquisition system that contacted the sampled gas were constructed of Type 316 stainless steel or Teflon®. The sampled gas was continuously extracted from a central point within the duct at a constant rate (±10%) for the duration of each test run. Figure 2-8 provides a drawing of the CEM sampling system.

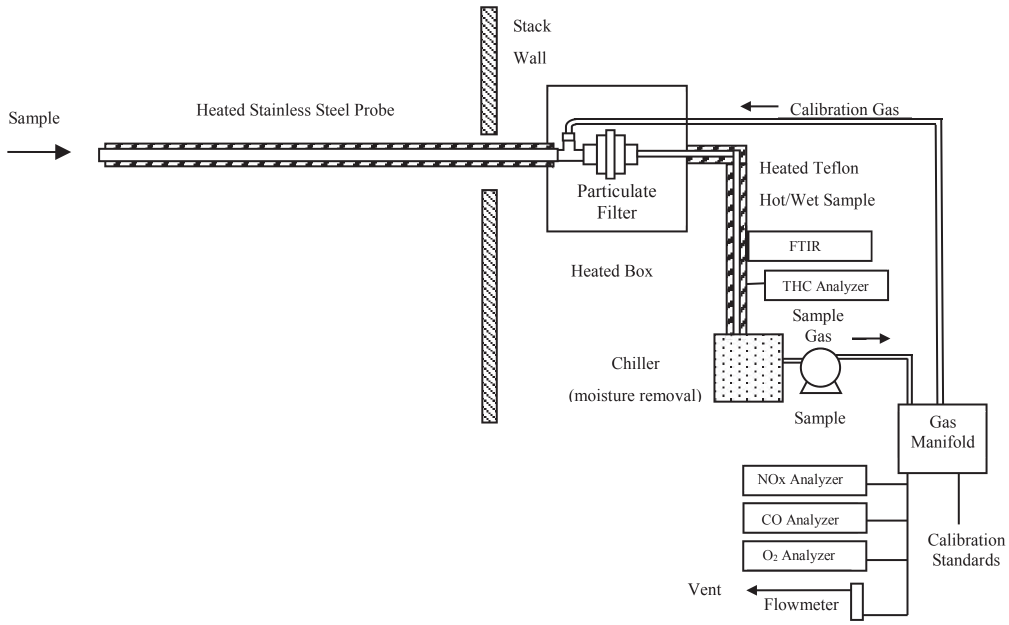

Figure 2-8. CEM Sampling System

A portion of the sample gas was routed through the distribution manifold board for delivery to the gas analyzers. The configuration of the sampling acquisition system allowed for the injection of gas standards directly to the analyzers or through the entire sampling system. All pretest and posttest calibration procedures were performed as outlined in the applicable EPA Reference Methods.

All of the gas standards were prepared according to the test methods using EPA Protocol procedures. Copies of the certificate of analysis documents for the gas standards used during the test program were available onsite and are provided in the emissions test report. The calibration gas concentrations are listed in Table 2-1 through 2-3. The analyzers used in this test program are listed in Table 2-4.

Table 2-1. Gas Cylinder Concentration Ranges, Dec. 4-5, 2018 Tests

Parameter	O_2, %	CO_2, %	CO, ppmvd	VOC, ppmvd as propane	NOx, Ppmvd
Zero Gas	0.0	0.0	0.0	0.0	0.0
Low-Level Gas	NA	NA	NA	30.07	NA
Mid-Level Gas	11.05	9.95	226.4	52.38	48.0
High-Level Gas	21.99	18.22	450	85.84	89.5
Calibration Span	21.99	18.22	450	100	89.5

Table 2-2. Gas Cylinder Concentration Ranges, January 16, 2019 Tests					
Parameter	O_2, %	CO_2, %	CO, ppmvd	VOC, ppmvd as Propane	NOx, Ppmvd
Zero Gas	0.0	0.0	0.0	0.0	0.0
Low-Level Gas	NA	NA	NA	25.5	NA
Mid-Level Gas	11.05	9.95	125.6	52.38	48.0
High-Level Gas	21.99	18.22	226.4	85.84	89.5
Calibration Span	21.99	18.22	450	100	89.5

Table 2-3. Gas Cylinder Concentration Ranges, March 7, 2019 Tests					
Parameter	O_2, %	CO_2, %	CO, ppmvd	VOC, ppmvd as Propane	NOx, ppmvd
Zero Gas	0.0	0.0	0.0	0.0	0.0
Low-Level Gas	NA	NA	NA	25.7	NA
Mid-Level Gas	11.05	10.0	46.1	50.2	49.8
High-Level Gas	21.8	18.2	89.5	85.8	89.5
Calibration Span	21.8	18.2	100	100	89.5

Table 2-4. Test Program Analyzers				
Analyte	Manufacturer	Model	Measurement Principle	Range
O_2	California Analytical	200	Paramagnetic	25 %
CO_2	California Analytical	200	Gas Filter Correlation NDIR	20 %
VOC	California Analytical	200M	Flame Ionization	100 ppm
NOx	Teledyne/API	T200H	Chemiluminescent	100 ppm
CO	Teledyne/API	300 EM	NDIR	500 ppm

The CO and NOx emissions were calculated on a pound per hour basis. The NOx emissions were calculated based on the molecular weight of NO2.

Outputs from the individual emission monitors were connected to a computerized data acquisition system. Outputs from the analyzer were sent to a portable computer via a National Instruments™ FieldPoint controller. The signals were downloaded to a STRATA© software program every two seconds. The two-second readings were averaged for the duration of the test run.

Prior to the start of the emission tests, Air Control Techniques, P.C. conducted a stratification test in accordance with Section 8.1.2 of U.S. EPA Method 7E at the dryer/RTO sampling location. Sampling was conducted for a duration that exceeded twice the maximum system response time at each point. The point-to-point variations did not differ from the mean concentration by more than ±5% or 0.5 ppm. Accordingly, the gas streams were classified as unstratified, and sampling was conducted at a single point.

2.7 FTIR Sampling System

Sample gas was continuously passed through a sampling system, which included an in-stack probe, a heated out-of-stack glass mat filter for particulate matter removal, a Teflon® heat-traced sample line, a MIDAC Fourier Transform Infrared (FTIR) spectrometer, a Teflon® heated-head pump, and a gas manifold board as shown in Figure 2-9. All components of the sample acquisition system that contacted the sampled gas were Type 316 stainless steel or Teflon®. All components of the sampling system and the FTIR cell were maintained at or above 180° C. Air Control Techniques, P.C. ensured that the sampling system contained no "cold spots" to prevent loss of the target analytes. The sampling rate was maintained at greater than 10 liters per minute.

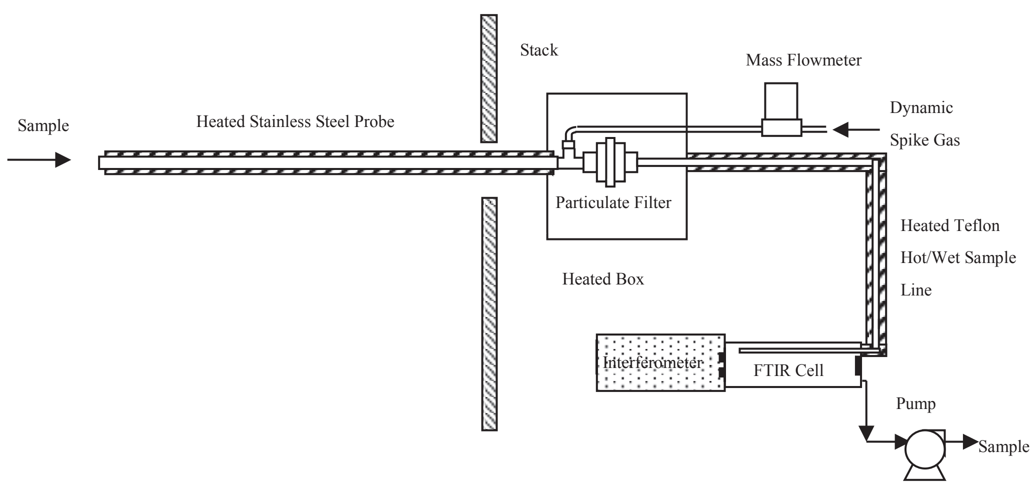

Figure 2-9. Method 320/321 Sampling System

The FTIR system included a MIDAC Corporation (Costa Mesa, CA) I-2001 spectrometer equipped with a heated, nominal 10-meter path absorption cell, a potassium bromide (KBr) beam splitter, zinc selenide (ZnSe) non-hygroscopic windows, and a liquid nitrogen-cooled Mercury Cadmium Telluride detector. Measurements were made using a MIDAC Model I-2001 high resolution Michelson interferometer with AutoQuant Pro V.4.0.0.136 software. Sampled gas was continuously passed through the sampling system, and sample spectra (based on 56 co-added interferograms) were recorded every minute. The system's nominal spectral resolution was 0.5 cm^{-1}. Samples and standards were analyzed at temperatures greater than 120°C and near ambient pressures.

The inside walls of the cells were polished stainless steel to minimize interaction of the sample with the cell walls, and the cell mirrors were bare gold. The gas pressure in the FTIR sample cell was monitored with a pressure transducer connected directly to the sample cell. The heated sample cell was wrapped in an insulating thermal jacket, and the temperature was controlled with type J thermocouples. The absorption cell volume was approximately 2 liters.

The FTIR system operated via a portable computer. A data archive storage system (USB Mass Storage Drive) was used for data backup. All interferograms, single beams, absorbance spectra, and background single beams were stored and archived. The Air Control Techniques, P.C. FTIR field operator documented the sampling parameters throughout the test program including the filename, time, cell pressure, cell temperature, spectra scan rate, corresponding background, and any relevant notes.

Spectral Analysis—Air Control Techniques used the program AutoquantPro™ Version 4.0.0.136 (©Midac Corporation) to collect and analyze all the infrared field data. The program allows the development and storage of analytical methods for analysis of spectral data (absorbance) files. The reference spectra used for these analyses were developed by MIDAC Corporation, EPA, and Air Control Techniques, P.C. One method for the task of determining the absorption path length and at least one additional method for determining the concentrations of the target compounds was developed for the test program.

Air Control Techniques, P.C. selected the analytical wavelengths and conducted analyses for analytical uncertainty and detection limit determination using reference spectra standards and prepared the computerized analytical programs for measuring HCl, methanol, formaldehyde, and acetaldehyde concentrations. The reference spectra used for these analyses were developed by EPA, Air Control Techniques, P.C., and the MIDAC Corporation. Prior to testing, an evaluation of possible analytical interferents (e.g., H2O, CO2, CO, pinenes) for the gas stream was determined. Reference spectra of the possible interferents were included in the modeling program to minimize analytical uncertainty and detection limits of the target compounds. Water spectra were recorded onsite with the FTIR instrument used for the field testing to simulate the actual gas stream moisture. The recorded water spectra were included as the primary spectra for modeling.

The sampling method was adjusted following the test program to minimize interferences, reduce the detection limits, and increase the measurement accuracy of the target compounds. The method adjustments included the addition of water spectra collected during the test program.

Minimum Detectable Concentrations—The practical minimum detectable concentration (MDC) is instrument, compound, and interference specific. The actual sensitivity of the FTIR measurement system for the individual target analytes depends upon the specific infrared absorptivity (signal) and wavelength, the analysis region for each target analyte, the amount of instrument noise, the concentration of unaccounted interfering compounds in the sample gas, and the amount of spectral overlap imparted by these compounds in the wavelength region(s) used for the quantification of the target analytes.

The detection limit is the lowest concentration of an analyte for which its overall fractional uncertainty is required to be less than its analytical uncertainty limit. The MDC was calculated based on the Standard Error of the Estimated Concentration, or SEC, also known as the Marginal Standard Deviation. The SEC is a measure of the residual spectrum after the scaled reference spectra have been removed from the sample spectrum. The remaining “residual noise” was referenced against each target compound reference spectrum again, and the resulting concentration is the SEC.

The SEC represents the uncertainty of the concentration values for the target analyte and is based on the error variance. The error variance for the case of a single reference spectrum is calculated as the square root of the sums of the squares of the residual spectrum (R) as shown in Equation 1, where *n* is the number of observations.

$$\sigma^2 = \frac{\sum_i R_i^2}{(n-1)} \qquad \text{Equation 1}$$

The SEC is calculated based on the error variance, the reference spectra concentration (C), and the spectrum (A).

$$SEC = \frac{\sigma\, C}{\sqrt{\sum_i \mathrm{A}_i^2}} \qquad \text{Equation 2}$$

The MDC values were calculated as two times the SEC, which provides greater than a 95% confidence interval.

Quality Assurance and Quality Control - A linearity test was performed on the detector. Calibration transfer standard (CTS) spectra were compared at three aperture settings. The CTS band areas agreed to within the uncertainty of the cylinder standard (±2%) and the RMSD noise in the system.

Air Control Techniques, P.C. conducted numerous on-site quality assurance checks including single beam backgrounds, CTS spectra tests, and dynamic analyte spiking. During testing, Air Control Techniques, P.C. conducted a quality assurance review of the spectral data. The review included visual inspection of the sample spectra against the reference spectra. Periodically, the target analyte concentrations were calculated separately and compared with the analytical results.

The FTIR extractive sampling system was leak checked from the probe to the pump outlet using a rotameter. A leak check was performed on the FTIR spectrometer cell under maximum vacuum and greater than ambient pressure for greater than two minutes. The cell leak was less than 4 percent of the cell volume.

Sample spectra were divided point-by-point by a 128-scan background recorded using UHP nitrogen. The single beam spectrum was constantly monitored, and a new background was generated at the beginning and end of each test day or if the signal transmittance (relative to the background) changed by 5 percent or more (absorbance = -0.02 to 0.02) in any analytical spectral region indicating component build-up on the optical surfaces or alignment-related baseline shifts.

CTS tests were performed prior to and following each test run. CTS spectra were collected at the sampling resolution using the same optical configuration as for sample spectra. A cylinder of 100.9 ppm ethylene in nitrogen served as the CTS. The CTS gas was introduced to the FTIR and allowed to reach steady state. The CTS was used to determine the effective cell path length based on comparisons of the "field" CTS spectra to a laboratory CTS spectrum recorded by MIDAC.

EPA Method 320, EPA Method 321, and the equivalent ASTM Standard D6348-03 specify several analytical uncertainty parameters that the analyst must calculate to characterize the FTIR system performance including root mean square (RMA) noise. The RMA noise is a measure of the instrument accuracy for the target analyte and is calculated as the root mean square deviation (RMSD) of the absorbance values in the analytical region(s) from the mean absorbance value in the same region(s). The RMSD in the noise should be less than one tenth of the minimum analyte peak absorbance of sample or MDC in the target analytical region.

3. SUMMARY AND DISCUSSIONS OF RESULTS

3.1 Dryer/RTO Test Results

Objectives and Test Matrix—The objective of the test program was to measure air emissions exiting the Dryer/RTO stack. A matrix of the test methods used in this test program is provided in Table 3-1.

Table 3-1. Dryer/RTO Tests

Stack	EPA Test Method	Target Analyte	Number of Runs	Run Times, Minutes	Analytical Measurement
S1 Dryer-RTO	Methods 1, 2, and 4	Stack Gas Volumetric Flow Rate	3	60	Velocity. Pressure, Gravimetric
	Method 3A	Oxygen and Carbon Dioxide	3	60	Paramagnetic and NDIR
	Method 5	Filterable Particulate Matter	3	60	Gravimetric
	Method 7E	Nitrogen Oxides as NO2	3	60	Chemiluminescence
	Method 10	Carbon Monoxide	3	60	NDIR
	Method 18	Methane	3	60	GC
	Method 25A	VOCs as Propane	3	60	FID
	Method 202	Condensable Particulate Matter	3	60	Gravimetric
	Method 320	Methanol, Formaldehyde, and Acetaldehyde	3	60	FTIR
	Method 321	HCl	3	60	FTIR

Summary of Results—The results of the particulate matter, VOC, CO, and NOx tests are summarized in Table 3-2. The VOC data are expressed as propane. The NOx data are expressed as NO2. Methane, a non-VOC compound detected by Method 25A, was measured using Method 18. All of the methane analyses were between the laboratory minimum detection limit and the limit of quantification. Accordingly, the methane data were considered to be negligible and were not subtracted from the Method 25A VOC data.

Table 3-2. Test Results Summary, Dryer/RTO Stack				
Parameter	Run 1	Run 2	Run 3	Average

NOx Concentration, ppm_{vd}	38.5	34.4	32.6	35.2
Emissions, Lbs./hour as NO_2	20.6	17.6	17.3	18.5
Emission Rate, Lbs. NO_2/ODT	0.31	0.27	0.27	0.28

[1] All methane analyses were between the laboratory minimum detection limit and the limit of quantification.

Table 3-3 presents the HAP emissions data measured in accordance with Methods 320 and 321. All concentrations are expressed on a ppm dry basis (ppmvd).

Table 3-3. HAP Test Results, Dryer/RTO Stack

Parameter	Run 1	Run 2	Run 3	Average
Test date	12/5/2018	12/5/2018	12/5/2018	N/A
Test time	8:40-9:47	10:47-11:57	12:15-13:27	N/A
Production Rate, ODT/hour	67.0	64.1	64.7	65.3
Methanol Emissions				
Concentration, ppm_{vd}	0.0	0.0	0.0	0.0
Emission Rate, Lbs./hour	0.0	0.0	0.0	0.0
Emission Lbs./ODT	0.0	0.0	0.0	0.0
Formaldehyde Emissions				
Concentration, ppm_{vd}	0.97	0.98	0.89	0.95
Emission Rate, Lbs./hour	0.34	0.33	0.32	0.33
Emission Lbs./ODT	0.0051	0.0052	0.0049	0.0050
Acetaldehyde Emissions				
Concentration, ppm_{vd}	0.0	0.0	0.0	0.0
Emission Rate, Lbs./hour	0.0	0.0	0.0	0.0
Emission Lbs./ODT	0.0	0.0	0.0	0.0
HCl Emissions				
Emission Factor, ppm_{vd}	0.0	0.0	0.0	0.0
Emission Rate, Lbs./hour	0.0	0.0	0.0	0.0
Emission Lbs./ODT	0.0	0.0	0.0	0.0
Total HAP Emissions				
Emission Rate, Lbs./hour, 4 analytes	0.34	0.33	0.32	0.33
Emission Lbs./ODT	0.0051	0.0052	0.0049	0.0050

All of the HAPs emissions were low as expected due to the high operating temperature of the RTO.

3.2 Dry Hammermill Test Results

Objectives and Test Matrix—The objective of the test program was to measure air emissions exiting the Dry Hammermill Stack (S3). A matrix of the test methods used in this test program is provided in Table 3-4

Table 3-4. Dry Hammermill Stack Tests

Stack	EPA Test Method	Target Analyte	Number of Runs	Run Times, Minutes	Analytical Measurement
S3 DHM	Methods 1, 2, and 4	Stack Gas Volumetric Flow Rate	3	60	Velocity. Pressure, Gravimetric
	Method 3A	Oxygen and Carbon Dioxide	3	60	Paramagnetic and NDIR
	Method 5	Filterable Particulate Matter	3	60	Gravimetric
	Method 25A	VOCs as Propane	3	60	FID
	Method 202	Condensable Particulate Matter	3	60	Gravimetric
	Method 320	Methanol, Formaldehyde, and Acetaldehyde	3	60	FTIR
	Method 321	HCl	3	60	FTIR

Summary of Test Results—The results of the tests conducted at the dry hammermill stack (S3) are summarized in Tables 3-5 and 3-6.

Table 3-5. Test Results Summary, DHM Stack

Parameter	Run 1	Run 2	Run 3	Average
Test date	12/4/2018	12/4/2018	12/4/2018	N/A

3.3 RCO 1 and RCO 2 Test Results

Objectives and Test Matrix—The objective of the test program was to measure air emissions exiting the Pellet Cooler Stacks S5 and S6. A matrix of the test methods used in this test program is provided in Table 3-7

Table 3-7. RCO 1 and RCO 2 Tests

Stack	EPA Test Method	Target Analyte	Number of Runs	Run Times, Minutes	Analytical Measurement
S5 and S6 Pellet Coolers	Methods 1, 2, and 4	Stack Gas Volumetric Flow Rate	3	60	Velocity. Pressure, Gravimetric
	Method 3A	Oxygen and Carbon Dioxide	3	60	Paramagnetic and NDIR
	Method 5	Filterable Particulate Matter	3	60	Gravimetric
	Method 7E	Nitrogen Oxides	3	60	Chemiluminescent
	Method 10	Carbon Monoxide	3	60	Infrared
	Method 18	Methane	3	60	GC
	Method 25A	VOCs as Propane	3	60	FID
	Method 202	Condensable Particulate Matter	3	60	Gravimetric
	Method 320	Methanol, Formaldehyde, and Acetaldehyde	3	60	FTIR
	Method 321	HCl	3	60	FTIR

The results of the tests conducted on the RCO 1 Stack on March 7, 2019 are summarized in Tables 3-8 and 3-9. The VOC, CO, and NOx data are expressed on a ppm dry basis. The VOC data are on a propane basis. The NOx data are on a NO2 basis.

Methane, a non-VOC compound detected by Method 25A, was measured using Method 18. All of the methane analyses were between the laboratory minimum detection limit and the limit of quantification. Accordingly, the methane data were considered to be negligible and were not subtracted from the Method 25A VOC data.

Table 3-9 presents the RCO 1 HAP emissions data measured in accordance with Methods 320 and 321. All concentrations are expressed on a ppm dry basis. All of the HAP concentrations were below the detection limits of Method 320 and 321.

Table 3-9. HAP Test Results, RCO 1, Pellet Cooler Stack S5				
Parameter	Run 1	Run 2	Run 3	Average

The results of the tests conducted on the RCO 2 Stack on January 16, 2019 are summarized in Tables 3-10 and 3-11. These tables summarize the data from Runs 3, 4, and 5. The data from Runs 1 and 2 were voided due to post-test leak check problems caused by the difficulty of moving the sampling train in a very space-constrained and awkwardly located sampling port. The data from Runs 1 and 2 are provided in Appendix IIA.

The VOC, CO, and NOx data are expressed on a ppm dry basis. The VOC data are on a propane basis. The NOx data are on a NO_2 basis.

Table 3-10. Test Results Summary, RCO 2, Pellet Cooler Stack S6				
Parameter	Run 3	Run 4	Run 5	Average

Methane, a non-VOC compound detected by Method 25A, was measured using Method 18. All of the methane analyses were between the laboratory minimum detection limit and the limit of quantification. Accordingly, the methane data were considered to be negligible and were not subtracted from the Method 25A VOC data.

There were four process-related interruptions during Run 5. The data summarized in Tables 3-10 and 3-11 include only periods when the process was operating at the indicated production rate.

Table 3-11 presents the HAP emissions data measured in accordance with Methods 320 and 321. All concentrations are expressed on a ppm dry basis.

Table 3-11. HAP Test Results, RCO 2, Pellet Cooler Stack S6

4.0 QUALITY ASSURANCE AND QUALITY CONTROL

4.1 Particulate Matter Tests, Methods 5 and 202

The Method 5/202 tests met all of the EPA quality assurance requirements. As indicated in Tables 4-1 through 4-4, the isokinetic sampling rates were well within the 90% to 110% range. The sampling train post leak checks were all zero at vacuums that exceeded the maximum run vacuum. The probe, filter, impinger exit, and CPM filter temperatures were all consistent with the EPA methods. The measured cyclonic flow angle in the dryer stack was 0.83 degrees—well within the less than 20 degree requirement specified in Method 1.

Table 4-1. Method 5/Method 202 Quality Assurance Objectives and Results, Dryer/RTO Stack S1

Parameter	Objectives	Test Run Values		
		Run 1	Run 2	Run 3
Number of traverse points	Method 1 criteria 24 points	24	24	24

Parameter	Objectives	Test Run Values		
		Run 3	Run 4	Run 5
Number of traverse points	Method 1 criteria, 24 points	24	24	24
Sample volume	>30 DSCF	44.807	45.544	43.969
Isokinetic sampling rate	90-110%	102.5	102.5	102.8
Post test sample train leak check	<0.02 DSCF or 4% at maximum run vacuum	0 @ 7	0 @ 12	0 @8
Probe temperatures	248±25°F	255-262	250-258	254-260
Filter temperatures	248±25°F	246-257	251-259	245-260
Maximum Impinger exit temperatures	<68°F	60	55	48
CPM filter exit temperature	65-85°F	75	77	75
Cyclonic flow angle	<20 degrees	2.71		

Method 202 Blanks—The Method 202 blank sample data for each of the three test periods are summarized in Table 4-5.

Table 4-5. Method 202 Blank Sample Analyses			
Sample	Milligrams		
	December 4-5	January 16	March 7
Proof Blank	1.4	1.8	1.2
Field Blank	1.9	2.0	1.1
Acetone Reagent	0.0 in 184 ml	0.2 in 196 ml	0.0 in 144 ml
Deionized Water	0.0 in 200 ml	0.6 in 200 ml	0.0 in 146 ml
Hexane Reagent	0.2 in 154 ml	0.5 in 190 ml	0.0 in 70 ml

All of the reagents used in the January 16, 2019 RCO 2 tests were slightly above the 1.0 ppm by weight value specified in Method 202. This was discussed with the laboratory. They indicated that these reagent blank values are in the same range as those in tests conducted by their other emission testing clients.

S-Type Pitot Tube Calibration—All S-Type Pitot tubes used in this project conformed to EPA guidelines concerning construction and geometry. Pitot tubes were inspected prior to use, and a Pitot tube coefficient of 0.84 was used.

Sample Nozzle Calibration—Glass nozzles were used for isokinetic sampling on the combined Method 5/Method 202 sampling trains. All nozzles were thoroughly cleaned, visually inspected, and calibrated according to the procedure outlined in Section 3.4.2 of EPA Publication No. 600/4-77-027b.

Temperature Monitor –The thermocouples used in this project was calibrated using the procedures described in Section 3.4.2 of EPA Publication No. 600/4-77-027b. Each temperature sensor was calibrated at a minimum of three points over the anticipated range of use against an NIST-traceable mercury in glass thermometer.

Dry Gas Meter Calibration—The dry gas meter was fully calibrated to determine the volume correction factor prior to field use. Post-test calibration checks were performed as soon as possible after the equipment has been returned to the shop. Pre-and post-test calibrations agreed within ±5 percent. The calibration procedure is documented in Section 3.3.2 of EPA Publication No. 600/4-77-237b.

Moisture Scale Calibration—The scale used at the test location to determine flue gas moisture content was calibrated using a standard set of weights.

4.2 Oxygen, Carbon Dioxide, Nitrogen Oxides, Volatile Organic Compound and Carbon Monoxide Tests, Methods 3A, 7E, 10, and 25A

Dryer/RTO Stack S1—Oxygen, carbon monoxide, nitrogen oxides, volatile organic compounds, and carbon monoxide were determined using EPA Methods 3A, 7E, 10, and 25A. These tests met all of the EPA quality assurance requirements for these methods. The quality assurance data are summarized in Tables 4-6 through 4-10 for the Dryer/RTO stack S1.

4.3 HAPs Tests, Method 320 and Method 321

Air Control Techniques, P.C. performed daily quality assurance checks. Background scans and calibration transfer standard (CTS) spectra tests were performed prior to and following each test series. An analyte spike was performed using a methanol/SF_6 calibration standard.

The flow rate at the outlet of the pump was measured while the probe was plugged to verify that the sampling system was leak free. The flow rate was less than 200 ml/min. The FTIR cell was tested for leaks by closing the value while the cell was at minimum absolute pressure. The cell pressure remained constant for at least two minutes.

Background Spectra—Sample spectra were divided point-by-point by a 128-scan background recorded using nitrogen. The single beam spectrum was constantly monitored, and a new background was generated at the beginning and end of each test day or when residual and absorbance spectra indicated component build-up on the optical surfaces or alignment-related baseline shifts.

Calibration Transfer Standards and Absorption Path Lengths—A cylinder of 99.79 ppm ethylene in nitrogen served as the CTS. A CTS gas was introduced to the FTIR and allowed to reach steady state. The CTS was used to determine the effective cell path length based on comparisons of the “field” CTS spectra to a laboratory CTS spectrum recorded by MIDAC. As shown in Table 4-24, the maximum path length deviation was less than 5% of the average during the test program.

Table 4-24. CTS Results Summary							
Source	Date	Time	CTS (m)	Cell Pressure (psi)	Cell Temp (°C)	Deviation from Previous	Deviation from Average
Dry Hammermill	12/4/18	0736	8.19	14.42	181	NA	0.1%
	12/4/18	1459	8.20	14.37	181	-0.1%	-0.1%
Dryer/RTO	12/5/18	736	8.034	14.490	181	NA	0.1%
	12/5/18	1403	8.055	14.43	181	-0.3%	-0.1%
Pellet Cooler RCO 1	3/7/19	748	8,12	14.86	181	NA	0.0
Pellet Cooler RCO 2	1/15/19	730	7.98	14.70	181	NA	0.0

Minimum Detectable Concentration—EPA Method 320 and the equivalent ASTM Standard D6348-03 specify a number of analytical uncertainty parameters that the analyst may calculate to characterize the FTIR system performance. Emissions were calculated using the detection limit for this run. The MDL were calculated as follows.

$$\text{MDL (ppm)} = \text{SEC x 2}$$

Analytes with a SEC value that is twice the measured concentration are classified as a non-detectable concentration, and the reported value is 0.0. The MDL values for each test are listed in Appendix C of each of the three appendices.

QA Review—An analysis of possible analytical interferents (e.g., H_2O, CO_2, CO, pinenes) for this gas stream was determined prior to the test program. Reference spectra of the possible interferents were entered into the modeling program to minimize analytical uncertainty and detection limits of the target compounds.

Water spectra were recorded onsite with the FTIR instruments that were used for the field testing to simulate the actual gas stream moisture. The recorded water spectra were included as the primary spectra for modeling.

APPENDIX I-A
Method 5-Method 202 Data Sheets

Method 1 - Air Control Techniques, P.C.

Date: 12/3/2018

Client	Enviva
Job #	2333
Plant Name	Enviva, Greenwood
City, State	Greenwood, SC
Sampling Location	RTO Dryer
No. of Ports Available	4
No. of Ports Used	4
Port Inside Diameter, Inches	4
Distance From Far Wall To Outside Of Port, Inches	106
Nipple Length And/Or Wall Thickness, Inches	6
Depth Of Stack Or Duct, Inches	100
Stack Or Duct Width (if rectangular), Inches	
Equiv. Diameter = 2DW/(D+W), Inches	
Stack/Duct Area, Square Feet (πR^2 or L x W)	54.542

ANALYTICAL REPORT

CLIENT: AIR CONTROL TECHNIQUES, INC.

PROJECT: 2333

ANALYTICAL SERVICES PROVIDED:

- FILTERABLE & CONDENSIBLE PARTICULATE MATTER
  (EPA METHOD 5/202)

Confirmation of Data Review:

The analytical data and results provided in this report have been checked thoroughly for accuracy, has been performed and validated in accordance with the approved methods, and relate only to the samples provided for this project report.

The results contained herein shall not be reproduced except in full, without written approval of Resolution Analytics.

Date of Review: December 16, 2018

Analytical Narrative

Sample Matrix & Components:

Dry Filters, Front½ Acetone Rinses, Acetone Blank

Summary of Sample Prep:

The acetone rinses were transferred to pre-tared teflon "baggies" in a low humidity environment. The acetone rinses were evaporated then desiccated for 24 hours, after which time they were weighed daily every six hours until consecutive weights agreed within ±0.5 mg. The filters were baked 2 to 3 hours at 105° C, cooled in a desiccator and weighed.

All weights were recorded to the nearest 0.1 mg and include filterable particulate catch only. The total catch reported for each run is a sum of the filter and rinse catches. The acetone blank catch has been subtracted from sample rinse catches in proportion with their respective volumes.

Summary of Instrumentation:

Denver model Pinnacle Series analytical balance

Analytical Detection Limit(s): 0.1 mg per fraction

Miscellaneous Comments Regarding Sample Analysis: **(Note unusual catch weights, interferences, odd sample behavior, and steps taken to confirm unusual results. Also note any deviations from standard analytical procedures, together with justification and possible affect on results. Specify samples when applicable.)**

No modifications to EPA Method 5 analytical procedure were made. See data sheets for individual sample descriptions.

Analytical Narrative

Sample Matrix & Components:

H_2O liquid impinger samples, organic impinger rinses, CPM filter, reagent blanks

Summary of Sample Prep and Analysis:

The samples were received in the lab at a temperature of less than 85° F, and logged in our custody records. The teflon filters were each sonicated/extracted 3 times with DI H_2O, then 3 times with hexane. The extract was added to the appropriate sample fraction. The impinger contents were extracted 3 times with hexane and the extracts were combined with the organic rinses, then evaporated in pretared teflon baggies. The water fraction was evaporated in pretared teflon baggies to near dryness at 105° C, then at ambient until completely dry. When needed, the water fractions were resuspended in 50 mls DI H_20, titrated with 0.1 N NH_4OH until acid neutralization, and then evaporated using the same procedure as before. Samples were then desiccated for 24 hours and weighed at a minimum of 6 hour intervals to constant weight. All weights were recorded to the nearest 0.1 mg. Where field blanks have been provided, samples have been blank corrected up to a maximum of 2.0 mg.

Summary of Instrumentation:

Denver model Pinnacle Series analytical balance

Analytical Detection Limit(s): 0.1 mg per fraction

Miscellaneous Comments Regarding Sample Analysis: (Note unusual catch weights, interferences, odd sample behavior, and steps taken to confirm unusual results. Also note any deviations from standard analytical procedures, together with justification and possible affect on results. Specify samples when applicable).

No modifications to M202 analytical procedure were made. See data sheets for individual sample notes and comments.

800-1 Capitola Drive Durham, NC 27713-4385

I certify that to the best of my knowledge all analytical data presented in this report:

- Have been checked for completeness
- Are accurate, error-free, and legible
- Have been conducted in accordance with approved protocol, and that all deviations and analytical problems are summarized in the appropriate narrative(s)

This analytical report was prepared in Portable Document Format (.PDF) and contains ??? pages.

Report Issued: xx/xx/xxxx

Narrative Summary

ENTHALPY
ANALYTICAL

Enthalpy Analytical Narrative Summary

Company	Air Control Techniques PC
Job #	1218-052 - EPA Method 18 (Bags)
Client #	2333

Custody	Matthew St. Lawrence of Enthalpy Analytical, LLC received the samples on 12/7/18 at ambient temperature after being relinquished by Air Control Techniques, PC. The samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, LLC.
Analysis	The samples were analyzed for methane using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A). The standards and samples were analyzed following the procedures specified in section 8.2.1, Integrated Bag Sampling and Analysis. All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. Methane was referenced to certified gas phase standards. The analyses were performed using the Agilent Technologies Model 6890N Gas Chromatograph "Betty" (S/N US10430048) equipped with a Flame Ionization Detector.
Calibration	The calibration curves are located in the Raw Data section of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.
Chromatographic Conditions	The acquisition method GC142P133_CAL.M is included in the Raw Data section of this report.

ENTHALPY ANALYTICAL

Enthalpy Analytical Narrative Summary
(continued)

QC Notes	As required by the method, a recovery study was performed on a bag sample. The bag sample ***S1-M18-1*** was spiked on 12/7/18 at 12:25 PM. The recovery efficiency value met the method-required limits of 70 to 130%. The recovery efficiency value was used to adjust the results following equation 18-7 of Method 18. The analysis of the laboratory method blank did not contain methane at a concentration greater than the detection limit.
Reporting Notes	These analyses met the requirements of the TNI Standard. Any deviations from the requirements of the reference method or TNI Standard have been stated above. The results presented in this report are representative of the samples as provided to the laboratory.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, LLC data reports, unless specifically noted otherwise.

- Any analysis which refers to the method as ***"Type"*** represents a planned deviation from the reference method. For instance a Hydrogen Sulfide assay from a Tedlar bag would be labeled as "EPA Method 16-Type" because Tedlar bags are not mentioned as one of the collection options in EPA Method 16.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.

- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.

- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.

- The letter ***J*** in the Qualifier or Flag column in the results indicates that the value is between the MDL and the LOQ. The laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.

- The letter ***E*** in the Qualifier or Flag column indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.

- Sample results are presented 'as measured' for single injection methodologies, or an average value if multiple injections are made. If all injections are below the MDL, the sample is considered non-detect and the ND value is presented. If one, but not all, are below the MDL, the MDL value is used for any injections that are below the MDL. For example, if the MDL is 0.500 and LOQ is 1.00, and the instrument measures 0.355, 0.620, and 0.442 - the result reported is the average of 0.500, 0.620, and 0.500 - - - i.e. 0.540 with a J flag.

- When a spike recovery (Bag Spike, Collocated Spike Train, or liquid matrix spike) is being calculated, the native (unspiked) sample result is used in the calculations, as long as the value is above the MDL. If a sample is ND, then 0 is used as the native amount (not the MDL value).

- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.

- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. The MS analysis indicates what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).

ENTHALPY
ANALYTICAL

General Reporting Notes
(continued)

- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as a MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.

- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).

- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.

- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two spikes are retained as LCSs. The LCSs are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection, and/or sample transport.

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits. In the case of small numbers, generally 3 significant figures are presented, but still only 2 should be used with confidence. Many neat materials are only certified to 3 digits, and as the mathematically correct final result is always 1 digit less than all its pre-cursors - 2 significant figures are what are most defensible.

- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations on sample chromatograms, if provided in the report. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name on the chromatogram.

Calibration Table

===

Calib. Data Modified : 3/20/2018 2:56:30 PM

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 1.000 %
Abs. Non-ref. Window : 0.000 min
Uncalibrated Peaks : using compound Propane
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID2 B,

Calibration Table

General Calibration Setting

Calib. Data Modified : 2/22/2018 9:12:06 AM
Signals calculated separately : No

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 1.000 %
Abs. Non-ref. Window : 0.000 min
Uncalibrated Peaks : using compound Propane
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal Details

Signal 1: FID2 B,

CERTIFICATE OF ANALYSIS
Grade of Product: EPA Protocol

Part Number:	E03NI79E15A0088	Reference Number:	122-401268406-1
Cylinder Number:	EB0066823	Cylinder Volume:	151.0 CF
Laboratory:	124 - Durham (SAP) - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22018	Valve Outlet:	590
Gas Code:	CO2,O2,BALN	Certification Date:	Aug 06, 2018

Expiration Date: Aug 06, 2026

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.
Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
CARBON DIOXIDE	10.00 %	9.952 %	G1	+/- 0.6% NIST Traceable	08/06/2018
OXYGEN	11.00 %	11.05 %	G1	+/- 0.4% NIST Traceable	08/06/2018
NITROGEN	Balance

Fill Date: 12/16/2016
Part Number: NI CO450E-AS
Lot Number: 304513351605
Cylinder Style & Outlet: AS CGA 350
Cylinder Pressure & Volume: 2000 psig 140 cu. ft.

Certified Concentration:

Expiration Date:	12/21/2024	NIST Traceable
Cylinder Number:	CC109287	Analytical Uncertainty:
450 ppm	CARBON MONOXIDE	± 0.7 %
Balance	NITROGEN	

Certifcation Information: Certification Date: 12/21/2016 Term: 96 Months *Expiration Date:* 12/21/2024

This cylinder was certified according to the 2012 EPA Traceability Protocol, Document #EPA-600/R-12/531, using Procedure G1. Do Not Use this Standard if Pressure is less than 100 PSIG.

Analytical Data: *(R=Reference Standard, Z=Zero Gas, C=Gas Candidate)*

1. Component: CARBON MONOXIDE

Requested Concentration: 450 ppm
Certified Concentration: 450 ppm
Instrument Used: HORIBA VIA-3000 S/N Y9EY78L6
Analytical Method: NDIR
Last Multipoint Calibration: 12/7/2016

Reference Standard Type: GMIS
Ref. Std. Cylinder #: CC118336
Ref. Std. Conc: 398 PPM
Ref. Std. Traceable to SRM #: 1680b
SRM Sample #: 2-J-49

CERTIFICATE OF ANALYSIS

Grade of Product: EPA Protocol

Part Number:	E02NI99E15A0930	Reference Number:	122-401180045-1
Cylinder Number:	CC57597	Cylinder Volume:	144.4 CF
Laboratory:	124 - Durham (SAP) - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22018	Valve Outlet:	350
Gas Code:	PPN,BALN	Certification Date:	Apr 17, 2018

Expiration Date: Apr 17, 2026

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
PROPANE	30.00 PPM	30.07 PPM	G1	+/- 0.7% NIST Traceable	04/17/2018
NITROGEN	Balance

DGM Serial Number	328893

Calibration Conditions			
Date	**Time**	01/04/19	8:30
Barometric Pressure		30.1	in Hg
Theoretical Critical Vacuum[1]		14.2	in Hg
Calibration Technician		JBG	

Factors/Conversions		
Std Temp	528	°R
Std Press	29.92	in Hg
K_1	17.647	oR/in Hg

[1]For valid test results, the Actual Vacuum should be 1 to 2 in. Hg greater than the Theoretical Critical Vacuum shown above.

[2]The Critical Orifice Coefficient, K', must be entered in English units, (ft3*oR1/2)/(in.Hg*min).

Method 5-Method 202 Data Sheet

Method 1 - Air Control Techniques, P.C.

Date: 1/16/2019

Client	Enviva
Job #	2333
Plant Name	Enviva, Greenwood
City, State	Greenwood, SC
Sampling Location	RCO 2

No. of Ports Available	2
No. of Ports Used	2
Port Inside Diameter, Inches	4
Distance From Far Wall To Outside Of Port, Inches	45
Nipple Length And/Or Wall Thickness, Inches	3
Depth Of Stack Or Duct, Inches	42
Stack Or Duct Width (if rectangular), Inches	
Equiv. Diameter = 2DW/(D+W), Inches	
Stack/Duct Area, Square Feet (π R^2 or L x W)	9.621

	Upstream	Downstream
Distance to Flow Disturbances, feet		
Diameters	0.0	0.0

Diameters			
Velocity	Up	Down	Particulate
12	>7.00	>1.75	12
12	6	1.5	16
16	5	1.25	20
16	2	0.5	24 or 25

Note: If more than 8 and 2 diameters and duct is greater than 12" and less than 24", use 8 or 9 points.

Point Location Data

Point	% of Duct Depth	Distance From Inside Wall	Distance From Outside of Port
1	2.1	0.882	3 7/8

Analytical Narrative

Sample Matrix & Components:

Dry Filters, Front½ Acetone Rinses, Acetone Blank

Summary of Sample Prep:

The acetone rinses were transferred to pre-tared teflon "baggies" in a low humidity environment. The acetone rinses were evaporated then desiccated for 24 hours, after which time they were weighed daily every six hours until consecutive weights agreed within ±0.5 mg. The filters were baked 2 to 3 hours at 105° C, cooled in a desiccator and weighed.

All weights were recorded to the nearest 0.1 mg and include filterable particulate catch only. The acetone blank catch has been subtracted from sample rinse catches in proportion with their respective volumes.

Summary of Instrumentation:

Denver model Pinnacle Series analytical balance

Analytical Detection Limit(s): 0.1 mg per fraction

Miscellaneous Comments Regarding Sample Analysis: **(Note unusual catch weights, interferences, odd sample behavior, and steps taken to confirm unusual results. Also note any deviations from standard analytical procedures, together with justification and possible affect on results. Specify samples when applicable.)**

No modifications to EPA Method 5 analytical procedure were made. See data sheets for individual sample descriptions.

Analytical Narrative

Sample Matrix & Components:

H_2O liquid impinger samples, organic impinger rinses, CPM filter, reagent blanks

Summary of Sample Prep and Analysis:

The samples were received in the lab at a temperature of less than 85° F, on ice in a cooler, and logged in our custody records. The teflon filters were each sonicated/extracted 3 times with DI H_2O, then 3 times with hexane. The extract was added to the appropriate sample fraction. The impinger contents were extracted 3 times with hexane and the extracts were combined with the organic rinses, then evaporated in pretared teflon baggies. The water fraction was evaporated in pretared teflon baggies to near dryness at 105° C, then at ambient until completely dry. When needed, the water fractions were resuspended in 50 mls DI H_20, titrated with 0.1 N NH_4OH until acid neutralization, and then evaporated using the same procedure as before. Samples were then desiccated for 24 hours and weighed at a minimum of 6 hour intervals to constant weight. All weights were recorded to the nearest 0.1 mg. Where field blanks have been provided, samples have been blank corrected up to a maximum of 2.0 mg.

Summary of Instrumentation:

Denver model Pinnacle Series analytical balance

Analytical Detection Limit(s): 0.1 mg per fraction

<u>Miscellaneous Comments Regarding Sample Analysis:</u> (Note unusual catch weights, interferences, odd sample behavior, and steps taken to confirm unusual results. Also note any deviations from standard analytical procedures, together with justification and possible affect on results. Specify samples when applicable).

No modifications to M202 analytical procedure were made. See data sheets for individual sample notes and comments.

I certify that to the best of my knowledge all analytical data presented in this report:

- Have been checked for completeness
- Are accurate, error-free, and legible
- Have been conducted in accordance with approved protocol, and that all deviations and analytical problems are summarized in the appropriate narrative(s)

This analytical report was prepared in Portable Document Format (.PDF) and contains 78 pages.

Narrative Summary

ENTHALPY
ANALYTICAL

Enthalpy Analytical Narrative Summary

Company	Air Control Techniques, P.C.
Analyst	NBT
Parameters	EPA Method 18 Bags

Client #	2333
Job #	0119-087
# Samples	5, 1 S&R

Custody

David Myers received the samples on 1/21/19 after being relinquished by Air Control Techniques, P.C. The samples were received at ambient temperature and in good condition though sample ***S6-M18-5*** was received with a the valve open. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, LLC.

Analysis

The samples were analyzed for methane using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A).

All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. Methane was referenced to certified gas phase standards.

The Gas Chromatograph "Rosie" was equipped with a Flame Ionization Detector for this analysis.

Calibration

The calibration curve is included in the Raw Data section of this report. The data analysis method is referenced in the Analysis Method column on the Detailed Results page.

The first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Chromatographic Conditions

The acquisition method (AQM_ROSIEP080.M) is included in the Raw Data section of this report.

QC Notes

As required by the method, a recovery study was performed. The bag sample ***S6-M18-1*** was spiked at 9:25AM on 1/22/19. The recovery efficiency values met the method-required limits of 70 to 130%. The recovery efficiency values were used to adjust the associated sample results following equation 18-7 of Method 18.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)	The analytes of interest were not identified in the analysis of the laboratory blank at concentrations greater than the detection limit.
Reporting Notes	These analytical results are reported on a wet basis. The user of this report should determine the percent moisture in the sample and correct the reported value to ppmvd as appropriate.
	The results presented in this report are representative of the samples as provided to the laboratory.
	These analyses met the requirements of the TNI Standard. Any deviations from the requirements of the reference method or TNI Standard have been stated above.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, LLC data reports, unless specifically noted otherwise.

- Any analysis which refers to the method as ***"Type"*** represents a planned deviation from the reference method. For instance a Hydrogen Sulfide assay from a Tedlar bag would be labeled as "EPA Method 16-Type" because Tedlar bags are not mentioned as one of the collection options in EPA Method 16.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.

- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.

- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.

- The letter ***J*** in the Qualifier or Flag column in the results indicates that the value is between the MDL and the LOQ. The laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.

- The letter ***E*** in the Qualifier or Flag column indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.

- Sample results are presented 'as measured' for single injection methodologies, or an average value if multiple injections are made. If all injections are below the MDL, the sample is considered non-detect and the ND value is presented. If one, but not all, are below the MDL, the MDL value is used for any injections that are below the MDL. For example, if the MDL is 0.500 and LOQ is 1.00, and the instrument measures 0.355, 0.620, and 0.442 - the result reported is the average of 0.500, 0.620, and 0.500 - - - i.e. 0.540 with a J flag.

- When a spike recovery (Bag Spike, Collocated Spike Train, or liquid matrix spike) is being calculated, the native (unspiked) sample result is used in the calculations, as long as the value is above the MDL. If a sample is ND, then 0 is used as the native amount (not the MDL value).

- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.

- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. The MS analysis indicates what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).

ENTHALPY
ANALYTICAL

General Reporting Notes
(continued)

- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as a MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.

- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).

- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.

- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two spikes are retained as LCSs. The LCSs are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection, and/or sample transport.

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits. In the case of small numbers, generally 3 significant figures are presented, but still only 2 should be used with confidence. Many neat materials are only certified to 3 digits, and as the mathematically correct final result is always 1 digit less than all its pre-cursors - 2 significant figures are what are most defensible.

- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations on sample chromatograms, if provided in the report. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name on the chromatogram.

Calibration Table

===

Calib. Data Modified : Wednesday, November 14, 2018 8:02:51 AM

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 1.000 %
Abs. Non-ref. Window : 0.000 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID2 B,

CERTIFICATE OF ANALYSIS

Grade of Product: CERTIFIED STANDARD-SPEC

Part Number:	X08NI99C15A0079	Reference Number:	141-124578026-1
Cylinder Number:	CC72412	Cylinder Volume:	144.4 CF
Laboratory:	124 - Conley Stryker - OH	Cylinder Pressure:	2015 PSIG
Analysis Date:	Sep 19, 2016	Valve Outlet:	350
Lot Number:	141-124578026-1		

Expiration Date: Sep 19, 2019

Product composition verified by direct comparison to calibration standards traceable to N.I.S.T. weights and/or N.I.S.T. Gas Mixture reference materials.

ANALYTICAL RESULTS

Component	Req Conc	Actual Concentration (Mole %)	Analytical Uncertainty
ETHANE	100.0 PPM	100.0 PPM	+/- 2%
HEXANE	100.0 PPM	100.0 PPM	+/- 2%
METHANE	100.0 PPM	100.0 PPM	+/- 2%

CERTIFICATE OF ANALYSIS
Grade of Product: EPA Protocol

Part Number:	E03NI79E15A0088	Reference Number:	122-401268406-1
Cylinder Number:	EB0066823	Cylinder Volume:	151.0 CF
Laboratory:	124 - Durham (SAP) - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22018	Valve Outlet:	590
Gas Code:	CO2,O2,BALN	Certification Date:	Aug 06, 2018

Expiration Date: Aug 06, 2026

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

APPENDIX II-F
Sampling Equipment Calibration Sheets

METHOD 5 POST-TEST CONSOLE CALIBRATION USING CALIBRATED CRITICAL ORIFICES

3-POINT ENGLISH UNITS

Meter Console Information	
Console Model Number	522
Console Serial Number	909033
DGM Model Number	RW 110
DGM Serial Number	328893

Calibration Conditions			
Date	**Time**	01/21/19	10:30
Barometric Pressure		30.4	in Hg
Theoretical Critical Vacuum[1]		14.3	in Hg
Calibration Technician		JBG	

Factors/Conversions		
Std Temp	528	°R
Std Press	29.92	in Hg
K_1	17.647	oR/in Hg

[1]For valid test results, the Actual Vacuum should be 1 to 2 in. Hg greater than the Theoretical Critical Vacuum shown above.

[2]The Critical Orifice Coefficient, K', must be entered in English units, (ft3*oR1/2)/(in.Hg*min).

Notes

1. Paused test, 12:24pm to 12:28pm, 2.2 vibration, but during a port change, so did not affect testing.

Had power issue with analyzer, does not affect the emissions, extended the run

No run for PM, VOC, CO, NOx, HCl, Methane, Ethane, Methanol, Formaldehyde, and Acetaldehyde

failed leak test for PM results
Moisture was consistent with Runs 3 thru 5.

Appendix II-G, Table 3. Process Data, RCO 2, January 16, 2019, Run 3							
Process Parameter	14:07 p.m.	14:22 p.m.	14:37 p.m.	14:52 p.m.	15:07 p.m.	15:22 p.m.	Average

APPENDIX III-A
Method 5-Method 202 Data Sheets

Method 1 - Air Control Techniques, P.C.

Date: 3/7/2019

Client	Enviva
Job #	2333
Plant Name	Enviva, Greenwood
City, State	Greenwood, SC
Sampling Location	RCO 1 - Pellet Cooler South
No. of Ports Available	2
No. of Ports Used	2
Port Inside Diameter, Inches	4
Distance From Far Wall To Outside Of Port, Inches	45
Nipple Length And/Or Wall Thickness, Inches	3
Depth Of Stack Or Duct, Inches	42
Stack Or Duct Width (if rectangular), Inches	
Equiv. Diameter = 2DW/(D+W), Inches	
Stack/Duct Area, Square Feet (πR^2 or L x W)	9.621

	Upstream	Downstream
Distance to Flow Disturbances, feet	6	5
Diameters	1.7	1.4

Diameters			
Velocity	Up	Down	Particulate
12	>7.00	>1.75	12
12	6	1.5	16
16	5	1.25	20
16	2	0.5	24 or 25

Note: If more than 8 and 2 diameters and duct is greater than 12" and less than 24", use 8 or 9 points.

Location of Points in Circular Stacks or Ducts

APPENDIX III-B
Method 5-Method 202 Laboratory Report

RESOLUTION ANALYTICS, INC.

Specialists in Air Emissions Analysis

ANALYTICAL REPORT

CLIENT: AIR CONTROL TECHNIQUES, INC.

PROJECT: 2333

ANALYTICAL SERVICES PROVIDED:

- FILTERABLE & CONDENSIBLE PARTICULATE MATTER (EPA METHOD 5/202)

Confirmation of Data Review:

The analytical data and results provided in this report have been checked thoroughly for accuracy, has been performed and validated in accordance with the approved methods, and relate only to the samples provided for this project report.

The results contained herein shall not be reproduced except in full, without written approval of Resolution Analytics.

Date of Review: March 12, 2019

Analyte(s): Filterable PM

Analytical Narrative

Sample Matrix & Components:

Dry Filters, Front½ Acetone Rinses, Acetone Blank

Summary of Sample Prep:

The acetone rinses were transferred to pre-tared teflon "baggies" in a low humidity environment. The acetone rinses were evaporated then desiccated for 24 hours, after which time they were weighed daily every six hours until consecutive weights agreed within ±0.5 mg. The filters were baked 2 to 3 hours at 105° C, cooled in a desiccator and weighed.

All weights were recorded to the nearest 0.1 mg and include filterable particulate catch only. The acetone blank catch has been subtracted from sample rinse catches in proportion with their respective volumes.

Summary of Instrumentation:

Denver model Pinnacle Series analytical balance

Analytical Detection Limit(s): 0.1 mg per fraction

Miscellaneous Comments Regarding Sample Analysis: **(Note unusual catch weights, interferences, odd sample behavior, and steps taken to confirm unusual results. Also note any deviations from standard analytical procedures, together with justification and possible affect on results. Specify samples when applicable.)**

No modifications to EPA Method 5 analytical procedure were made. See data sheets for individual sample descriptions.

Analyte(s): Condensible PM

Analytical Narrative

Sample Matrix & Components:

H_2O liquid impinger samples, organic impinger rinses, CPM filter, reagent blanks

Summary of Sample Prep and Analysis:

The samples were received in the lab at a temperature of less than 85° F, and logged in our custody records. The teflon filters were each sonicated/extracted 3 times with DI H_2O, then 3 times with hexane. The extract was added to the appropriate sample fraction. The impinger contents were extracted 3 times with hexane and the extracts were combined with the organic rinses, then evaporated in pretared teflon baggies. The water fraction was evaporated in pretared teflon baggies to near dryness at 105° C, then at ambient until completely dry. When needed, the water fractions were resuspended in 50 mls DI H_20, titrated with 0.1 N NH_4OH until acid neutralization, and then evaporated using the same procedure as before. Samples were then desiccated for 24 hours and weighed at a minimum of 6 hour intervals to constant weight. All weights were recorded to the nearest 0.1 mg. Where field blanks have been provided, samples have been blank corrected up to a maximum of 2.0 mg.

Summary of Instrumentation:

Denver model Pinnacle Series analytical balance

Analytical Detection Limit(s): 0.1 mg per fraction

Miscellaneous Comments Regarding Sample Analysis: (Note unusual catch weights, interferences, odd sample behavior, and steps taken to confirm unusual results. Also note any deviations from standard analytical procedures, together with justification and possible affect on results. Specify samples when applicable).

No modifications to M202 analytical procedure were made. See data sheets for individual sample notes and comments.

800-1 Capitola Drive Durham, NC 27713-4385

I certify that to the best of my knowledge all analytical data presented in this report:

- Have been checked for completeness
- Are accurate, error-free, and legible
- Have been conducted in accordance with approved protocol, and that all deviations and analytical problems are summarized in the appropriate narrative(s)

This analytical report was prepared in Portable Document Format (.PDF) and contains 96 pages.

Report Issued: 03/21/2019

Narrative Summary

ENTHALPY
ANALYTICAL

Enthalpy Analytical Narrative Summary

Company	Air Control Techniques PC
Job #	0319-054 EPA Method 18 (Bags)
Client #	2333

Custody

David Myers of Enthalpy Analytical, LLC received the samples on 3/8/2019 at ambient temperature after being relinquished by Air Control Techniques PC. The samples were received in good condition.

Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, LLC.

Analysis

The samples were analyzed for methane using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A).

The standards and samples were analyzed following the procedures specified in section 8.2.1, Integrated Bag Sampling and Analysis.

All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. Methane was referenced to certified gas phase standards.

The analyses were performed using an Agilent Technologies Model 7890A, Gas Chromatograph ("Edith" CN10722006) equipped with a Flame Ionization Detector.

Calibration

The calibration curves are located in the Raw Data section of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

ENTHALPY ANALYTICAL

Enthalpy Analytical Narrative Summary
(continued)

Chromatographic Conditions	The acquisition methods ***AQ_EDITHP503_HRVOC_LONG*** and ***AQ_EDITHP503_HRVOC*** are included in the Raw Data section of this report.
QC Notes	As required by the method, a recovery study was performed on a bag sample. The bag sample ***RCO1-1*** was spiked on 3/8/2019 at 11:11 AM. The recovery efficiency value met the method-required limits of 70 to 130%. The recovery efficiency value was used to adjust the results following equation 18-7 of Method 18. The analysis of the laboratory method blank exhibited no methane at concentrations greater than the MDL.
Reporting Notes	These analytical results are reported on a wet basis. The user of this report should determine the percent moisture in the sample and correct the reported value to ppmvd as appropriate. These analyses met the requirements of the TNI Standard. Any deviations from the requirements of the reference method or TNI Standard have been stated above. The results presented in this report are representative of the samples as provided to the laboratory.

ENTHALPY ANALYTICAL

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, LLC data reports, unless specifically noted otherwise.

- Any analysis which refers to the method as ***"Type"*** represents a planned deviation from the reference method. For instance a Hydrogen Sulfide assay from a Tedlar bag would be labeled as "EPA Method 16-Type" because Tedlar bags are not mentioned as one of the collection options in EPA Method 16.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.

- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.

- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.

- The letter ***J*** in the Qualifier or Flag column in the results indicates that the value is between the MDL and the LOQ. The laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.

- The letter ***E*** in the Qualifier or Flag column indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.

- Sample results are presented 'as measured' for single injection methodologies, or an average value if multiple injections are made. If all injections are below the MDL, the sample is considered non-detect and the ND value is presented. If one, but not all, are below the MDL, the MDL value is used for any injections that are below the MDL. For example, if the MDL is 0.500 and LOQ is 1.00, and the instrument measures 0.355, 0.620, and 0.442 - the result reported is the average of 0.500, 0.620, and 0.500 - - - i.e. 0.540 with a J flag.

- When a spike recovery (Bag Spike, Collocated Spike Train, or liquid matrix spike) is being calculated, the native (unspiked) sample result is used in the calculations, as long as the value is above the MDL. If a sample is ND, then 0 is used as the native amount (not the MDL value).

- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.

- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. The MS analysis indicates what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).

ENTHALPY ANALYTICAL

General Reporting Notes
(continued)

- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as a MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.

- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).

- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.

- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two spikes are retained as LCSs. The LCSs are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection, and/or sample transport.

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits. In the case of small numbers, generally 3 significant figures are presented, but still only 2 should be used with confidence. Many neat materials are only certified to 3 digits, and as the mathematically correct final result is always 1 digit less than all its pre-cursors - 2 significant figures are what are most defensible.

- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations on sample chromatograms, if provided in the report. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name on the chromatogram.

Calibration Table
===

Calib. Data Modified : 12/14/2018 9:50:22 AM

Rel. Reference Window : 0.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 0.000 %
Abs. Non-ref. Window : 0.050 min
Uncalibrated Peaks : Separately calculated (see below)
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID1 A, Front Signal
Uncalibrated Peaks : using compound Propane
Signal 2: FID3 B, Back Signal
Uncalibrated Peaks : not reported

CERTIFICATE OF ANALYSIS
Grade of Product: EPA Protocol

Part Number:	E03NI79E15A0088	Reference Number:	122-401268406-1
Cylinder Number:	EB0066823	Cylinder Volume:	151.0 CF
Laboratory:	124 - Durham (SAP) - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22018	Valve Outlet:	590
Gas Code:	CO2,O2,BALN	Certification Date:	Aug 06, 2018

Expiration Date: Aug 06, 2026

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.
Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty	Assay Dates
CARBON DIOXIDE	10.00 %	9.952 %	G1	+/- 0.6% NIST Traceable	08/06/2018
OXYGEN	11.00 %	11.05 %	G1	+/- 0.4% NIST Traceable	08/06/2018
NITROGEN	Balance				

CALIBRATION STANDARDS

Type	Lot ID	Cylinder No	Concentration	Uncertainty	Expiration Date

CERTIFICATE OF ANALYSIS

Grade of Product: EPA Protocol

Part Number:	E02NI99E15A0581	Reference Number:	122-401180044-1
Cylinder Number:	CC341990	Cylinder Volume:	144.4 CF
Laboratory:	124 - Durham (SAP) - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22018	Valve Outlet:	350
Gas Code:	PPN,BALN	Certification Date:	Apr 17, 2018

Expiration Date: Apr 17, 2026

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

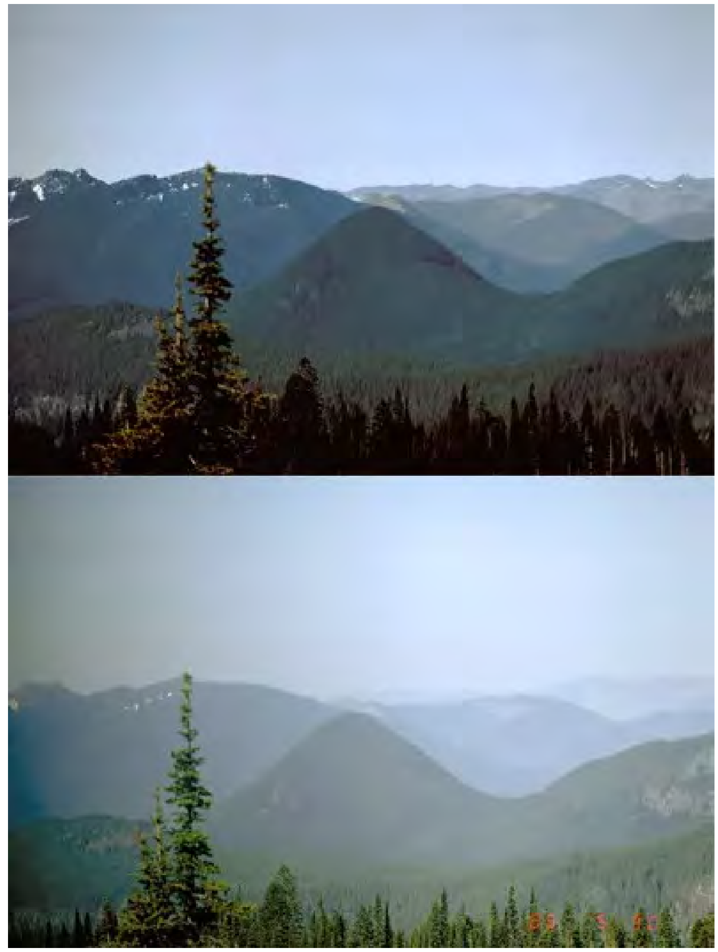
Mount Rainier

National Park
Washington

Air Quality

Mount Rainier National Park is designated as a Class I air protection area. National parks over 6,000 acres, like Mount Rainier, and national wilderness areas over 5,000 acres that were in existence before August 1977 are designated as Class I areas, as defined by an amendment to the Clean Air Act. In addition to Mount Rainier, some of the surrounding U.S. Forest Service wilderness areas are also designated as Class I areas. **Areas designated as Class I receive the highest level of air-quality protection.**



Two photos from an air quality camera in Paradise show different degrees of air clarity. The upper photo is from a clear day; the lower photo shows a day with higher levels of haze and air pollution.
NPS Air Resources Photos

Consequently, Mount Rainier National Park staff are very involved in the National Park Service's comprehensive air resources management program, designed to assess air pollution impacts and protect air quality related values. Air quality related values include scenic vistas; sensitive natural ecosystem processes, functions, and components; and cultural resources.

The air resources management program at Mount Rainier includes monitoring, research, and regulatory interaction with local, state and federal agencies. Long-term monitoring programs include monitoring for gaseous pollutants such as ozone, visibility impairment, and atmospheric depositions. More information is available on the **IMPROVE (Interagency Monitoring of Protected Visual Environments) (http://vista.cira.colostate.edu/Datawarehouse/IMPROVE/Data/Photos/MORA/start.htm)** web site. In addition, there is an ongoing effort to determine the ecological effects of air pollutants on park resources.

The National Park Service (NPS) **Air Quality Research Program (https://www.nps.gov/subjects/air/air-monitoring.htm)** involves an extensive network of monitoring for pollution, visibility conditions, and biological effects in NPS units. At Mount Rainier the monitoring program has included:

- Use of cameras for measuring visibility.
- Fine particulate monitors for identifying the causes and sources of visibility impairment.
- Ozone monitors for establishing baseline conditions, assisting ozone effects research, measuring precipitation chemistry, and evaluating new pollution sources.

Current Air Quality in Paradise

This graph shows levels of particulate matter affecting air quality in Paradise on the south side of the park at 5,400 feet elevation.

Ohanapecosh Air Quality - Down for the winter. Check back summer 2024!

The **Ohanapecosh air quality sensor** is located near the Ohanapecosh Campground and it is not uncommon to see poor air quality spikes on the graph above, especially in the evening when many visitors are having campfires. The valley that Ohanapecosh sits in is susceptible to inversion events that can trap the campfire smoke, keeping it nearer the ground and preventing dispersion. When that happens even campfires can effect the local air quality. Learn more about air quality monitoring at **How We Measure Smoke (https://www.nps.gov/subjects/air/howwemeasure-smoke.htm)**.

Air Quality Camera

A webcam has been installed at Paradise to show the effects of air pollution such as visibility impairment. The air quality webcam is part of the NPS air quality web camera network. Images are updated every 15 minutes. Visit the **NPS Air Resources** (https://www.nps.gov/subjects/air/index.htm) site for more air quality data- including ozone, particulate matter, visual range, and weather conditions- that are updated hourly.

WEBCAM

Air Quality

Monitors the air quality over the Nisqually Valley from Paradise. Note that ozone and weather measurements are from the weather station at Paradise; visibility readings are from the weather station at Tahoma Woods, near Ashford, WA.

View Webcam (https://www.nps.gov/subjects/air/webcams.htm?site=mora)

Air Pollution at Mount Rainier

Mount Rainier National Park is located downwind of a number of urban and industrial areas to the northwest and southwest and is not isolated from the by-products of industrialization. Man-made air pollutants are transported long distances and have been detected through air quality monitoring programs. A number of stationary and mobile sources of pollutants affecting the park include a variety of sources in the Puget Sound region as far north as Vancouver, and as far south as Portland, Oregon. Pollutants traveling across the Pacific Ocean from Asia, and including pollutants from Europe and eastern North America that circumnavigate the globe, are deposited in lakes, streams and on land within the Cascade mountain range at high elevations.

Visibility Impairment

Nearly two million visitors come to Mount Rainier each year to enjoy the scenery, but the view is often obscured by regional haze, especially in the summer. Haze is caused when sunlight encounters fine pollution particles in the air. Some light is absorbed by particles. Other light is scattered away before it reaches an observer. More pollutants result in more absorption and scattering of light, which reduce the clarity and color of what we see.

Fine particulates are measured at the **IMPROVE (http://vista.cira.colostate.edu/Datawarehouse/IMPROVE/Data/Photos/MORA/start.htm)** (Interagency Monitoring of Protected Visual Environments) site at Tahoma Woods as well as in the park at Paradise. Photographic documentation of visibility has also been conducted at Paradise and Camp Muir, as well as at the Fremont and Tolmie Peak Fire Lookouts. Visibility impairment at Mount Rainier National Park is among the highest of all sites monitored in the west. The **NPS Visibility Monitoring Program (https://www.nps.gov/subjects/air/visibility.htm)** provides access to the most current data on visibility monitoring in the park.

Wildfire Smoke

Increased **wildfire activity (https://www.nps.gov/mora/learn/news/fire.htm)**, whether local or regional, is leading to increased smoke events. Smoke and PM2.5 concentrations (small particles of ash and other material) in the air deteriorate air quality and have negative health effects. It's easy to see how smoke haze affects visibility, such as in the photos below from the air quality webcam at

Paradise from July 18, 2021, compared to August 2, 2021. However, it's also important to monitor air quality at the surface. Mount Rainier National Park is installing low-cost particle sensors to monitor PM2.5 levels at various locations in the park. Better air quality monitoring information will be used in the future to create a tiered list of management responses to poor air quality conditions.

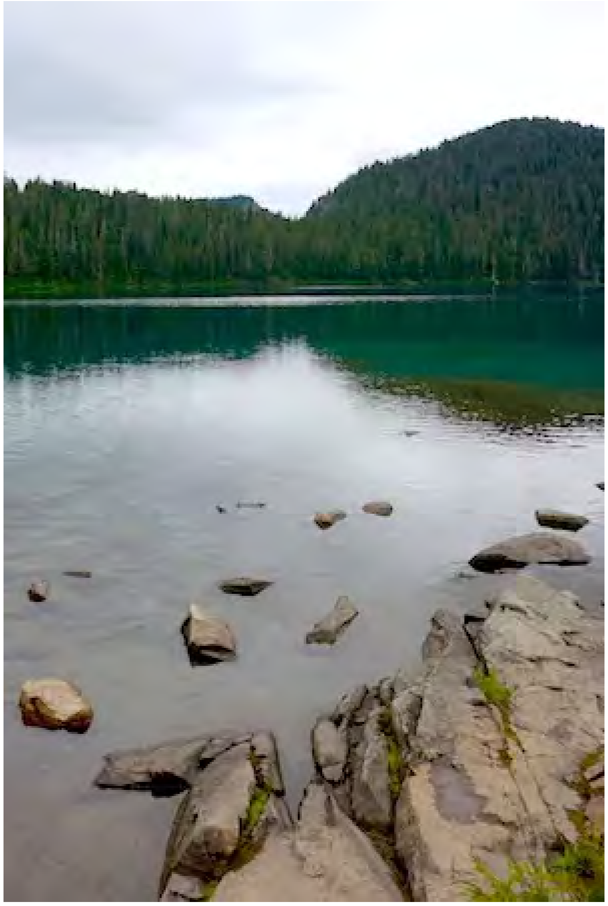
Acid Deposition

As precipitation water passes through the air it reacts with carbon dioxide, sulfur oxides, and nitrogen oxides to form acids. These compounds then fall to the Earth in either dry form (such as gas and particles) or wet form (such as rain, snow, and fog). The park's lakes and streams are very sensitive to acidic deposition because the soils and bedrock cannot neutralize acids well. Acid deposition impacts aquatic organisms and ecosystems as well as terrestrial life through direct contact and by changing the chemical balance in the soil and increasing the acidity of lakes and streams.

Water quality for approximately 20 of the major streams in the park have been inventoried along with approximately 48% of the park lakes. Of these, 10 stream sites have been documented as extremely sensitive, while lakes on the west and south sides of the park tend to be more sensitive. Spring snowmelt or late summer storms can cause highly acidic deposition events which can affect the aquatic ecology of these surface waters.



Mowich Lake
NPS Photo

Studies conducted at Eunice Lake in the northwest corner of the park documented increased levels of sulfate during the spring, early summer snowmelt period. The chemistry of bulk precipitation collected at Paradise has been measured since 1986. Precipitation samples taken at Paradise have shown higher than background levels of sulfates. The chemistry of cloudwater samples taken at Paradise have shown some of the lowest levels of pH and highest levels of acidity of any taken in the state.

Mount Rainier National Park established a National Atmospheric Deposition Site within the park in 1999 to collect precipitation samples and analyze their chemistry. Data is available on the **National Atmospheric Deposition Program (http://nadp.isws.illinois.edu/data/sites/siteDetails.aspx?net=AMON&id=WA99)** web site.

Ozone

Plants can be sensitive to ozone at levels well under the national health standards for people. Lichens, mosses, and liverworts are often the most sensitive components of the vegetation within an ecosystem and can serve as early indicators of air pollution effects. Plants such as trees, shrubs, and herbaceous species are also injured by ozone which can damage leaves and needles and weaken the plants' ability to withstand disease and insect infestations.

Two leaves, one without injury (left) and the other showing damage from ozone exposure (right).
Images from the NPS/USFS report "Guide to Ozone Injury in Vascular Plants in the Pacific Northwest"

Clean air is defined as ozone concentrations ranging from 15 to 30 ppb (parts per billion). Elevated ozone levels (above 80 ppb) were measured at Longmire in the southwest section of Mount Rainier National Park during the summers of 1987 and 1988. Values above 80 ppb were not uncommon at an ozone monitor at Carbon River in the northwest corner of the park during 1989 to 1992 and there were a few readings above 100 ppb. Similar values have been measured at Tahoma Woods, while ozone levels at Paradise have, on some days, been the highest recorded in the state.

High levels of ozone have also been measured in rural areas surrounding the park in Enumclaw (10 miles north of the park), Cedar River (30 miles north of the park), and Pack Forest (15 miles west of the park). Chlorotic foliar spotting on the foliage of ponderosa pine at Pack Forest has been reported and scientists hypothesized that ozone-sulfur dioxide synergism was responsible for the damage.

Ozone impacts on sensitive vegetation in the Pacific Northwest have received little attention until recent years because of the relatively low levels of ozone in the area. Ozone sensitive species in Mount Rainier have recently been identified and are being monitored in selected areas. Passive ozone monitors are also used to document ozone levels at sites where vegetation plots have been established. In addition, continuous ozone monitors are in operation at Tahoma Woods and Paradise. The **Guide to Ozone Injury in Vascular Plants of the Pacific Northwest (https://www.fs.fed.us/pnw/pubs/pnw_gtr446.pdf)** describes some of the effects of ozone on vegetation. This document is the result of NPS and U.S. Forest Service studies of ozone sensitive plant species.

This graph shows how ozone is affecting air quality at Paradise.

Air Toxics

Air Toxics is a term that includes persistent organic pollutants and heavy metals. Studies indicate that air pollutants from Europe and Asia remain airborne for thousands of miles across the Pacific Ocean and deposit in snow at relatively high elevations in North America. Air toxics also originate from local and regional sources. These contaminants such as DDT, dioxin and mercury, may accumulate in annual snowpack, particularly in higher elevation ecosystems. Once deposited, many pollutants, particularly persistent organic pollutants, accumulate and concentrate in foodwebs, threatening the viability of aquatic and terrestrial ecosystems. These air toxics are of particular concern because they remain in the environment a long time, can accumulate in the biological tissue of organisms, and are toxic to humans and wildlife.

There is very little information on the accumulation of any of these toxic materials in the natural environments of the U.S. or elsewhere in the world. The National Park Service is initiating an air-toxic focused assessment program based in the National Parks of the western United States to provide spatially extensive, site specific, and temporally resolved information regarding the exposure, accumulation and impacts of airborne contaminants in these ecosystems for the purpose of instituting long-term monitoring.

Subject:	RE: Air Emissions Questions
Date:	Friday, June 23, 2023 6:00:56 AM
Attachments:	image001.png image002.png

Hi Brandon,

The only points with NOx and CO emissions are those where there is combustion. Therefore, points EP04 and EP-08.
These would be the preliminary data that we can give at this time:

EP04 – DRYING LINE:

Carbon Monoxide (CO) (lbs/hr): ≤42 lbs/hr
Nitrogen Oxide (NOx) (lbs/hr): ≤52 lbs/hr

EP08 – DRY MILLING AND PELLETING LINE:

Carbon Monoxide (CO) (lbs/hr): ≤16 lbs/hr
Nitrogen Oxide (NOx) (lbs/hr): ≤5 lbs/hr

Note: NOx emissions for Dryer Island are based on fuel nitrogen level at 0.22% bone dry basis. Higher nitrogen content within fuel will result in higher NOx emissions.

We will include this data in the drawing table and we will send it to you updated as soon as possible.

Regarding the cyclone filters, they are equipment that incorporate a bag filter, in order to reduce PM emissions up to 5 mg/Nm3.
We are still studying the final design and selecting the supplier. As soon as we have selected it, we will send the vendor documentation.
It is a very common equipment in our plants, we can send documentation of another project if you need it urgently but it may not correspond to the final vendor.

Un saludo / Best regards,

Antonio Torrubia

Asunto: Air Emissions Questions
Importancia: Alta

Alberto,

Can we add NOx and CO rate emission's to chart? We're need to include those in our Air Permit.

Also, we need clarification on the cyclone filter. Is it a traditional cyclone or will it have an actual filter in the system like a baghouse.

We also would like to have the vendor documentation to attach to our air permit application. The state is used to seeing that in the applications.

Regards,

Brandon Henderson

Dear Sirs, please find enclosed our offer for the following products / services:

REQUESTED PRODUCTS/ SERVICES	**Supply of a wood pellets production plant**
DELIVERY TIME	To be checked inside
PRICE	To be checked inside
METHOD OF PAYMENT	To be checked inside
OFFER VALIDITY	To be checked inside
NOTES	General Conditions of Sales according to attached ANNEX 1

In case of accepting the conditions exposed in this offer, please send us back this document properly signed as a sign of acceptance. If you wish, you can use your own document.

☐ I agree to receive commercial communications from Prodesa by email.

2. INTRODUCTION

This offer has been prepared according to the request of **PNWRE** for the supply of a wood pellets production plant.

The design data that have been considered for this budget offer are the following:

EMPLACEMENT			
State	Washington, USA	City	Hoquiam, Grays Harbor County
Site coordinates	46° 58' 34 " N; 123° 54' 58" W (Corner of Airport Way & Paulson Rd – Port of Grays Harbor)		

SITE CONDITIONS			
	Minimum	Average	Maximum
Ambient temperature	14 º F / -10 ºC	51 º F / 10 ºC	89 º F / 31 ºC
Relative humidity	85 - 90%	Site elevation (o.s.l.)	18 ft – 5.5 m
Wind load	48 psf - 235 kg/m^2 ; (135 mph - 60 m/s)	Snow load	25 psf - 122 kg/m^2
Seismic load	Ss = 1.532; S1 = 0.712; TL = 16; Sds = 1.225; PGA = 0.734		

ELECTRICAL DATA			
Voltage supply	460 Vac 24 Vdc	Frequency	60 Hz

INPUT MATERIAL:

RAW MATERIAL SPECIES (FOREST RESIDUALS) – GENERAL PROCESS		
Type	Softwood	Hardwood
Proportion (%)	80 - 90%	10 - 20%
Species	Douglas Fir: 37.04% W Hemlock: 42.74% W Red Cedar: 3.00% Sitka Spruce: 3.07% Pacific Silver Fir: 1.40% Lodgepole Pine: 0.43% Western White Pine: 0.04% TOTAL: 87.72%	Red Alder: 10.41% Big Leaf Maple: 1.44% Black Cottonwood: 0.29% Bitter Cherry: 0.02% Oregon Ash: 0.01% TOTAL: 12.17%

RAW MATERIAL SPECIES (MILL RESIDUALS) – GENERAL PROCESS		
Type	Softwood	Hardwood
Proportion (%)	80 - 90%	10 - 20%
Species	Douglas Fir: 40 - 45% W Hemlock & Other: 40 - 45%	Red Alder & Other: 10 - 20%

RAW MATERIAL DATA – GENERAL PROCESS	
Type of material	**Forest residual – ground chips (325,000 GMT/y; 50%)**
Product size distribution (PSD)	< 1” 3% (by weight) 1 - 6” 87% (by weight) > 6” 10% (by weight)
Bulk Density	350 kg/m^3 (average)
Water content (W.B.)	40% (average)
Type of material	**Sawdust (184,000 GMT/y; 30%)**
Product size distribution (PSD)	TBC
Bulk Density	350 kg/m^3 (average)
Water content (W.B.)	50% (average)

Type of material	**Shavings (122,600 GMT/y; 20%)**
Product size distribution (PSD)	TBC
Bulk Density	150 kg/m^3 (average)
Water content (W.B.)	25% (average)

FUEL:

RAW MATERIAL SPECIES – COMBUSTION SYSTEM		
Type	Softwood	Hardwood
Proportion (%)	45 - 55%	45 - 55%
Species	Douglas Fir W Hemlock & Other	Red Alder Other

RAW MATERIAL DATA – COMBUSTION SYSTEM	
Type of material	**Bark & Hogfuel (220,000 GMT/y; 100%)***
Product size distribution (PSD)	1 - 6’’ (approximately)
Bulk density M.C.	305 kg/m^3 (average)
Ash content	8-10%
Ash melting point	> 1100 ºC
Water content (W.B.)	55 %

FINAL PRODUCT:

FINAL PELLET REQUIRED	
Material	Wood pellets
Size	3.15 < L ≤ 40 mm Diameter = 6 mm
Bulk density	650 - 750 kg/m^3
Moisture Content (m.c.) wet basis	<10%
Required capacity	400,000 metric tons/year (441,000 sh.ton/year)

This is a **budget offer**. The final dimensioning and power of the equipment included in this offer will be defined after having analysed the raw material that the plant will work with. Meanwhile, this budget offer is based on average production figures.

Information contained in this offer is confidential and cannot be communicated to third party without our permission.

During the project realization, PRODESA reserves the right to bring all the necessary variations in design, equipment and brands in order to ensure the best operation of the plant.

GENERAL REMARKS ABOUT ELECTRICAL EQUIPMENT:

- Motors IEC and NEMA. Motors included in the offer are not NFPA/ATEX Classified
- The use of low tension for all the installation (460 V and 60 Hz) has been considered.
- MCCs, I/O and PLC panels are supplied including UL certification. The design will be according to UL 508.

3. GENERAL DESCRIPTION

For a better process understanding, please see the process mass and energy diagram 2572-PBS-04-0001A, the process flow diagram 2572-PBS-04-0002 and the layout 2572-PME-03-1001B.

3.1 RAW MATERIAL RECEPTION

We propose a truck scale system to control the raw materials received in the plant.

In order to receive the raw material and fuel, and discharge the trucks, three truck dumpers are included: one for the forest residues, other for the sawmill residues and a third one for the biomass used as fuel.

Once the product is discharged by the trucks, it will be storage in piles through a front end loader.

3.2 WET MILLING LINE

The line includes:

- Raw material moving floors
- Forest residuals cleaning and screening unit
- Sawmill residuals screening unit
- Wet hammer mills

One (1) 250 m^3 MOVING FLOOR delimited by walls to store the ground chips, and a second one to store the sawdust and shavings are included.

Example of moving floor

The chips moving floor discharges the product into a chain conveyor to feed the CLEANING AND SCREENING unit, with the objective of separate impurities (sand, stones), fines and overs. Fines will be discharge to the dryer feeding system, while the intermediate fraction will be sent to the wet hammer mills. Impurities and overs will be discharged into a container (by client).

Example of cleaner and screening system

The sawdust and shavings moving floor discharges the product to a DISC SCREEN to separate big pieces that will be sent to the wet hammer mills. The good product will be sent directly to the dryer feeding system.

So, the cleaned chips will be processed in the wet hammer mills to reduce the particle size so they have an optimum drying

Two hammer mills of 500 kW each have been selected to reduce the particle size of the cleaned chips so they have an optimum drying process and they reach the dry milling stage with the optimum moisture content and size.

The produced microchips are discharged downwards by mechanical and pneumatic systems. Thus, one pneumatic system for each hammer mill is required, and each one equipped with dust collection systems, in order to control the dust emission to the atmosphere and to recover the small size particles into the product flow.

General view of wet milling line

Wet hammer mill

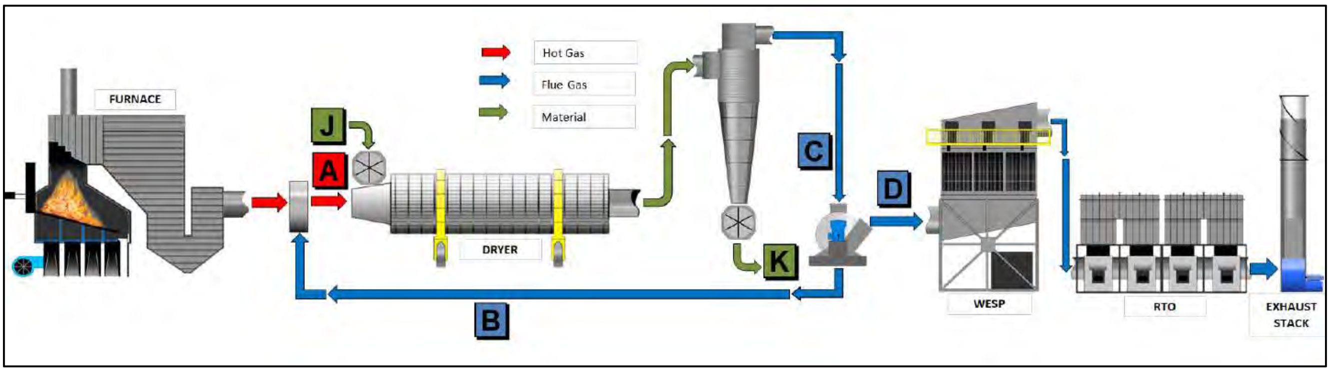
3.3 DRYER FEEDING SYSTEM

The microchips produced in the wet milling line are transported by several conveyors to the drying island.

3.4 DRYING ISLAND: DRUM DRYER AND HEAT GENERATION SYSTEM

The drying line is the heart of the plant. Design, control and operation are the key to achieve the production objectives.

The drying island includes: Heat generation system, Drum dryer, and Gases emissions treatment (WESP and RTO).

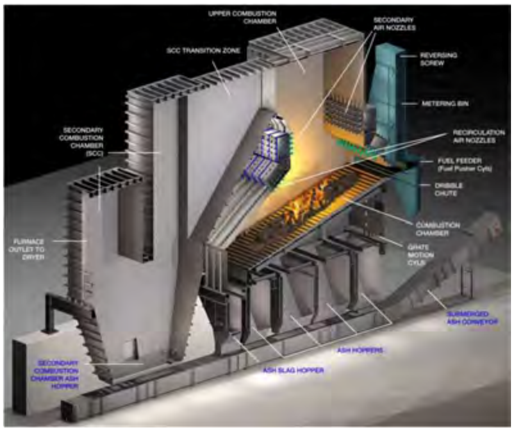


HEAT GENERATION SYSTEM: Biomass Furnace and Fuel Feeding System

We include a biomass furnace of 55 m2 to provide the thermal energy required by the drum dryer. This furnace has pusher grates and a biomass dosing system by a fuel feed pushers.

A 250 m3 moving floor discharges the biomass used as fuel to a chain conveyor to feed the furnace metering bin.

Example of Heat Energy System



Heat Energy System Overview

DRUM DRYER

The selected dryer is a high temperature drum dryer that uses hot gases at around 400ºC provided by a heat generation system (biomass furnace)

During the drying process the raw material features will change and it is necessary to work gently with the wood in order to keep the proper conditions to ensure the best product quality. Moisture, colour and chemical parameters of raw material are related to the drying process.

The drum dryer has the following benefits:

- Well proven drying system
- Low energy consumption
- Automated operation
- Good product quality

DRUM DRYER DESCRIPTION:

The Dryer System receives hot gas from the Heat Energy System and combines this hot gas stream with the Dryer System's flue gas stream within the Dryer System's Recycle Bustle. Once two gas streams are mixed, the resultant gas mixture enters the Dryer Drum for purpose of drying wet woody biomass.

Dryer System's Metering Bin is located at ground level and material from the Metering Bin is fed to Dryer System's Infeed Airlock via a chain conveyor.

Dryer Drum is a single-pass unit that is responsible for distributing and classifying each biomass particle to allow for its efficient drying. This is accomplished with utilization of a complex 'flighting system' within the Dryer Drum. Dried material is conveyed from the drum discharge to two (2) High Efficiency Cyclones that are responsible for effectively removing dried biomass from flue gas stream. Dried biomass exits out the bottom of High Efficiency Cyclones and into the Cyclone Airlocks; each Cyclone has its own dedicated Airlock.

Dried biomass from Cyclone Airlocks is received by a Collection Screw that conveys dried biomass to the Diverter Gate. The Diverter Gate under upset operating conditions discharges biomass to client's Fire Dump. The Diverter Gate under normal operating conditions discharges material to the dry product silo feeding chain conveyor.

Flue gas exits Cyclones out the top and is processed either to the Dryer System as recycle, or to the Pollution Control Equipment (WESP + RTO)

Biomass and flue gas is conveyed through the Dryer System via an Induced Draft Fan (ID Fan).

GASES EMISSIONS SYSTEM: WESP + RTO

To remove fine particulate from gas stream prior to discharging scrubbed flue gas stream to the atmosphere, we propose a WESP (Wet Electrostatic Precipitator).

After that, there is four-chamber RTO to receive particulate cleaned flue gas from the WESP and treat this flue gas for the purpose of VOC and CO destruction, before this flue gas is exhausted to atmosphere.

Example of WESP

Example of RTO

3.5 DRY PRODUCT STORAGE

Once the product goes out from the drying process, the moisture content is around 10% and it is transported the dry product storage by a chain conveyor.

The main aim of this is to uncouple drying line and milling line. Thus, both lines can work in an uncoupled way, increasing the production capability of the plant because during maintenance works in one line, the other one continues producing.

In addition, due to moisture content at dryer outlet is around 10%, it is required to have a certain retention time after the dryer in order to get very homogenous moisture content in the product.

During storage, the whole product is in contact and moisture content will become an average value into the silos. Homogenous moisture content means a stable pelletizing process and high pellet quality.

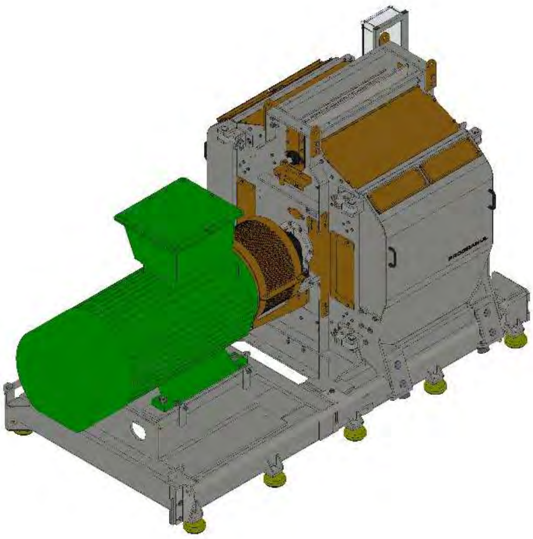
A chain conveyor transports the product from the outlet of the buffer silo to the milling line.

3.6 DRY MILLING LINE

As the most, dry milling line is required to reduce the particle size, thus the machines and line design has been developed to get the required wood pellet quality.

We propose one milling line with four (4) hammer mill with one (1) motor of 900 HP each one. The product is discharged by gravity system, equipped also with a cyclofilter, in order to control de dust emissions to the atmosphere.

To control de VOCs emissions, the air flow of two of the four hammer mills will pass through ~~an scrubber and RTO~~ together with the pellet cooler air flow. (Design change from RTO to RCO)



3.7 DRY AND MILLED PRODUCT STORAGE

In between the dry milling and the pelleting line there another silo for the product storage is included.

The main aim of this storage is to uncouple the milling line and pelletizing line. In addition, a more homogenous moisture content in the product will be achieved which is one of the key factors to reach high pelletizing productions.

At the outlet of the silo, a chain conveyor transports the product to the pelleting line.

3.8 PELLETING LINE

Pellet mills feeding will be done by a dosing screw conveyor. This system works fulltime charge in order to get the best performance in the pellet mill. A conditioner is installed between the conveyor and the pellet mill in order to adjust the moisture content in the raw material as required and to have a continuous feeding in the pellet mill.

We propose two pelleting lines with six (6) pellet mills with 500 HP each.

Once the pellet is produced, the temperature in the product is around 90ºC, thus two (2) coolers (one per line) are required to achieve the quality and to comply with the pellets specifications. The cooler is equipped with a ~~cyclone~~ to reduce the dust emission to the atmosphere and to recover the very small size particles into the product flow. (Design change from cyclones to baghouse)

Additionally, another ~~RTO~~ receives VOC laden flue gas stream from the pelletizing line and from 2 dry hammer mills, which treats this flue gas for the purpose of VOC destruction, before this flue gas is exhausted to atmosphere. (Design change from RTO to RCO)

After each cooler, a vibratory screen sieves the product, thus fines and broken pellets that not comply with the specifications, are taken out from the line.

The final dimensioning and motorization of the pellet mills will be reviewed after having a raw material screen analysis and information about the wood species that will be processed.

3D – Example of pelleting line.

Pelleting line in a Pellet plant Prodesa's design

4. DESIGN DATA

4.1 RAW MATERIAL RECEPTION

Raw material	Product as in *Section 2. Introduction*
Number of truck scales	1
Number of truck dumpers	3
Truck dumper type	75' Back-On Truck Dump Platform
Empty weight of truck	30,000 lbs
Full truck weight	120,000 lbs
Platform Lift & Lower Time	4 – 4.5 min
Max. Dumping Angle	63 degrees
HPU Horsepower/unit	2 x 60 HP
Life Cycles	2,000,000 cycles

4.2 WET MILLING LINE

Raw material	Product as in *Section 2. Introduction*
RAW MATERIAL STORAGE	
Chips storage	1 x Moving floor 250 m^3 (8,828 ft^3)
Sawdust and shavings storage	1 x Moving floor 250 m^3 (8,828 ft^3)
CHIPS CLEANING AND SCREENING UNIT	
Design capacity	57.4 ton/h
Screened fractions	0 – 1.5 mm 1.5 – 10 mm 10 – 60 mm 60 – 150 mm > 150 mm
Separated impurities	Sand and stones
WET MILLING LINE	
Number of hammer mills	2
Design capacity	54.2 ton/h @ 350 kg/m3 = 155 m3/h (5,474 ft^3/h)
Hammer mill installed power (each)	500 kW (700 HP)

4.3 DRYER FEEDING SYSTEM

Raw material	Product from wet milling line
Design capacity	54.2 ton/h

4.4 DRYING ISLAND

4.4.1 HEAT ENERGY SYSTEM: Biomass Furnace

Number of Reciprocating Grate Zones	Four (4)
Wet Fuel Moisture Content (bark)	50% (wet basis)
Maximum Overall Moisture Content	55% (wet basis)
Minimum Overall Moisture Content	35% (wet basis)
Grate Fuel Design LHV at 50% mc (wet basis)	3,480 Btu/lb
Grate Fuel Design HHV at 50% mc (wet basis)	4,300 Btu/lb
Fuel Size (Maximum)	100% bark <6” 90% bark <4” 70% all fuel >2” Max 25% <1” Max 15% <1/2”
Bulk Density of Fuel (average)	18 – 20 lbs/cuft (volumetric)
Designed Combined Fuel Alkali Content	< 0.25 lb/MMBtu
Material Grate Bars	High Heat Resistant Steel (ASTM A297, Grade HD)
Grate Speed Control	10% to 100%, modulating
Thermal Turn Down Ration	4:1
Primary Air Static Pressure	5” WC
Secondary Air Static Pressure	12” WC
Number of Secondary Air Zones	Two

4.4.2 DRUM DRYER

A. Design ambient conditions:

Temperature	51º F (10 ºC)
Relative humidity	85-90%

B. Product and design data:

Product inlet	Microchips from wet milling line
Product inlet moisture content	45% wet basis
Product inlet flow	85.5 ton/h @ 45% mc
Dryer technology	Drum dryer
Product outlet flow	51.11 ton/h [1] @ 8% mc
Dryer drum size	Ø 20’ by 90’ long

[1] At design ambient conditions

C. Thermal energy

Gas inlet temperature	510ºC (950ºF)
BTU/hr (HHV)	164,810,016

[1] At design ambient conditions and product not frozen

Remarks:

— *With very wet and/or frozen raw material, water evaporation and dry raw material capacity is reduced in spite of higher energy consumption.*
— *If strong and short time oscillations in heat supply, product inlet moisture, particle size distribution or particle composition occur, a constant outlet moisture content cannot be guaranteed.*
— *If ambient conditions and/or moisture content of wet product change, the dryer capacity and also the thermal energy consumption will change.*

4.4.3 GASES EMISSIONS TREATMENT: WESP + RTO

Air flow (from drum dryer)	124,031 ACFM (210,730 m^3/h)
Inlet temperature	113ºC (235ºF)
WET ELECTROSTATIC PRECIPITATOR (WESP)	
Quantity	1
Number of Ø10'' tubes	621
Number of Fields	3
REGENERATIVE THERMAL OXIDIZER (RTO)	
Quantity	1
Number of combustion chambers	4
Combustion chambers size	11' wide by 23' long by 8' tall
Projected gas consumption	5.7 mmBTU/h

4.5 DRY PRODUCT STORAGE

Product	Dry product from dryer system.
Moisture content	8% (wet basis)
Description	Vertical silo.
Capacity	1,000 m^3 (35,315 ft^3)

4.6 DRY MILLING LINE

Inlet product	Product from dry product storage
Number of hammer mills	4
Electrical power (each one)	900 HP
Design capacity (each)	15,5 ton/h

**The final dimensioning and the motorization of the hammer mills will be reviewed after having a raw material screen analysis and information about the wood species that will be processed.*

4.7 DRY AND MILLED PRODUCT STORAGE

Product	Dry and milled product from dry milling line.
Moisture content	8% (wet basis)
Description	Vertical silo.
Capacity	1,000 m^3 (35,315 ft^3)

4.8 PELLETING LINE

PELLETING LINE	
Product	Dry and milled product from dry milling line.
Number of pellet mills	12
Electrical power (each one)	500 HP
Design capacity (each one)	5.5 ton/h
Pellets diameter	6 mm
PELLETING LINE: ~~RTO~~ Client updated to RCO	
Air flow (from drum dryer)	29,500 ACFM (50,121 m^3/h) from DHM 76,000 ACFM (129,125 m^3/h) from pelleting line
Quantity	1
Number of combustion chambers	4
Combustion chambers size	11’ wide by 23’ long by 8’ tall
Projected gas consumption	~~1.8 mmBTU/h~~ Client updated to 2 x 2.25 MMBtu/hr

**The final dimensioning and the motorization of the pellet mill will be reviewed after having a raw material screen analysis and information about the wood species that will be processed.*

INSTALLED ELECTRICAL POWER

The table below shows the installed electrical power per lines of the equipment included in the main scope of supply of this offer. It is important to remark that these values are indicative and with no contractual value.

Description	**Electrical installed power**	
Raw material reception	378 HP	282 kW
Wet milling line	2,301 HP	1,717 kW
Dryer feeding system	115 HP	86 kW
Drying island	3,434 HP	2,562 kW
Dry product storage	132 HP	99 kW
Dry milling line	4,266 HP	3,183 kW
Dry and milled product storage	137 HP	103 kW
Pelleting line	7,981 HP	5,956 kW
TOTAL	**18,744 HP**	**13,988 kW**

5. EQUIPMENT DESCRIPTION

Pos	Units	Description
5.1		**RAW MATERIAL RECEPTION**
5.1.1	**1**	**Truck Scale** Truck scale for controlling the raw material and fuel entrance. It includes a visor with high memory capacity for different products, clients, suppliers, etc. Technical data Dimensions: 85.35 x 9.8 ft (26.016 x 3 m) Height: 11.4'' (290 mm) Capacity: 80 ton Number of cells: 12 (analogics)
5.1.2	**3**	**75' Back-On Truck Dumper** It includes a 75' dumping platform The platform is designed for a GVW of 120,000 pounds and utilizes two 3 stage inverted telescopic cylinders which operate at a pressure of 1,600psi with a safety factor of 3:1. Once the receiving truck has backed onto the platform it is raised to its maximum angle causing the material to flow freely into the ground. The full lift and lower cycle is completed in approximately 4.5 minutes. It includes a walkway on the driver side as well as handrail on both the passenger and driver side Technical data/unit Empty weight of truck: 30,000 lbs Full truck weight: 120,000 lbs Platform Lift & Lower Time: 4 – 4.5 minutes Max. Dumping Angle: 63 degrees HPU Horsepower: 2 x 60 HP Life Cycles: 2,000,000 cycles

Pos	Units	Description
5.2		**WET MILLING LINE**
5.2.1	**1**	**Ground chips moving floor** It receives the ground chips from the client´s front end loader. Delimited by concrete walls (out of PRODESA´s supply) Technical data: Volume 250 m^3 (8,828 ft^3) Number of grates 4 Hydraulic unit motors 2 x 60 HP (2 x 45 kW)
5.2.2	**1**	**Cleaning unit feeding chain conveyor** It receives the ground chips from the moving floor (pos 5.2.1) and feeds the cleaning and screening unit (pos 5.2.3) Supports included. Technical data: Total length 126 ft (38.5 m) Inclination 0º - 25º Installed power 15 kW (20 HP)
5.2.3	**1**	**Cleaning and screening unit** To separate impurities and to screen different fractions. It consists on integrated roller screening and air separation units, which enables screening and cleaning of infeed material. The infeed material mix is screened into different fractions, to get a better cleaning result for each fraction. All rolls in the roller bed rotate in the same direction shaking and conveying the material towards the rear end of the screen. The finest fraction (e.g. sand and dust) is separated in the first roller section and accordingly the coarse fractions are separated later on the coarser section(s). Mixture of wood and impurities move along the roller bed, heavy contaminants are concentrated and form a mineral-enriched layer on the roller bed. Mineral-enriched layer is taken out in a larger gap. This sub-flow is further cleaned in an air cleaning unit. Sand and stones are separated by airflow and the wood material is returned to the process via cyclones. Defined by roller pattern and gap size (smaller than previous “removal gap” for enriched material) the fractions to be separated, go through the gaps of the rollers and fall under the roller bed for further processing. It includes the screens, cleaning units, pneumatici systems, structures, electrical cabinets and control system

Pos	Units	Description
5.2.4	**1**	**Cleaned and screened chips chain conveyor** It receives the cleaned and screened chips from the cleaning and screening unit (pos 5.2.3) and discharges it into the wet hammer mills feeding chain conveyor (pos 5.2.5) Supports included. Technical data: Total length 224.7 ft (68.5 m) Inclination 0º - 30º Installed power 30 kW (40 HP)
5.2.5	**1**	**Wet hammer mills feeding chain conveyor** It receives the chips from the previous chain conveyor (pos 5.2.4). It includes two intermediate outlets to feech each of the wet hammer mills and a final outlet as emergency exit. Supports included. Technical data: Total length 82 ft (25 m) Inclination 0º Installed power 7.5 kW (10 HP)
5.2.6	**2**	**Feeding system for Hammer Mill** Vibratory feeder: Width: 5.9 ft (1800 mm) Length: 9.8 ft (3000 mm) Drive (per unit): 2 x 2.5 HP (2 x 1.7 kW) Canted and welded steel construction without cover. Driven by 2 maintenance-free vibration motors. Exit side conveyor trough of nonmagnetic VA steel if magnetic drum is used. Magnetic drum: Diameter: 1.3 ft (406 mm) Length: 6.4 ft (1965 mm) Drive (per unit) 1.5 HP (1.1 kW) Complete with clamp bearing, gear motor and dust hood. Support frame: For feeding system.

Pos	Units	Description
5.2.7	**2**	**Wet Hammer mill Type HH 600x2000** Consisting of: Heavy particle separator type CLEANER, installed at the material infeed chute of the Hammer Mill. CLEANER housing with adjustable guide plates, and expansion room, 2 fans each 4 kW with compensator and blowing in channel. Hammer Mill type HH 600 x 2000. Direction of rotor rotation: right-handed or left-handed, reversible. Technical data: Infeed opening 2 x 6.6 ft (600 x 2000 mm) Rotor diameter 6.6 ft (2000 mm) Motor power 670 HP (500 kW) Self-propelled air 16 000 m^3/h Basic equipment: Vertical infeed. Infeed flap, adjustable to direct the material for right-handed or left-handed rotation, hydraulically. Three-part machine housing in welded steel construction. Machine sides folding away hydraulically. Screens and milling tracks integrated in side parts Milling tracks surface hardened Rotor in arc welded steel construction, dynamically balanced, with swinging hammers made out of special steel, pendulous suspended on hardened shafts. Hammers with 2 drill holes therefore all 4 edges can be used. V-belt pulley mounted at the rotor shaft. Zero-speed control (24 V DC) for rotor speed. Limit switch at the housing side parts. All electrical components wired on a conduit box.
5.2.8	**2**	**Dust extraction system for Hammer mill** It includes: - Piping and connection to machine. - Cyclone separator complete with rotary valve and steel support: Air flow Up to 16 000 m^3/h Installed power rotary valve 0.5 HP (0.37 kW) - Radial fan Air flow Up to 16 000 m^3/h Installed power 50 HP (37 kW)

Pos	Units	Description
5.2.9	**2**	**Screw conveyor** U-shaped conveyor trough of 5 mm bent steel plate, with bolted-on cover. Auger (screw) of 8 mm steel plate, welded on center shaft. Center shaft with bolted, exchangeable shaft ends running in double-row spherical roller bearings. Anti-clockwise rotating auger. Drive unit with hollow-shaft mounted flat gear of type Nord (standard) or SEW.
5.2.10	**1**	**Microchips chain conveyor** It collects the microchips produced in the two wet hammer mills and discharges it to the dryer feeding conveyors. Supports included <u>Technical data:</u> Total length: 69 ft (21 m) Inclination: 0º - 45º Installed power: 11 kW (15 HP)
5.2.11	**1**	**Sawdust and shavings moving floor** It receives the sawdust and shavings from the client´s front end loader. Delimited by concrete walls (out of PRODESA´s supply) <u>Technical data</u>: Volume: 250 m^3 (8,828 ft^3) Number of grates: 4 Hydraulic unit motors: 2 x 60 HP (2 x 45 kW)
5.2.12	**1**	**Disc screen feeding chain conveyor** It receives the product from the moving floor (pos 5.2.11) and feeds disc screen (pos 5.2.12) Supports included. <u>Technical data:</u> Total length: 98.4 ft (30 m) Inclination: 0º - 15º Installed power: 11 kW (15 HP)
5.2.13	**1**	**Disc screen** It receives the product from the previous conveyor (pos 5.2.12). To separate big pieces. The good product is discharged to a conveyor that feeds the dryer feeding system. Driven by gearbox and chain transmission. It includes the upper and lower hopper for connection with the previous and post chain conveyors.

Pos	Units	Description
5.2.14	**1**	**Disc screen outlet chain conveyor** It receives the product from the disc screen (pos 5.2.13) and discharges the dryer feeding system. Supports included. Technical data: Total length 44.2 ft (13.5 m) Inclination 0º Installed power 5.5 kW (7.5 HP)
5.2.15	**1**	**Structures and painting** Metal structures necessary for the support of described equipment, as well as access stairs and walkways required for the inspection and maintenance of the facility. All items (except stainless and galvanized steel) are supplied with a first coat of synthetic painting according to our standard RAL.

Pos.	Units	Description
5.3		**DRYER FEEDING SYSTEM**
5.3.1		**Wet product chain conveyor** It receives the microchips from the wet hammer mills (pos.5.2.10) and the sawdust and shavings from the disc screen outlet conveyor (pos 5.2.14), and discharges it to the dryer feeding chain conveyor. Supports included. Technical data: Total length: 220 ft (67 m) Inclination: 0º - 45º Installed power: 37 kW (50 HP)
5.3.2	**1**	**Dryer feeding chain conveyor** It receives the product from the previous chain conveyor (pos 5.3.1) and feeds the dryer dosing bin Supports included Technical data: Total length: 207 ft (63 m) Inclination: 20º Installed power: 45 kW (60 HP)
5.3.3		**Structures and painting** Metal structures necessary for the support of described equipment, as well as access stairs and walkways required for the inspection and maintenance of the facility. All items (except stainless and galvanized steel) are supplied with a first coat of synthetic painting according to our standard RAL.

Pos	Units	Description
5.4	**1**	**Drying Island: DRUM DRYER**
5.4.1	**1**	**Hot Gas Isolation Gate** The Hot Gas Isolation Gate is bolted between the Heat Energy System and Recycle Bustle. This gate enables plant personnel to seal off the Dryer System from the hot gasses generated by the Heat Energy System. When activated, to hold back gasses generated by the Heat Energy System from entering the Dryer System, and thus provide safe passage for plant maintenance personnel into the Dryer System. Technical data: Housing material: 3/8'' thick A36 mild steel Gate material: 12 mm thick 304 SS Actuator: Twin hydraulic cyclinders
5.4.2	**1**	**Recycle system** To control the flow of Dryer System flue gas back to the Dryer System via the Recycle Bustle. The Recycle System consists of gas ductwork that runs from the discharge of the Dryer System's ID Fan to the Recycle Bustle; the Recycle Bustle is located between the Burner and the Dryer Drum. Within this ductwork is a Recycle Damper that controls the amount of flue gas recycled.
5.4.3	**1**	**Recycle bustle** To accept recycled gas from the Dryer Exhaust System and blend it back into the incoming hot gas stream generated by the Heat Energy System.
5.4.4	**1**	**Inlet fitting** To act as a conduit for the transition of the homogeneous drying gas from the Recycle Bustle into the Dryer Drum and for the introduction of the wet woody biomass to be dried into the Dryer Drum
5.4.5	**1**	**Purge Fan** To purge the Dryer System clean of combustible gas to prevent explosions from occurring within the Dryer System
5.4.6	**1**	**Metering Bin** To receive the wet material from the chain conveyor pos 5.3.2, store it and meter it to the infeed airlock. The Metering Bin is located above the Infeed Airlock. The Metering Bin contains augers at bin bottom that are driven by a Variable Frequency Drives.

Pos	Units	Description
		The augers feed/meter the product to the infeed airlock. Above the auger there is an agitator that distributes the product evenly across the augers to ensure proper and constant feed of the augers. Technical data: Capacity: Approx 30 minutes
5.4.7	**1**	**Infeed Airlock** To receive wet material from the Metering Bin and discharge it onto the louvered chute of the Inlet Fitting. The Infeed Airlock comprises a formed machined steel body with a rotating vane. The vane has eight pockets with knife tips. The design loading is based on achieving the optimum balance between minimizing the introduction of ambient air into the system and creating a maximum, nonplugging load in each pocket.
5.4.8	**1**	**Rotary drum** The Drum assembly consists of three major subassemblies: the Drum, the trunnion assemblies, and the drive. The Drum is a cylindrical structure formed of rolled mild steel plate, reinforced with structural section channel, tee, and angle ribs, and external bands. The Drum rides on two full diameter forged tracks. The Drum's interior is a network of lifting flights and baffles, designed to shower material across the Drum's cross-section as it rotates and to regulate the forward movement of material through the Drum. Around the circumference of the Drum are mounted segmented chain teeth sets, on which a roller chain rides. Drum rotation is effected by an electric motor and a gear reducer. The Drum's tires are supported on four trunnion wheels, arranged in opposed pairs at the two track locations. Each trunnion is cast and machined from nodular iron, with shafts riding in split pillow-block spherical roller bearings. Rear runnion Wheels are flanged to fix the location of the Drum. Seals are located at both ends of the drum and are designed to limit ambient air infiltration. Seals are mounted to adapter-taper fittings to insure alignment. Drive chain, trunnions wheels, and tracks are lubricated by Molybdenum Blocks. The Drum is clad with a corrugated skin held in place with stainless steel bands. This creates an air gap which acts as insulation. Technical data: Length: 90' Diameter: 20'

Pos	Units	Description
5.4.9	**1**	**Ductwork** To convey dried biomass and spent gas from the Drum discharge to the High Efficiency Cyclone, and to convey spent gas from the High Efficiency Cyclone discharge to the ID Fan, and from the ID Fan either to the Recycle Bustle and Emission Control Equipment. The Ductwork is made from rolled mild steel. There are essentially two types of Duct in the system: Material Duct that conveys both spent gas and entrained particulate and Gas Duct that conveys spent gas only.
5.4.10	**1**	**Double-Duct** To keep inner walls of the ductwork after material separating Cyclones hotter than the condensable temperature of the complex hydrocarbons that evaporate from woody biomass during the drying process thus prevent ‘pitch’ buildup Double-Duct encompasses the duct from Cyclone discharge to the ID Fan inlet; it also encompasses the recycle duct, which runs from ID Fan to the Recycle Bustle, and duct from ID Fan to WESP’s Quench Duct. Double-Duct is heated via natural gas burners. Sole purpose of the Double-Duct is to keep the inner walls of the process duct (process duct processes Dryer System flue gas) hotter than the condensable temperature of complex hydrocarbons that evaporate from woody biomass during the drying process. This prevents hydrocarbons from condensing onto inner walls of the process duct, which is commonly in the industry referred as ‘pitch’ buildup. Pitch buildup is prone to fires, explosions, and while it accumulates it slowly reduces production capacity of the Dryer Island due to restricting air flow. It is very costly and time consuming to manually clean ‘pitch’ buildup.
5.4.11	**2**	**High efficiency cyclones** To separate dried biomass from the spent gas and deliver it into the Cyclone Airlock. High Efficiency Cyclone accepts spent gas and dried material from the incoming Material Duct. The inlet geometry features a tangential transition to the tub section with inlet angle between Material Duct and transition of fifteen degrees. The cone section is a relatively shallow angle for better efficiency at removing smaller particulate from the gas stream. At the exit to the cone there is an oversized Vortex Breaker with anti-spin baffles to effectively stop the cyclonic action of the material and to evenly distribute it into the Cyclone Airlock pockets minimizing the risk of plugging and wear on the tips of the Airlock. Spent gas is drawn from the top of the Cyclones into the Gas Duct. Explosion relief panels are located on top of the Cyclone.

Pos	Units	Description
5.4.12	**2**	**Cyclone Airlock** To receive dried biomass from the High Efficiency Cyclone and discharge dried biomass to Collection Screw(s). High Efficiency The Cyclone Airlock comprises a formed machined steel body with a rotating vane. The vane has eight pockets with knife tips. The design loading is based on achieving the optimum balance between minimizing the introduction of ambient air into the system and creating a maximum, nonplugging load in each pocket
5.4.13	**1**	**Collection screw** To collect dried material from the Cyclone Airlocks, and process dried material to the dry product chain conveyor or to client´s Fire Dump.
5.4.14	**1**	**ID Fan** To provide the motive force and requisite pressures through the Dryer System. The ID Fan is positioned at grade level after the High Efficiency Cyclone and connects to Gas Ductwork on both the inlet and the outlet sides. It draws gas through the entire Dryer System prior to the inlet and then forces some gas back into the Dryer System via the Recycle Bustle and the reminder of the gas to the WESP. There are expansion joints located at both the inlet and the outlet of the ID Fan that accommodate for the thermal expansion of the Gas Ductwork, but also isolate the Ductwork from any potential vibrations originating with the ID Fan. The ID Fan flow is modulated via a Variable Frequency Drive and it is governed by the pressure differential reading across the High Efficiency Cyclones Technical data: Type: Single wheel, double inlet, centrifugal, class IV. Blade Shape: Radial. Speed: 1,200 rpm Access: Man door for maintenance
5.4.15	**1**	**Recycle & Stack Dumper** To control the flow of gas to the Recycle Bustle or to the Pollution Control Equipment.

Pos	Units	Description
5.4.16	**1**	**Emergency Abort Stack** To vent Dryer System gasses to atmosphere during upset operating conditions At times the Dryer System flue gas will need to be aborted to atmosphere during upset operating conditions; rather than sending these flue gasses to the Pollution Control Equipment or to the Heat Energy System. The Emergency Abort Stack provides the ability to vent gases to atmosphere during upset operating conditions. The control damper is air actuated and is fail safe; if there is a power outage or air failure the Emergency Abort Stack will automatically open. Technical data: Height Approx. 65' above grade Diameter 50''
5.4.17	**1**	**Dryer System Control Devices** The following devices are included in order to control the Dryer System via PLC: • Temperature Control Sensors • Temperature Transmitters • Pressure Transmitters • Speed Switches • Proximity Switches (Capacitive and Inductive) • Plug Detectors • Deluge Nozzles
5.4.18	**1**	**Spark detection and suppression** To monitor the Dryer System for sparks and fires, and extinguish those sparks and fires. The Spark Detection and Suppression monitors various locations within the Dryer. System. Deluge nozzles are linked to the spark detection devices and respond appropriately based on input. The deluge works in conjunction with the Diverter Gate to abort material to the Buyer's Fire Dump. The Spark Detection and Suppression is integrated into the overall Dryer System controls with audible fire alarm, control panel display, and fire sequence relay.
5.4.19	**1**	**Structures, supports and platforms** All the metallic structures for the sustentation of the described equipment, the access ladders and platforms and passage ways needed for the correct inspection and maintenance of the installation. All the equipment (except those in inox steel) are supplied with a layer of epoxy covered by a layer of synthetic paint, according with our standard RAL.

Pos	Units	Description
5.5	**1**	**Drying Island: HEAT ENERGY SYSTEM**
5.5.1	**1**	**Fuel moving floor** It receives the biomass used as fuel from the client´s front end loader. Delimited by concrete walls (out of PRODESA´s supply) Technical data: Volume 250 m^3 8,828 ft^3) Number of grates 4 Hydraulic unit motors 2 x 60 HP (2 x 45 kW)
5.5.2	**1**	**Fuel feeding chain conveyor** It receives the biomass from the fuel moving floor (pos 5.5.1) and discharges it into the furnace flop gate (pos 5.5.3) Technical data: Total length 171 ft (52 m) Inclination 20º Installed power 11 kW (15 HP)
5.5.3	**1**	**Flop Gate** The Flop Gate provides isolation of the fuel feed system from the Fuel Feed Conveyor. The Flop Gate only opens when the Furnace is calling for fuel based on low level sensor located in the Metering Bin. The Flop Gate blocks air (oxygen) from getting inside the Metering Bin during fuel feed upsets or when shutting down a Furnace which contributes to fires
5.5.4	**1**	**Reversing screw** The Reversing Screw is located directly above the Metering Bin and directs fuel to both sides of the Metering Bin, thus ensuring even fuel distribution within the Metering Bin. It provides for even fuel feed into the Furnace from the Metering Bin. The motor driving the screw is a reversing motor.
5.5.5	**1**	**Metering bin** The Metering Bin consists of fuel feed pushers that push fuel onto the Combustion Chamber's grates, and cover the entire grate area with fuel at a controlled fuel bed level. The complete grate area forms an active drying and combustion area. A double alarm system (level control furnace and level control fuel feeders) warns operator in case of interruptions of fuel supply. A gate valve and sprinkler system are installed for prevention of back burning into the Metering Bin. The Metering Bin provides approximately fifteen (15) minutes of fuel storage capacity.

Pos	Units	Description
5.5.6	**1**	**Reciprocating Grate Combustion Chamber** The Combustion Chamber constructed of a robust steel frame structure with moving and stationary grate frames. Reciprocating grate bars are carried by moving support frames. Stationary grate bars are supported by the structure frame. The Reciprocating Grate frames and grate bars are supported on ball bearings. There are four (4) zones of moving grates within the Furnace. The grate bars are of high heat resistant alloy with cooling fins to prevent overheating; water cooling is not required. The grate bars are overlapping, thus preventing through fall of unburned fuel. A hydraulic power pack with pump operates the fuel feeders and grates. The primary combustion air enters the fuel bed from the under-fire air zone through slots between the grate bars. The sides of the grate's assembly are cast steel side bars to protect the refractory of the furnace from abrasion by the moving grate bars. The reciprocating grate bars are activated by hydraulic cylinders. The relative movement between stationary and moving grate bars causes the fuel to continually turn and convey along the grate to enhance the combustion process.
5.5.7	**1**	**Hydraulic Power Pack** Hydraulics for ram feeder, shut off slide, grate cylinders, and the last grate section. Hydraulic Power Pack unit complete with one high-capacity hydraulic pump, complete with coupling, guard, three 4-way directional solenoid valves, tank trim, all components pre-piped, and mounted on a rigid tank.
5.5.8	**1**	**Hyadraulic Displacement Pumps** Hydraulic Displacement Pumps operate all four (4) grate sections of the Furnace and control the speed of the strokes based on firing rate and controlling the speed of the pumps. Each pump motor requires a variable frequency drive.
5.5.9	**1**	**Primary Air Fan** Forced draft fan with flanged inlet and outlet, inlet vane control damper, electric actuator with linkage and mounting bracket. The Primary Air Fan provides the primary combustion air into the under-fire air zones. Air is fed from under the grate bars and is controllable in each of the foursections
5.5.10	**1**	**Secondary Air Fan** Secondary Air Fan is a forced draft fan with flanged inlet and outlet, inlet vane control damper, electric actuator with linkage and mounting bracket. The Secondary Air Fan feeds the air over the fuel pile for complete combustion of fuel.

Pos	Units	Description
5.5.11	**1**	**Furnace Casing and Combustion Air Ducts** Carbon steel construction for the complete chamber with external stiffening beams. Ducting for the Primary and Secondary Air Fans from the fans to the Furnace air boxes and headers.
5.5.12	**1**	**Secondary Combustion and Dropout Chamber** This chamber provides final combustion of the gases from the Furnace. The chamber also provides for mixing of the furnace gas with the Dryer System flue gas. After mixing and blending, the gases are discharged to the Dryer ducting. The Chamber is refractory lined and includes a dropout chamber and flue gas turn around design for maximum removal of fly ash in front of the Dryer. The chamber is designed with the top as a secondary combustion chamber to burn-out the carry over and the bottom as an ash drop-out in order to get clean burned out gas that can be directly fed into the dryer.
5.5.13	**1**	**Refractory** Internal refractory block insulation rated to 1900°F. Furnace material is plastic rated to 2700°F. Using low cement materials and installation to be done using shot-crete method. To be blown-in-place on site.
5.5.14	**1**	**Submerged Ash Conveyor** Submerged Ash Conveyor of drag chain design, complete with gearbox and drive, collects ash from underneath the Furnace grate. Submerged Ash Conveyor provides an air lock for the Furnace ash hoppers
5.5.15	**1**	**Emergency Exhaust Stack** Mounted on top of the Furnace and includes automatic hydraulic damper. The purpose of the Emergency Stack is to open at high temperature and/or high pressure in the system and at power failures. It is fabricated from mild steel and refractory-lined for the first 5 feet above the furnace roof. The remainder of the stack is made of stainless steel and includes one pneumatically operated damper on top as a stack cap. Stack cap is made of stainless steel and also has refractory lining. Technical data: Height — Approx. 50 ft above grade
5.5.16	**1**	**Video Camera and Monitor** One (1) air-cooled video cameras are provided at the rear end of the Furnace with one (1) monitors to allow for visual inspection of the furnace combustion process from the operator room. The video monitors will be located in the operator control room

Pos	Units	Description
5.5.17	**1**	**Heat Energy System Control Devices** The following devices are included in order to control the Heat Energy System via PLC: • Temperature Control Sensors • Temperature Transmitters • Zero Speed Switches • Pressure Transmitters • Proximity Switches (Capacitive and Inductive) • Level Indicators • Deluge Nozzles
5.5.18	**1**	**Structures, supports and platforms** All the metallic structures for the sustentation of the described equipment, the access ladders and platforms and passage ways needed for the correct inspection and maintenance of the installation. All the equipment (except those in inox steel) are supplied with a layer of epoxy covered by a layer of synthetic paint, according with our standard RAL

Pos	Units	Description
5.6	**1**	**Drying Island: WET ELECTROSTATIC PRECIPITATOR (WESP)**
5.6.1	**1**	**Inlet Quench Duct** The Inlet Quench Duct is equipped with recycled water sprays to saturate the gas stream and also scrub out the large particulate present in the exhaust gas. The Inlet Quench Duct attaches to the corresponding
5.6.2	**1**	**Wet Electrostatic Precipitator (WESP)** One Complete WESP unit will be provided. The unit will be complete with collecting electrodes, discharge electrodes, and a suspended power grid Technical data: Design Pressure: ± 25 IWC (0.06 bar) Collection Electrodes: 304L SS Discharge Electrodes: 304L SS Collection Section Housing: 304L SS tubes and tube sheets; A36 CS steel structural supports; A36 CS partical external skin
5.6.3	**1**	**Quench Water Recycle** The Quench Water Recycle will include a common recycle tank with one (1) recycle pump. Recycle water is sprayed into the quench duct and spent recycle water will gravity drain into the recycle tank located beneath the WESP. The Quench Water Recycle will be controlled automatically by the PLC control system. Make up water requirements due to evaporation or blow down will be satisfied with flush water or on demand by level control Technical data: Recycle Tank capacity: 20,000 gallons (75 m3) Recycle Pumps capacity: 2,500 gallon/min (9,375 l/min)
5.6.4	**1**	**Decanter Centrifuge** The Decanter Centrifuge removes solids collected by the Wet ESP and is required for the system. The Decanter Centrifuge is configured to treat a slipstream of up to 50 gallons per minute (187.5 liters/minute) of recycle water from the Wet ESP. The cake produced by the Decanter Centrifuge will be approximately 50% solids by weight and, depending on the nature of the solids, can be burned in the Reciprocating Step-Grate Furnace or sent to landfill. The centrate (cleaned water) will gravity drain back to the recycle tank. A small blow-down stream of approximately 2 gallons per minute (7.5 liters/minute) will

Pos	Units	Description
		also be necessary to control dissolved solids. The exact amount will be determined after start up based on dissolved solids level..
5.6.5	**1**	**Chemical Injection** The Chemical Injection is incorporated into the flush and recycle systems. This system is designed to periodically inject sodium hydroxide (NaOH) directly into the flush water to aid in cleaning of the Wet ESP collection tubes. The flush and caustic systems will be controlled by the Dryer Island PLC. The Chemical Injection is also designed to inject a de-foaming agent into the water recirculation system to control foam when it occurs. The de-foaming system will be controlled at the PLC and also have the capability for manual control. The caustic and de-foaming system will be enclosed in a containment area. It is recommended that the entire system be insulated and heat traced.
5.6.6	**1**	**High Voltage Power Supply** Type: 3 phase, air cooled. T/R: NEMA 4. Control Panel: NEMA 1 to be located in MCC Output Rating: 70 kilovolt, 1500 milliamp. Input Power: 105 KVA, 460 V / 3-phase / 60 Hz. High Voltage Transmission: Pipe in grounded duct. Features: Control Panel with digital controller, KV and MA signal transmitters; remote start/stop function; grounding switch; key interlock system.
5.6.7	**1**	**Purge Air** Purge Air will provide clean, warm air to all support insulators to prevent fouling by process gas. The Purge Air System will also be equipped with a ducting network that uses the tube bundle for pre-heating the air
5.6.8	**1**	**Flush System** Type: Intermittent sprays. Flushed Areas: Collection sections (tubes and probes) plus mist eliminator. Features: All required nozzles and internal headers are provided. One feed system consisting of heated flush tank immersed in the recycle water for heat transfer purposes and a pump will be supplied. Hot water with caustic added is much more effective in removing sticky organic deposits from the collection tubes than cold water

Pos	Units	Description
5.6.9	**1**	**Control Devices** The following devices are included in order to control the WESP via PLC: • Temperature Control Sensors • Temperature Transmitters • Zero Speed Switches • Pressure Transmitters • Proximity Switches (Capacitive and Inductive) • Level Indicators • PH Level Indicators
5.6.10		**Structures, supports and platforms** All the metallic structures for the sustentation of the described equipment, the access ladders and platforms and passage ways needed for the correct inspection and maintenance of the installation. All the equipment (except those in inox steel) are supplied with a layer of epoxy covered by a layer of synthetic paint, according with our standard RAL

Pos	Units	Description
5.7	**1**	**Drying Island: REGENERATIVE THERMAL OXIDIZER (RTO)**
5.7.1	**1**	**Inlet manifold** Materials of Construction: Type 304L stainless steel, with minimum 10-gauge thickness, adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC; 176°F (0.06 bar @ 80°C). Access: One access door for internal inspection of inlet manifold
5.7.2	**1**	**Diverter Valves** Materials of Construction: Type 304L stainless steel 3/16 in. thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC; 176°F (0.06 bar @ 80°C) inlet and 209°F outlet (98°C); maximum operational temperature is 600°F (316°C) during bake-out, and occurrence is for duration of 15-minute intervals. Valve Trim Construction: Main disk 3/16-inch-thick, Type 2101 duplex stainless steel; support disks 3/16-inch-thick Type 304L stainless steel. Seat materials are Type 304L stainless steel. Seal arrangement is metal to metal sealing surfaces without elastomeric compounds that would damage during bake-out. Access: One access door for internal inspection. Valve Actuation System: Parker 2A heavy duty pneumatic cylinder, adjustable end cushions at each end of travel; direct link with Parker linear alignment coupling, inductive proximity switches measuring actual valve shaft position, actuation time is 0.5 seconds full open to full close; the assembly is pre-assembled and pre-wired to junction box.
5.7.3	**1**	**Hopper Transitions** Materials of Construction: Type 304 stainless steel 3/16-inch-thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC; 176°F (0.06 bar @ 80°C) inlet and 209°C outlet (98°C); maximum operational temperature is 600°F (316°C) during bake-out.
5.7.4	**1**	**Heat Recovery Sections** Materials of Construction: Type 304L stainless steel 3/16-inch-thick and adequately stiffened to withstand maximum internal pressures Operational Parameters: ±25” IWC (0.06 bar); 176°F (80°C) inlet and 1500°F outlet (816°C); maximum operational temperature 1800°F (982°C) at top and 1100°F (593°C) at bottom. Media Support Structure: Type 304 stainless steel structure with laser cut slotted plate; maximum design temperature of 1100°F (593°C); maximum free passage of 70% open area; centered in heat recovery chamber with no direct contact to outside walls; both ends floating to allow for thermal expansion.

Pos	Units	Description
		Access: Inspection access to the support structures is through the diverter valve; inspection access to top of heat recovery section is through combustion chamber access.
5.7.5	**1**	**Combustion Chamber** Materials of Construction: Type 304L stainless steel 3/16-inch-thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC (0.06 bar); normal operation 1500°F (816°C); maximum operational temperature 1800°F (982°C). Access: One access door in the combustion chamber
5.7.6	**1**	**Outlet Manifolds** Materials of Construction: A36 carbon steel, ¼" thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC (0.06 bar); 204°F (96°C) normal operating temperature; maximum operational temperature is 800°F (427°C) during bake-out and occurrence is for a duration of 15 minutes intervals. Access: One (1) man door for internal inspection.
5.7.7	**1**	**Process Dampers** Materials of Construction: Type 304L stainless steel for inlet side of RTO and A36 for discharge side of RTO. Type: Butterfly with tadpole seats.
5.7.8	**1**	**ID Fan** Temperature: 450°F design temperature (232°C). Static Pressure: 25 IWC (0.06 bar); includes additional pressure with 2 IWC (0.005 bar) for incoming duct loss
5.7.9	**1**	**Exhaust Stack** Materials of Construction: A36 carbon steel. Height: 50' above grade. Features: Sampling platform per specifications, ladder from grade to platform, free standing
5.7.10	**1**	**Internal Ceramic Refractory** Heat Recovery Sections: Minimum 6" thick 8 lb density (15.24 cm thick @ 3.64 kg density). Combustion Chamber: Minimum 8" thick 8 lb density (20.32 cm thick @ 3.64 kg density). Type: Unifrax or approved equal; Anchor-Loc spun fiber ceramic modules. Attachment Method: Welded/threaded stud, Stainless steel.

Pos	Units	Description
		Combustion Chamber Temperature: 1550°F (843°C). Maximum Internal Temperature: 2200°F (1204°C). External Skin Temperature: Less than 150°F (66°C) at 70°F (21°C) with 5 mph (8 km/hr) wind.
5.7.11	**1**	**Heat Recovery Media** Type: MLM structured media by Lantec or equal. Thermal Efficiency: 96.5% TE.
5.7.12	**1**	**Burner System** Type: Maxon Kinemax. Size: 8 mmBTU/hr each (8.44 Gj). (Total RTO rating) Quantity: Six (6) burners. Features: Maxon series 5000 blocking valves, Honeywell C6097 A series pressure switches, Actarus B 38 R pressure regulators, Maxon MicroRatio series air/gas proportioning valves, combustion blower, Honeywell RM 7800L flame supervisory system, Honeywell C7061 A self-checking flame scanner, and Honeywell UDC 2500 over temperature control; supplied pre-piped, pre-wired, skid mounted
5.7.13	**1**	**RTO Control Devices** The following devices are included in order to control the RTO via PLC: • Temperature Control Sensors • Temperature Transmitters • Zero Speed Switches • Pressure Transmitters • Proximity Switches (Capacitive and Inductive) • Flame Scanner(s)
5.7.14	**1**	**Structures, supports and platforms** All the metallic structures for the sustentation of the described equipment, the access ladders and platforms and passage ways needed for the correct inspection and maintenance of the installation. All the equipment (except those in inox steel) are supplied with a layer of epoxy covered by a layer of synthetic paint, according with our standard RAL

Pos	Units	Description
5.8	**1**	**Drying Island: REFRACTORY WORKS**
		Supply all manpower, lifting and hoisting equipment, and travel and living expenses, to install the refractory on the Heat Energy System and connecting hot gas ductwork between the Heat Energy System and Dryer Drum. It includes: 1) Heat Energy System refractory supply. 2) Heat Energy System refractory anchors supply. 3) Dryer System's hot gas ductwork refractory supply. 4) Dryer System's hot gas ductwork refractory anchor supply. 5) Heat Energy System anchor and refractory installation. 6) Dryer System hot gas ductwork anchor and refractory installation. 7) Heat Energy System refractory cure-out. 8) Dryer System refractory cure-out. 9) Refractory installation/cure-out 3rd party inspection. 10) Confined space area attendants and monitors.

Pos.	Units	Description
5.9		**DRY PRODUCT STORAGE**
5.9.1	**1**	**Chain conveyor** Moves the dry product from the dryer to the intermediate storage silo. <u>Technical data:</u> Length 154 ft (47 m) Inclination 22º Installed power 18.5 kW (25 HP) Material SS
5.9.2	**1**	**Screw conveyor** It receives the dry product from the previous chain conveyor (pos 5.9.1) and discharges it into the dry product silo. It includes a second outlet as emergency exit.. <u>Technical data:</u> Length 21 ft (6.5 m) Inclination 0º Installed power 7.5 kW (10 HP)
5.9.3		**Intermediate storage vertical silo** <u>VERTICAL SILO</u>: Bolted carbon and carbon steel construction, delivered in prefabricated segments or parts for assembling on site. It consists of: • Interior floor assembly with all assembling and connection openings • 4’ x 4’ opening in skirt as outlet for process conveyor • 4’ x 4’ opening in skirt as outlet for dump conveyor1 • 6' x 6'-8" Double Walk-Through Door in silo skirt1 • 36” x 48” maintenance opening at level of product floor • 4'-6" x 4'-6" exterior platform at level of product floor with access ladder and fall • protection system • 1 set of explosion vents arranged underneath eave • 4 x eave mounted conveyor support columns, designed for max 10 kip vertical load each • Exterior ladder with fall protection system - OSHA Compliant – as access to silo • roof, design with no cage and no rest platforms • Accessible roof (1:12) – self supported • 1 guardrail (full perimeter) • 4’ square inlet flange on roof

<table>
<tr><th>Pos.</th><th>Units</th><th>Description</th></tr>
<tr><td></td><td></td><td>

2'x 3' bin vent flange on roof
24" roof combination manway pressure relief valve, 2.0 oz. pressure, 0.5 oz. vacuum with removable security cross
2 x 4" dia., Flange (for level control (continuous), silo roof)
4 x 2 1/2" dia. half coupling (for level control min, intermediate or max in silo roof or silo shell)
1 fire suppression line w/ roof mounted nozzles (dry line system)

<u>Silo Technical data:</u>
Volume (gross) 45,732 ft3 (1,295 m3)
Volume (net), approx. 35,456 ft3 (1,004 m3)
Angle of repose 45º
Inner silo diameter 33.85' (10.317 mm)
It includes a <u>ROTATING SCREW:</u>
1 turret, supported in a heavy-duty rotary-joint, with external teeth system for transmission of the forward feed drive forces.
2 rotating screw, support to one side in the silo center at the turret, screw spiral with progressive pitch, screw flights in special design; supported in a heavy-duty bevel helical gearbox.
1 Drive unit for the screw spiral in multilevel design
2 forward feed drive for rotation of the turret around the silo centreline
1 support frame for assembly of the complete rotating screw unit into the silo bottom structure.
1 level switch / overfilling protection in the lower part of the turret for automatic switch-off, in case of an unforeseen shutdown of the downstream conveyor below the rotating screw unit.
1 sealing between turret and silo bottom.
<u>Rotating Screw Technical data:</u>
Diameter 33.85' (10,317 mm)
Discharge rate 11,000 ft3/h (311 m3/h)
Installed power main drive 45 kW (60 HP)
Installed power forward device 2 x 0.5 Kw (2 x 0.33 HP)

Installed at the dry product silo outlet, allows discharge the product:

Outlet 1: Emergency Screw Conveyor
Outlet 2: Milling line feeding chain conveyor

</td></tr>
</table>

Pos.	Units	Description
5.9.5	**1**	**Emergency screw conveyor** To empty the silo in case of emergency.
5.9.6	**1**	**Milling line feeding chain conveyor** To transport the dried product from the intermediate storage silo diverter (pos 5.9.4) to the dry hammer mills feeding chain conveyor (pos 5.10.1). Technical data: Length 126 ft (38.5 m) Inclination 20º Installed power 15 kW (20 HP)
5.9.7	**1**	**Structures, supports and platforms** All the metallic structures for the sustentation of the described equipment, the access ladders and platforms and passageways needed for the correct inspection and maintenance of the installation.

Pos	Units	Description
5.10		**DRY MILLING LINE**
5.10.1	**1**	**Dry hammer mills feeding chain conveyor** It receives the product from the previous conveyor (pos 5.9.6) and feeds the dry hammer mills. Double bottom chain conveyor so it is possible to feed the hammer mills and the leftover will be discharged to a second conveyor (pos 5.10.8) to return it to the dry product storage silo (pos 5.9.3) Technical data: Length 108 ft (33 m) Inclination 0º Installed power 15 kW (20 HP)
5.10.2	**4**	**DHM Dosing bin with triple extracting screw** Steel bin to collect the dry product and dose it to the hammer mill. It includes dosing screws with frequency converters. Driven by gear box directly mounted on the screw shaft.
5.10.3	**4**	**Destoner Rolston DRS 15** - Stone separator to evacuate heavy sizes (stones). - Permanent magnet to evacuate the metal pieces. - Suction pipe to introduce air in the hammer mill. Technical data: Dimensions 47" x 39 " x 63" Weight 1370 lbs
5.10.4	**4**	**Dry hammer mill THOR DHM 15** PROGRANUL AdvancePelleting by PRODESA **Body and frame:** - A robust body made from welded steel which sits over the rotor - A single base frame for the body and motors - Suspension feet under the frame with height adjustment - A product deflector flap controlled manually at the inlet of hammer mill (two possible positions according to the rotational direction of the rotor) **Drive:** - Coupling is carried out by machined plates with semi-elastic cylindrical fingers (Mounted under protective guards) - Motor included: Motor: 900 HP Motor rpm: 1,500 rpm

Pos	Units	Description

	Direct drive

Rotor:

- Big and heavy, mounted to two external roller bearings

Diameter	55"
Width	60"

- Rotor rotational direction can be clock-wise or counter clock-wise

Screens

- The total screening surface is composed of 6 distinct sections (individual screens)

Total suface area	48 ft^2

- Internal impact zones are composed of removable plates, some of which are equipped with static counter-hammers
- 1st set of screens (6) supplied with the hammer mill (diameter to be defined in further stages)
- Screens are changed manually when the hammer mill is stopped

Hammers:

Units	216 (1st set)
Speed	109 m/s
Dimensions	13" x 3" x 0.4"
Weight	4.6 lbs

Access doors:

- Two access doors on each side of the machine; each equipped with electric security locks

An electrical terminal block for the connection of various sensors (pre-wired in our workshop):

- Two electromechanical limit switches confirming the position of the inlet deflector flap
- Vibration sensor mounted to one of the side plates
- Temperature sensors on the bearings

Tools for hammer mill maintenance:

- Set of anti-drop steel plates (to prevent anything from falling under the hammer mill during maintenance)

Additional technical data:

Inlet opening	12" x 60.9"
Self-propelled air	14,714 CFM (25,000 Nm^3/h)

Pos	Units	Description
		Total weight (without motor) 7.850 kg 5.10.5	**4**	**Dry hammer mill PLENUM CHAMBER and PNEUMATIC SYSTEM** It includes: • PLENUM CHAMBER The milled product is discharged by gravity in a discharge hopper. It includes: o Back pressure flaps: Equipment which prevents the transmission of the dangerous effects of an explosion, a pressure wave and flames before the filter. It prevents too the dust returns when the installation is stopped. o Extracting chain conveyor o Rotary valve, for the pneumatic sealing of the hammer mill circuit. • PNEUMATIC SYSTEM It includes the ducting (from plenum chamber to inlet cyclofilter, outlet cyclofilter to fan) cyclofilter with explosion panels, valves, exhaust fan and stack: o Ducting o Explosion isolation valve, to be installed at the inlet duct, with micro switch and dust level sensor

Pos	Units	Description
		o Cyclofilter, with explosion venting and explosion vent burst indicators. 232 filter bags that provide 2,413 square feet of media for 15,000 CFM airflow. o 48'' Bottom hopper with screw conveyor + 12'' NFPA Rotary valve o Fan 75 HP o Cyclofilter platform/ladder
5.10.6	**1**	**Spark detector and extinguishing system** To be installed in the ducts of the pneumatic systems of each hammer mill, it includes the following devices: • Spark detection central (one unique and common for all the different lines) For the connection of the detecting instruments (upgradeable) It registers the all the events: alarms, number of sparks, sparks threshold, time threshold, extinguishing time. Microprocessor with an automatic control system. • Spark detectors • Extinghisihing devices • Flashing alarm hor
5.10.7	**1**	**Dry and milled product chain conveyor** It receives the product from the dry hammer mills and discharges into pelleting line feeding chain conveyor (pos. 5.11.6). Technical data: Length: 197 ft (60 m) Inclination: 0º - 21º Installed power: 18.5 kW (25 HP)
5.10.8	**1**	**Dry product recirculation chain conveyor** It receives the product from the dry hammer mills feeding chain conveyor pos 5.10.1 to be introduced again in the dry product storage silo Technical data: Length: 123 ft (37.5 m) Inclination: 16º Installed power: 15 kW (20 HP)

Pos	Units	Description
5.10.9	**1**	**Support structures and painting** Metal structures necessary for the support of described equipment, as well as access stairs and walkways required for the inspection and maintenance of the facility. All items (except stainless and galvanized steel) are supplied with a first coat of synthetic painting according to our standard RAL.

Pos.	Units	Description
5.11		**DRY & MILLED PRODUCT STORAGE**
5.11.1	**1**	**Chain conveyor** Moves the leftover dry and milled product from the pelleting line, to the dry and milled product storage. Technical data: Length 164 ft (50 m) Inclination 0º - 25º Installed power 18.5 kW (25 HP)
5.11.2	**1**	**Screw conveyor** It receives the dry and milled product from the previous chain conveyor (pos 5.11.1) and discharges it into the dry and milled product silo. It includes a second outlet as emergency exit.. Technical data: Length 21 ft (6.5 m) Inclination 0º Installed power 7.5 kW (10 HP)
5.11.3	**1**	**Intermediate storage vertical silo** VERTICAL SILO: Bolted carbon and carbon steel construction, delivered in prefabricated segments or parts for assembling on site. It consists of: • Interior floor assembly with all assembling and connection openings • 4' x 4' opening in skirt as outlet for process conveyor • 4' x 4' opening in skirt as outlet for dump conveyor1 • 6' x 6'-8" Double Walk-Through Door in silo skirt1 • 36" x 48" maintenance opening at level of product floor • 4'-6" x 4'-6" exterior platform at level of product floor with access ladder and fall • protection system • 1 set of explosion vents arranged underneath eave • 4 x eave mounted conveyor support columns, designed for max 10 kip vertical load each • Exterior ladder with fall protection system - OSHA Compliant – as access to silo • roof, design with no cage and no rest platforms • Accessible roof (1:12) – self supported • 1 guardrail (full perimeter)

Pos.	Units	Description
5.12.4	**12**	**Pellet mill TORO PM 8.1** PROGRANUL AdvancePelleting by PRODESA

Pellet mill designed for wood pelleting with a vertically mounted ring die.

Body and frame

- Made from welded steel
- Designed to position the motor at the rear of the pellet mill
- Anti-vibrational plates placed between the pellet mill body and the floor
- Equipped with 4 cantilever plates on each frame according to the Prodesa design

Main shaft mechanical assembly

- Hollow main shaft – made from cast iron
- Main pulley made from a special cast iron, mounted onto heavy duty high quality bearings
- Safety pin calibrated according to motor power

Secondary shaft

- Mounted to two bearings with housing support

Drive / transmission

- Main drive – XPC V-belt transmission – under protective guard designed according to Prodesa standard
- Secondary drive – Toothed belt transmission – enclosed in the pellet mill body
- Motor included:

Motor	500 HP
Motor rpm	1,800 rpm

Compression

- A conical bowl to distribute the product entering via the feeding chute
- Scrapers to help guide the product between the rolls and inner die surface
- **Ring die** (ESR) – see note below
    - Dismantled via a thermo-mechanical system

Working width	4"
Inner diameter	32"
Working surface	3 ft^2 (432 in^2)
Pellet diameter	6-8 mm
Rotation speed	91 rpm

<table>

</table>
Main door and hinged feeding chute
- Made of stainless steel
- Door opening to the left or right (reversible)
- Mechanical safety locks for both the main door and hinged chute (opening to the right). To be connected to the local control cabinet (deported electronics)
- Opening on door with butterfly flap for steam extraction
An electrical box to connect the sensors and probes (Pre-wired in our workshop)
- Temperature probes for the secondary shaft bearings
- Vibration control probes placed on the secondary shaft bearing housing
- Speed control and module counting of the main pulley
- Cooling fan for the toothed belts
- Safety pin rupture sensor
<u>Additional data:</u>
Weight 26,500 lbs

Pos	Units	Description
5.13	**1**	**Milling and Pelleting Island RTO** (RCO correction)
5.13.1	**1**	**Inlet manifold** Materials of Construction: Type 304L stainless steel, with minimum 10-gauge thickness, adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC; 176°F (0.06 bar @ 80°C). Access: One access door for internal inspection of inlet manifold.
5.13.2	**1**	**Diverter Valves** Materials of Construction: Type 304L stainless steel 3/16 in. thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC; 176°F (0.06 bar @ 80°C)inlet and 209°F outlet (98°C); maximum operational temperature is 600°F (316°C) during bake-out, and occurrence is for duration of 15-minute intervals. Valve Trim Construction: Main disk 3/16-inch-thick, Type 2101 duplex stainless steel; support disks 3/16-inch-thick Type 304L stainless steel. Seat materials are Type 304L stainless steel. Seal arrangement is metal to metal sealing surfaces without elastomeric compounds that would damage during bake-out. Access: One access door for internal inspection. Valve Actuation System: Parker 2A heavy duty pneumatic cylinder, adjustable end cushions at each end of travel; direct link with Parker linear alignment coupling, inductive proximity switches measuring actual valve shaft position, actuation time is 0.5 seconds full open to full close; the assembly is pre-assembled and pre-wired to junction box.
5.13.3	**1**	**Hopper Transitions** Materials of Construction: Type 304 stainless steel 3/16-inch-thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC; 176°F (0.06 bar @ 80°C) inlet and 209°C outlet (98°C); maximum operational temperature is 600°F (316°C) during bake-out
5.13.4	**1**	**Heat Recovery Sections** Materials of Construction: Type 304L stainless steel 3/16-inch-thick and adequately stiffened to withstand maximum internal pressures Operational Parameters: ±25” IWC (0.06 bar); 176°F (80°C) inlet and 1500°F outlet (816°C); maximum operational temperature 1800°F (982°C) at top and 1100°F (593°C) at bottom. Media Support Structure: Type 304 stainless steel structure with laser cut slotted plate; maximum design temperature of 1100°F (593°C); maximum free passage of 70% open area; centered in heat recovery chamber with no direct contact to outside walls; both ends floating to allow for thermal expansion.

Pos	Units	Description
		Access: Inspection access to the support structures is through the diverter valve; inspection access to top of heat recovery section is through combustion chamber access .
5.13.5	**1**	**Combustion Chamber** Materials of Construction: Type 304L stainless steel 3/16-inch-thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC (0.06 bar); normal operation 1500°F (816°C); maximum operational temperature 1800°F (982°C). Access: One access door in the combustion chamber.
5.13.6	**1**	**Outlet Manifolds** Materials of Construction: A36 carbon steel, ¼” thick and adequately stiffened to withstand maximum internal pressures. Operational Parameters: ±25 IWC (0.06 bar); 204°F (96°C) normal operating temperature; maximum operational temperature is 800°F (427°C) during bake-out and occurrence is for a duration of 15 minutes intervals. Access: One (1) man door for internal inspection
5.13.7	**1**	**Process Dampers** Materials of Construction: Type 304L stainless steel for inlet side of RTO and A36 for discharge side of RTO. Type: Butterfly with tadpole seats..
5.13.8	**1**	**ID Fan** Static Pressure: 25 IWC (0.06 bar); includes additional pressure with 2 IWC (0.005 bar) for incoming duct loss
5.13.9	**1**	**Exhaust Stack** Materials of Construction: A36 carbon steel. Features: Sampling platform per specifications, ladder from grade to platform, free standing
5.13.10	**1**	**Internal Ceramic Refractory** Heat Recovery Sections: Minimum 6” thick 8 lb density (15.24 cm thick @ 3.64 kg density). Combustion Chamber: Minimum 8” thick 8 lb density (20.32 cm thick @ 3.64 kg density). Type: Unifrax or approved equal; Anchor-Loc spun fiber ceramic modules. Attachment Method: Welded/threaded stud, Stainless steel. Combustion Chamber Temperature: 1550°F (843°C). Maximum Internal Temperature: 2200°F (1204°C).

Pos	Units	Description
		External Skin Temperature: Less than 150°F (66°C) at 70°F (21°C) with 5 mph (8 km/hr) wind.
5.13.11	**1**	**Heat Recovery Media** Type: MLM structured media by Lantec or equal. Thermal Efficiency: 96.5% TE.
5.13.12	**1**	**Burner System** Type: Maxon Kinemax. Features: Maxon series 5000 blocking valves, Honeywell C6097 A series pressure switches, Actarus B 38 R pressure regulators, Maxon MicroRatio series air/gas proportioning valves, combustion blower, Honeywell RM 7800L flame supervisory system, Honeywell C7061 A self-checking flame scanner, and Honeywell UDC 2500 over temperature control; supplied pre-piped, pre-wired, skid mounted.
5.13.13	**1**	**RTO Control Devices** The following devices are included in order to control the RTO via PLC: • Temperature Control Sensors • Temperature Transmitters • Zero Speed Switches • Pressure Transmitters • Proximity Switches (Capacitive and Inductive) • Flame Scanner(s)
5.13.14	**1**	**Structures, supports and platforms** All the metallic structures for the sustentation of the described equipment, the access ladders and platforms and passage ways needed for the correct inspection and maintenance of the installation. All the equipment (except those in inox steel) are supplied with a layer of epoxy covered by a layer of synthetic paint, according with our standard RAL

Pos.	Units	Description
5.14		**Electrical equipment and control system**
5.14.1	**1**	**Control system** • Automatic process control. In order to control and regulate the plant, a PLC (Siemens S7-300, S7-1500 or similar), with visualization and trending, is supplied. For maintenance and regulation of every equipment, it exists the possibility of controlling them in a manual mode. • Independent control systems in dry line and pellet line. In this way, for maintenance, it can be possible to disconnect completely one line, whereas the other one can continue operating. • There are instrumentation control inputs and outputs in electrical cabinets, which are located near the equipment. These inputs and outputs include IP 54 protection in order to reduce the cabling and to avoid interferences. • Local control electrical cabinets for the main equipment, such as mills and pellet mills. • Communication between electrical cabinets by Profibus, Profinet or CANopen. Ring layout in order to guarantee a better performance. • Double communications card. The first one to ensure SCADA communications and the other one to control inputs/outputs. • Safety controllers to manage the general emergency stop and the safety circuits of main equipment. • Internet connection for remote maintenance to be supplied by client. • Process instrumentation: IFM,Edress Hauser, Wika, Schmersall, ACO, etc.
5.14.2	**1**	**Monitoring System** • Monitoring system PC-SCADA, based on WinCC, Cimplicity or similar. • PC in Rack with constant supply, SAI. • Rack of connecting PC-SCADA, SAI and Switch of Ethernet connections. • Redundant hard disks. • Display system in several monitors at the same time. Thanks to it, it can be possible to display the whole plant state in a simple way. • Display of process parameters, input data and state of the sequence. • Functioning and operation control, with the equipment working in a manual mode. • Graphs and functioning records. In this way, it can be possible to visualize current trends or recover old records in order to analyze them. • Display active alarms and record them in the long-term. • Internet connection for remote maintenance to be supplied by client.

Pos.	Units	Description
5.14.3	**1**	**Electrical Power Cabinet** • Control and protection of motors and drives. • Cutoff switch with protection against overcurrents and differential failure. • Network analyzer integrated with record and display of data from SCADA. • Direct starter for motors (P <= 7,5 kW), Siemens, ABB or similar. • Slow starter for motors (P >7,5 kW or less if it is required for the process), Siemens, ABB or similar. • High performance frequency variators. It is possible to add a line filter for drivers if the process requires it. ABB, Siemens or similar. • Control panels for the starters and variators. They are located in the frontal part of the electrical cabinet, in this way you can manipulate them without opening the cabinet. • Variators and starters communicated with the PLC by Profibus, Profinet, etherCAN or similar. • Terminal connection on the bottom of the electrical cabinet for areas under 35 mm^2. If the area is higher than 35 mm^2, the connection takes place in the driver shovel. *The cabling of all the elements described in this offer to the control panel is not included.*

Pos.	Units	Description
5.15		**Engineering, Documentation and Project Management**
5.15.1	**1**	**Engineering and Documentation** The following documentation in English language is included in the price: ✓ Loading drawing. ✓ Layout drawing. ✓ Electrical drawing. ✓ Motor and instrument list. ✓ P&ID. ✓ Operating instructions. ✓ List of spare parts. **Project Management** Remote services of a Prodesa's Project Manager to coordinate the different stages of engineering, manufacturing, shipping, erection supervision and commissioning. Includes monthly visits during the engineering stage to coordinate the Balance of Plant (Building, civil works, utilities, etc.) with the client and contractors.

6. TRANSPORT, ERECTION SUPERVISION, COMMISSIONING

6.1 TRANSPORT

Prices are considered as DDP Hoquiam, Grays Harbor County (Washington, USA) according to INCOTERMS 2020 and in accordance with applicable duties, taxes and other costs related to import, in force at the moment of issuance of this offer.

In case of modifications on these costs:

- During the validity period of the offer or
- In case of project execution: during the period between the date of contract signature and the delivery date of the last material.

PRODESA reserves its right to revise the price of this DDP transport cost.

6.2 ERECTION SUPERVISION

The erection supervision by a wide experienced chief is included in our scope of supply.

We have included in the scope of this offer the services of three-four (3-4) experienced technicians during six (6) months to support the erection/assembly.

The electrical and mechanical erection will be done with local fitters. The cost of those fitters is not included in this offer.

Additionally services will be “per diem” rates.

NOTE: Our works on site include all the travel expenses, the accommodation and the subsistence allowances of our technicians.

6.3 COMMISSIONING

The commissioning consists on a cold start-up followed by a warm start-up. Our engineers will be onsite as required in order to carry out this operation.

The client will supply the utilities that will be specified before the commissioning.

For the commissioning, we have included the services of three (3) experienced technicians during four (4) months that will set the plant into operation and will train the staff.

Additionally services will be “per diem” rates.

The cold start-up phase is defined as all tasks and checks carried out in the equipment in dynamic and energized conditions (without raw material) in order to prepare the plant for the warm start-up (with product).

The end of the warm start-up is defined as the moment when the plant starts to produce pellets, so the Take Over. At this time, operational risks of the pellets plant is transferred to the client.

The training of the client’s staff will be in English language. The training will be together to the commissioning.

NOTE: Our works on site include all the travel expenses, the accommodation and the subsistence allowances of our technicians.

7. SUPPLY LIMITS

Product inlet

Ground chips:	Truck dumper	(pos. 5.1.2)
Shavings and sawdust	Truck dumper	(pos. 5.1.2)
Fuel	Truck dumper	(pos 5.1.2)

Product outlet

Pellets:	Pellet sifter	(pos. 5.12.15)

Thermal energy

Fuel :	Truck dumper	(pos 5.1.2)

Electricity

Electrical connection in our control panel.

Water

Inlet water flanges to the different consumption points.

Compressed air

Connections of different air consumption points: filters, coolers, etc.

Lubricant

Connections of different lubricant consumption points.

8. PRICE

As this is a budget proposal, prices and scope of supply may be altered in further discussions with the client.

Prices are given in USD.

VAT and taxes not included.

9. TERMS OF PAYMENT

First payment: 30% at the signature of the contract.

The rest of the payments: 70%

Resting 70 % will be done by Partial or Total Transferable and Irrevocable Letter of Credit, in these stages:

- 50% at the delivery of the main equipment, by divided payments in each partial delivery of main equipment.
- 10 % at the end of the mechanical erection.
- 5 % at the end of the cold start-up.
- 5% at the end of the warm start-up.

The following sentences are applicable to the Letter of Credit or any other terms of payment agreed with the client:

- It must be emitted not later than one (1) month after the first payment is done. In case of delay in the emission of this Letter of Credit, the project will be delayed in proportional time or higher depending on the circumstances of the manufacturing.
- In case of delay in the delivery of the equipment, erection or commissioning due to circumstances beyond PRODESA´s control, will invoice the corresponding pending stages of the LC in 15 days of our communication to execute the works.

10. PRICE VALIDITY

This offer is valid for 1 month from the date of issuance.

11. DELIVERY TIME

To be confirmed.

12. NOT INCLUDED

Unless especially mentioned in our quotation, the following parts and services are not included in our price:

1. Building with concrete, foundations and civil works, and Building construction, painting and demolition works possibly necessary on existing buildings
2. Based plates.
3. Cabling from the different elements described in the contract to the electrical panels.
4. Manpower for mechanical and electrical erection.
5. Cranes, scaffolding and other elevating devices necessary for the erection and offloading.
6. Thermal and acoustic isolation or reduction equipment (if required and not mentioned).
7. Grounding, Grounding network and bonding grid.
8. Reactive energy compensation.
9. Harmonics reduction system.
10. Ducting for compressed air, water, steam etc.
11. Air compressor, water pumps, etc.
12. Heat trace cables.
13. Piping insulation.
14. Pipe bridges.
15. Spare parts and parts subject to wear.
16. Radiographs of welds.
17. Protecting measures for electrical motors installed outdoor.
18. Required operating materials (pressurised air, water, electricity, lubricants, hydraulic oil, etc.) and disposal of the same
19. Operating material or fuels for commissioning test running and/or performance testing.
20. Energy and electrical cabinets during the erection and commissioning.
21. Toilets, changing rooms, and material storage room during the work.
22. Containers and management of the waste generated during the assembly and start up.
23. Containers for rejected product (overs, fines, metals, heavy particles...).
24. The cost of testing, third parties certifications and adaptations to regulations different to the ones considered, as local regulations for example. There is no provision for technical support to these adaptations in case of required.
25. Expenses for tests, stamps and approvals eventually requested by the authority in the country of destination.
26. Emissions and noise tests.
27. Registration with the Local Authority.
28. Any travel expenses, accommodation, allowances, etc, derived from mandatory quarantines due to COVID19 (If applicable at time of travel). These costs will be invoiced according to Prodesa's Administration fares
29. All other services and supplies not mentioned in our description.

Subject: NOC Application Submittal

Dear Mark Goodin:

On behalf of Pacific Northwest Renewable Energy, LLC, Environmental Science Associates is submitting a Notice of Construction application for a wood pellet manufacturing facility to be located in Hoquiam, Washington. A signed Form 1 and application fee will be provided separately.

Sincerely,

Ed Warner
Air Quality Analyst

PORT OF GRAYS HARBOR WOOD PELLET PLANT

Notice of Construction Permit Application

1 Executive Summary

Pacific Northwest Renewable Energy, LLC (PNWRE) is proposing to construct and operate a wood pellet facility on an approximately 60-acre parcel in the city of Hoquiam, Washington. The facility would include a wood biomass pellet plant, storage silos, and a new conveyor that would connect to an existing conveyor at the Willis Enterprises Moon Island Chip Mill (Willis Enterprises).

The processing of woody biomass at the proposed PNWRE facility would involve the use of three truck tippers; a chips cleaning line with air emissions controlled by a cyclone; two wet hammer mills with air emissions controlled by cyclones; one hog fuel furnace and dryer with air emissions controlled by a wet electrostatic precipitator (WESP) and a regenerative thermal oxidizer (RTO); four dry hammer mills, each with air emissions controlled by a combined cyclone and fabric filter system (cyclofilter); 12 pellet mills in production and two cooling lines with air emissions controlled by baghouses; a regenerative catalytic oxidizer (RCO) controlling air emissions from the combined dry hammer mills and pellet cooling lines; five wood pellet storage silos; and a covered conveyor system to deliver wood pellets to the existing Willis Enterprises conveyance system and ship loadout facility. The wet raw materials for pellet production and hog fuel for the furnace would be delivered to the facility via truck. The facility would have the capacity to process up to 440,800 tons per year (TPY) of dried wood pellets.

The project would induce emissions of air contaminants in the region, thereby requiring an approved Notice of Construction (NOC) application from the Olympic Region Clean Air Agency (ORCAA). The PNWRE facility is not expected to generate criteria pollutant emissions in quantities that would trigger the need for a Prevention of Significant Deterioration (PSD) permit but is anticipated to trigger the need for a Title V Air Operating Permit. The facility would be an area source of hazardous air pollutants (HAPs), as potential emissions of each individual HAP would be less than the applicable major source threshold, 10 TPY. Total HAP are less than the combined HAP major-source threshold, 25 TPY.

This report serves as the NOC permit application required by ORCAA. The purpose of this application is to document an emission inventory for the PNWRE facility, review relevant permitting programs and equipment standards, and compare project-specific air modeling results to applicable thresholds. General forms required by ORCAA for an NOC application are found in **Appendix A**.

2 Facility Description

2.1 Site Description

Pacific Northwest Renewable Energy (PNWRE) is proposing to construct and operate a wood pellet facility located on an approximately 60-acre parcel in the city of Hoquiam, Washington. The facility would be adjacent to the Willis Enterprises Moon Island Chip Mill (Willis Enterprises) and near Terminal 3 at the Port of Grays Harbor. Hoquiam is in Grays Harbor County and falls under the jurisdiction of the Olympic Region Clean Air Agency (ORCAA). The area has a moderate coastal climate with mild summer and winter temperatures and plentiful rain. The county is currently designated as attainment/unclassifiable for all federal ambient air quality standards for criteria pollutants.[1] **Figure 1** shows the general location of the proposed PNWRE facility.

Figure 1 General Location of the Proposed Wood Pellet Facility

2.2 Process Description

The processing of wood pellets at the proposed PNWRE facility would involve the use of three truck tippers with outdoor storage piles; a chip cleaning line; two wet hammer mills; one hog fuel furnace and dryer with air emissions controlled by a wet electrostatic precipitator (WESP) and a regenerative thermal oxidizer (RTO); four dry hammer mills; 12 pelletizers; two pellet coolers; a regenerative catalytic oxidizer (RCO) that controls emissions from the dry hammer mills and

[1] U.S. Environmental Protection Agency. 2021. "Status of Washington Designated Areas." Available: https://www3.epa.gov/airquality/urbanair/sipstatus/reports/wa_areabypoll.html. Last updated March 12, 2021. Accessed May 31, 2023.

pelletizers; five pellet storage silos; and a conveyance system for product loadout. The woody biomass raw materials for processing and hog fuel for the furnace would be delivered via truck. A new conveyor would transport wood pellets from the silos and connect them to the existing Willis Enterprises conveyor system located on the Willis Enterprises chip mill site. Pellets would then be conveyed to the Port of Grays Harbor Terminal 3 for loading onto vessels. The facility would be designed to produce, store, and export up to 440,800 short tons per year (TPY) of wood pellets at 8% moisture content. While the facility's operational plan is based on 8,000 hours per year, air quality impacts are calculated based on 8,760 hours per year. Facility layout and process flow diagrams are found in **Appendix B**.

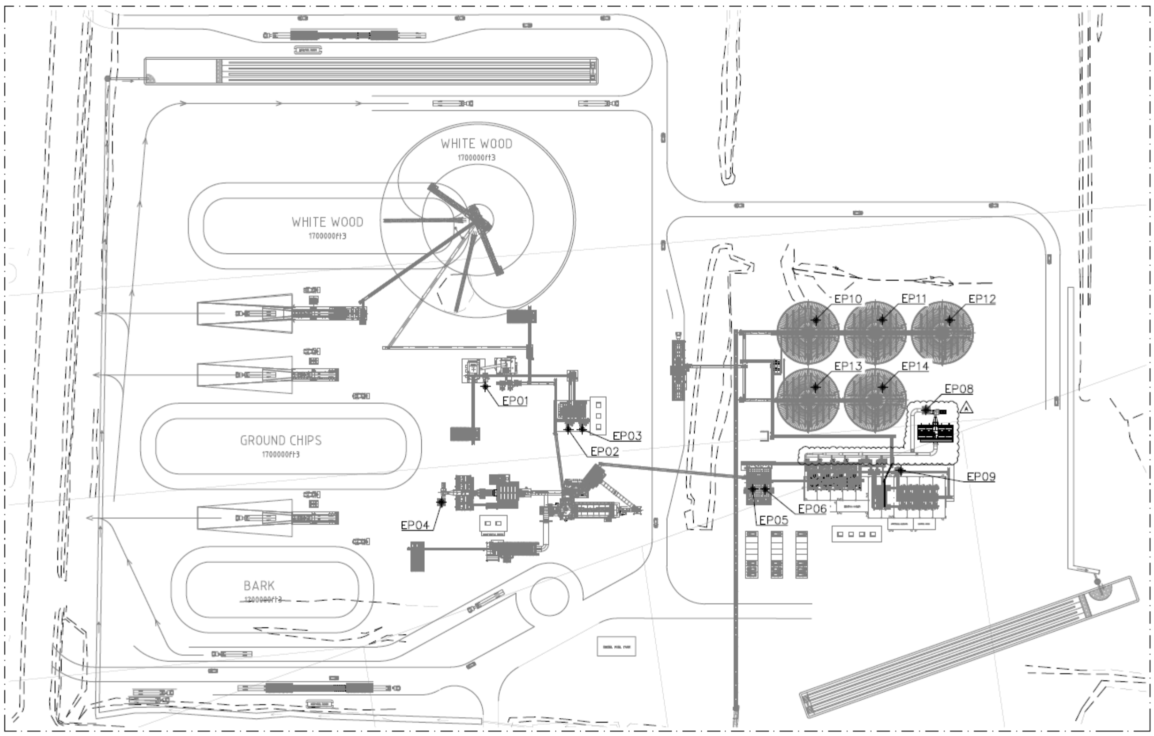

Figure 2 General Facility Layout

2.2.1 Raw-Material Receiving and Storage Area

The manufacture of wood pellets would start with the raw woody biomass consisting of forest residues (ground chips) and mill residues (white wood), which would be delivered by truck. Trucks delivering ground chips and white wood would be emptied via dedicated truck tippers while front-end loaders would form outdoor storage piles of these materials. Biomass fuel or bark, also referred to as "hog fuel," would likewise be delivered via truck and a front-end loader would form an outdoor storage pile. These storage piles are expected to be up to 1.7 acres each in size. PNWRE is also considering the use of a radial stacker/reclaimer for the handling, stockpiling, and transfer of white wood after it has been deposited by the truck tipper. This method would generate the same amount of emissions as the material handling and stockpiling of white wood via front-end loader, but it would eliminate emissions associated with front-end loader traffic for this material. The analysis herein presents emissions for the receiving and storage of white wood as if a front-end loader were being used, to conservatively represent the highest potential emissions impact; however, PNWRE may implement the radial stack/reclaimer instead, depending on economic conditions.

To minimize the dust emissions from vehicle traffic, the PNWRE facility would implement a dust control plan. The plan would include abiding by a 10 miles per hour (mph) posted speed limit for all vehicles and heavy equipment, regularly applying water on road surfaces via water truck, and using a pickup broom truck as needed.

Front-end loaders would transfer raw materials and biomass fuel to dedicated walking-floor bins. The walking floors would move the materials to the next phase in their processing. From this point onward, all raw material handing processes would be fully enclosed. The ground-chips walking floor would discharge to a chain conveyor that would feed the chip cleaning line. The white wood walking floor would discharge to a disc screen that would separate larger pieces for further sizing in the wet hammer mills, with the remaining product routed to the dryer. The bark walking floor would route the biomass fuel to the furnace.

2.2.2 Chip Cleaning Line

Ground chips created from forest residuals include impurities such as sand and stone that must be separated from the wood. The chip cleaning line would use a series of scalper rolls to remove these impurities and organize the chips by size. The smallest sizes, or fines, would be routed to the dryer feeding system, while the intermediate fraction would be sent to the wet hammer mills. A cyclone would be used to mitigate particulate emissions, while also recovering airborne product from the scalping process to combine it with the fines routed to the dryer feeding system. The oversized pieces and impurities would be discharged to a container as waste.

2.2.3 Wet Hammer Mills

Wet hammer mills would be used to reduce the size of the raw materials to facilitate optimum drying. They are referred to as “wet hammer mills” because the raw materials would not have been dried yet. Two identical hammer mills in parallel would be used to reduce the size of the chips. Each wet hammer mill would use a cyclone to mitigate particulate emissions, while also recovering product to route to the dryer feeding system. After the chips pass through the wet hammer mills, they would be discharged downward by mechanical and pneumatic systems to conveyors that would transport them to the dryer.

2.2.4 Drying Line

The drying line is the heart of the proposed PNWRE facility. The drying line would include the furnace, drum dryer, and emissions control system. The furnace would combust hog fuel to provide heat for the dryer and would have a maximum heat input capacity of 164.81 million British thermal units per hour (MMBtu/hr). Wet raw materials would be staged in a metering bin before being fed to the drum dryer inlet. Hot flue gas from the furnace would be routed through the drum dryer, where the heat would dry the raw material from approximately 45 percent moisture content to a target 10 percent final moisture content. Dried material would be conveyed from the drum dryer discharge through a pair of high-efficiency cyclones in parallel that would separate the dried wood material from the moisture-rich exhaust gas stream. The exhaust stream then either would be recycled back through the drum dryer or would pass through the emissions control system before emitting from a stack into the atmosphere. The dried material would be conveyed to a dry-product intermediate-storage silo.

The emissions control system for the drying line would consist of cyclones and a WESP for controlling emissions of particulate matter (PM); and an RTO for mitigating emissions of volatile organic compounds (VOC), carbon monoxide (CO), and organic HAP and toxic air pollutants (TAPs). A WESP controls PM using electrical forces to remove particles entrained within an exhaust stream onto collector surfaces such as pipes or plates within the WESP. The particulate is washed from the collector surfaces with liquid spray for collection and disposal. Cyclones are located prior to the WESP to recover airborne product and reduce the inlet PM loading to the WESP. An RTO is a type of thermal incinerator or oxidizer that destroys VOC and condensable organics by burning them at high temperatures, while oxidizing the CO in the exhaust to carbon dioxide.

2.2.5 Dry-Product Intermediate Storage

Dried material would pass from the dryer into the dry-product intermediate-storage silo. Two dust filter-equipped vents in this vessel (EP-05 and EP-06) would emit exhaust to the atmosphere. The retention time in the silo would allow the material moisture content to homogenize, which would help to optimize the pelletizing process. A chain conveyor would transport the product from the outlet of the silo to the dry hammer mills.

2.2.6 Dry Hammer Mills

Four dry hammer mills would process the dried material to the desired size. Each hammer mill would emit exhaust through a combined cyclone and fabric filter device (cyclofilter) for recovering product and controlling particulate emissions. The exhaust streams would then be combined with exhaust streams from the pellet coolers, then passed through an RCO for VOC control before emitting from a stack to the atmosphere. An RCO functions like an RTO to destroy VOC and condensable TAP via oxidation; however, it uses a catalyst material rather than ceramic material to achieve oxidation at lower temperatures.

2.2.7 Milled Dry-Product Intermediate Storage

From the dry hammer mills, the dried and milled product would be conveyed to the milled dry-product intermediate-storage silo with a dust filter-equipped vent (EP-09). The dried product would be offered additional retention time for achieving a more homogenous moisture content, a key factor for achieving the desired quality in the final product. A chain conveyor would transport the product from the outlet of the silo to the pellet mill hoppers that would independently feed each pellet mill.

2.2.8 Pellet Mills

There would be two pellet lines consisting of six pellet mills each, for a total of 12 pellet mills. In each pellet mill, rollers would push the material through the holes of a die plate. Knives on the exterior of the die plate would cut the wood pellets from the plate once the pellets achieve the required length. The temperature of a freshly produced pellet is around 200 degrees Fahrenheit (°F). Therefore, each of the two pellet lines would discharge into a pellet cooler where the material would flow countercurrent to a stream of ambient air introduced in the cooler. The air flow reduces the temperature of the wood pellets at the point of pellet discharge. Each pellet cooler would be equipped with a baghouse to remove dust from the exhaust stream. The exhaust streams from the two pellet cooler baghouses would be combined with the exhaust streams from the dry hammer mills, then passed through an RCO for VOC control before emitting from a stack to the atmosphere.

2.2.9 Pellet Silos and Loadout

Pellets would move from the pellet coolers to the 5 pellet silos. The total combined capacity of the pellet silos would be approximately 60,000 short tons. Pellets would be aggregated in the silos until enough volume is accumulated for bulk shipments. The silos would utilize aeration fans and venting to maintain low pellet temperature for final shipment. An automated enclosed conveyor would draw pellets from the silos evenly according to loading schedules and transport them to the neighboring Willis Enterprises' existing conveyors and vessel loadout facilities. Willis Enterprises operates under an RC2-class ORCAA registration (source number 2112, file number 647). PNWRE would also have the ability to deliver pellets via a truck unloading system; however, this system would be used only in special circumstances. PNWRE proposes no more than 10 loaded trucks per day and 32,000 tons per year of truck loadout utilization.

2.2.10 Emergency Equipment

An emergency backup diesel generator would be available for use during periods of power loss. The generator would be no larger than 300-kilowatt capacity.

3 Emission Calculations

Table 1 identifies the facility-wide criteria pollutant emissions from point sources for the proposed PNWRE facility. The emissions are based on operation at maximum capacity assuming compliance with the proposed emissions limitations, consistent with the definition for potential to emit (PTE) from ORCAA Regulation 1.4. The table includes point-source emissions only and excludes fugitive emissions because wood pellet production is not among the 28 listed categories of PSD regulations with lower major source thresholds (100 TPY) that require including fugitive emissions for comparison to major-source regulatory thresholds. Although the proposed facility would not exceed the PSD major-source threshold of 250 TPY for any criteria pollutant, some pollutants would exceed the Title V major-source threshold of 100 TPY. PNWRE would apply for the required Title V Operating Permit within 12 months of commencing operation. Detailed emissions calculations are found in **Appendix C**.

TABLE 1
FACILITY-WIDE POTENTIAL EMISSIONS

Pollutant	Facility-wide Point-Source PTE (TPY)	Title V Major-Source Threshold (TPY)	Title V Major? (Yes/No)	PSD Major-Source Threshold (TPY)	PSD Major? (Yes/No)
Filterable PM	108	N/A	N/A	250	No
Total PM_{10} [1]	88	100	No	250	No
Total $PM_{2.5}$ [1]	71	100	No	250	No
NO_X	230	100	Yes	250	No
CO	185	100	Yes	250	No
VOC	67	100	No	250	No
SO_2	18	100	No	250	No
CO_2e	163,592	N/A	N/A	100,000	No[2]
Total HAP	1.32	25	No	N/A	N/A
Max Individual HAP[3]	0.31	10	No	N/A	N/A

NOTES: CO = carbon monoxide; CO_2e = carbon dioxide equivalent; HAP = hazardous air pollutant; N/A = not applicable; NO_X = nitrogen oxides; PM = particulate matter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; PSD = Prevention of Significant Deterioration; PTE = potential to emit; SO_2 = sulfur dioxide; TPY = tons per year; VOC = volatile organic compound

1 Total PM_{10} and $PM_{2.5}$ include condensable fraction.
2 CO_2e cannot trigger PSD unless already triggered by another pollutant.
3 The maximum individual HAP is formaldehyde.

4 Regulatory Applicability Analysis

This section identifies and discusses the federal and state air quality regulations that potentially apply to the stationary sources associated with this project.

4.1 Applicability of Notice of Construction

ORCAA Regulations Rule 6.1 states that an approved NOC permit application is required for construction, installation, or establishment of any stationary source and applies to the proposed PNWRE wood pellet facility. The NOC forms required by ORCAA can be found in **Appendix A**. As outlined in ORCAA Rule 6.1.4, for the NOC application to be approved, the applicant must demonstrate that Best Available Control Technology (BACT) has been employed for all air pollutants. In addition, TAP emissions regulated under Washington Administrative Code (WAC) Chapter 173-460 must meet the applicable requirements of that program. The facility shall comply with all applicable federal regulations such as New Source Performance Standards (NSPS) and National Emissions Standards for Hazardous Air Pollutants (NESHAP). This NOC application has been prepared to demonstrate that the proposed PNWRE facility would comply with all requirements in ORCAA Rule 6.1.4 and allow ORCAA to issue an air permit.

4.2 Prevention of Significant Deterioration (Major New Source Review)

The Washington Department of Ecology (WDOE) administers the state PSD air quality permitting program that applies to new sources or modifications that are considered "major." The PSD program defines a major new source or a major modification as having potential emissions of any pollutant regulated under the program that exceeds 250 TPY.

As discussed in Section 3 of this report, the PNWRE wood pellet facility would not emit any criteria pollutant at a rate exceeding 250 TPY; therefore, the project is not required to submit an application for a PSD permit. This NOC application demonstrates that criteria pollutants would not be emitted in quantities that would trigger the PSD program.

4.3 Title V Operating Permit Program

Title V of the federal Clean Air Act requires facilities with the potential to emit more than 100 tons of a regulated criteria pollutant, 10 tons of a single HAP, or 25 tons of all HAPs combined on an annual basis, to obtain a Title V Air Operating Permit. As described in Section 3 of this report, facility-wide potential emissions are expected to exceed 100 TPY for a criteria pollutant; therefore, a Title V Air Operating Permit would be required. PNWRE would submit a Title V Air Operating Permit application within 12 months of the commencement of operation.

4.4 New Source Performance Standards

The NSPS are federal emissions standards applied to specific categories of stationary sources that are constructed, modified, or reconstructed after the standard was proposed. These standards are found in Title 40, Part 60 of the Code of Federal Regulations (CFR). The NSPS represent the minimum level of control that is required on a new or modified source. The following sections discuss some potentially applicable NSPS regulations. Note that some of the discussions demonstrate that the NSPS are not applicable to the PNWRE wood pellet facility.

4.4.1 40 CFR 60 Subpart A – General Provisions

Elements of Subpart A apply to each affected facility under any NSPS rule, as specified in each NSPS source category standard. Subpart A contains general requirements for notifications, monitoring, performance testing, reporting, recordkeeping, operation, and maintenance.

4.4.2 40 CFR 60 Subpart Db – Industrial, Commercial, and Institutional Steam Generating Units

This NSPS applies to industrial, commercial, and institutional steam generating units with a heat input greater than 100 MMBtu/hr that began construction, modification, or reconstruction after June 19, 1984. While this regulation applies to wood-burning combustion units, it is focused on combustion used to produce steam or heat water. A steam generating unit is defined within this regulation as a device that combusts any fuel or byproduct/waste and produces steam or heats water or heats any heat transfer medium. The burner in the dryer includes one 165 MMBtu/hr burner firing biomass (wood materials) to provide heat for the dryer. The burner would generate heat for the direct drying of wood materials only, and no heat from the burner would be utilized to generate steam, heat water, or heat any heat transfer medium. PNWRE does not propose installation of any steam-generating units at the wood pellet facility; therefore, the facility would not be subject to NSPS Subpart Db.

4.4.3 40 CFR 60 Subpart CCCC – Commercial and Industrial Solid Waste Incineration Units

This NSPS applies to commercial and solid waste incineration units (CISWI) and air curtain incinerators (ACI). A CISWI is defined within this regulation as any distinct operating unit at a commercial or industrial facility that combusts a solid waste meeting the definition in 40 CFR Part 241. As stated in §241.2, traditional fuels that are produced as fuels and are unused products that have not been discarded are not solid wastes, including cellulosic biomass (virgin wood). The traditional fuels definition further states that clean cellulosic biomass, defined in §241.2 to include forest-derived biomass such as bark and hogged fuel, is a fuel product. Therefore, the bark that would be used as fuel for the facility furnace is not solid waste and the furnace is not a CISWI. An ACI is defined within this NSPS as an incinerator that operates by forcefully projecting a curtain of air across an open chamber or pit in which combustion occurs. There are no proposed ACI for the PNWRE wood pellet facility. The facility would not be subject to NSPS CCCC.

4.4.4 40 CFR 60 Subpart IIII – Stationary Compression Ignition Internal Combustion Engines

This NSPS applies to manufacturers, owners, and operations of certain stationary compression ignition (CI) internal combustion engines (ICEs). PNWRE is proposing to operate a CI ICE emergency generator. Therefore, NSPS IIII is applicable to the CI ICE at the facility. PNWRE proposes to operate the CI ICE as an emergency engine as defined in this regulation. The facility shall comply with the following requirements:

- Use only ultra-low-sulfur diesel.
- Operate, maintain, install, and configure the engines per the manufacturer’s instructions.
- Maintain a copy of the U.S. Environmental Protection Agency (EPA) certificate for the engine.
- Ensure that the engine is equipped with a non-resettable hour meter and that run logs noting the reason for operation are maintained.
- Limit maintenance and readiness testing to 100 hours per year. (There is no time limit on the use of emergency stationary ICE in emergency situations.)

4.5 National Emissions Standards for Hazardous Air Pollutants

The NESHAP are emission standards for HAPs from specific source categories. These regulations generally specify the Maximum Achievable Control Technology (MACT) that must be applied for a given industry category. Consequently, these rules are often called “MACT standards.” These federal regulations are found in 40 CFR Parts 61 and 63 and are applicable to major and area sources of HAPs. A “HAP major source” is defined as a facility with potential emissions exceeding 25 TPY for total HAPs or potential emissions exceeding 10 TPY for any individual HAP. An "area source" is a stationary source of HAPs that is not a major source. As identified in Table 1, the proposed PNWRE wood pellet facility would be an area source of HAP emissions because maximum individual HAP emissions would be less than 10 TPY and total HAP emissions would be less than 25 TPY. The following sections discuss some potentially applicable NESHAP regulations. Note that some of the discussions demonstrate that the NESHAP is not applicable to the facility.

4.5.1 40 CFR 63 Subpart A – General Provisions

All affected sources are subject to the general provisions of 40 CFR 63 Subpart A unless specifically excluded by the source-specific NESHAP. Subpart A requires initial notification and performance testing, recordkeeping, and monitoring; provides reference methods; and mandates general control device requirements all other subparts as applicable.

4.5.2 40 CFR 63 Subpart DDDD – Plywood and Composite Wood Products

This regulation applies to major sources of HAPs that manufacture plywood or composite wood products by bonding wood materials (e.g., fibers, particles, strands, veneers) or agricultural fiber, generally with resin under heat and pressure, to form a structural panel or engineered wood product. The PNWRE wood pellet facility would not use any form of resin or manufacture structural panels or any similar type of wood product (i.e., veneer, particleboard, fiberboard, kiln-dried lumber). Furthermore, the facility would be an area source of HAPs; therefore, NESHAP Subpart DDDD is not applicable to the proposed facility.

4.5.3 40 CFR 63 Subpart DDDDD – Industrial, Commercial, and Institutional Boilers and Process Heaters

This regulation applies to solid, liquid, and gaseous-fired boilers and process heaters at major sources of HAP emissions. This regulation includes the following language in the definition of a process heater: "an enclosed device using controlled flame, and the unit's primary purpose is to transfer heat indirectly to a process material… Process heaters are devices in which the combustion gases do not come into direct contact with the process materials." The combustion gases from the dryer burner at the PNWRE facility's drying line would be in direct contact with the wood materials; therefore, the dryer burner does not meet the definition of a process heater. Boilers are defined within this regulation as an enclosed device using controlled flame combustion for the primary purpose of recovering thermal energy in the form of steam or hot water. The furnace for the dryer would not be used for generating steam or hot water; therefore, it does not meet the definition of a boiler. Furthermore, the PNWRE facility would be an area source of HAP emissions. For these reasons, the proposed facility is not subject to Subpart DDDDD.

4.5.4 40 CFR 63 Subpart JJJJJJ – Industrial, Commercial, and Institutional Boilers Area Sources

This regulation applies to industrial, commercial, and institutional boilers located at area sources of HAPs. Boilers are defined within this regulation as an enclosed device using controlled flame combustion for the primary purpose of recovering thermal energy in the form of steam or hot water. The furnace for the dryer would not be used for generating steam or hot water; therefore, it does not meet the definition of a boiler. The PNWRE facility would be an area source of HAP emissions; however, there would be no boilers that meet the applicability criteria, so this regulation would not apply.

4.5.5 40 CFR 63 Subpart QQQQQQ – Wood Preserving Area Sources

This regulation applies to wood preserving operations located at area sources of HAPs. A "wood preserving operation" is defined by Subpart QQQQQQ as a pressure treatment process with use of a wood preservative containing chromium, arsenic, dioxins, or methylene chloride, where the preservative is applied to the wood product inside a retort or similarly closed vessel. The PNWRE facility would not use any wood preservatives in the production of wood pellets; therefore, this regulation would not apply.

4.5.6 40 CFR 63 Subpart ZZZZ – Stationary Reciprocating Internal Combustion Engines

This regulation applies to reciprocating internal combustion engines (RICE) at both major and area sources of HAPs. The PNWRE facility would operate one diesel-fired emergency generator that would meet the applicability criteria of this regulation. The emergency CI RICE would have a maximum rated design power greater than 25 horsepower and a construction date after January 1, 2006; therefore, these engines would be considered new units under the rule. New CI RICE at area sources of HAPs must meet the requirements of this rule by meeting the requirements of 40 CFR 60 Subpart IIII; no other requirements from 40 CFR 63 Subpart ZZZZ apply to the emergency CI RICE.

4.6 General Air Pollution Control Regulations

ORCAA Regulation 8 establishes general emission standards that apply to all emission units, including those at the project site. PNWRE would comply with these general emissions standards. The relevant general emission standards are as follows:

- Rule 8.2 General Standards for Maximum Visual Emissions – opacity from any emissions unit (with some exceptions) is limited to 20 percent.
- Rule 8.3 General Standards for Maximum Particulate Matter – PM emissions are limited to 0.10 grains per dry standard cubic foot of gas for most sources, and reasonable precautions must be taken to prevent fugitive particulate material from becoming airborne. This rule also prohibits PM fallout that negatively affects adjacent properties.

4.7 Washington Toxic Air Pollutant Regulations

In Washington, all new and modified sources emitting TAPs must show compliance with the Washington TAP program found in WAC Chapter 173-460. The program requires that an NOC application demonstrate, using the procedures established by the program, that the increase in TAP emissions from a project would be sufficiently low to protect human health and safety from potential carcinogenic and/or other toxic effects. Like the federal list of toxic air contaminants referred to as HAPs, WDOE maintains a list of carcinogens and noncarcinogens referred to as TAPs in WAC 173-460-150. The Washington TAP program and associated TAP list was last updated in November 2019. The procedures for a new source of TAP emissions to comply with the program are:

1. Apply BACT for toxic air pollutants associated with a project (tBACT), then quantify the level of emissions of each TAP.

2. In an NOC application, address each TAP emissions quantification greater than its *de minimis* level per specified averaging period in the TAP list in WAC 173-460-150.

3. Conduct a first-tier review[2] by investigating whether the TAP addressed in an NOC application has an emissions impact less than its corresponding Acceptable Source Impact Level (ASIL) from the TAP list in WAC 173-460-150. If the estimated impacts are less than the ASIL, then health risks are considered insignificant and a permit may be issued.

    a. The initial screening method for a first-tier review is to compare estimated TAP emissions rates to their Small Quantity Emission Rate (SQER) values found in the TAP list in WAC 173-460-150. If a TAP emissions rate is less than its SQER, its impact is considered to be less than its ASIL and the requirements of the Washington TAP program have been satisfied for NOC approval.

    b. If a TAP emissions level is not less than its SQER, then dispersion modeling may be conducted to determine a maximum ambient concentration for that TAP. If the modeled TAP concentration is less than its ASIL, then health risks are considered insignificant and the requirements of the Washington TAP program have been satisfied for NOC approval.

4. If TAP emissions levels cannot be shown to be insignificant via the first-tier review, then conduct a second-tier review. A second-tier review[3] requires that the applicant submit a petition to WDOE to conduct the second-tier review. WDOE will make an approval recommendation to the permitting agency after reviewing the petition.

5. If a second-tier review cannot demonstrate that cancer and health risks are within allowable limits, then conduct a third-tier review. A third-tier review[4] is a risk management analysis conducted by WDOE to determine whether the risk of the project is acceptable based on available preventive measures and estimated environmental benefits to the state of Washington. WDOE will make an approval recommendation based upon the risk management analysis.

The TAP emissions from the proposed PNWRE facility satisfy the criteria of the Washington TAP program for NOC approval based upon a first-tier review. **Table 2** summarizes the results of the first-tier review, demonstrating that each TAP emitted in quantities greater than *de minimis* levels either would be emitted at a rate less than its SQER or has a modeled concentration measuring less than its ASIL. Detailed TAP emissions calculations are included in Appendix C. A discussion of the air dispersion modeling methodology is found in Section 6.

[2] WAC 173-460-080 (https://app.leg.wa.gov/WAC/default.aspx?cite=173-460-080) codifies the first-tier review procedure.

[3] WAC 173-460-090 (https://app.leg.wa.gov/WAC/default.aspx?cite=173-460-090) codifies the second-tier review procedure.

[4] WAC 173-460-100 (https://app.leg.wa.gov/WAC/default.aspx?cite=173-460-100) codifies the third-tier review procedure.

TABLE 2
RESULTS OF FIRST-TIER REVIEW FOR TOXIC AIR POLLUTANT EMISSIONS

CAS Registry Number	TAP Name	Averaging Period	Emission Rate (lb/averaging period)	SQER[1] (lb/averaging period)	Modeling Required? (Yes/No)	ASIL[1] (mg/m³)	Modeling Result (mg/m³)

NOTES: CAS = Chemical Abstract Service; μg/m³ = micrograms per cubic meter; ASIL = Acceptable Source Impact Level; hr = hour; lb = pounds; N/A = not applicable; SQER = Small Quantity Emission Rate; TAP = toxic air pollutant

1 SQER and ASIL values are from Washington Administrative Code 173-460-150.

5 Best Available Control Technology

ORCAA Rule 6.1.4 states that any new stationary source of emissions must employ Best Available Control Technology (BACT) for all air pollutants. A paraphrasing of the regulatory language defining BACT in Rule 1.4 is that it is an emission limitation based on the maximum degree of reduction for each air pollutant subject to regulation under the Washington Clean Air Act emitted from any new stationary source which the permitting agency, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such stationary source. Sources must also employ BACT for toxic air pollutants (tBACT) as part of the Washington TAP program. This section includes a BACT analysis, addressing tBACT where appropriate, from the following sources of emissions at the PNWRE wood pellet facility:

- Raw material receiving
- Chips cleaning line
- Wet hammer mills
- Drying line
- Dry hammer mills and pellet line
- Intermediate and final product storage silos
- Product loadout
- Vehicle traffic
- Emergency generator

5.1 BACT Methodology

Presented below are the five basic steps of a top-down BACT review:

5.1.1 Step 1 – Identify All Control Technologies

Available control technologies are identified for each emission unit in question. The following methods are used to identify potential technologies: (1) Researching the Reasonably Available Control Technology (RACT)/Best Available Control Technology (BACT)/Lowest Achievable Emission Reduction (LAER) Clearinghouse (RBLC) database, (2) survey regulatory agencies, and (3) draw from previous engineering experience.

5.1.2 Step 2 – Eliminate Technically Infeasible Options

After the identification of control options, an analysis is conducted to eliminate technically infeasible options. A control option is eliminated from consideration if there are process-specific conditions that prohibit the implementation of the control.

5.1.3 Step 3 – Rank Remaining Control Technologies by Control Effectiveness

Once technically infeasible options are removed from consideration, the remaining options are ranked based on their control effectiveness. If there is only one remaining option, or if all remaining technologies could achieve equivalent control efficiencies, ranking based on control efficiency is not required.

5.1.4 Step 4 – Evaluate the Most Effective Controls and Document Results

The BACT process is intended to require sources to implement the most efficient air pollution control strategies that are feasible. When a source selects a control strategy that does not represent the most efficient option in the ranking, a detailed economic, energy, and environmental impact evaluation must be performed that justifies the selection. If a control option is determined to be economically feasible without adverse energy or environmental impacts, it is not necessary to evaluate the remaining options with lower control efficiencies.

The economic evaluation centers on the cost effectiveness of the control option. Costs of installing and operating control technologies are estimated and annualized following the methodologies outlined in EPA’s Control Cost Manual and other industry resources. Cost effectiveness is expressed in dollars per ton of pollutant controlled. Objective analyses of energy and environmental impacts associated with each option are also conducted.

If the most effective control device is selected, a detailed cost analysis is not required.

5.1.5 Step 5 – Select BACT

In the final step, one pollutant-specific control option is selected that satisfies BACT for each emission unit under review based on evaluations from the previous step. A BACT emissions limit is proposed when appropriate that reflects the control option selected by the analysis. Vendor-provided information can be found in **Appendix D**.

5.2 BACT Analysis for Raw-Material Receiving

Woody biomass would be delivered to the PNWRE facility via trucks that would be emptied via truck dumpers and formed into outdoor storage piles with front-end loaders. There would be three truck dumpers and associated storage piles: one for forest residues (chips), one for sawmill residues (white wood), and one for biomass used as fuel (bark). Filterable PM would be emitted as the material slides from the open truck trailer and lands on the ground, as the front-end loaders drop the material onto piles, and again as the front-end loaders empty the material into dedicated walking-floor bins. Filterable PM would also be emitted from wind erosion of the outdoor storage piles. These emissions sources are considered fugitive emissions sources because they would occur outdoors and could not be reasonably passed through a stack, chimney, or vent. After the deposit of raw materials into the walking-floor bins, all raw-material handling processes would be fully enclosed and/or within buildings. Raw material is considered “wet” because of its moisture content, estimated between 18 percent and 55 percent depending on the wood species.

5.2.1 PM BACT for Raw-Material Receiving

5.2.1.1 Steps 1–4 – Identify and Evaluate Control Technologies for Raw-Materials Receiving

Fugitive PM emissions from raw-material handling are analogous to fugitive dust emissions. Because these emissions cannot reasonably be passed through a stack, chimney, or vent, add-on pollution control technologies designed for these types of emissions points are not technically feasible. The primary pollution control strategy accepted as BACT for fugitive dust emissions is the use of wet suppression techniques to increase the moisture content of the material. Increased moisture content results in heavier material particles, which makes it more difficult for them to become airborne. Given that the wood materials would already have a high moisture content upon delivery to the PNWRE facility, the raw material would achieve the benefits of wet suppression techniques without additional application of water.

5.2.1.2 Step 5 – Select BACT for Raw-Materials Receiving

The wood materials would achieve the benefits of wet suppression techniques because they would already have a high moisture content upon delivery to the PNWRE facility. Therefore, no additional control technology is proposed as BACT for the truck dumpers or material storage piles.

5.3 BACT Analysis for Chips Cleaning Line and Wet Hammer Mills

Both the chips cleaning line and the wet hammer mills would involve mechanical handling of the raw "wet" materials, either to clean and organize by size in the case of the chips cleaning line, or to reduce the size of the chips in the case of the wet hammer mills. In both of these activities, filterable PM emissions would be generated from the handling of the raw materials.

5.3.1 PM BACT for Chips Cleaning Line and Wet Hammer Mills

5.3.1.1 Step 1 – Identify Control Technologies for Chips Cleaning Line and Wet Hammer Mills

The following PM control technologies for the chips cleaning line and wet hammer mills have been identified:

- Baghouse
- Cyclone

Baghouse[5]

In a fabric filter baghouse, a particle-laden exhaust stream is passed through a tightly woven or felted fabric, causing the PM in the exhaust stream to be collected on the fabric by sieving and other mechanisms. Fabric filters may be in the form of sheets, cartridges, or bags, with a number of the individual fabric filter units housed together in a group. Bags are the most common type of filter. The dust cake that forms on the filter from the collected PM can significantly increase collection efficiency. Fabric filters are frequently referred to as "baghouses" because the fabric is usually configured in cylindrical bags. Typical design efficiencies are between 99 and 99.9 percent.

Cyclone[6]

A cyclone removes particulate from a gas stream by centrifugal and inertial forces, induced by forcing particulate-laden gas to change direction. Typically, cyclones are effective for particulate greater than 10 microns in diameter; however, there are high-efficiency cyclones designed to be effective for particulate matter less than or equal to 10 microns and 2.5 microns in diameter (PM_{10} and $PM_{2.5}$, respectively). Cyclones operate by creating a double vortex inside the cyclone body, usually a cone-shaped chamber. The incoming gas is forced into circular motion down the

[5] U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Fabric Filter – Pulse-Jet Cleaned Type (also referred to as Baghouses). EPA-452/F-03-025. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P100RQ6L.txt. Accessed June 15, 2023.

[6] U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Cyclones. EPA-452/F-03-005. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P100C75Q.txt. Accessed June 15, 2023.

cyclone near the inner surface of the cyclone tube. At the bottom of the cyclone, the gas turns and spirals up through the center of the tube and out of the top of the cyclone. Control efficiencies for a single conventional cyclone are 70–90 percent for PM, 30–90 percent for PM_{10}, and 0–40 percent for $PM_{2.5}$. High-efficiency single cyclones are designed to achieve higher control of smaller particles and have control efficiencies of 80–99 percent for PM, 60–95 percent for PM_{10}, and 20–70 percent for $PM_{2.5}$.

5.3.1.2 Step 2 – Eliminate Technically Infeasible Options for Chips Cleaning Line and Wet Hammer Mills

The material processed in the chips cleaning line and wet hammer mills is high in moisture content. Baghouses are not suitable for high-moisture-content exhaust streams because of the crusty caking or plugging of the fabric filters that would occur.[7] This plugging leads to blinding, a phenomenon that prevents airflow through the cake buildup and reduces efficiency. Therefore, a baghouse is not technically feasible for the chips cleaning line and wet hammer mills and has been removed from further consideration.

5.3.1.3 Step 3 – Rank Remaining Control Options by Effectiveness for Chips Cleaning Line and Wet Hammer Mills

The only remaining feasible control technology is cyclones.

5.3.1.4 Step 4 – Evaluate the Most Effective Controls and Document Results for Chips Cleaning Line and Wet Hammer Mills

The only remaining feasible control technology is cyclones.

5.3.1.5 Step 5 – Select BACT for Chips Cleaning Line and Wet Hammer Mills

PNWRE proposes the use of cyclones for controlling PM from the chips cleaning line and wet hammer mills. Cyclones provide the added benefit of allowing for reclamation of airborne product. PNWRE would route product reclaimed by the cyclones to the drying line. PM emissions from the chips cleaning line cyclone would not exceed 6.81 lb/hr and PM emissions from each wet hammer mill cyclone would not exceed 1.91 lb/hr.

5.4 BACT/tBACT Analysis for Drying Line

The drying line includes the hog fuel furnace and drum dryer. The furnace would combust hog fuel to provide heat for the dryer and would have a maximum heat input capacity of 164.81 MMBtu/hr. Wet raw materials would be staged in a metering bin before being fed to the drum dryer inlet. Hot flue gas from the furnace would be routed through the drum dryer where the heat would dry the raw material from approximately 50 percent moisture content to a target 10 percent final moisture content. Dried material would be conveyed from the drum dryer discharge through a pair of high-efficiency cyclones in parallel that would separate the dried wood material from the moisture-rich exhaust gas stream. The exhaust stream then either would be recycled back through the drum dryer or would pass through the emissions control system before emitting from a stack

7 U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Fabric Filter – Pulse-Jet Cleaned Type (also referred to as Baghouses). EPA-452/F-03-025. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P100RQ6L.txt. Accessed June 15, 2023.

into the atmosphere. The furnace would generate combustion emissions of filterable and condensable PM, nitrogen oxides (NO_X), CO, VOC, and sulfur dioxide (SO_2). TAP emissions would also be generated during this process. This BACT analysis would also serve as tBACT for complying with the Washington TAP program.

5.4.1 PM BACT for Drying Line

5.4.1.1 Step 1 – Identify Control Technologies for Drying Line

Filterable PM and condensable PM would be generated from the combustion of wood fuel in the dryer furnace. An RBLC search to identify PM control technologies for the drying line identified the following:

- Baghouse
- Electrostatic precipitator
- Wet electrostatic precipitator

Baghouse

Refer to the discussion in Section 5.3.1.1 for a description of the theory of operation of a baghouse.

Electrostatic Precipitator[8]

An ESP is a PM control device that uses electrical forces to move particles entrained within an exhaust stream onto collector surfaces such as pipes or plates. The entrained particles are given an electrical charge when they pass through a corona, a region where the gaseous ions flow. Electrodes in the center of the flow lane are maintained at high voltage and generate the electrical field that forces the particles to the collector surface. In dry ESPs, the collectors are knocked, or “rapped,” by various mechanical means to dislodge the particulate, which slides downward into a hopper where they are collected and disposed of. Typical design efficiencies are between 99 and 99.9 percent.

Wet Electrostatic Precipitator[9]

A WESP is a PM control device that uses electrical forces to move particles entrained within an exhaust stream onto collector surfaces such as pipes or plates in the same manner as a dry ESP. Where a WESP differs from a dry ESP is that the collectors are either intermittently or continuously washed by a spray of liquid to remove the particulate from the surfaces. Water is usually the liquid used for washing the collection surfaces. A drainage system collects the wet effluent, which is then disposed of. A WESP can be effective in collecting sticky particles and mists, as well as explosive or flammable dusts. The humid atmosphere that results from washing in a WESP cools and conditions the gas stream, causing pollutants to condense. Liquid particles such as condensable PM are collected along with particles and provide another means of rinsing the collection surfaces. Typical design efficiencies are between 99 and 99.9 percent.

8 U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Dry Electrostatic Precipitator (ESP)—Wire-Plate Type. EPA-452/F-03-028. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1008OHL.txt. Accessed June 26, 2023.

9 U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Wet Electrostatic Precipitator (ESP)—Wire-Plate Type. EPA-452/F-03-030. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1008OHV.txt. Accessed June 15, 2023.

5.4.1.2 Step 2 – Eliminate Technically Infeasible Options for Drying Line

The drying line uses heat to draw moisture from the product and transfer it to the exhaust stream, resulting in a moisture-laden exhaust stream. Baghouses are not suitable for high-moisture-content exhaust streams because of the crusty caking or plugging of the fabric filters that would occur.[10] This plugging leads to blinding, a phenomenon that prevents airflow through the cake buildup and reduces efficiency. Therefore, a baghouse is technically infeasible for the drying line and has been removed from further consideration.

Dry ESPs are not recommended for removing sticky or moist particles.[11] Therefore, a dry ESP is not technically feasible for the drying line and has been removed from further consideration.

5.4.1.3 Step 3 – Rank Remaining Control Options by Effectiveness for Drying Line

The only remaining control technology is the WESP.

5.4.1.4 Step 4 – Evaluate the Most Effective Controls and Document Results for Drying Line

The only remaining control technology is the WESP. In addition to filterable PM effectiveness, a WESP controls TAPs that are in particulate form, such as most metals, as well as aerosolized PM, acid mists, and VOCs.[12]

5.4.1.5 Step 5 – Select BACT for Drying Line

PNWRE proposes installation and utilization of a WESP with filterable PM not to exceed 7.73 pounds per hour (lb/hr) as BACT for the drying line's filterable particulate emissions. Filterable PM_{10} and $PM_{2.5}$ are assumed to be equivalent to filterable PM from this source. When accounting for condensable particulate emissions, total PM_{10} and $PM_{2.5}$ are not to exceed 12.74 lb/hr.

5.4.2 NO_X BACT for Drying Line

5.4.2.1 Steps 1–4 – Identify and Evaluate Control Technologies for Drying Line

The drying line's furnace would burn hog fuel (wood bark) as a fuel source. A regenerative thermal oxidizer, or RTO, that would combust natural gas would also be proposed to control other pollutants. NO_X emissions result primarily from thermal NO_X formation during combustion. Nitrogen and oxygen in the combustion air combine with one another at the high temperatures in a flame. An RBLC search to identify NO_X control technologies for hog fuel-fired or wet bark-fired dryers at wood pellet facilities did not yield any results. Therefore, good combustion practices, which is always available, is the only available control technology.

---

[12] U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Wet Electrostatic Precipitator (ESP)—Wire-Plate Type. EPA-452/F-03-030. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1008OHV.txt. Accessed June 15, 2023.

5.4.2.2 *Step 5 – Select BACT for Drying Line*

PNWRE proposes good combustion practices—the only available control technology—with NO_X emissions not to exceed 52 lb/hr as BACT for the drying line's NO_X emissions.

5.4.3 CO and VOC BACT for Drying Line

5.4.3.1 *Steps 1–4 – Identify and Evaluate Control Technologies for Drying Line*

CO and VOC emissions result primarily from the incomplete combustion of fuels. Wood combustion also releases VOC from compounds evaporated from the wood. Because of their similar formation mechanisms and control strategies, CO and VOC are analyzed together during BACT. An RBLC search to identify CO and VOC control technologies identified the following:

- Good combustion practices
- Regenerative thermal oxidizer

Regenerative Thermal Oxidizer[13,14]

An RTO is a type of thermal incinerator or oxidizer that destroys VOC and condensable organics by burning them at high temperatures. Thermal oxidizers also reduce CO emissions in direct-fired dryer exhausts by oxidizing the CO in the exhaust to carbon dioxide. RTOs are designed to preheat the inlet emission stream with heat recovered from the incineration exhaust gases. A gas burner brings the preheated emissions up to an incineration temperature between 788 degrees Celsius (°C) and 871°C (1,450°F and 1,600°F) in a combustion chamber with sufficient gas residence time to complete the combustion. Combustion gases then pass through a cooled ceramic bed where heat is extracted. By reversing the flow through the beds, the heat transferred from the combustion exhaust air preheats the gases to be treated, thereby reducing auxiliary fuel requirements.

PNWRE considers this technology to be available for the dryer.

5.4.3.2 *Step 5 – Select BACT for Drying Line*

Good combustion practices and RTO are proposed as BACT for the drying line's VOC and CO emissions, with VOC emissions not to exceed 6.58 lb/hr and CO emissions not to exceed 42 lb/hr. The RTO would be rated to achieve at least 95 percent destruction efficiency of VOC.

5.4.4 SO_2 BACT for Drying Line

5.4.4.1 *Steps 1–4 – Identify and Evaluate Control Technologies for Drying Line*

SO_2 emissions result primarily from a mass balance conversion of sulfur present in the combustion fuels. Wood does not typically have a notable sulfur content and therefore does not emit SO_2 in large quantities. An RBLC search to identify SO_2 controls applied to hog fuel or wet bark combustion did not yield any results. Accordingly, good combustion practices, which are always available, are proposed to satisfy BACT for SO_2.

[13] U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Regenerative Incinerator. EPA-452/F-03-021. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1008OH5.txt. Accessed June 19, 2023.

[14] U.S. Environmental Protection Agency. 2002. AP-42, Section 10.6.2, Particleboard Manufacturing. Available: https://www.epa.gov/sites/default/files/2020-10/documents/c10s06-2.pdf. Accessed June 19, 2023.

5.4.4.2 Step 5 – Select BACT for Drying Line

Good combustion practices are proposed as BACT for the drying line's SO_2 emissions.

5.4.5 tBACT for Drying Line

tBACT, which is BACT as applied to TAP emissions, is required by the Washington TAP program. TAP emissions from the drying line would be in the form of VOC emissions, or PM emissions in the case of most metals. Therefore, the BACT strategies employed for control of PM and VOC emissions from the drying line (WESP and RTO) would satisfy tBACT as well.

5.5 BACT/tBACT Analysis for Combined Exhaust from the Dry Hammer Mills and Pellet Line

PNWRE intends to route emissions from the dry hammer mills and the pellet line to a common stack prior to release to the atmosphere. Therefore, the BACT analysis addresses both of these processes together. The dry hammer mills would reduce the size of the dried material for optimal pellet formation. The dried material would be pressed and cut into pellets of desired dimensions in the pellet line, experiencing a reduction in dusting characteristics after having been formed into pellets. PM and VOC emissions would be generated from these processes. The TAP emissions would be in the form of VOC emissions; therefore, tBACT would equate to the BACT employed for VOC control.

5.5.1 PM BACT for Dry Hammer Mills and Pellet Line

5.5.1.1 Step 1 – Identify Control Technologies for Dry Hammer Mills and Pellet Line

The following PM control technologies would be analyzed:

- Fabric filters/baghouse
- Cyclone

5.5.1.2 Step 2 – Eliminate Technically Infeasible Options for Dry Hammer Mills and Pellet Line

These technologies are feasible.

5.5.1.3 Step 3 – Rank Remaining Control Options by Effectiveness for Dry Hammer Mills and Pellet Line

1. Fabric filters/baghouse
2. Cyclones

5.5.1.4 Step 4 – Evaluate the Most Effective Controls and Document Results for Dry Hammer Mills and Pellet Line

PNWRE proposes to use "cyclofilters," which are a combination of cyclones and fabric filters, for controlling the PM from the dry hammer mills. The cyclone portion of the cyclofilter would allow for product recovery while the fabric filtration would offer the best-performing PM control. Each of the four dry hammer mills would emit exhaust through a dedicated cyclofilter before the exhaust combines with the exhaust from the pellet coolers. Each of the two pellet coolers would emit exhaust to a baghouse before the exhaust combines with the exhaust from the dry hammer mills.

5.5.1.5 Step 5 – Select BACT for Dry Hammer Mills and Pellet Line

PNWRE proposes the combined use of cyclofilters and baghouses for controlling PM from the dry hammer mills and pellet line. The cyclofilters would allow for airborne product reclamation and the integrated fabric filter system would offer the best-performing PM control. The combined emission streams would have a filterable PM emission rate not to exceed 1.87 lb/hr. Filterable PM_{10} and $PM_{2.5}$ are assumed to be equivalent to filterable PM from this source. The combined exhaust streams would have controlled the PM sufficiently to prevent blinding of catalyst used in the downstream RCO for VOC control before release to the atmosphere. When considering the condensable PM formed during combustion in the RCO, the total PM_{10} and $PM_{2.5}$ emissions would not exceed 1.89 lb/hr.

5.5.2 VOC BACT/tBACT for Dry Hammer Mill and Pellet Line

5.5.2.1 Step 1 – Identify Control Technologies for Dry Hammer Mill and Pellet Line

The following VOC/TAP control technologies would be analyzed:

- Regenerative Thermal Oxidizer
- Regenerative Catalytic Oxidizer

Refer to the discussion in Section 5.4.3.1 for a description of the theory of operation of an RTO.

An RCO is a regenerative incinerator that operates under principles similar to those of an RTO, where VOC is destroyed via oxidation. An RCO uses a catalyst material rather than ceramic material in the packed bed. This allows for destruction of VOC at a lower oxidation temperature.[15] An RCO has a destruction efficiency similar to that of an RTO, but with lower fuel requirements because of the lower temperatures.

5.5.2.2 Step 2 – Eliminate Technically Infeasible Options for Dry Hammer Mill and Pellet Line

These technologies are feasible for this source of emissions.

5.5.2.3 Step 3 – Rank Remaining Control Options by Effectiveness for Dry Hammer Mill and Pellet Line

Both RTO and RCO achieve the same levels of VOC/TAP control.

15 U.S. Environmental Protection Agency. 2003. Air Pollution Control Technology Fact Sheet: Regenerative Incinerator. EPA-452/F-03-021. Available: https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=P1008OH5.txt. Accessed June 19, 2023.

5.5.3.4 Step 4 – Evaluate the Most Effective Controls and Document Results for Dry Hammer Mill and Pellet Line

PNWRE proposes to use an RCO for control of the VOC/TAP from this source of emissions. No further evaluation is necessary because PNWRE has proposed the best-performing technology.

5.5.3.5 Step 5 – Select BACT/tBACT for Dry Hammer Mill and Pellet Line

PNWRE proposes an RCO for controlling VOC/TAP from the combined exhaust stream for the dry hammer mill and pellet line. The RCO would be rated to achieve at least 95 percent destruction efficiency of the VOC/TAP emissions with a VOC emission rate not to exceed 8.6 lb/hr.

5.6 BACT Analysis for Intermediate and Final Product Storage Silos and Truck Loadout

The dry-product intermediate-storage silo (two vents, EP-06 and EP-06) is a vessel that would be used for staging material after it exits the drying line and before it is processed in the dry hammer mills. Milled dry-product intermediate-storage silo EP-09 is a vessel that would be used for staging material after it exits the dry hammer mills and before it is processed in the pellet line. The estimated maximum potential PM emissions of these enclosed silo vents would not exceed 0.07 TPY each and vent filters are included in the design, so additional control devices are not necessary.

Five pellet storage silos, EP-10 through EP-14, would provide staging for final product before loadout. The silos would utilize aeration fans and venting via mechanical extractor to maintain low pellet temperature for final shipment. Pellets have reduced dusting characteristics because of their inherent moisture content and high density. Each silo would maintain a maximum PM PTE of no more than 3.85 TPY, so additional control devices are not necessary.

Transferring to Willis Enterprises' existing conveyance and vessel loadout equipment would be the primary means of product export; however, the facility would include truck loadout capability onsite (EP-15) that could be used in special circumstances. Because this source would be used only in special circumstances, PNWRE proposes no more than 10 loaded trucks per day and 32,000 tons per year of truck loadout utilization. Fugitive PM emissions would be generated from the deposit of pellets into trucks; however, maximum potential PM emissions would be less than 0.02 TPY, so additional control devices are not necessary.

PNWRE proposes proper maintenance and good operating practices as BACT for PM emissions from the product storage silos and truck loadout.

5.7 BACT Analysis for Vehicle Traffic

Raw materials would be provided to PNWRE via heavy-duty trucks and front-end loaders would move the unloaded raw materials as needed. In special circumstances, pellets could be exported from the facility via heavy-duty trucks. This vehicle traffic on the facility's unpaved roads would be a source of PM emissions.

5.7.1 PM BACT for Vehicle Traffic

5.7.1.1 Steps 1–4 – Identify and Evaluate Control Technologies for Vehicle Traffic

The following PM control technology is generally applied to unpaved roads and is considered feasible:

- Reasonable precautions, including regular application of water or other dust suppressants.

The PNWRE facility would implement a dust control plan, which would include abiding by a 10-mph posted speed limit for all vehicles and heavy equipment, regularly applying water on road surfaces via water truck, and using a pickup broom truck as needed. The Western Region Air Partnership Fugitive Dust Handbook[16] provides control efficiencies for various control strategies on unpaved roads, offering 44 percent control for limiting speeds to 25 mph and up to 74 percent from applying water. The PNWRE dust control plan would require even lower speeds, daily monitoring of road surfaces that would include watering, and use of a pickup broom truck as needed. Therefore, an 85 percent control efficiency has been identified and applied to unpaved haul road traffic based on the combined application of these measures.

5.7.1.2 Step 5 – Select BACT for Vehicle Traffic

PNWRE proposes to mitigate PM emissions from vehicle traffic by employing reasonable precautions and adherence to a dust control plan as BACT. This is consistent with ORCAA Regulation 8.3(c), which requires that reasonable and/or appropriate precautions be taken to prevent fugitive particulate material from becoming airborne.

5.8 BACT/tBACT Analysis for Emergency Generator

A 300-kilowatt backup emergency generator would be installed at the PNWRE facility. The diesel-fired engine for this generator would be certified to meet the emissions standards of 40 CFR 60, Subpart IIII and would be fired with ultra-low-sulfur diesel only. Other than emergency use, backup emergency engines are limited by 40 CFR 60, Subpart IIII to no more than 100 hours per year of operation for maintenance checks and readiness testing.

Add-on controls for emergency backup diesel-fired generators are impractical because of the intermittent and infrequent operation of these units. Therefore, PNWRE proposes that BACT/tBACT for all pollutants be good combustion practices and following manufacturer's instructions for maintenance. In addition, PNWRE would comply with the applicable conditions for emergency engines from 40 CFR 60, Subpart IIII.

PNWRE has not selected a specific generator yet; however, the selected unit would not exceed 300 kilowatts in capacity. A conservative estimate of sufficient engine size (500 horsepower) and EPA Tier 3 nonroad emissions standards have been used to account for engine emissions from maintenance checks and readiness testing.

[16] Western Governors' Association. 2006. *WRAP Fugitive Dust Handbook.* Denver, CO. Prepared by Countess Environmental, Westlake Village, CA. September 7, 2006. Available: https://www.wrapair.org/forums/dejf/fdh/content/FDHandbook_Rev_06.pdf. Accessed July 5, 2023.

6 Air Dispersion Modeling Methodology

This section of the application report presents the procedures used to perform the air dispersion modeling analysis.

6.1 Model Selection

Version 22112 of the AERMOD model was used to estimate maximum ground-level concentrations in the air dispersion analysis. AERMOD is a refined, steady-state, multi-source air dispersion model used for industrial sources.

6.2 Meteorological Data

The modeling analysis was performed using five years of representative meteorological data prepared for input with AERMOD version 22112. The AERMOD meteorological data were derived using several data sets, including surface station data collected at the Bowerman Airport, WA, station (WBAN Station No. 94225) for calendar years 2018–2022. Upper air sounding data are taken from the Quillayute Airport, WA station (WBAN Station No. 72797). The meteorological data were processed with AERMET v22112, along with the ADJU* option to account for deficiencies in AERMOD under low wind speed conditions. Wind roses are found in **Appendix E**.

The AERMINUTE pre-processor (version 15272), a tool for assessing 1-minute ASOS data, was used to process 1-minute wind speed and direction data from Bowerman Airport. AERMINUTE produces hourly average winds from the 1-minute data that are used as inputs to AERMET's second stage.

In addition to the meteorological data, processing of land use data to derive albedo, Bowen ratio, and surface roughness was conducted using the AERSURFACE preprocessor (version 20060) in a manner consistent with EPA guidance. The resulting parameters are used by AERMOD to estimate surface energy fluxes and construct boundary layer profiles. EPA guidance indicates that AERSURFACE should be used to process land use arcs out to one kilometer from the project site and using arcs equal or greater than 30 degrees for assessing surface roughness. The most recent version of the AERSURFACE also allows for the incorporation of imperviousness data and canopy data that helps inform the surface roughness calculations. Bowen ratio and albedo are assessed by calculating their geometric means associated with common land use types across a 10 kilometer by 10 kilometer region.

For the project site, AERSURFACE processed National Land Cover (2016 NLCD) data acquired from the EPA.[17] These data were used as inputs to the AERSURFACE tool along with information on the meteorological surface data site, including that the site is not expected to have continuous snow cover in winter, that the site is not in an arid region, and that the site is an airport. The tool was also supplied with the canopy and imperviousness data from the NLCD data set.

[17] National Land Cover Data, as published by the EPA, ftp://newftp.epa.gov/aqmg/nlcd/

The results from AERSURFACE provided an albedo of 0.13 that did not vary by season. The Bowen ratio was calculated as 0.28, 0.24, 0.21, and 0.28 for winter, spring, summer, and autumn respectively. The surface roughness estimated by AERSURFACE is provided in **Table 3**.

TABLE 3
BOWERMAN AIRPORT SURFACE ROUGHNESS

Sector	Winter	Spring	Summer	Autumn
1	0.165	0.170	0.174	0.172
2	0.075	0.082	0.096	0.094

11	0.068	0.070	0.072	0.070
12	0.106	0.110	0.113	0.110

6.3 Coordinate System

The locations of emission sources, structures, and receptors are represented in the Universal Transverse Mercator (UTM) coordinate system using the North American Datum of 1983, Continental U.S. projection. The UTM grid divides the world into coordinates that are measured in north meters (measured from the equator) and east meters (measured from the central meridian of a particular zone, which is set at 500 kilometers). UTM coordinates for this analysis are based on UTM Zone 10. The location of the PNWRE facility is approximately 5,203,070 Northing and 430,485 Easting in UTM Zone 10.

6.4 Terrain Elevations

Terrain elevations for receptors, buildings, and sources were determined using the National Elevation Dataset (NED) supplied by the U.S. Geological Survey. The NED is a seamless data set with the best available raster elevation data of the contiguous United States. NED data retrieved for this model have a grid spacing of 1/3 arc-second or 10 meters. The AERMOD preprocessor, AERMAP version 18081, was used to compute model object elevations from the NED grid spacing. AERMAP also calculates hill height data for all receptors.

6.5 Urban/Rural Determination

The proposed PNWRE facility is located in the city of Hoquiam on the west coast of Washington. According to 2020 census data, Hoquiam has a population of 8,774.[18] Outside of the city, most of the land use is not considered urban (medium- to high-intensity developed land). For the purposes of this model, it is conservatively assumed that the area surrounding the facility does not meet the definition of urban land use. Therefore, the urban option was not selected in AERMOD.

6.6 Receptor Grids

The model has receptors along the fence line spaced 12.5 meters apart. There is also a variable-density, circular Cartesian receptor grid extending 10,000 meters from the center of the PNWRE facility site. This receptor grid spacing was set up according to the following list:

- 25-meter spacing for the first 400 meters from the center of the facility site.
- 50-meter spacing from 400 to 900 meters from the center of the facility site.
- 100-meter spacing from 900 to 2,000 meters from the center of the facility site.
- 300-meter spacing from 2,000 to 4,500 meters from the center of the facility site.
- 600-meter spacing from 4,500 to 10,000 meters from the center of the facility site.

In addition to the receptor grid above, a fine 12.5-meter spaced grid was used for the first 150 meters extending outward from the proposed facility's fence line. **Figure 3** and **Figure 4** show maps of the receptors. **Figure 5** shows the proposed facility with the fence line represented by the red outline surrounding the facility with included buildings.

[18] U.S. Census Bureau, Population Division. 2023. Annual Estimates of the Resident Population for Incorporated Places in Washington: April 1, 2020 to July 1, 2022 (SUB-IP-EST2022-POP-53). May 2023. Available: https://www2.census.gov/programs-surveys/popest/tables/2020-2022/cities/totals/SUB-IP-EST2022-POP-53.xlsx. Accessed June 30, 2023.

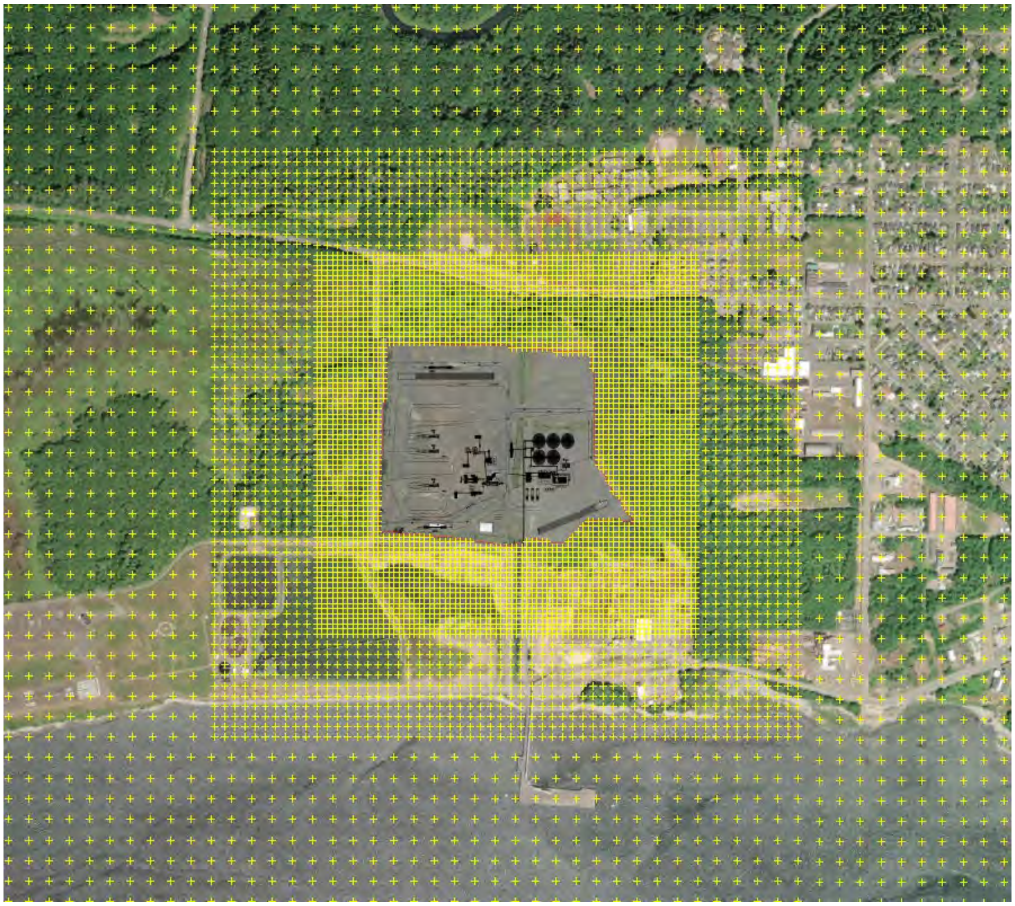

Figure 4 Zoomed-In Receptor Grid

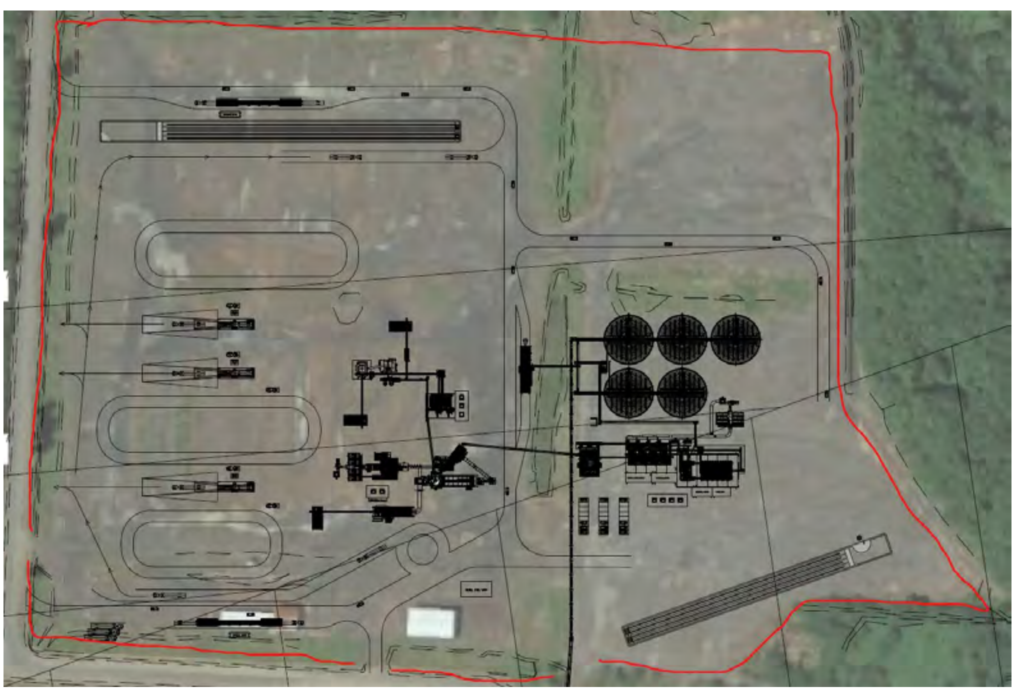

Figure 5 Facility Fence Line

6.7 Building Downwash

Emissions from a source are evaluated in terms of the source's proximity to nearby structures. The purpose of this evaluation was to determine whether stack discharges might become caught in the turbulent wakes of the structures at the PNWRE facility. Wind blowing around a building creates zones of turbulence greater than those that would exist if the buildings were absent. The concepts and procedures expressed in the Guideline for Determination of Good Engineering Practice Stack Height were applied.[19] All structures that may affect downwash of emissions from the proposed facility were included in the models and are presented in **Table 4**.

TABLE 4
BUILDING PARAMETERS

Building	Shape	Center (UTM X, UTM Y)	Building Height (m)	Side Length 1 (m)	Side Length 2 (m)	Diameter (m)
01	Rectangular	(430453, 5203005)	27.0	5.5	6.5	N/A

6.8 Source Types and Parameters

Emission releases from the equipment on-site were represented in the model as point sources, horizontal point sources, area sources, and volume sources. Emission unit parameters were based on vendor quotes and emissions estimates using EPA AP-42 and Region 10 Memorandum of emission factors for activities at sawmills in the Pacific Northwest. Area and volume source parameters were based on the dimensions of nearby structures or obstructions according to the User’s Guide for the AMS/EPA Regulatory Model (AERMOD). The current facility site layout is provided in Appendix B.

The modeling parameters for the sources are determined based the following and are included in **Table 5** and **Table 6** as well as **Appendix F**:

- Exhaust temperature, exhaust flow rate/velocity, stack height, and stack diameter were obtained from client information. Engineering assumptions applied for modeling the backup emergency generator.
- Dimensions for the following volume source emission units were determined based on dimensions from the facility site plan and Table 3-2 of the AERMOD Users' Guide.
- Dimensions for the following area source emission units were configured according to Section 3.3.2.3 of the AERMOD Users’ Guide.
- Haul road volume source parameters were determined using the dimensions of an average semi-truck trailer and the EPA guidance memo on haul roads.

TABLE 5
POINT SOURCE PARAMETERS

Source	Release Type	Center (UTM X, UTM Y)	Release Height (m)	Exit Velocity (m/s)	Exit Temperature (K)	Diameter (m)
Chips cleaning line	Vertical	(430412, 5203082)	15.0	15.7	283.2	1.20
Wet hammer mill 1 pneumatic system	Vertical	(430455, 5203054)	15.0	17.7	283.2	0.60
Wet hammer mill 2 pneumatic system	Vertical	(430462, 5203054)	15.0	17.7	283.2	0.60
Drying line WESP/RTO	Vertical	(430389, 5203010)	27.0	15.4	328.2	2.20
Dry milling & pellet line RCO	Vertical	(430640, 5203064)	27.0	18.6	374.2	2.10
Dry product intermediate storage	Horizontal	(430550, 5203018)	13.0	13.4	283.2	0.84
Dry product intermediate storage	Horizontal	(430556, 5203018)	13.0	13.4	283.2	0.84

Silo 3	Vertical	(430650, 5203118)	28.0	13.8	283.2	0.84
Silo 4	Vertical	(430583, 5203077)	28.0	13.8	283.2	0.84
Silo 5	Vertical	(430617, 5203077)	28.0	13.8	283.2	0.84
Emergency generator	Vertical	(430415, 5203000)	2.7	130.3	822.2	0.10

NOTES: m = meter; m/s = meter per second; K = degrees Kelvin; UTM = Universal Transverse Mercator; N/A = not applicable

TABLE 6
VOLUME AND AREA SOURCE PARAMETERS

Source	Source Type	Configuration/Location	Release Height (m)	Initial Horizontal Dimension (m)	Initial Vertical Dimension (m)
White wood storage pile	Polygon Area	Dimension of the storage pile	3.05	N/A	1.4
Ground chips storage pile	Polygon Area	Dimension of the storage pile	3.05	N/A	1.4
Hog fuel wood storage pile	Polygon Area	Dimension of the storage pile	3.05	N/A	1.4
Truck route for white wood delivery	Multiple Volume	Following delivery route; entry and exit	2.55	9.0	5.1
Truck route for ground chips delivery	Multiple Volume	Following delivery route; entry and exit	2.55	9.0	5.1
Truck route for hog fuel delivery	Multiple Volume	Following delivery route; entry and exit	2.55	9.0	5.1
Truck route for product loadout	Multiple Volume	Following delivery route; entry and exit	2.55	9.0	5.1
Front end loader activity for white wood	Multiple Volume	Following loader paths to unload truck and load floor bin	4.46	10.7	8.9
Front end loader activity for ground chips	Multiple Volume	Following loader paths to unload truck and load floor bin	4.46	10.7	8.9
Front end loader activity for hog fuel wood	Multiple Volume	Following loader paths to unload truck and load floor bin	4.46	10.7	8.9
Product truck loading	Volume	Dimensions of the truck loading bucket	3.04	1.9	10.2

NOTES: m = meter; m/s = meter per second; N/A = not applicable

Emissions for all sources were calculated on a PTE basis and represent the maximum expected emissions from facility operations as described in Section 3 for point sources and presented in Appendix C for fugitive sources. Emissions from the emergency engine were estimated using 100 hours/year, per 40 CFR 60, Subpart IIII for emergency engines. The occurrence of maintenance and testing of this unit was assumed to only contribute to a maximum of one hour runtime on any given day for the 24-hour PM_{10}, 24-hour $PM_{2.5}$, 1-hour nitrogen dioxide (NO_2), 1-hour carbon monoxide (CO), and 8-hour CO national ambient air quality standards (NAAQS).

7 Air Dispersion Modeling Analysis

7.1 Toxic Air Pollutant Modeling

The Washington TAP program requires that where any predicted TAP emission rates would exceed their corresponding SQER values, the project proponent must show via dispersion modeling, that the predicted maximum concentrations do not exceed their corresponding ASIL concentration. The SQER and ASIL values are codified in WAC 173-460-150. As shown in Table 2 in Section 4.7 of this report, PNWRE identified 12 predicted TAP emissions rates that exceeded their SQER values and thus require dispersion modeling as part of the first-tier analysis. **Table 7** summarizes the results of the dispersion modeling and shows that the modeled concentrations are less than their respective ASIL values.

TABLE 7
MODELING RESULTS FOR TOXIC AIR POLLUTANTS

CAS Registry Number	TAP Name	Averaging Period	Emission Rate (lb/averaging period)	SQER[1] (lb/averaging period)	ASIL[1] ($\mu g/m^3$)	Modeling Result ($\mu g/m^3$)
57-97-6	7,12-Dimethylbenz(a) anthracene	year	1.72E-03	1.40E-03	8.50E-06	1.42E-08
75-07-0	Acetaldehyde	year	3.29E+02	6.00E+01	3.70E-01	8.58E-03
107-02-8	Acrolein	24-hr	1.39E+00	2.60E-02	3.50E-01	4.09E-02

7440-43-9	Cadmium	year	4.14E-01	3.90E-02	2.40E-04	1.89E-06
CRVICOMP	Chromium, hexavalent	year	2.53E-01	6.50E-04	4.00E-06	9.68E-07
7439-96-5	Manganese	24-hr	3.17E-01	2.20E-02	3.00E-01	1.14E-02
7439-97-6	Mercury	24-hr	1.39E-02	2.20E-03	3.00E-02	5.03E-04
7440-02-0	Nickel	year	2.61E+00	6.20E-01	3.80E-03	1.05E-05

NOTES: CAS = Chemical Abstract Service; $\mu g/m^3$ = micrograms per cubic meter; ASIL = Acceptable Source Impact Level; hr = hour; lb = pounds; N/A = not applicable; SQER = Small Quantity Emission Rate; TAP = toxic air pollutant

1 SQER and ASIL values are from Washington Administrative Code 173-460-150.

7.2 National Ambient Air Quality Standards Modeling

ORCAA guidance for ambient air quality analyses suggests using an approved screening method to predict emissions impacts and compare them to the significance levels in ORCAA's rule 6.1.4 (Table 6.1.b).[20] If impacts are less than the insignificant impact thresholds, it can be concluded that the proposed source will not contribute to a violation of a standard. Based on engineering judgement, increases in PM_{10}, $PM_{2.5}$, NO_2, and CO emissions from the project would exceed the insignificant impact thresholds. Therefore, a cumulative NAAQS analysis would be required to demonstrate that the project would not cause or contribute to a violation of the NAAQS.

In a cumulative NAAQS analysis, the scope of the analysis is expanded from the SIL analysis to include impacts from nearby sources by including background concentrations. Background concentrations in **Table 8** were obtained from NW-AIRQUEST.[21] For each pollutant and averaging period, the concentration of the closest grid point to the proposed facility (coordinates 46.99, -123.89) was used.

21 Idaho DEQ, 2023. Background Concentrations 2014-2017. Available: https://idahodeq.maps.arcgis.com/apps/MapSeries/index.html?appid=0c8a006e11fe4ec5939804b873098dfe.

TABLE 8
BACKGROUND CONCENTRATIONS

Pollutant	Averaging Period	Background Concentration	Unit of Measure
PM_{10}	24-hour	42.1	µg/m^3
$PM_{2.5}$	24-hour	12.5	µg/m^3
	Annual	5.1	µg/m^3
NO_2	1-hour	15.1	ppb
	Annual	2.6	ppb
CO	1-hour	1.04	ppm
	8-hour	0.69	ppm

NOTES: µg/m^3 = micrograms per cubic meter; ppb = parts per billion; ppm = parts per million; CO = carbon monoxide; NO_2 = nitrogen dioxide; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter

Table 9 shows the modeled concentrations for the proposed PNWRE facility. All criteria pollutant concentrations are below the NAAQS. Therefore, the proposed facility has been demonstrated to be in compliance with the NAAQS.

TABLE 9
NATIONAL AMBIENT AIR QUALITY STANDARDS MODEL RESULTS

Pollutant	Averaging Period	Design Concentration	Modeled Concentration	Total Concentration	NAAQS	Exceeds NAAQS? (Yes/No)
PM_{10} (µg/m^3)	24-hour	H6H	79.8	122	150	No
$PM_{2.5}$ (µg/m^3)	24-hour	H8H	11.6	24.1	35	No
	Annual		3.86	8.96	12	No
NO_2 (ppb)	1-hour	H8H	68.6	83.7	100	No
	Annual		0.818	3.42	53	No
CO (ppm)	1-hour	H2H	0.381	1.42	35	No
	8-hour	H2H	0.0809	0.771	9	No

NOTES: µg/m^3 = micrograms per cubic meter; ppb = parts per billion; ppm = parts per million; CO = carbon monoxide; NAAQS = national ambient air quality standard; NO_2 = nitrogen dioxide; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter

INSTRUCTIONS FOR FORM 6
BEST AVAILABLE CONTROL TECHNOLOGY (BACT)

BACT by definition is the most effective control option which is technically feasible considering economic, energy, and other environmental impacts. Control options can be eliminated as BACT on a basis of technical, economic, energy, or environmental considerations. The following procedure is designed to facilitate a BACT analysis in cookbook fashion. The following analysis should be performed for each pollutant requiring BACT.

STEP 1: IDENTIFY AVAILABLE CONTROL TECHNOLOGIES: For the source, emissions unit, activity, or process requiring BACT, identify and list all "available" emissions control options for the pollutant in question. Available control options are those air pollution control technologies and techniques with a practical potential for application to the source, emissions unit, activity, or process. In general, any control option in commercial use in the U.S. at the time the analysis is performed should be included on the list of available control options. One very good resource for obtaining listings of control options in use for a particular source type is the U.S. EPA BACT/LAER Clearinghouse (RBLC) which can be viewed at http://cfpub.epa.gov/RBLC/.

STEP 2: ELIMINATE TECHNICALLY INFEASIBLE OPTIONS: Considering site-specific factors and constraints, remove from the list compiled in STEP 1 all technically infeasible control options. A control option can be considered as technically infeasible if technical difficulties such as physical, chemical, or engineering constraints would preclude the successful use of the control option in the particular application in question. For all control options eliminated, demonstration that a control option is technically infeasible should be clearly documented in the BACT Analysis and included with the BACT submittal.

STEP 3: RANK REMAINING CONTROL TECHNOLOGIES BY CONTROL EFFECTIVENESS: Rank and list in attached table all remaining control options in order of control effectiveness with the most effective control alternative at the top of the list.

STEP 4: ENERGY, ENVIRONMENTAL, AND ECONOMIC CONSIDERATIONS: Using the "Top Down" procedure specified below, control options may be eliminated as BACT candidates on the basis of energy, environmental, and economic impacts of the option.

Energy impacts include but are not limited to energy efficiency impacts, fuel cycle efficiency considerations, and fuel availability. Environmental impacts include but are not limited to ground water and water impacts, solid and hazardous waste impacts, and air quality impacts from increases in emissions of other air pollutants that result from implementing the control option. Economic impacts include the sum of up-front capital cost and annual operation and maintenance costs of implementing the control option.

A control option may be eliminated as a BACT candidate on grounds of significant energy, environmental, or economic impacts. Rationale for eliminating a control option should be well documented and included in the analysis. Economic impacts should be evaluated by comparing the cost effectiveness of the control option with generally acceptable cost effectiveness ranges for control of the particular pollutant in question. Inquire with ORCAA on the generally acceptable ranges of cost effectiveness.

STEP 4, TOP DOWN PROCEDURE:

STEP 4.A: Start with the most effective control option from the list compiled in STEP 3.

STEP 4.B: Provide the information specified in items a through g below for the control option being considered. The attached table is provided for convenience of organizing this information.

a. Control Efficiency: Enter the percent of the pollutant removed by the control option. Control efficiency should be calculated based on the control achieved from the control option in question only.

b. Potential Emissions: Potential emissions in pounds of pollutant per hour and tons of pollutant per year should be calculated based on the maximum potential to emit rather than actual emissions. Potential emissions represent the maximum capacity of a source, emissions unit, process, or activity to emit an air pollutant under physical constraints considering air pollutant emission controls and applicable regulatory limits. Operational factors such as hours of operation or partial loading which influence emissions may be included as constraints which limit the potential to emit provided that the project proponent agrees to incorporate these constraints in enforceable regulatory compliance limits.

c. Expected Emissions: Expected emissions in tons of pollutant per year should be calculated considering expected operational considerations such as down time for maintenance, periods of partial load, capacity factors, etc.

d. Annual Expected Emission Reduction: Using the expected emission rate computed in "c" and control efficiency entered in "a", compute the expected annual emission reduction in tons per year.

e. Annual Cost of Control Option: Compute the annual cost of the control option using standard economic principles. Annual cost should include both the initial capital costs as well as operation and maintenance costs. All costs should be amortized over the expected life of the control option (default is ten years). Include in the analysis the calculations, assumptions, and economic parameters used in the calculations.

f. Cost Effectiveness: Cost effectiveness is the ratio of the annual cost computed in "e" to the annual expected emission reduction computed in "d".

g. Other Considerations: List all other media impacts (water, solid waste, etc.) and energy impacts which are associated with the control option.

STEP 4.C: If there are no outstanding issues regarding energy, environmental and economic impacts, the analysis is ended and this control option is proposed as BACT.

STEP 4.D: In the event that the control option is determined to be inappropriate due to energy, environmental, or economic impacts, this control option is eliminated and the analysis proceeds to the next control option on the list. Rationale for elimination of a control option on grounds of significant energy, environmental or economic impacts should be well documented and included with the analysis.

STEP 4.E: Go to STEP 4.B and proceed with the analysis for the next control option on the list.

STEP 5: DOCUMENTATION: Include with the analysis all information, calculations, assumptions, and data used in making the BACT determination.

REGULATION 1 – GENERAL PROVISION

RULE 1.1 POLICY

The Olympic Region Clean Air Agency (Agency), consisting of the counties of Clallam, Grays Harbor, Jefferson, Mason, Pacific and Thurston, having formed pursuant to chapter 70A.15 RCW, as amended, adopts the following Regulations to control the emission of air contaminants from sources within the jurisdiction of the Agency: to provide for the uniform administration and enforcement of these Regulations: and to administer the requirements and purposes of chapter 70A.15 RCW, as amended, and the Federal Clean Air Act.

It is hereby declared to be the public policy of the Olympic Region Clean Air Agency to secure and maintain such levels of air quality as will protect human health and safety; and, to the greatest degree practicable, prevent injury to plant and animal life and to property; and be consistent with the social, economic, and industrial well-being of the territory of the Agency.
[Adopted 08/17/06; Amended 02/26/22]

RULE 1.2 NAME OF AGENCY

The name of the multi-county air pollution control authority comprised of the activated or inactivated air pollution control authorities of Clallam County, Grays Harbor County, Jefferson County, Mason County, Pacific County, and Thurston County will be known and cited as the "Olympic Region Clean Air Agency."
[Adopted 08/17/06; Amended 02/26/22]

RULE 1.3 SHORT TITLE

These Regulations may be known and cited as "Regulations of the Olympic Region Clean Air Agency."
[Adopted 08/17/06]

RULE 1.4 DEFINITIONS

When used in regulations of the Olympic Region Clean Air Agency, the following definitions will apply, unless defined otherwise in individual Regulations:

"Actual Emissions" means the actual rate of emissions of a pollutant from an emission unit, as determined in accordance with (a) through (c) of this rule.

(a) In general, actual emissions as of a particular date must equal the average rate, in tons per year, at which the emission unit actually emitted the pollutant during a two-year period which precedes the particular date, and which is representative of normal source operation. The Agency must allow the use of a different time period upon determination that it is more representative of normal source rates, and types of materials processed, stored, or combusted during the selected time operation. Actual emissions must be calculated using the emissions unit's actual operating hours, production period.

(b) The Agency may presume that source-specific allowable emissions for the unit are equivalent to the actual emissions of the emissions unit.

(c) For an emissions unit that has not begun normal operations on the particular date, actual emissions will equal the potential to emit of the emissions unit on that date.

"Agency" shall mean the same as "Authority."

"Agriculture or Agricultural" means the growing of crops, the raising of fowl or animals as gainful occupation.

"Air Contaminant" means dust, fumes, mist, smoke, other particulate matter, vapor, gas, odorous substance, or any combination thereof. "Air pollutant" means the same as "air contaminant."

"Air Pollution" means the presence in the outdoor atmosphere of one or more air contaminants in sufficient quantities, and of such characteristics and duration as is, or is likely to be, injurious to human health, plant or animal life, property, or which unreasonably interferes with enjoyment of life and property. For these Regulations, air pollution does not include air contaminants emitted in compliance with chapter 17.21 RCW, the Washington Pesticide Application Act, which regulates the application and control of the use of various pesticides.

"Allowable Emissions" means the emission rate of a source calculated using the maximum rated capacity of the source (unless the source is subject to federally enforceable limits which restrict the operating rate, or hours of operation, or both) and the most stringent of the following:

(a) The applicable standards as set forth in 40 CFR part 60, 61, or 63;
(b) Any applicable state implementation plan emissions limitation including those with a future compliance date; or,
(c) The emissions rate specified as a federally enforceable permit condition, including those with future compliance date.

"Alteration" means the act of altering, which means to change or make different and includes any addition to or enlargement or replacement; or change of the design, capacity, process or arrangement; or any increase in the connected loading of equipment or control facility; or any change in fuels, method of operation or hours of operation not previously approved by the Agency through a Notice of Construction Approval, which would increase or adversely affect the kind or amount of air contaminant emitted by a stationary source.

"Ambient Air" means the surrounding outside air.

"Ambient Air Quality Standard" means an established concentration, exposure time, and frequency of occurrence of air contaminant(s) in the ambient air, which must not be exceeded.

"Attainment Area" means a geographic area designated by EPA at 40 CFR Part 81 as having attained the National Ambient Air Quality Standard for a given criteria pollutant.

"Authority" means the Olympic Region Clean Air Agency. "Agency" shall mean the same as "Authority."

“Begin Actual Construction” means, in general, initiation of physical on-site construction activities on an emission unit, which are of a permanent nature. Such activities include, but are not limited to, installation of building supports and foundations, laying underground pipe work and construction of permanent storage structures. With respect to a change in method of operations, this term refers to those on-site activities other than preparatory activities which mark the initiation of the change.

“Best Available Control Technology (BACT)” means an emission limitation based on the maximum degree of reduction for each air pollutant subject to regulation under chapter 70A.15 RCW emitted from or which results from any new or modified stationary source which the permitting agency, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such stationary source or modification through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of such air pollutant. In no event must application of the best available control technology result in emissions of any pollutants which would exceed the emissions allowed by any applicable standard under 40 CFR Part 60, Part 61, and Part 62. Emissions from any stationary source utilizing clean fuels, or any other means, to comply with this paragraph must not be allowed to increase above levels that would have been required under definition of BACT in the Federal Clean Air Act as it existed prior to enactment of the Clean Air Act Amendments of 1990.

“Board” means the Board of Directors of the Olympic Region Clean Air Agency.

“Bubble” means a set of emission limits which allows an increase in emissions from a given emissions unit in exchange for a decrease in emissions from another emissions unit, pursuant to RCW 70A.15.2240 and Rule 6.1.12 of Regulation 6.

“Commenced” as applied to “Construction” means that the owner or operator has all the necessary pre-construction approvals or permits and either has:

- **(a)** Begun, or caused to begin, a continuous program of actual on-site construction of the source, to be completed within a reasonable time; or
- **(b)** Entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of actual construction of the source to be completed within a reasonable time.

For this definition, “necessary pre-construction approvals” means those permits or orders of approval required under federal air quality control laws and regulations, including state, local and federal regulations and orders contained in the SIP.

“Concealment” means any action taken to reduce the observed or measured concentrations of a pollutant in a gaseous effluent while, in fact, not reducing the total amount of pollutant discharged.

“Control Apparatus” means any device that prevents or controls the emission of any air contaminant.

“Construction” means any physical change or change in the method of operation (including fabrication, erection, installation, demolition, or modification of an emissions unit) which would result in a change in actual emissions.

“Criteria Pollutant” means a pollutant for which there is established a National Ambient Air Quality Standard at 40 CFR Part 50. The criteria pollutants are carbon monoxide (CO), particulate matter, ozone (O_3), sulfur dioxide (SO_2), lead (Pb), and nitrogen dioxide (NO_2).

“Daylight Hours” means the hours between official sunrise and official sunset.

“Ecology” means the Washington State Department of Ecology.

“Emission” means a release of air contaminants into the ambient air.

“Emission Point” means the location (place in horizontal plane and vertical elevation) at which an emission enters the atmosphere.

“Emission reduction credit (ERC)” means a credit granted pursuant to chapter 173-400 WAC. This is a voluntary reduction in emissions.

“Emission Standard” and “Emission Limitation” means requirements established under the Federal Clean Air Act or chapter 70A.15 RCW which limits the quantity, rate, or concentration of emissions of air contaminants on a continuous basis, including any requirement relating to the operation or maintenance of a stationary source to assure continuous emission reduction and any design, equipment work practice, or operational standard adopted under the Federal Clean Air Act, chapter 70A.15 RCW.

“Emission Unit” means any part of a stationary source or source which emits or would have a potential to emit any pollutant subject to regulation under the Federal Clean Air Act, chapter 70A.15 or 70A.388 RCW.

“EPA” means the United States Environmental Protection Agency (USEPA).

“Equipment” means any stationary or portable device, or any part thereof, capable of causing the emission of any air contaminant into the atmosphere.

“Establishment” means the act of establishing, which means creating, setting up, or putting into practice any equipment, material, fuel, or operational change.

“Excess Emission” means emissions of an air pollutant more than the applicable emission standard.

“Executive Director” means the Air Pollution Control Officer of the Olympic Region Clean Air Agency.

“Facility” means all emission units in the same industrial grouping located on contiguous or adjacent properties and under common ownership and control.

“Federal Clean Air Act (FCAA)” means the Federal Clean Air Act, as known as Public Law 88-206, 77 Stat. 392, December 17, 1963, 42 U.S.C. 7401 et seq., as last amended by the Clean Air Act Amendments of 1990, P.L. 101-549, November 15, 1990.

“Federally Enforceable” means all limitations and conditions enforceable by EPA, including those requirements developed under 40 CFR Parts 60, 61, and 63, requirements within the Washington SIP, requirements within any permit established under 40 CFR 52.21 or order of approval under a SIP approved new source review regulation, or any voluntary limits on emissions pursuant to Rule 6.1.12 or WAC 173-400-091.

“Fuel Burning Equipment” means any equipment, device or contrivance used for the burning of any fuel, and all appurtenances thereto, including ducts, breechings, control equipment, fuel feeding equipment, ash removal equipment, combustion controls, stacks, chimneys, etc., used for indirect heating in which the material being heated is not contacted by and adds no substances to the products of combustion.

“Fugitive Dust” means a particulate emission made airborne by forces of wind, man’s activity, or both. Unpaved roads, construction sites, and tilled land are examples of areas that originate fugitive dust. Fugitive dust is a type of fugitive emission.

“Fugitive Emission” means emissions that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

“Garbage” means refuse, animal, or vegetable matter as from a kitchen, restaurant, or store.

“Good Engineering Practice (GEP)” refers to a calculated stack height based on the equation specified in WAC 173-400-200(2)(a)(ii).

“Hogged-fuel” means wood slabs, edging, trimmings, etc., which have been put through a “hog” to reduce them to a uniform small size, and includes shavings from planing mills, sawdust from saw-kerfs, bits of bark, chips, and other small-recovered products from the manufacture of wood products or any combination thereof.

“Incinerator” means a furnace used primarily for the thermal destruction of waste.

“In Operation” means engaged in activity related to the primary design function of the source.

“Installation” means the act of installing, which means placing, assembling, or constructing equipment or control equipment at the premises where the equipment or control equipment will be used, and includes all preparatory work at such premises.

“Light Detection and Ranging (LIDAR)” means the EPA alternate method 1 determination of the opacity of emissions from stationary sources remotely by LIDAR.

“Lowest Achievable Emission Rate (LAER)” means the same as it is defined in WAC 173-400-810.

“Major Modification” as it applies to stationary sources subject to requirements for new sources in nonattainment areas means the same as it is defined in WAC 173-400-810.

“Major Stationary Source” (a) as it applies to stationary sources subject to requirements for new sources in **nonattainment areas** means the same as it is defined in WAC 173-400-810; or,
(b) As it applies to stationary sources subject to requirements for new sources in **attainment or unclassified areas** means the same as it is defined in WAC 173-400-710.

“Masking” means the mixing of a chemically nonreactive control agent with a malodorous gaseous effluent to change the perceived odor.

“Material Handling” means the handling, transporting, loading, unloading, storage, and transfer of material with no significant chemical or physical alteration.

“Modification” means any physical change in, or change in the method of operation of, a stationary source that increases the amount of any air contaminant emitted by such stationary source or that result in the emissions of any air contaminant not previously emitted. The term modification will be construed consistent with the definitions of modification in Section 7411, Title 42, United States Code, and with rules implementing that section.

“National Ambient Air Quality Standards (NAAQS)” means an ambient air quality standard set by EPA at 40 CFR Part 50 and includes standards for carbon monoxide (CO), particulate matter, ozone (O_3), sulfur dioxide (SO_2), lead (Pb), and nitrogen dioxide (NO_2).

“National Emission Standards for Hazardous Air Pollutants (NESHAP)” means the federal rules in 40 CFR Part 61.

“National Emission Standards for Hazardous Air Pollutants for Source Categories” means the federal rules in 40 CFR Part 63.

“Net Emissions Increase” (a) as it applies to stationary sources subject to requirements for new sources in **nonattainment** areas means the same as it is defined in WAC 173-400-810; or,
(b) as it applies to stationary sources subject to requirements for new sources in **attainment or unclassified** areas means the same as it is defined in WAC 173-400-710.

“New Source” means:

- **(a)** The construction or modification of a stationary source that increases the amount of any air contaminant emitted by such stationary source or that results in the emission of any air contaminant not previously emitted; and
- **(b)** Any other project that constitutes a new stationary source under the Federal Clean Air Act.

“New Source Performance Standards (NSPS)” means the federal rules set forth in 40 CFR Part 60.

“Nonattainment Area” means a geographic area designated by EPA at 40 CFR Part 81 as exceeding a national ambient air quality standard (NAAQS) for a given criteria pollutant. An area is nonattainment only for the pollutants for which the area has been designated nonattainment.

"Nonroad Engine" means:

(a) Except as discussed in (b) of this rule, a nonroad engine is any internal combustion engine:

(1) In or on a piece of equipment that is self-propelled or serves a dual purpose by both propelling itself and performing another function (such as garden tractors, off-highway mobile cranes and bulldozers); or
(2) In or on a piece of equipment that is intended to be propelled while performing its function (such as lawnmowers and string trimmers); or
(3) That, by itself or in or on a piece of equipment, is portable or transportable, meaning designed to be and capable of being carried or moved from one location to another. Indicia of transportability include, but are not limited to, wheels, skids, carrying handles, dolly, trailer, or platform.

(b) An internal combustion engine is not a nonroad engine if:

(1) The engine is used to propel a motor vehicle, or a vehicle used solely for competition, or is subject to standards promulgated under section 202 of the Federal Clean Air Act; or
(2) The engine is regulated by a New Source Performance Standard promulgated under section 111 or 112 of the Federal Clean Air Act; or
(3) The engine otherwise included in (a)(3) of this rule remains or will remain at a location for more than twelve consecutive months or a shorter period of time for an engine located at a seasonal source. A location is a single site at a building, structure, facility, or installation. Any engine (or engines) that replaces an engine at a location and that is intended to perform the same or similar function as the engine replaced will be included in calculating consecutive time period. An engine located at a seasonal source is an engine that remains at a seasonal source during the full annual operating period of the seasonal source. A seasonal source is a stationary source that operates at a single location approximately three months (or more) each year. The paragraph does not apply to an engine after the engine is removed from the location.

"Notice of Construction Application" means a written application to permit construction, installation or establishment of a new stationary source, modification of an existing stationary source, or replacement or substantial alteration of control technology at an existing stationary source.

"Olympic Air Pollution Control Authority (OAPCA)" is the former name of Olympic Region Clean Air Agency (ORCAA). Reference to "OAPCA" means the same as ORCAA.

"Opacity" means the degree to which an object seen through a plume is obscured, stated as a percentage.

"Order" means any order issued by ecology or a local air agency pursuant to chapter 70A.15 RCW, including, but not limited to RCW 70A.15.3011, 70A.15.2520, 70A.15.2210, 70A.15.2220, and 70A.15.2040(3), and includes, where used in the generic sense, the terms order, corrective action order, order of approval, and regulatory order.

"Order of Approval" or **"Approval Order"** means a regulatory order issued by Ecology or the Agency to approve the Notice of Construction application for a proposed new source or modification, or the replacement or substantial alteration of control technology at an existing stationary source.

"Owner" means person, agent, lessor, lessee, possessor, manager, supervisor, operator, or other responsible party of real property or other assets which includes equipment or control apparatus.

"Ozone Depleting Substance" means any substance listed in Appendices A and B to Subpart A of 40 CFR part 82.

"Particulate Matter" or **"Particulates"** means any airborne finely divided solid or liquid material with an aerodynamic diameter smaller than 100 micrometers.

"Parts Per Million (ppm)" means parts of a contaminant per million parts of gas, by volume, exclusive of water or particulates.

"Permit" means a written warrant or license granted by the Board, Executive Director, or duly authorized Representative or Agent.

"Permitting Agency" means ecology or the local air pollution control agency with jurisdiction over the source.

"Person" means an individual, firm, public or private corporation, association, partnership, political subdivision, municipality, or government agency.

"$PM_{2.5}$" means particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers as measured by a reference method based on 40 CFR Part 50 Appendix L and designated in accordance with 40 CFR Part 53 or by an equivalent method designated in accordance with 40 CFR Part 53.

"PM_{10}" means particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers as measured by a reference method based on 40 CFR Part 50 Appendix J and designated in accordance with 40 CFR Part 53 or by an equivalent method designated in accordance with 40 CFR Part 53.

"$PM_{2.5}$ Emissions" means finely divided solid or liquid material, including condensable particulate matter, with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers emitted to the ambient air as measured by an applicable reference method, or an equivalent or alternate method, specified in Appendix M of 40 CFR Part 51 or by a test method specified in the SIP.

“PM_{10} Emissions” means finely divided solid or liquid material, including condensable particulate matter, with an aerodynamic diameter less than or equal to a nominal 10 micrometers emitted to the ambient air as measured by an applicable reference method, or an equivalent or alternate method, specified in Appendix M of 40 CFR Part 51 or by a test method specified in the SIP.

“Potential to Emit” means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the stationary source to emit a pollutant including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, will be treated as part of its design only if the limitation or the effect it would have on emissions is federally enforceable. Secondary emissions do not count in determining the potential to emit of a source.

“Prevention of Significant Deterioration (PSD)” means the program in WAC 173-400-700 to 173-400-750. Ecology is responsible for the PSD program for stationary sources in ORCAA’s jurisdiction.

“Process” means any equipment, device apparatus, chemical, natural element, procedure, effort, or any combination thereof which performs a service, function, use, or method, leading to an end of a performance, or manufacturing production.

“Reasonably Available Control Technology (RACT)” means the lowest emission limit that a particular stationary source or stationary source category is capable of meeting by the application of control technology that is reasonably available considering technological and economic feasibility. RACT is determined on a case-by-case basis for an individual stationary source or stationary source category considering the impact of the stationary source upon air quality, the availability of additional controls, the emission reduction to be achieved by additional controls, the impact of additional controls on air quality, and the capital and operating costs of the additional controls. RACT requirements for any stationary source or stationary source category will be adopted only after notice and opportunity for comment are afforded.

“Refuse” means waste as defined in Rule 1.4 of this Regulation.

“Regulation” means any regulation, or any subsequently adopted additions or amendments thereto, of the Olympic Region Clean Air Agency.

“Regulatory Order” means an order issued by Ecology or an agency to an air contaminant source that applies to that source, any applicable provision of chapter 70A.15 RCW, or the rules adopted there under, or, for sources regulated by a local air agency, the regulations of that agency.

“Representative” or **“Agent”** means any person authorized by the Executive Director of the Agency to represent them in an official and specific manner.

“Residential” means a two or single-family unit.

“Secondary Emissions” means emissions which would occur because of the construction or operation of a major stationary source or major modification, but do not come from the major stationary source or major modification itself. Secondary emissions must be specific, well defined, quantifiable, and impact the same general area as the stationary source or modification that causes the secondary emissions. Secondary emissions may include, but are not limited to:

(a) Emissions from ships or trains located at the new modified stationary source; and,

(b) Emissions from any off-site support facility which would not otherwise be constructed or increase its emissions because of the construction or operation of the major stationary source or major modification.

“Significant” (a) as it applies to stationary sources subject to requirements for new sources in **nonattainment areas** means the same as it is defined in WAC 173-400-810; or,
(b) as it applies to stationary sources subject to requirements for new sources in **attainment or unclassified areas** means the same as it is defined in WAC 173-400-710.

“Source” means all the emissions units, including quantifiable fugitive emissions, that are located on one or more contiguous or adjacent properties, and are under the control of the same person or persons under common control, whose activities are ancillary to the production of a single product or functionally related groups of products. Activities will be considered ancillary to the production of a single product or functionally related group of products if they belong to the same Major Group (i.e., which have the same two-digit code) as described in the Standard Industrial Classification Manual, 1972, as amended by the 1977 supplement.

“Source Category” means all sources of the same type of classification.

“Stack” means any point in a source designed to emit solids, liquids, or gases into the air, including a pipe or duct.

“Stack Height” means the height of an emission point measured from the ground-level elevation at the base of the stack.

“Standard Conditions” means a temperature of 20ºC (68ºF) and a pressure of 760 mm (29.92 inches) of mercury.

“Standard Cubic Foot of Gas” means that amount of the gas, which would occupy a cube having dimensions of one foot on each side if the gas were free of water vapor and at standard conditions.

“State Implementation Plan (SIP)” or the “Washington SIP” in 40 CFR Part 52, subpart WW. The SIP contains state, local and federal regulations and orders, the state plan and compliance schedules approved and promulgated by EPA, for implementing, maintaining, and enforcing the National Ambient Air Quality Standards.

“Stationary Source” means any building, structure, facility, or installation, which emits or may emit any air contaminant. This term does not include emissions resulting directly from an internal combustion engine for transportation purposes or from a nonroad engine or nonroad vehicle as defined in section 216(11) of the Federal Clean Air Act.

"Synthetic Minor" means any stationary source that's potential to emit has been limited below applicable thresholds by means of a federally enforceable order, rule, or permit condition.

"Temporary" means a period not to exceed one (1) year.

"Total Reduced Sulfur (TRS)" means the sum of the sulfur compounds hydrogen sulfide, mercaptans, dimethyl sulfide, dimethyl disulfide, and any other organic sulfides emitted and measured by EPA method 16 or an approved equivalent method and expressed as hydrogen sulfide.

"Total Suspended Particulate (TSP)" means particulate matter as measured by the method described in 40 CFR Part 50 Appendix B.

"Toxic Air Pollutant (TAP)" means any toxic air pollutant listed in WAC 173-460-150. The term toxic air pollutant may include particulate matter and volatile organic compounds if an individual substance or a group of substances within either of these classes is listed in WAC 173-460-150. The term toxic air pollutant does not include particulate matter and volatile organic compounds as generic classes or compounds.

"True Vapor Pressure" means the equilibrium partial pressure exerted by the stored organic compound at:

(a) The annual average temperature of the organic compound as stored; or
(b) At the local annual average temperature as reported by the National Weather Service if stored at ambient temperature.

"Unclassifiable Area" means an area that cannot be designated attainment or nonattainment based on the available information as meeting or not meeting the National Ambient Air Quality Standard for the criteria pollutant that is listed by EPA at 40 CFR part 81.

"United States Environmental Protection Agency (USEPA)" will be referred to as EPA.

"Vent" means any opening through which gaseous emissions are exhausted into the ambient air.

"Volatile Organic Compound (VOC)" means the same as it is defined in WAC 173-400-030.
[Adopted 08/17/06; Amended 05/22/10; 03/18/11; 05/13/12; 02/26/22]

RULE 1.5 EXECUTIVE DIRECTOR – POWERS AND DUTIES

(a) The Executive Director shall observe and enforce the provisions of state law and all orders, ordinances, resolutions or rules and regulations of the Agency pertaining to control and prevention of air pollution in accordance with the policies of the Board of Directors.

(b) At least thirty days prior to the commencement of any formal enforcement action under RCW 70A.15.3150 or 70A.15.3160, whenever the Executive Director has reason to believe that any provision of state law or any regulation relating to the control or prevention of air pollution has been violated, the Executive Director may cause written notice to be served upon the alleged violator or violators. The notice must specify the provision of state law or the regulation alleged to be violated and the facts alleged to constitute a violation there of and may include an order that necessary corrective action be taken within a specified time. In lieu of an order, the Executive Director may require that the alleged violator or violators appear before the Board for a hearing, at a time and place specified in the notice, given at least twenty (20) days prior to such hearing, and answer the charges.

(c) The Executive Director and/or a qualified designated agent may make any investigation or study which is necessary for enforcing these Regulations or any amendment thereto of controlling or reducing the amount or kind of air contaminant.

(d) The Executive Director and/or a qualified designated agent may obtain from any person, subject to the jurisdiction of the Agency, such information or analysis as will disclose the nature, extent, quantity, or degree of air contaminants which are, or may be, discharged by such source and type or nature of control equipment in use.

(e) To investigate conditions specific to the control, recovery, or release of air contaminants into the atmosphere, the Executive Director or a duly authorized representative has the power to enter at reasonable times upon any private or public property, excepting non-multiple unit private dwellings housing two families or less. No person may refuse entry or access to the Executive Director, or a duly authorized representative, who request entry for an inspection, and who presents appropriate credentials; nor obstruct, hamper, or interfere with any such inspection.

(f) If during the course of an inspection, the Executive Director or a duly authorized representative desires to obtain a sample of air contaminant, fuel, or process material or other material which affects or may affect the emission of air contaminants, the Executive Director or a designated agent shall notify the owner or operator of the time and place of obtaining a sample so the owner or operator has the opportunity to take a similar sample at the same time and place; and the Executive Director or a duly authorized representative shall give a receipt to the owner or operator for the sample obtained.

(g) The Executive Director may engage, at the Agency's expense and with Board approval, qualified individuals, or firms to make independent studies and reports as to the nature, extent, quantity, or degree of any air contaminants which are or may be discharged from any source.

(h) The Executive Director is empowered to sign official complaints or issue citations or initiate court suits or use other means to enforce the provisions of the Regulations.

(i) To demonstrate compliance with emission standards, the Executive Director has the authority to require a source to be tested, either by the Agency personnel or by the owner, using source test procedures approved by the Agency. The owner must be given reasonable advance notice of the requirement of the test.

(j) For Agency personnel to perform a source test, the Executive Director has the authority to require the owner of the source to provide an appropriate platform and sampling ports. The owner must have the opportunity to observe the sampling and, if there is adequate space to conduct the tests safely and efficiently, to obtain sample at the same time.

[Adopted 08/17/06; Amended 02/26/22]

RULE 1.6 CONFIDENTIAL INFORMATION

Whenever any record or other information, other than ambient air quality data or emissions data, furnished to or obtained by the Agency, pursuant to any sections in chapter 70A.15 RCW, relate to processes or production unique to the owner or operator or are likely to affect adversely the competitive position of such owner or operator if released to the public or to the competitor, and the owner or operator of such processes or production so certifies, such records or information will only be for the confidential use of the Agency.

Nothing herein will be construed to prevent the use of records or information by the Agency in compiling or publishing analysis or summaries relating to the general condition of the outdoor atmosphere: Provided, that such analysis or summaries do not reveal any information otherwise confidential under the provisions of this rule: Provided further, that emission data furnished to or obtained by the Agency will be correlated with applicable emission limitations and other control measures and will be available for public inspection during normal business hours at offices of the Agency.

[Adopted 08/17/06; Amended 02/26/22]

RULE 1.7 APPOINTMENT OF HEARING OFFICER

(a) In all instances where the Board is permitted or required to hold hearings under the provisions of chapter 70A.15 RCW, such hearings must be held before the Board; or the Board may appoint a hearing officer, who will be the Executive Director of the Agency or his/her designee to hold such hearings.

(b) A duly appointed hearing officer has all the powers, rights and duties of the Board relating to the hearings.

[Adopted 08/17/06; Amended 02/26/22]

RULE 1.8 APPEALS FROM BOARD ORDERS

(a) Any order issued by the Agency becomes final unless such order is appealed to the Hearings Board as provided in chapter 43.21B RCW. The sole basis for appeal of a fee assessed by the Executive Director or Board will be that the assessment contains an arithmetic or clerical error.

(b) Any order issued by the Agency may be appealed to the Pollution Control Hearings Board if the appeal is filed with the Hearings Board and served on the Agency within thirty (30) days after receipt of the order in accordance with chapter 371-08 WAC. This is the exclusive means of appeal of such an order.

(c) The Agency in its discretion may stay the effectiveness of an order during the pendency of such an appeal.

(d) At any time during the pendency of such an appeal of such an order to the Pollution Control Hearings Board, the appellant or other affected parties may apply to the Hearings Board pursuant to chapter 43.21B RCW and chapter 371-08 WAC for a stay of the order or the removal thereof.

[Adopted 08/17/06; Amended 02/26/22]

RULE 1.9 SEVERABILITY

If any phrase, clause, or rule of these Regulations is declared unconstitutional or invalid by any court of competent jurisdiction, it will be conclusively presumed that the Board of Directors would have enacted these Regulations without the phrase, clause, or rule so held unconstitutional or invalid; and the remainder of the Regulations will not be affected because of said part being held unconstitutional or invalid.

[Adopted 08/17/06; Amended 02/26/22]

RULE 1.10 SERVICE OF NOTICE

(a) Service of any written notice required by ORCAA Regulations must be made on the owner(s) as follows:

- **(1)** Either by mailing the notice in a prepaid envelope directed to the owner at the address listed on their application, order, registration certificate, or at the address where the equipment is located, by United States Certified Mail, return receipt requested; or
- **(2)** By leaving the notice with the owner or if the owner is not an individual, with a member of the partnership or group concerned, or with an officer, registered agent or managing agent of the corporation.

(b) Service of any written notice required by ORCAA Regulations must be made on the Agency, as follows:

- **(1)** Either by mailing the notice in a prepaid envelope directly to the Agency at its office by United States Certified Mail, return receipt requested; or
- **(2)** By leaving the notice at the Agency office with an employee of the Agency.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

RULE 1.11 FEDERAL REGULATION REFERENCE DATE

Whenever federal regulations are referenced in ORCAA's rules, the effective date is July 1, 2023.

[Adopted 08/17/06; Amended 10/29/16; 10/16/17; 03/23/19; 01/04/2020; 11/22/2020; 10/17/2021; 02/26/2022; 10/31/2022; Amended 10/28/2023]

RULE 1.12 STATE REGULATIONS REFERENCE DATE

Whenever state regulations are referenced in ORCAA's rules, the effective date is July 1, 2023.

[Adopted 02/26/2022; Amended 10/31/2022; Amended 10/28/2023]

REGULATION 2 – ENFORCEMENT PROCEDURES AND PENALTIES

RULE 2.1 VOLUNTARY COMPLIANCE

Nothing in this Regulation prevents the Agency from making efforts to obtain voluntary compliance through warning, conference, or any other appropriate means.
[Adopted 08/17/06; Amended 02/26/22]

RULE 2.3 VARIANCES

Any person who owns or is in control of any plant, building, structure, establishment, process, or equipment may apply to the Agency or the Board for a variance to exceed a specific maximum emission standard of these Regulations for a limited period, except for any federally enforceable standard, provided that a variance to state standard is also approved by the Department of Ecology. The application must be accompanied by such information and data as the Agency or Board requires. The Board may grant such variance but only after approval by the Department of Ecology and public hearing or due notice and in accordance with the provisions set forth in RCW 70A.15.2310, as now or hereafter amended. Any hearing held pursuant to this rule must be conducted in accordance with the rules of evidence as set forth in RCW 34.04.100, as now or hereafter amended. A variance will be charged fees per the Agency's Notice of Construction Fee Schedule.
[Adopted 08/17/06; Amended 04/26/15; 02/26/22]

RULE 2.4 NOTICES OF VIOLATIONS

At least 30 days prior to the commencement of any formal enforcement action under RCW 70A.15.3150 or 70A.15.3160, the Board or Executive Director will serve written notice upon the alleged violator or violators. The notice must specify the provisions of chapter 70A.15 RCW or the orders, rules, or regulations adopted pursuant thereto, alleged to be violated, and the facts alleged to constitute a violation thereof, and may include an order directing that necessary corrective action be taken within a reasonable time. In lieu of an order, the Board or the Executive Director may require the alleged violator or violators appear before the Board for a hearing. Every notice of violation will offer the alleged violator an opportunity to meet with the Agency prior to the commencement of enforcement action.

- **(a)** Each act of commission or omission which procures, aids, or abets in the violation is a violation and is subject to the same penalty.
- **(b)** In case of a continuing violation, whether knowingly committed, each day's continuance is a separate and distinct violation.

[Adopted 08/17/06; Amended 02/26/22]

RULE 2.5 REGULATORY ACTIONS AND PENALTIES

The Executive Director may take any of the following regulatory actions to enforce the provisions of chapter 70A.15 RCW or any of the rules or regulations in force pursuant thereto, which are incorporated by reference.

- **(a)** Civil Penalties

(1) Any person who violates any of the provisions of chapter 70A.15 RCW or any of the rules or regulations in force pursuant thereto may incur a civil penalty in an amount not to exceed $14,915.00 per day for each violation.
(2) Any person who fails to act as specified by an Order issued pursuant to chapter 70A.15 RCW or Regulations of ORCAA is liable for a civil penalty of not more than $14,915.00 for each day of continued noncompliance.
(3) Within 30 days after receipt of Notice of Civil Penalty, the person incurring the penalty may apply in writing to the Executive Director for the remission or mitigation of the penalty. Any such request must contain the following:

- **(i)** The name, mailing address, and telephone number of the appealing party;
- **(ii)** A copy of the Notice of Civil Penalty appealed from;
- **(iii)** A short and plain statement showing the grounds upon which the appealing party considers such Order to be unjust or unlawful;
- **(iv)** A clear and concise statement of facts upon which the appealing party relies to sustain their grounds for appeal;
- **(v)** The relief sought, including the specific nature and extent; and
- **(vi)** A statement that the appealing party has read the notice of appeal and believes the contents to be true followed by the party's signature.

Upon receipt of the application, the Executive Director may remit or mitigate the penalty only upon a demonstration by the requestor of extraordinary circumstances such as the presence of information or factors not considered in setting the original penalty.

(4) Any civil penalty may also be appealed to the Pollution Control Hearings Board pursuant to chapter 43.21B RCW and chapter 371-08 WAC if the appeal is filed with the Hearings Board and served on the Agency within 30 days after receipt by the person penalized of the notice imposing the penalty or 30 days after receipt of the notice of disposition of the application for relief from penalty.
(5) A civil penalty becomes due and payable on the later of:

- **(i)** 30 days after receipt of the notice imposing the penalty;
- **(ii)** 30 days after receipt of the notice of disposition on application for the relief from penalty, if such application is made; or
- **(iii)** 30 days after receipt of the notice of decision of the Hearings Board if the penalty is appealed.

(6) If the amount of the civil penalty is not paid to the Agency within the time allowed, the Agency may use any available methods, including Superior Court, to recover the penalty. In all actions brought in the Superior Court for recovery of penalties hereunder, the procedure and rules of evidence are the same as in ordinary civil action.
(7) To secure the penalty incurred under this rule, this Agency may secure a lien on any vessel used or operated in violation of these Regulations, which will be enforced as provided in RCW 60.36.050.

(b) Criminal Penalties

(1) Any person who knowingly violates any of the provisions of chapter 70A.15 RCW or any rules or regulations in force pursuant thereto, is guilty of a crime and upon conviction thereof, may be punished by fine of not more than $10,000.00, or by imprisonment in the county jail for not more than 1 year, or by both for each separate violation.

(2) Any person who negligently releases into the ambient air any substance listed by the Department of Ecology as a hazardous air pollutant, other than in compliance with terms of an applicable permit or emission limit, and who at the time negligently places another person in imminent danger of death or substantial bodily harm is guilty of a crime and may, upon conviction, be punished by a fine of not more than $10,000.00, or by imprisonment for not more than 1 year, or both.

(3) Any person who knowingly releases into the ambient air any substance listed by the Department of Ecology as a hazardous air pollutant, other than in compliance with the terms of an applicable permit or emission limit, and who knows at the time that they have thereby placed another person in imminent danger of death or substantial bodily harm is guilty of a crime and may, upon conviction, be punished by a fine of not less than $50,000.00, or by imprisonment for not more than 5 year, or both.

(c) Additional Enforcement

(1) Notwithstanding the existence or use of any other remedy, whenever any person has engaged in, or is about to engage in, any acts or practices which constitute or will constitute a violation of any provision of chapter 70A.15 RCW, or any order, rule or regulation issued by the Board of Executive Director or a duly authorized agent, the Board, after notice to such person and an opportunity to comply, may petition the Superior Court of the county wherein the violation is alleged to be occurring or to have occurred for a restraining order or a temporary or permanent injunction or another appropriate order.

(2) As an additional means of enforcement, the Board or Executive Director may accept an assurance of discontinuance of any act or practice deemed in violation of chapter 70A.15 RCW or of any order, rule, or regulation adopted pursuant thereto, from any person engaging in, or who has engaged in, such act or practice. Any such assurance must specify a time limit during which such discontinuance is to be accomplished. Failure to perform the terms of any such assurance constitutes prima facie proof of a violation of this chapter or the orders, rules or regulations issued pursuant thereto, which make the alleged act or practice unlawful for securing any injunction or other relief from Superior Court in the county wherein the violation is alleged to be occurring or to have occurred.

[Adopted 08/17/06; Amended 02/12/07; 02/26/22]

RULE 2.6 COMPLIANCE SCHEDULES

(a) Issuance. Whenever a source is found to be in violation of an emission standard or other provision of ORCAA's Regulations or chapter 70A.15 RCW or title 173 WAC or any applicable federal regulation the Agency may issue a regulatory order requiring that the source be brought into compliance within a specified time. The order must contain a schedule for installation, with intermediate benchmark dates and a completion date, which constitutes a compliance schedule.

(b) The source, including any person who owns or is in control of any plant, building, structure, establishment, process, or equipment, which is in violation of an emission standard or other provision of ORCAA's Regulations or chapter 70A.15 RCW or title 173 WAC may submit a proposed Compliance Schedule to the Board for approval. The proposed Compliance Schedule must meet the requirements of this rule and must be accompanied by such information and data as the Executive Director or the Board may require.

(c) Public Noticing. Compliance Schedules must meet the requirements for public involvement in accordance with chapter 70A.15 RCW as now or hereafter amended. Any hearing held pursuant to this rule must be conducted in accordance with the Rules of Evidence as set forth in Chapter 34.04 RCW, as now or hereafter amended.

(d) Federal Action. A source will be considered in compliance with this rule if all the provisions of its individual compliance schedule, including those stated by regulatory order, are being met. Such compliance does not preclude federal enforcement action by the EPA until and unless the schedule is submitted and adopted as an amendment to the State Implementation Plan.

(e) Penalties for delayed compliance. Sources on a compliance schedule but not meeting emissions standards may be subject to penalties as provided in the Federal Clean Air Act. In addition, failure at any phase to make progress towards compliance pursuant to any Compliance Schedule accepted by the Board may be deemed an unreasonable delay and in violation of the terms of said Compliance Schedule and the Board or Executive Director may require that the responsible person appear before the Board to explain the delay and show cause why abatement action should not be started, enforcement action taken, and/or the Compliance Schedule revoked.

(f) Fee for Compliance Schedule. The Agency will not commence processing a compliance schedule request until it has received a filing fee as determined by Rule 3.3.

[Adopted 08/17/06; Amended 02/26/22]

REGULATION 3 – FEES

The Board will establish Fee Schedules by Resolution. The Fee Schedules will be reviewed periodically to determine if the fee revenue collected is sufficient to recover program costs. Any proposed fee revision must include opportunity for public review and comment. Accordingly, the Agency must account for program costs, including direct and indirect employee costs and overhead. If it is determined that the total program fee revenue is either significantly excessive or deficient for this purpose, the Board may choose to amend the fee schedules to recover program costs more accurately.
[Adopted 08/17/06; Amended 02/26/22]

RULE 3.1 ANNUAL REGISTRATION FEES

(a) The Agency will charge Initial and Annual registration fees pursuant to RCW 70A.15.2200. Annual registration fees will be assessed per the annual fee schedules set forth in Rule 3.1(b) below. Initial registration fees will be assessed upon initial registration of a source and will equal the annual registration fee based on projected emissions and prorated for the remaining months in the fiscal year. Initial and Annual registration fees provide revenue to fund the Agency's ongoing Registration Program.

(b) All sources requiring registration will be assessed an annual registration fee; the fees required by this rule will be based on process rates, equipment specifications, and emissions data from the previous calendar year on file with the Agency, if this information is not on file with the Agency, the Agency may base the annual fee on the enforceable emissions limitations for the source and maximum capacities and production rates. In assessing annual registration fees, the Agency will consider updates and revisions to any source's file received prior to July 1 of the current year. The fees will be assessed per items (1) and (2) of this rule. Sources assessed annual operating permit fees under Rule 3.2 will not be assessed annual fees under this rule.

(1) An Emissions Fee as specified in the Registration Fee Schedule per ton of each air contaminant listed in Table 3.1 that is emitted by the source. The emissions fee will be based on actual emissions from the source, for the last calendar year when available, or as specified in the file or permit. Only non-VOC TAPs will be subject to the emission fee; and

(2) A Registration Classification Fee as specified in the Registration Fee Schedule.

(c) The Agency sends annual registration invoices out on or after August 1 of each year to cover the cost of administering the program for the current fiscal year commencing July 1 and ending June 30. The agency assesses annual registration fees based on the most recent information on file with the Agency including any updates to the source's file received prior to July 1 of that year.

(d) Upon assessment by the Agency, annual registration fees are due and payable and will be deemed delinquent if not fully paid on or before the due date on the invoice. However, sources classified as RC1, RC2, or RC3 have the option to pay their annual fee in quarterly installments. RC1, RC2, and RC3 sources choosing to pay quarterly installments may indicate so on the first invoice received and remit payment of the first installment to the Agency along with the duplicate copy of the invoice. Quarterly installments are equal to 25% of the total annual registration fee and are due on or before the due date on the invoice.

(e) Any source which fails to pay, in full, their annual registration fee or annual registration installment by the due date, as stated on the invoice, may be assessed a late penalty in the amount of 25% of their annual registration fee. This late penalty is in addition to the annual registration fee.

(f) Annual registration fees may be appealed per the procedure specified in Rule 1.8.

(g) Failure to pay annual registration fees is a violation of these Regulations and will result in the issuance of a Notice of Violation and prescribed penalties.

(h) On a periodic basis, the Agency conducts a workload analysis to determine the adequacy of annual registration fees in funding the Agency's Registration Program. The workload analysis is based on the Agency's historical record of time and resource expenditures associated with the registration program. The workload analysis will be presented to the Board periodically. Any proposed revisions to the annual registration fee schedule must be presented to the Board for adoption after public noticing pursuant to these Regulations public noticing requirements and opportunity for a public hearing.

(i) All registered sources needing to be re-inspected, due to verified conditions or actions caused by the source, will be charged an additional amount as specified in the Registration Fee Schedule.

(j) The Agency's Registration fees must cover the direct and indirect cost of the Registration program as specified in RCW 70A.15.2200.

(k) The applicable fees are established in the current fee schedule adopted by Resolution of the Board of Directors of ORCAA.

Table 3.1: Pollutants Considered For Fees

Total Suspended Particulates (TSP)
Carbon Monoxide (CO)
Sulfur Oxides (SOx)
Nitrogen Oxides (NOx)
Volatile Organic Compounds (VOC)
Toxic Air Pollutants (TAP)

[Adopted 08/17/06; Amended 05/17/07; 05/13/12; 04/26/15; 02/26/22]

RULE 3.2 OPERATING PERMIT FEES

(a) Fee Applicability. Any source or area source in the Agency's jurisdiction subject to the requirement to obtain an Operating Permit pursuant to 40 CFR Part 70 or RCW 70A.15.2260 (Title V sources), except those Title V sources for which air emissions are regulated by the Washington State Department of Ecology or Energy Facility Site Evaluation Council (EFSEC), must pay annual fees to the Agency per the provisions in this rule.

(b) Operating Permit Program Account. The Agency must maintain a dedicated account for the Air Operating Permit Program. The account will be funded exclusively by fee revenue from annual fees collected from Title V sources within the jurisdiction of the Agency. All fee revenue collected under Rule 3.2 must be deposited in the Air Operating Permit account.

(c) Operating Permit Program Funding. The sum of fees assessed by the Agency under Rule 3.2 covers all direct and indirect costs of developing and administering the Agency's Operating Permit Program including Ecology's cost for development and oversight of the Agency's Operating Permit Program, as provided in RCW 70A.15.2270.

(d) Ecology Development and Oversight Fees. The Agency assesses an annual Ecology Development and Oversight Fee to all Title V sources within the jurisdiction of the Agency. The total amount of Ecology Development and Oversight Fees assessed annually by the Agency equals Ecology's annual cost of development and oversight of the Agency's Operating Permit Program, as provided in RCW 70A.15.2270.

(e) Annual Fees, Existing Title V Sources. The Agency assesses an Annual Fee to all existing Title V sources. The total amount of Annual Fees assessed by the Agency to existing Title V sources must equal the projected net annual cost to administer the Agency's Operating Permit Program during the current fiscal year.

(f) Net Annual Cost Projections. Projected net annual cost to administer the Agency's Operating Permit Program will be determined annually and must equal the projected annual cost to administer the program minus any balance of funds in the Operating Permit Program account at the end of the previous fiscal year. Projected annual costs include all direct and indirect costs to administer the Agency's Operating Permit Program and is based on a workload analysis conducted by staff. Net annual cost projections including the workload analysis must be included in the Agency's annual budget and approved by resolution of the Agency's Board of Directors in a public hearing.

(g) Workload Analysis. Only fee eligible activities as specified below, as provided in RCW 70A.15.2270, are considered in the workload analysis conducted annually by staff. Fee eligible activities will include:

(1) Preapplication assistance and review of an application and proposed compliance plan for a permit, permit revision, or permit renewal;

(2) Source inspections, testing, and other data gathering activities necessary for development of a permit, permit revision or renewal;

(3) Acting on an application for a permit, permit revision or renewal, including the cost of developing an applicable requirement as part of the processing of a permit, permit revision or renewal, preparing a draft permit and fact sheet, preparing a proposed permit, and preparing a final permit;

(4) Notifying and soliciting, reviewing. and responding to comment from the public and contiguous states and tribes, conducting public hearings regarding the issuance of a draft permit and other costs of providing information to the public regarding operating permits and the permit issuance process;

(5) Modeling necessary to establish permit limits or to determine compliance with the permit limits;

(6) Reviewing compliance certifications and emission reports, conducting related compilation and reporting activities;

(7) Conducting compliance inspections, complaint investigations and other activities necessary to ensure that a source is complying with permit conditions;

(8) Administrative enforcement activities and penalty assessment, excluding the cost of proceedings before the Pollution Control Hearings Board (PCHB) and all costs of judicial enforcement;

(9) The share attributable to permitted sources to the development and maintenance of emissions inventories;

(10) The share attributable to permitted sources of the ambient air quality monitoring and associated recording and reporting activities;

(11) Training for permit administration and enforcement;

(12) Fee determination, assessment, and collection, including the cost of necessary administrative dispute resolution and enforcement;

(13) Required fiscal audits, periodic performance audits and reporting activities;

(14) Tracking of time, revenues and expenditures and accounting activities;

(15) Administering the permit program including costs of clerical support, supervision, and management;

(16) Provisions of assistance to small business under jurisdiction of the Agency as required under Section 507 of the Federal Clean Air Act; and,

(17) Other activities required by operating permit regulations issued by EPA under the Federal Clean Air Act.

(h) Allocation of Fees. The Annual Fee for a Title V source will be calculated using the following three-part fee allocation equation:

Table 3.2a: Operating Permit Fee Formulas

Annual Fee = Facility Fee + Equipment Fee + Emissions Fee
WHERE: Facility Fee = (Annual Net Cost ÷ 3) ÷ n Equipment Fee = [(Annual Net Cost ÷ 3) ÷ U_{total}] x U_{source} Emissions Fee = [(Annual Net Cost ÷ 3) ÷ E_{total}] x E_{source} Annual Net Cost = Projected net annual cost as approved by the Agency's Board of Directors. n = Total number of Title V sources in the Agency's jurisdiction. Note, each area source category requiring a Title V permit will be counted as one source in determining "n." However, the facility fee for an area source category will be divided equally among all individual area sources within the area source category. U_{total} = Total number of emission units located at Title V sources in the Agency's jurisdiction. U_{source} = Number of emission units at the specific Title V source. For area source categories requiring a Title V permit, "U_{source}" is the number of individual area sources within the area source category that have been identified within the Agency's jurisdiction. However, the emission unit fee for an area source category will be divided equally among all individual area sources within the area source category. E_{total} = Total actual annual emissions of the air pollutants subject to fees from Title V sources based on the Agency's most recent emissions inventory. E_{source} = Total actual annual emissions of the air pollutants subject to fees, from the specific Title V source for the most recent calendar year. For area source categories requiring a Title V permit, "E_{source}" is the total actual annual emissions from the area source category. However, the Emissions Fee for an area source category will be divided equally among all individual area sources within the area source category. Air pollutants subject to fees = Total Particulates (TSP) Sulfur Oxides (SOx) Nitrogen Oxides (NOx) Volatile Organic Compounds (VOC) Toxic Air Pollutants

(i) Initial Fees. New Title V sources will be assessed an Initial Fee after commencement of operation to cover the Agency's cost of administering the program for the new Title V source for the remainder of the current fiscal year. The Initial Fee for a new Title V source will equal the Annual Fee based on Rule 3.2(h), which would otherwise be assessed if the Title V source commenced operation on or prior to the beginning of the current fiscal year, prorated by multiplying by the number of months remaining in the current fiscal year divided by 12.

(j) Fee Assessment and Payment Schedule. The Agency sends Annual Fee invoices on or after August 1 of each year to cover the cost of administering the program for the current fiscal year commencing on July 1 and ending on June 30.

Annual Fees are due and payable and will be deemed delinquent if not fully paid on or before the due date on the invoice. However, option will be given to pay Annual Fees in quarterly installments. Owners or operators may choose to pay their Annual fees in quarterly installments by signing the invoice payment addendum received and remit it with payment of the first quarterly installment to the Agency on or before the due date on the invoice. After initial payment, the remaining installments must be received on or before October 1, January 1, and April 1 Quarterly installments are equal to twenty-five percent (25%) of the total fee.

(k) Late Payment. Any Title V source which does not pay the Annual Fee or installment by the Invoice Due date will be assessed a late penalty equal to twenty-five percent (25%) of the balance due. Any penalty is in addition to the fee.

(l) Appeal of Annual Fees. Annual Fees may be appealed per the procedure specified in Rule 1.8. The basis for such appeals is limited to arithmetic or clerical errors.

(m) Exemption from Rule 3.1 fees. Title V sources assessed annual fees under Rule 3.2 are not subject to annual Registration Program Fees under Rule 3.1 of Regulation 3.

(n) Transfer of Ownership. Transfer of ownership of a Title V source does not affect any obligation to pay fees required by Rule 3.2. Any liability for fee payment, including payment of delinquent fees and other penalties survives any transfer of ownership of a Title V source.

(o) Accountability. The sum of the fees assessed by the Agency to all Title V sources within the Agency’s jurisdiction will not exceed the cost of developing and administering the program. The Agency keeps record of all direct and indirect costs to develop and administer the Operating Permit Program as specified in 40 CFR Part 70. This information is used by the Agency in determining the net annual cost projections required by Rule 3.2(f) above. Provided, however, the information obtained from tracking revenues, time, and expenditures will not provide a basis for challenge to the amount of an individual source’s fee.

[Adopted 08/17/06; Amended 04/26/15; 02/26/22]

RULE 3.3 NOTICE OF CONSTRUCTION FEES

(a) Fees for processing a Notice of Construction (NOC) application must include Filing Fees per Rule 3.3(b) and any applicable Additional NOC Processing Fees per Rule 3.3(c). Other cost to the agency of work performed outside of the agency in conjunction with approving an NOC application must be directly reimbursed to the agency per Rule 3.3(d).

(b) Filing Fees. A Filing Fee per the Notice of Construction Fee Schedule must be paid for each proposed piece of equipment or process, or for groups of identical equipment or processes that, if considered individually would be subject to an NOC. Filing Fees will be assessed and paid as follows:

(1) An NOC application may not be deemed complete unless initial Filing Fees have been paid in full.

(2) Equipment or processes may be considered identical and subject to a single filing fee provided:

  (i) They are identical in size and capacity;
  (ii) Employ identical air pollution control technology;
  (iii) Use the same fuel types;
  (iv) Are subject to the same performance standards and air regulatory determinations; and,
  (v) May be considered as a single emission point for determining ambient air quality impacts.

(3) Payment of NOC Filing Fees is due on or before the Invoice Due Date unless the Executive Director has approved an alternative payment plan.

(c) Additional NOC Processing Fees. Additional NOC Processing Fees must be paid at a rate as specified in the Notice of Construction Fee Schedule for direct time expended by agency staff working on any of the items or actions described in Table 3.3. If required, additional NOC Processing Fees will be determined and paid as follows:

(1) Additional NOC Fees may be assessed periodically as work to complete the items in Table 3.3 incurs, but not more frequently than monthly.
(2) All Additional NOC Processing Fees must be assessed and paid prior to issuing any Final Determination on an NOC application unless the Executive Director has approved an alternative payment plan.
(3) Payment of any Additional NOC Processing Fee is due on or before the Invoice Due date unless the Executive Director has approved an alternative payment plan.
(4) The Executive Director may approve an alternative payment plan if a request is submitted in writing by the applicant.
(5) In computing fees based on hourly rates, only hours attributed directly to completing tasks listed in Table 3.3 will be used in computing fees.
(6) The total hours used in computing fees will be based on the agency's official time accounting records.

(d) **Other Costs.** The following other costs must be borne by the applicant and paid prior to issuing any Final Determination on an NOC application unless an alternative payment plan has been approved by the Executive Director:

(1) The cost of publishing any required notice
(2) Consulting cost incurred by the agency in conjunction with approving an NOC application.

(e) Late Payment Penalties. Failure to pay, in full, any assessed NOC fee on or before the due date as stated on the invoice, may incur a late payment penalty in the amount of 25% of the total amount due.
(f) The Agency's NOC fees cover the direct and indirect cost of processing an NOC application and will be determined through a workload-driven process as allowed under RCW 70A.15.2210.

(g) On a periodic basis, the Agency reviews the Notice of Construction Fee Schedule based on a workload-driven process and determines if the total actual fee revenue is sufficient to recover program costs as allowed in RCW 70A.15.2210. Any proposed fee revision must be Board approved and includes opportunity for public review and comment.

(h) The Applicable fee(s) will be established in the current fee schedule adopted by Resolution of the Board of Directors of ORCAA.

Table 3.3: Additional NOC Processing Fees

Fee-Eligible Item	Description
NOC Application Assistance	Direct technical assistance completing an NOC application, including, but not limited to calculating emissions, filling out standard forms, determining applicable requirements, completing a BACT analysis, performing an air toxics screening analysis pursuant to chapter 173-460 WAC, or selecting monitoring equipment. An NOC Application Assistance fee may only be assessed if the fee rate is disclosed to the applicant and applicant requests such assistance in writing.
Work Exceeding Base-Fee Hours	Direct work attributed to processing an NOC application more than the sum of applicable base-fee hours stated in the Notice of construction Fee Schedule for each piece of equipment or process subject to an NOC.
State Environmental Policy Act (SEPA)	SEPA-related work such as reviewing Environmental Checklists, making threshold determinations, preparing Determinations of Nonsignificance (DNS) and other SEPA-related reports.
Public Noticing	Work directly associated with issuing public notice pursuant to WAC 173-400-171 and Rule 6.1.3 of ORCAA's Regulations. Associated work includes issuing a press release if warranted, copying, and posting the written Preliminary Determination for public viewing, and reviewing and responding to comments.
Public Hearing	Work associated with conducting a public hearing including, but not limited to, preparation of summary materials, copying, issuing hearing notice, conducting the hearing, and responding to comments

[Adopted 08/17/06; Amended 05/17/07; 04/26/15; 02/26/22]

RULE 3.4 OUTDOOR BURNING PERMIT FEES

The applicable fee(s) for the following Permits will be established in the current fee schedule adopted by Resolution of the Board of Directors of ORCAA.

(a) The fee for an Agricultural Burn Permit is specified in the Outdoor Burning Fee Schedule.

(b) The fee for a Land Clearing Burn Permit is specified in the Outdoor Burning Fee Schedule. The fees must cover the direct and indirect cost of the Land Clearing Burn Permit program and will be determined through a workload-driven process.

[Adopted 08/17/06; Amended 02/12/07; 05/10/08; 04/26/15; 10/11/15; 02/26/22]

RULE 3.5 ASBESTOS FEES

The applicable fee(s) for Asbestos and Demolition Notifications will be established in the current fee schedule adopted by Resolution of the Board of Directors of ORCAA.

The fees must cover the direct and indirect cost of the asbestos program and will be determined through a workload-driven process.
[Adopted 08/17/06; Amended 09/19/08; 04/26/15; 01/15/17; 02/26/22]

Rule 3.6 Notice of Intent to Operate Fees

(a) The submittal of a Notice of Intent to Operate (NOI) must be accompanied by the appropriate fees as specified in the Notice of Intent Fee Schedule.

(b) The applicable fee(s) will be established in the current fee schedule adopted by Resolution of the Board of Directors of ORCAA.

(c) The Agency's fees must cover the direct and indirect costs of the NOI application process and will be determined through a workload-driven process.

[Adopted 08/17/06; Amended 04/26/15; 02/26/22]

REGULATION 4 – REGISTRATION

RULE 4.1 REGISTRATION REQUIRED

(a) All stationary sources within the jurisdiction of the Agency, except for any stationary sources required to obtain an air operating permit under chapter 173-401 WAC, must be registered with the Agency. Notwithstanding the exemptions provided in Rule 4.1(b), the following stationary sources must be registered with the Agency:

(1) Any stationary source subject to a standard under New Source Performance Standards, 40 CFR Part 60, except; New Residential Wood Heaters (Subpart AAA); Kraft Pulp Mills (Subpart BB); and Primary Aluminum Reduction Plants (Subpart S);
(2) Any stationary source subject to a performance standard under National Emission Standards for Hazardous Air Pollutants, 40 CFR Part 61, except for asbestos demolition and renovation projects subject to 40 CFR Part 61 Subpart M;
(3) Any stationary source subject to a performance standard under National Emission Standards for Hazardous Air Pollutants for Source Categories, 40 CFR Part 63;
(4) Any stationary source that includes equipment or control equipment subject to an Approval Order issued by the Agency.

(b) The following stationary sources are exempt from registration requirements under Regulation 4. All stationary sources exempt from registration under Regulation 4 are still required to comply with other applicable air pollution requirements.

Maintenance/construction:
(1) Cleaning and sweeping of streets and paved surfaces;
(2) Concrete application, and installation;
(3) Dredging wet spoils handling and placement;
(4) Paving application and maintenance, excluding asphalt plants;
(5) Plant maintenance and upkeep activities (grounds keeping, general repairs, routine housekeeping, routine plant painting, welding, cutting, brazing, soldering, plumbing, retarring roofs, etc.);
(6) Plumbing installation and plumbing protective coating application associated with plant maintenance activities;
(7) Roofing application;
(8) Insulation application and maintenance, excluding products for resale;
(9) Janitorial services and consumer use of janitorial products;
(10) Asphalt laying equipment including asphalt-roofing operations (not including manufacturing or storage);
(11) Blast cleaning equipment that uses a suspension of abrasives in liquid water;
(12) Spray painting or blasting equipment used at temporary locations to clean or paint bridges, water towers, buildings, or similar structures.

Storage tanks:

(13) Lubricating oil storage tanks except those facilities that are wholesale or retail distributors of lubricating oils;

(14) Polymer tanks and storage devices and associated pumping and handling equipment, used for solids dewatering and flocculation;

(15) Storage tanks, reservoirs, pumping and handling equipment of any size containing soaps, vegetable oil, grease, animal fat, and nonvolatile aqueous salt solutions;

(16) Process and white-water storage tanks;

(17) Storage tanks and storage vessels, with lids or other appropriate closure and less than 260-gallon capacity (35 cu ft);

(18) Storage tanks of a capacity of 10,000 gallons or less, with lids or other appropriate closure, used for the storage of materials containing organic compounds, but not for use with materials containing toxic air pollutants (as defined in chapter 173-460 WAC);

(19) Storage tanks of a capacity of 40,000 gallons or less, with lids or other appropriate closure, used for storage of organic compounds, but not for use with materials containing toxic air pollutants (as defined in chapter 173-460 WAC), with a true vapor pressure less than 0.01 kPa (0.002 psia) (0.0001 atm);

(20) Storage tanks of a capacity of 40,000 gallons or less used for the storage of butane, propane, or liquefied petroleum gas;

(21) Tanks, vessels, and pumping equipment, with lids or other appropriate closure for storage or dispensing of aqueous solutions of inorganic salts, bases, and acids;

(22) Storage tanks used exclusively for storage of diesel fuel;

(23) Loading and unloading equipment used exclusively for the storage tanks exempted under this rule.

Combustion:

(24) Fuel burning equipment (not including incinerators) that:

- **(i)** is used solely for a private dwelling serving five families or less; or
- **(ii)** has a maximum heat input rate of 5 MMBtu/hr or less if burning natural gas, propane, or LPG; or
- **(iii)** has a maximum heat input rate of 0.5 MMBtu/hr or less if burning waste-derived fuels; or
- **(iv)** has a maximum heat input rate of 1 MMBtu/hr or less if burning recycled or used oil per the requirements of RCW 70A.15.4510; or
- **(v)** has a maximum heat input rate of 1 MMBtu/hr or less if burning any other type of fuel and with less than or equal to 0.05% sulfur by weight.

(25) All stationary gas turbines with a rated heat input less than 10 million Btu per hour.

(26) Stationary internal combustion engines having rated capacity:

- **(i)** less than 50 horsepower output; or

(ii) less than 500 horsepower and used only for standby emergency power generation.

(27) Nonroad engines.

Material handling:

(28) Storage and handling of water-based lubricants for metal working where organic content of the lubricant is less than 10%;

(29) Equipment used exclusively to pump, load, unload, or store high boiling point organic material in tanks less than one million gallons, material with initial atmospheric boiling point not less than 150ºC or vapor pressure not more than 5 mm Hg @21ºC, with lids or other appropriate closure.

Water treatment:

(30) Septic sewer systems, not including active wastewater treatment facilities;

(31) NPDES permitted ponds and lagoons used solely for settling suspended solids and skimming of oil and grease;

(32) De-aeration (oxygen scavenging) of water where toxic air pollutants as defined in chapter 173-460 WAC are not emitted;

(33) Process water filtration system and demineralizer vents;

(34) Sewer manholes, junction boxes, sumps and lift stations associated with wastewater treatment systems;

(35) Demineralizer tanks;

(36) Alum tanks;

(37) Clean water condensate tanks;

(38) Oil/water separators, except those at petroleum refineries;

(39) Equipment used exclusively to generate ozone and associated ozone destruction equipment for the treatment of cooling tower water or for water treatment processes;

(40) Municipal sewer systems, including wastewater treatment plants and lagoons with a design capacity of one million gallons per day or less, if they do not use anaerobic digesters, chlorine disinfections or sewer sludge incinerators.

Environmental chambers and laboratory equipment:

(41) Environmental chambers and humidity chambers not using toxic air pollutant gases, as regulated under chapter 173-460 WAC;

(42) Gas cabinets using only gases that are not toxic air pollutants regulated under chapter 173-460 WAC;

(43) Laboratory fume hoods;

(44) Laboratory calibration and maintenance equipment.

Monitoring/quality assurance/testing:

(45) Equipment and instrumentation used for quality control/assurance or inspection purpose;

(46) Hydraulic and hydrostatic testing equipment;

(47) Sample gathering, preparation and management;

(48) Vents from continuous emission monitors and other analyzers.

Miscellaneous:

(49) Single-family residences and duplexes;
(50) Plastic pipe welding;
(51) Primary agricultural production activities including soil preparation, planting, fertilizing, weed and pest control, and harvesting;
(52) Insecticide, pesticide, or fertilizer spray equipment;
(53) Comfort air conditioning;
(54) Flares used to indicate danger to the public;
(55) Natural and forced air vents and stacks for bathroom/toilet activities;
(56) Personal care activities including establishments like beauty salons, beauty schools, and hair cutting establishments;
(57) Recreational fireplaces including the use of barbecues, campfires, and ceremonial fires;
(58) Tobacco smoking rooms and areas;
(59) Noncommercial smokehouses;
(60) Blacksmith forges for single forges;
(61) Vehicle maintenance activities, not including vehicle surface coating;
(62) Vehicle or equipment washing;
(63) Wax application;
(64) Oxygen, nitrogen, or rare gas extraction and liquefaction equipment not including internal and external combustion equipment;
(65) Ozone generators and ozonation equipment;
(66) Ultraviolet curing processes, to the extent that toxic air pollutant gases as defined in chapter 173-460 WAC are not emitted;
(67) Electrical circuit breakers, transformers, or switching equipment installation or operation;
(68) Pneumatically operated equipment, including tools and hand-held applicator equipment for hot melt adhesives;
(69) Firefighting and similar safety equipment and equipment used to train fire fighters;
(70) Production of foundry sand molds, unheated and using binders less than 0.25% free phenol by sand weight;
(71) Natural gas pressure regulator vents, excluding venting at oil and gas production facilities and transportation marketing facilities;
(72) Solvent cleaners less than 10 square feet air-vapor interface with solvent vapor pressure not more than 30 mm HG @21ºC, and not containing toxic air pollutants (as defined in chapter 173-460 WAC);
(73) Surface coating, aqueous solution or suspension containing less than 1% (by weight) VOCs, and/or toxic air pollutants as defined in chapter 173-460 WAC;
(74) Cleaning and stripping activities and equipment using solutions having less than 1% VOCs (by weight); on metallic substances, acid solutions are not exempt;
(75) Dip coating operations, using materials less than 1% VOCs (by weight) and/or toxic air pollutants as defined in chapter 173-460 WAC;
(76) Laundry dryers, extractors or tumblers used exclusively for the removal of water from fabric;
(77) Residential composting facilities;
(78) Restaurants and other retail food preparing establishments;

(79) Routing, turning, carving, cutting, and drilling equipment used for metal, wood, plastics, rubber, leather, or ceramics;

(80) Steam cleaning equipment used exclusively for office or residential housekeeping;

(81) Vacuum cleaning systems used exclusively for office or residential housekeeping;

(82) Vacuum producing devices used in laboratory operations and vacuum producing devices that do not remove or convey air contaminants from or to another source;

(83) Vents used exclusively for:

  (i) Sanitary or storm drainage systems; or

  (ii) Safety valves.

(84) Washing or drying equipment used for products fabricated from metal or glass, if no volatile organic material is used in the process;

(85) Welding, brazing or soldering equipment;

(86) Coffee roaster with a design capacity less than 10 pounds per batch;

(87) Bark and soil screening operations;

(88) Portable sand and gravel plants and crushed stone plants with a cumulative rated capacity of all crushers less than or equal to 150 tons per hour;

(89) Fixed sand and gravel plants and crushed stone plants with a cumulative rated capacity of all crushers less than or equal to 25 tons per hour;

(90) Any portable stationary source approved by the Agency for temporary operation at a single location.

[Adopted 08/17/06; Amended 02/26/22]

RULE 4.2 REGISTRATION PROGRAM

(a) Program purpose. As authorized by RCW 70A.15.2200, the Agency's registration program is a program to develop and maintain a current and accurate record of stationary sources. Information collected through the registration program is used to evaluate the effectiveness of air pollution control strategies and to verify stationary source compliance with applicable air pollution requirements.

(b) Program components. The components of the Agency's registration program include:

  (1) Initial notification and annual or other periodic reports from owners of stationary sources providing the information described in Rule 4.3.

  (2) On-site inspections necessary to verify compliance with applicable air pollution control requirements and/or to supplement information provided by owners of stationary sources pursuant to the requirements of Rule 4.3.

  (3) Maintenance of computers and software used to compile and retrieve information provided by owners of stationary sources relating to air contaminant emissions and compliance with air pollution control requirements.

(4) Compilation of emission inventory reports and computation of emission reduction credits from information provided by owners of stationary sources pursuant to the requirements of Rule 4.3.
(5) Staff review, including engineering analysis for accuracy and correctness, of information provided by owners of stationary sources pursuant to the requirements of Rule 4.3.
(6) Clerical and other office support provided by the Agency in direct support of the registration program.
(7) Administrative support provided in directly carrying out the registration program.
(8) Assessment and collection of annual registration fees from all stationary sources requiring registration in accordance with Rule 3.1.

[Adopted 08/17/06; Amended 02/26/22]

RULE 4.3 REQUIREMENTS FOR STATIONARY SOURCES SUBJECT TO REGISTRATION

(a) The owner or operator of any stationary source subject to registration under Rule 4.1 must register the stationary source by submitting an initial notification to the Agency of its existence within 30 days from:

(1) Commencement of operation of any new or recommissioned stationary source including those sources subject to prior approval by the Agency through a Notice of Construction under Rule 6.1; or,
(2) Change in ownership of an existing registered stationary source.

(b) Initial notification must include the following information:

(1) Owner name, address, and phone number;
(2) Source location;
(3) Name, address, and phone number of on-site contact person;
(4) Identification and brief description in terms of type, location and size or capacity, of each stationary source subject to registration;
(5) Date each stationary source was constructed, installed, or established;
(6) Date each stationary source commenced operation;
(7) If subject to pre-construction review and approval by the Agency, the date of the approval and Notice of Construction application number.

(c) Owners or operators of any stationary source subject to registration must, upon request by the Agency, make annual and/or periodic reports to the Agency regarding emission sources, types and amounts of raw materials and fuels used, types, amounts and concentrations of air contaminants emitted, data on emissions units and control devices, data on emission points, and any other information directly related to the registration program as requested by the Agency.

(d) Annual and periodic reports as required by the Agency pursuant to Rule 4.3(c) must be made by the owner or lessee of the stationary source, or an agent, on forms provided by the Agency or in an Agency approved format. The owner of the stationary source is responsible for completion and submittal of the annual or periodic report within thirty (30) days of receipt of the request and forms provided by the Agency. The owner of the stationary source is responsible for the completeness and correctness of the information submitted.

(e) The owner or operator must notify the Agency of any changes in the following administrative information within 30 days from the change taking place:

(1) Owner name, address, and phone number;

(2) Name, address, and phone number of on-site contact person;

(3) Process or equipment changes resulting in an increase in emissions. Changes requiring prior approval by the Agency through a Notice of Construction (NOC) or requiring submittal of a Notice of Intent to Operate (NOI) application must also comply with the requirements of Rule 6.1 and 6.4 respectively; and,

(4) Any permanent shut down or decommissioning of a stationary source.

(f) Each notification or report required under this rule must be signed by the owner or operator of the stationary source, or by the agent appointed by the owner.

(g) The Agency may require the owner or operator of a stationary source develop and implement an Operations and Maintenance (O&M) plant to assure compliance with the applicable air regulations and standards. When required, a copy of the plan must be retained at the facility where the stationary source is located and must be available to the Agency for inspection.

(h) Owners or operators of stationary sources subject to registration will be classified per Rule 4.4 and must pay annual registration fees pursuant to Rule 3.1.

[Adopted 08/17/06; Amended 02/26/22]

RULE 4.4 CLASSIFICATION OF SOURCES REQUIRED TO REGISTER WITH AGENCY

All sources requiring registration pursuant to Rule 4.1 will be classified in one of the registration classifications listed in Table 4.4b. A source will be placed in the most appropriate classification as determined by the Agency. To determine classification, the pollutants listed in Table 4.4a will be considered.

Table 4.4a: Pollutants

Total Suspended Particulates (TSP)
Sulfur Oxides (SOx)
Nitrogen Oxides (NOx)
Volatile Organic Compounds (VOC)
Carbon Monoxide (CO)
Toxic Air Pollutants (TAP)

Table 4.4b: Registration Classification (RC)

CLASSIFICATION RC1 - Any source that has an effective Synthetic Minor Order issued pursuant to WAC 173-400-091. CLASSIFICATION RC2 - Any source with a potential to emit 30 tons or more per year

of any combination of pollutants listed in Table 4.4a.

CLASSIFICATION RC3 - Any source with a potential to emit 10 tons or more per year of any combination of pollutants listed in Table 4.4a.

CLASSIFICATION RC4 - Any source, with a potential to emit 5 tons or more per year of any combination of pollutants listed in Table 4.4a.

CLASSIFICATION RC5 - Any source with a potential to emit less than 5 tons per year of any combination of pollutants listed in Table 4.4a.

[Adopted 08/17/06; Amended 05/13/12; 02/26/22]

REGULATION 5 – OPERATING PERMIT PROGRAM

RULE 5.1 OPERATING PERMIT PROGRAM

(a) Purpose. The purpose of this rule is to provide for a comprehensive operating permit program consistent with the requirements of Title V of the Federal Clean Air Act Amendments of 1990 and its implementing regulation 40 CFR Part 70, and RCW 70A.15.2260 and its implementing regulation chapter 173-401 WAC.

(b) Commitment to administer the program. The Agency, provided full or partial delegation by the US Environmental Protection Agency (EPA) and the Washington Department of Ecology (ECY), will administer an air operating permit program for the Agency's jurisdiction in accordance with Title V of the Federal Clean Air Act Amendments of 1990 and its implementing regulation 40 CFR Part 70, and RCW 70A.15.2260 and its implementing regulation chapter 173-401 WAC.

(c) Applicability. The provisions of this rule apply to all sources subject to the requirements of chapter 173-401 WAC.

(d) Compliance. It is unlawful for any person to cause or allow the operation of any source subject to the requirements of chapter 173-401 WAC without complying with the provisions of chapter 173-401 WAC and any permit issued under its authority.

[Adopted 08/17/06; Amended 02/26/22]

RULE 5.2 (RESERVED)

RULE 5.3 RESTRICTING THE POTENTIAL TO EMIT

A service-based fee, in addition to annual registration or operating permit fees, will be assessed to those sources applying to the Agency for approval of enforceable conditions that restrict the sources' potential to emit, making the source a minor source and not subject to an operating permit. Fees for restricting a sources' potential to emit will be assessed per Regulation 3, Rule 3.3. The Agency assesses the fee based on only those emissions units affected by the enforceable condition as proposed by the applicant.

[Adopted 08/17/06; Amended 02/26/22]

REGULATION 6 – REQUIRED PERMITS AND NOTIFICATIONS

RULE 6.1 NOTICE OF CONSTRUCTION REQUIRED

(a) Approval of a Notice of Construction (NOC) Application required. It is unlawful for any person to cause or allow the following actions unless a Notice of Construction application has been filed with and approved by the Agency, except for those actions involving stationary sources excluded under Rule 6.1(b) and (c):

(1) Construction, installation, or establishment of any stationary source;
(2) Modification to any existing stationary source; or,
(3) Replacement or substantial alteration of emission control technology installed on an existing stationary source.

(b) Exemption provided Notice of Intent to Operate (NOI). An NOC application and approval by the Agency is not required prior to construction, installation, establishment, or modification of the stationary sources listed in Rule 6.4 if a complete Notice of Intent to Operate is filed with the Agency per that section.

(c) Categorical Exemptions. An NOC application and prior approval by the Agency is not required prior to construction, installation, establishment, or modification of stationary sources in the following stationary source categories, if sufficient records are kept documenting the exemption:

Maintenance/construction:
(1) Cleaning and sweeping of streets and paved surfaces;
(2) Concrete application, and installation;
(3) Dredging wet spoils handling and placement;
(4) Paving application and maintenance, excluding asphalt plants;
(5) Plant maintenance and upkeep activities (grounds keeping, general repairs, routine housekeeping, routine plant painting, welding, cutting, brazing, soldering, plumbing, retarring roofs, etc.);
(6) Plumbing installation and plumbing protective coating application associated with plant maintenance activities;
(7) Roofing application;
(8) Insulation application and maintenance, excluding products for resale;
(9) Janitorial services and consumer use of janitorial products;
(10) Asphalt laying equipment including asphalt-roofing operations (not including manufacturing or storage);
(11) Blast cleaning equipment that uses a suspension of abrasive in liquid water;
(12) Spray painting or blasting equipment used at temporary locations to clean or paint bridges, water towers, buildings, or similar structures.

Storage Tanks:
(13) Lubricating oil storage tanks except those facilities that are wholesale or retail distributors of lubricating oils;
(14) Polymer tanks and storage devices and associated pumping and handling equipment, used for solids dewatering and flocculation;

(15) Storage tanks, reservoirs, pumping and handling equipment of any size containing soaps, vegetable oil, grease, animal fat, and nonvolatile aqueous salt solutions;
(16) Process and white-water storage tanks;
(17) Storage tanks and storage vessels, with lids or other appropriate closure and less than 260-gallon capacity (35 cu ft);
(18) Gasoline storage tanks less than 2,000 gallons storage capacity;
(19) Gasoline dispensing facilities with a cumulative gasoline storage capacity of less than 10,000 gallons;
(20) Storage tanks of a capacity of 10,000 gallons or less, with lids or other appropriate closure, and for the storage of materials containing organic compounds, but not for use with materials containing toxic air pollutants (as defined in chapter 173-460 WAC);
(21) Storage tanks of a capacity of 40,000 gallons or less, with lids or other appropriate closure, used for the storage of organic compounds, but not for use with materials containing toxic air pollutants (as defined in chapter 173-460 WAC), with a true vapor pressure less than 0.01 kPa (0.002 psia) (0.0001 atm);
(22) Storage tanks of a capacity of 40,000 gallons or less used for the storage of butane, propane, or liquefied petroleum gas;
(23) Tanks, vessels, and pumping equipment, with lids or other appropriate closure for storage or dispensing of aqueous solutions of inorganic salts, bases, and acids.
(24) Storage tanks used exclusively for storage of diesel fuel;
(25) Loading and unloading equipment used exclusively for the storage tanks exempted under this rule.

Combustion:
(26) Fuel burning equipment (not including incinerators) that:

(i) is used solely for a private dwelling serving five families or less; or
(ii) has a maximum heat input rate of 5 MMBtu/hr or less if burning natural gas, propane, or LPG; or
(iii) has a maximum heat input rate of 0.5 MMBtu/hr or less if burning waste-derived fuels; or
(iv) has a maximum heat input rate of 1 MMBtu/hr or less if burning recycled or used oil per the requirements of RCW 70A.15.4510; or
(v) has a maximum heat input rate of 1 MMBtu/hr or less if burning any other type of fuel and with less than or equal to 0.05% sulfur by weight.

(27) All stationary gas turbines with a rated heat input less than 10 million Btu per hour.
(28) Stationary internal combustion engines having rated capacity:

(i) less than 50 horsepower output; or
(ii) less than 500 horsepower and used only for standby emergency power generation.

(29) Nonroad engines.

Material handling:

(30) Storage and handling of water-based lubricants for metal working where organic content of the lubricant is less than 10%;

(31) Equipment used exclusively to pump, load, unload, or store high boiling point organic material in tanks less than one million gallons, material with initial atmospheric boiling point not less than 150°C or vapor pressure not more than 5 mm Hg @ 21°C, with lids or other appropriate closure.

Water treatment:

(32) Septic sewer systems, not including active wastewater treatment facilities;

(33) NPDES permitted ponds and lagoons used solely for settling and suspended solids and skimming of oil and grease;

(34) De-aeration (oxygen scavenging) of water where toxic air pollutants as defined in chapter 173-460 WAC are not emitted;

(35) Process water filtration system and demineralizer vents;

(36) Sewer manholes, junction boxes, sumps and lift stations associated with wastewater treatment systems (does not include engines);

(37) Demineralizer tanks;

(38) Alum tanks;

(39) Clean water condensate tanks;

(40) Oil/water separators, except those at petroleum refineries;

(41) Equipment used exclusively to generate ozone and associated ozone destruction equipment for the treatment of cooling tower water or for water treatment processes.

(42) Municipal sewer systems, including wastewater treatment plants and lagoons with a design capacity of one million gallons per day or less.

Environmental chambers and laboratory equipment:

(43) Environmental chambers and humidity chambers not using toxic air pollutant gases, as regulated under chapter 173-460 WAC;

(44) Gas cabinets using only gases that are not toxic air pollutants regulated under chapter 173-460 WAC;

(45) Installation or modification of a single laboratory fume hood;

(46) Laboratory calibration and maintenance equipment.

Monitoring/quality assurance/testing:

(47) Equipment and instrumentation used for quality control/assurance or inspection purposes;

(48) Hydraulic and hydrostatic testing equipment;

(49) Sample gathering, preparation and management;

(50) Vents from continuous emission monitors and other analyzers.

Miscellaneous:

(51) Single-family residences and duplexes;

(52) Plastic pipe welding;

(53) Primary agricultural production activities including soil preparation, planting, fertilizing, weed and pest control, and harvesting;

(54) Insecticide, pesticide, or fertilizer spray equipment;
(55) Comfort air conditioning;
(56) Flares used to indicate danger to the public;
(57) Natural and forced air vents and stacks for bathroom/toilet activities;
(58) Personal care activities including establishments like beauty salons, beauty schools, and hair cutting establishments;
(59) Recreational fireplaces including the use of barbecues, campfires, and ceremonial fires;
(60) Tobacco smoking rooms and areas;
(61) Noncommercial smokehouses;
(62) Blacksmith forges for single forges;
(63) Vehicle maintenance activities, not including vehicle surface coating;
(64) Vehicle or equipment washing;
(65) Wax application;
(66) Oxygen, nitrogen, or rare gas extraction and liquefaction equipment not including internal and external combustion equipment;
(67) Ozone generators and ozonation equipment;
(68) Ultraviolet curing processes, to the extent that toxic air pollutant gases as defined in chapter 173-460 WAC are not emitted;
(69) Electrical circuit breakers, transformers, or switching equipment installation or operation;
(70) Pneumatically operated equipment, including tools and hand-held applicator equipment for hot melt adhesives;
(71) Fire fighting and similar safety equipment and equipment used to train fire fighters;
(72) Production of foundry sand molds, unheated and using binders less than 0.25% free phenol by sand weight;
(73) Natural gas pressure regulator vents, excluding venting at oil and gas production facilities and transportation marketing facilities;
(74) Solvent cleaners less than 10 square feet air-vapor interface with solvent vapor pressure not more than 30 mm Hg @21°C, and not containing toxic air pollutants (as defined in chapter 173-460 WAC);
(75) Surface coating, aqueous solution or suspension containing less than 1% (by weight) VOCs, and/or toxic air pollutants as defined in chapter 173-460 WAC;
(76) Cleaning and stripping activities and equipment using solutions having less than 1% VOCs (by weight); on metallic substances, acid solutions are not exempt;
(77) Dip coating operations, using materials less than 1% VOCs (by weight) and/or toxic air pollutants as defined in chapter 173-460 WAC.
(78) Laundry dryers, extractors or tumblers used exclusively for the removal of water from fabric;
(79) Residential composting facilities;
(80) Restaurants and other retail food preparing establishments;
(81) Routing, turning, carving, cutting, and drilling equipment used for metal, wood, plastics, rubber, leather. or ceramics;
(82) Steam cleaning equipment used exclusively for that purpose;
(83) Vacuum cleaning systems used exclusively for office or residential housekeeping;

(84) Vacuum producing devices used in laboratory operations and vacuum producing devices that no not remove or convey air contaminants from or to another source;

(85) Vents used exclusively for:

- **(i)** Sanitary or storm drainage systems; or
- **(ii)** Safety valves

(86) Washing or drying equipment used for products fabricated from metal or glass, if no volatile organic material is used in the process.

(87) Welding, brazing, or soldering equipment;

(88) Coffee roasters with a design capacity less than 10 pounds per batch;

(89) Bark and soil screening operations;

(90) Portable sand and gravel plants and crushed stone plants with a cumulative rated capacity of all initial crushers less than or equal to 150 tons per hour;

(91) Fixed sand and gravel plants and crushed stone plants with a cumulative rated capacity of all initial crushers less than or equal to 25 tons per hour.

[Adopted 08/17/06; Amended 10/29/16; 08/17/19; 02/26/22]

Rule 6.1.1 (Reserved)

Rule 6.1.2 Application Processing

(a) Application certification. All NOC applications must be signed by the applicant or owner, who may be required to submit evidence of their authority.

(b) Completeness determination. Within thirty (30) days after receiving an NOC application, the Agency will either notify the applicant in writing that the application is complete or notify the applicant in writing of all additional information necessary to complete the application. Complete applications must include:

- **(1)** Any standard NOC form of the Agency that is applicable to the proposed stationary source or modification;
- **(2)** An Environmental Checklist consistent with requirements in WAC 197-11-315 of the State Environmental Policy Act (SEPA), for any one of the following:
  - **(i)** A Determination of Non-significance (DNS) in accordance with WAC 197-11-340;
  - **(ii)** A Mitigated Determination of Non-significance (MDNS) in accordance with WAC 197-11-350; or,
  - **(iii)** Written statement by the applicant claiming that the proposed stationary source or modification is categorically exempt from SEPA.
- **(3)** When applicable, all information required for review under WAC 173-400-117 and WAC 173-400-700 through 750 and WAC 173-400-800 through 860;

(4) NOC processing fees in accordance with Rule 3.3(b) and (c); and,
(5) Any additional information requested by the Agency that is necessary to make the determinations required under Rule 6.1.4.

(c) Timeframe for Public Involvement:

(1) For NOC applications subject to a mandatory public comment period pursuant to Rule 6.1.3(b), the Agency will issue a Preliminary Determination within 60 days from receipt of a complete application followed by a public comment period in accordance with Rule 6.1.3(c).
(2) For all other NOC applications, the Agency will post a public comment period in accordance with Rule 6.1.3(a) within 30 days from receipt of an application.

(d) Final determination schedule. Final Determination on an application subject to a mandatory public comment period in accordance with Rule 6.1.3(b) will be made as promptly as possible after close of the public comment period. Final Determination on all other applications will be made within sixty (60) days of receipt of a complete NOC application.

(e) Approval. A final determination to approve an NOC application and an "Order of Approval," setting forth the conditions of approval, will be issued, and served as provided for in these Regulations, provided the following conditions are met:

(1) A complete application in accordance with Rule 6.1.2(b) was received by the Agency;
(2) The application verifies to the Agency that the applicable new source review requirements in Rule 6.1.4 have been met;
(3) Application processing fees in accordance with Rule 3.3 have been paid;
(4) The application includes an environmental checklist and other documents that verify compliance with the State Environmental Policy Act;
(5) Applicable public involvement requirements in Rule 6.1.3 have been met; and,
(6) The NOC has been signed by the Executive Director of the Agency or an authorized representative.

(f) Denial. If the Agency determines that a proposed project subject to approval of an NOC application does not meet the applicable approval requirements in Rule 6.1.3, then a final determination to deny approval and an Order to Deny Construction will be issued and served as provided for in these Regulations. Any Order to Deny Construction must:

(1) Be in writing;
(2) Set forth the objections in detail regarding the specific law or rule or rules of these Regulations that will not be met by the proposed project; and,
(3) Must be signed by the Executive Director of the Agency or an authorized representative.

(g) Scope of review of modifications. New source review of a modification to an existing stationary source is limited to the emission unit proposed to be modified, and the air contaminants whose emissions would increase because of the action; provided, however, that review of a major modification must also comply with applicable major new source review requirements under Rule 6.1.4(a) and/or Rule 6.1.4(b), as applicable.

(h) Integration with Title V permitting requirements. A person seeking approval to construct or modify a stationary source subject to chapter 173-401 WAC may elect to integrate review of the operating permit application or amendment required under RCW 70A.15.2260 and the NOC application required by this rule. An NOC application designated for integrated review will be processed in accordance with operating permit program procedures and deadlines in chapter 173-401 WAC. Applications submitted under WAC 173-400-700 through 750 and WAC 173-400-800 through 860 must also comply with public involvement requirements of Rule 6.1.3 and WAC 173-400-171.

(i) Professional Engineer review and sign-off. Every final determination on an NOC application must be reviewed and signed prior to issuance by a professional engineer, or staff under the direct supervision of a professional engineer.

(j) Appeals.

(1) Any order issued pursuant to this Rule may be appealed to the Pollution Control Hearings Board of the State of Washington, pursuant to Rule 1.8.

(2) Any order issued or the failure to issue such an order, does not relieve any person from their obligation to comply with any emission control requirement or with any other provision of law.

(k) Major NSR obligations of the Agency. If the new stationary source is a major stationary source, or the change is a major modification, the Agency will:

(1) Submit any control technology determination included in a final order of approval to the RACT/BACT/LAER clearinghouse maintained by EPA; and

(2) Send a copy of the final approval order to EPA.

(l) Deviations from approved plans. After approval to construct, install, establish, or modify a stationary source or air pollution control device is granted, deviations from the approved plans, drawings, data. and specifications that may result in changes to air pollutant emission rates, control efficiencies or impacts are not permissible without prior approval through an NOC application.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

Rule 6.1.3 Public Involvement

The public will be afforded an opportunity to express interest in any Notice of Construction (NOC) application prior to approval or denial by the Agency.

(a) Public Notice.

(1) A public interest fact sheet must be published on the Agency's website announcing the receipt of permit applications and other proposed actions that do not automatically require a public comment period pursuant to Rule 6.1.3(b). Fact sheets must be published on the Agency's webpage for a minimum of fifteen (15) days. If publication to the Agency's website is not possible, the fact sheet will be published in a newspaper of general circulation in the area of the proposed action. When published in a newspaper, fact sheets will be published for a minimum of one (1) day.

(2) The public must be afforded a minimum of fifteen (15) days from initial publishing of a fact sheet to express an interest in a permit application or proposed decision by responding to the Agency in writing via letter, fax, or email.

(3) Public interest fact sheets must include:

- **(i)** The name of the applicant;
- **(ii)** Location of the proposed project;
- **(iii)** A brief project description;
- **(iv)** Agency contact information;
- **(v)** Procedures for submitting comments and the date by which public comments are due;
- **(vi)** A statement that a public comment period will be provided if requested by any person, government agency, group, or the applicant.

(4) Requests for a public comment period must be submitted to the Agency in writing via letter, fax, or electronic mail. A public comment period must be provided pursuant to Rule 6.1.3(c) for any permit application or proposed action that receives such a request. Any application or proposed action for which a public comment period is not requested may be processed without further public involvement.

(5) The Agency must consider comments submitted in accordance with Rule 6.1.3(a)(2) provided they are received prior to close of the comment period specified in the public interest fact sheet.

(b) Mandatory public comment period. A public comment period in accordance with Rule 6.1.3(c) must be required prior to approval or denial of any NOC application if:

(1) The proposed project would cause a significant net increase in emissions of any air contaminant listed in the following table:

Table 6.1a: Significant Emissions Increase

AIR CONTAMINANT	POTENTIAL TONS/YEAR
Carbon Monoxide (CO)	100.0
Volatile Organic Compounds (VOC)	40.0
Sulfur Dioxide (SO_2)	40.0
Nitrogen Oxides (NO_x)	40.0
Particulate Matter (PM)	25.0
Fine Particulate Matter (PM_{10})	15.0
Lead	0.6
Fluorides	3.0
Sulfuric Acid Mist	7.0

Hydrogen Sulfide (H_2S)	10.0
Total Reduced Sulfur (including H_2S)	10.0
Total Toxic Air Pollutants (total TAPs) (TAPs as listed in chapter 173-460 WAC)	25.0
Any single Toxic Air Pollutant (TAP)	10.0
Municipal waste combustor organics (measured as total tetra-through octa-chlorinated dibenzo-p-dioxins and dibenzofurans)	0.0000035
Municipal waste combustor metals (measured as PM)	15.0
Municipal waste combustor acid gases (measured as SO_2 and hydrogen chloride)	40.0

(2) The applicant requests a limit on the potential to emit under Rule 6.1.12;

(3) The applicant requests to bank emission reduction credits;

(4) The proposed project involves refuse burning equipment;

(5) The Executive Director determines that there may be substantial public interest in the proposal;

(6) The proposed action is to extend the deadline to begin construction of a major stationary source or major modification in a nonattainment area;

(7) A modified or substituted air quality model, other than a guideline model in Appendix W of 40 CFR Part 51 (in effect on June 1, 2003) was used as part of review under Rule 6.1.4;

(8) The action involves an order to determine a category wide RACT;

(9) The action involves establishing a compliance schedule or variance;

(10) The order is to demonstrate the credible height of a stack which exceeds the GEP formula height and sixty-five (65) meters, by means of a fluid model or a field study, or purposes of establishing an emission limitation;

(11) The action includes an order to authorize a bubble; or,

(12) A public comment period is requested by any person, interested governmental agency, group, or the applicant in accordance with requirements for under Rule 6.1.3(a).

(c) Public Comment period. If required, a public comment period must be initiated through posting on the Agency's website for the duration of the public comment period. The Agency may supplement this method of notification by publication of a legal notice in a newspaper of daily circulation in the area of proposed action or by other methods appropriate to notify the local community. The public comment period can only be initiated after all information required by the Agency has been submitted and after a Preliminary Determination has been made. The cost of any supplemental noticing must be borne by the applicant per provisions in Rule 3.3. Public notice of any NOC application requiring a public comment period must include the following:

(1) Availability of the NOC application and any written Preliminary Determination of the Agency in at least one location near the proposed project site or on the Agency's website, excluding any confidential information as provided in Rule 1.6. The Agency's written Preliminary Determination must include the conclusions, determinations, and pertinent supporting information from the Agency's analysis of the effect of the proposed project on air quality.

(2) Publication of a legal notice in a newspaper of general circulation in the area of the proposed project which provides:

- **(i)** A brief description of the project;
- **(ii)** Location of the project and location of documents made available for public inspection;
- **(iii)** The deadline for submitting written comments;
- **(iv)** A statement that any person, interested governmental agency, group, or the applicant may request a public hearing; and,
- **(v)** A statement that a public hearing may be held if the Agency determines within a 30-day period that significant public interest exists; and,
- **(vi)** The date of the close of the public comment period in the event of a public hearing; and,
- **(vii)** For projects subject to Special protection requirements for federal Class I areas in WAC 173-400-117(5)(c), the legal notice must explain the permitting agency's decision or state that an explanation of the decision appears in the fact sheet for the proposed PSD permit.

(3) Notice to the US Environmental Protection Agency Region 10 Regional Administrator.

(d) Extent of public comment period. Unless a public hearing is held, the public comment period must be a minimum of thirty days. If a public hearing is held, the public comment period must extend through the hearing date and thereafter for such period, if an, as the notice of public hearing may specify.

(e) Public hearings. The applicant, any interested governmental entity, any group, or any person may request a public hearing within the comment period specified in the public notice. Any such request must indicate, in writing, the interest of the entity filing it and why a hearing is warranted. The Agency may, in its discretion, hold a public hearing if it determines significant public interest exists. Any such hearing will be held upon such notice and at a time and place as the Agency deems reasonable. The Agency must provide at least 30 days prior notice of any hearing.

(f) Consideration of public comments. No final decision on any NOC application can be made until all public comment periods have ended and any comments received in accordance with requirements for public comments under Rule 6.1.3 have been considered.

(g) Other requirements of law. Whenever procedures permitted or mandated by law will accomplish the objectives of public notice and opportunity for comment, those procedures may be used in lieu of the provisions of this rule (e.g., SEPA). This rule does not apply to an application for a "major modification" or an application for a "major stationary source."

(h) Public information. In accordance with Rule 1.6, all information, except information protected from disclosure under any applicable law, including, but not limited to, RCW 70A.15.2510, must be available for public inspection at the

agency. This includes copies of notices of construction applications, orders, and modifications.
[Adopted 08/17/06; Amended 02/26/22]

Rule 6.1.4 Requirements for Approval

(a) Attainment or Unclassified area requirements. The following requirements apply to any new stationary source or modification proposed in an attainment or unclassified area:

(1) The proposed new stationary source or modification will comply with all applicable new source performance standards, national emission standards for hazardous air pollutants, national emission standards for hazardous air pollutants for source categories, emission standards adopted under chapter 70A.15 RCW and applicable emission standards in ORCAA's Regulations.

(2) The proposed new stationary source or modification will employ BACT for all air pollutants not previously emitted or whose emissions would increase because of the new stationary source or modification.

(3) Allowable emissions from the proposed new stationary source or modification will not delay the attainment date for an area not in attainment nor cause or contribute to a violation of any ambient air quality standard. This requirement will be met if the projected impact of the allowable emissions from the proposed new stationary source or the projected impact of the increase in allowable emissions from the proposed modification at any location within a nonattainment area does not exceed the levels listed in the following table for the pollutants for which the area has been designated nonattainment:

Table 6.1.b Insignificant Impact Thresholds

Pollutant	Annual Average	24-hour Average	8-hour Average	3-hour Average	1-hour Average
CO	-	-	0.5 mg/m^3	-	2.0 mg/m^3
SO_2	1.0 µg/m^3	5.0 µg/m^3	-	25.0 µg/m^3	30.0 µg/m^3
PM_{10}	1.0 µg/m^3	5.0 µg/m^3	-	-	-
$PM_{2.5}$	0.3 µg/m^3	1.2 µg/m^3	-	-	-
NO_2	1.0 µg/m^3	-	-	-	-

An offsetting emission reduction may be used to satisfy some or all requirements of this rule.

(4) If the proposed project is subject to WAC 173-400-700 through 750 or WAC 173-400-800 through 860, Ecology has issued a final permit under those programs.

(5) If the proposed new stationary source or the proposed modification will emit any toxic air pollutants regulated under chapter 173-460 WAC, the stationary source meets all applicable requirements of that program.

(b) Nonattainment area requirements. The following requirements apply to any new stationary source or modification proposed in a nonattainment area:

(1) The proposed new stationary source or modification will comply with all applicable new source performance standards, national emission standards for hazardous air pollutants, national emission standards for hazardous air pollutants for source categories, emission standards adopted under chapter 70A.15 RCW and applicable emission standards in ORCAA's Regulations.

(2) The proposed new stationary source or modification will employ BACT for all air contaminants, except that if the new stationary source is a major stationary source or the proposed modification is a major modification it will achieve LAER for the air contaminants for which the area has been designated nonattainment and for which the proposed new stationary source or modification is major.

(3) The proposed new stationary source or modification will not cause any ambient air quality standard to be exceeded, will not violate the requirements for reasonable further progress established by the Standard Operating Procedures and will comply with Rule 6.1.4(a)(3) for all air contaminants for which the area has not been designated nonattainment.

(4) If the proposed new stationary source is a major stationary source or the proposed modification is a major modification, the Agency has determined, based on review of an analysis performed by the source of alternative sites, sizes, production processes, and environmental control techniques, that the benefits of the project significantly outweigh the environmental and social costs imposed because of its location, construction, or modification.

(5) If the proposed new stationary source or the proposed modification is major for the air contaminant for which the area is designated nonattainment, allowable emissions from the proposed new stationary source or modification of that air contaminant are offset by reductions in actual emissions from existing sources in the nonattainment area. Emission offsets must be sufficient to ensure that total allowable emissions from existing major stationary sources in the nonattainment area, new or modified sources which are not major stationary sources, and the proposed new or modified stationary source will be less than total actual emissions from existing sources (before submitting the application) so as to represent (when considered together with the nonattainment provisions of section 172 of the Federal Clean Air Act) reasonable further progress. All offsetting emission reductions must satisfy the following requirements:

(i) The proposed new level of allowable emissions of the source or emissions unit(s) providing the reduction must be less than the current level of actual emissions of that source or emissions unit(s). No emission reduction can be credited for actual emissions that exceed the current allowable emissions of the source or emissions unit(s) providing the reduction. Emission reductions imposed by local, state, or federal regulations, regulatory orders, or permits required by the Federal Clean Air Act, including the SIP, cannot be credited.

(ii) The emission reductions must provide for a net air quality benefit. For marginal ozone nonattainment areas, the total emission of volatile organic compounds or total emissions of nitrogen oxides are reduced by a ratio of 1.1 to 1 for the area in which the new stationary source or modification is located. For any other nonattainment area, the emissions offsets must provide a positive net air quality benefit in the nonattainment area. Determinations on whether emissions offsets provide a positive net air quality benefit will be made in accordance with the guidelines contained in 40 CFR 51 Appendix S (in effect on July 1, 2000).

(iii) If the offsets are provided by another source, the reductions in emissions from that source must be federally enforceable by the time the order of approval for the new or modified stationary source is effective. An emission reduction credit issued under WAC 173-400-131 may be used to satisfy some, or all, of the offset requirements of this rule.

(6) If the proposed new stationary source is a major stationary source or the proposed modification is a major modification, the owner or operator has demonstrated that all major stationary sources owned or operated by such person (or by any entity controlling, controlled by, or under common control with such persons) in Washington are subject to emission limitations and are in compliance, or on a schedule for compliance, with all applicable emission limitations and standards under the Federal Clean Air Act, including all rules in the SIP.

(7) If the proposed new stationary source or modification is subject to WAC 173-400-700 through 750 and WAC 173-400-800 through 860, Ecology has issued a final permit under these programs.

(8) If the proposed new stationary source or modification will emit any toxic air pollutants regulated under chapter 173-460 WAC, the source meets all applicable requirements of that chapter.

(9) If the proposed new stationary source is a major stationary source within the meaning of WAC 173-400-710 or 810, or the proposed modification is a major modification within the meaning of WAC 173-400-710 or 810, the project meets the special protection requirements for federal Class I areas in WAC 173-400-117.

[Adopted 08/17/06; Amended 02/26/22]

Rule 6.1.5 Notice of Completion – Order of Violation

(a) The owner or applicant must notify the Agency of the completion of construction, installation, establishment, or modification of a stationary source approved through an NOC application and, in the case of a new stationary source, the date upon which operation will commence. The Agency may inspect the new or modified stationary source and may issue an Order of Violation if it is found that it is not in accord with the approved NOC application or Order of Approval.

(b) Upon receipt of an Order of Violation, the owner may appeal the order in accordance with the provisions and procedures in Rule 1.8 and Rule 2.1 of these Regulations.

(c) The issuance of approval as provided by Rule 6.1.2(e) does not relieve the owner of the obligation to comply with the laws or regulations as adopted by this Agency or prevent the Board or Executive Director from issuing violation notices as provided by Rule 1.5(b).

[Adopted 08/17/06; Amended 02/26/22]

Rule 6.1.6 Time Limit on Approval of Construction

Approval to construct or modify a stationary source becomes invalid if construction is not commenced within eighteen months after receipt of the approval, if construction is discontinued for a period of eighteen months or more, or if construction is not completed within a reasonable time. The Agency may extend the eighteen-month period upon a satisfactory showing that an extension is justified. An extension for a project operating under a PSD permit must also comply with public notice requirements in WAC 173-400-171. This provision does not apply to the period between construction of the approved phases of a phased construction project. Each phase must commence construction within eighteen months of the projected and approved commencement date.

[Adopted 08/17/06; Amended 02/26/22]

Rule 6.1.7 (Reserved)

Rule 6.1.8 Conditions in Orders of Approval Enforceable

Failure to comply with any term or condition of an Order of Approval constitutes a violation of this rule and is subject to penalties pursuant to RCW 70A.15.3150 and RCW 70A.15.3160.

[Adopted 08/17/06; Amended 02/26/22]

Rule 6.1.9 Work Done Without Approval

Where work, for which a Notice of Construction is required, is commenced, or performed prior to making application and receiving approval, the Executive Director or an authorized agent may investigate as part of the Notice of Construction review. In such a case, an investigation fee, in addition to the fees of Rule 3.3 may be assessed in an amount up to 3 times the fees required of Rule 3.3. Payment of the fees does not relieve any person from the requirement to comply with the regulations nor from any penalties for failure to comply.

[Adopted 08/17/06; Amended 02/26/22]

Rule 6.1.10 Requirements for Replacement or Substantial Alteration of Emission Control Technology at an Existing Stationary Source

(a) Any person proposing to replace or substantially alter the emission control technology installed on an existing stationary source must file a Notice of Construction (NOC) application with the Agency. Replacement or substantial alteration of control technology does not include routine maintenance, repair, or similar parts replacement.

(b) For projects not otherwise reviewable under Rule 6.1(a)(1) or Rule 6.1(a)(2), the Agency may:

(1) Require that the owner or operator employ RACT on the affected stationary source;
(2) Prescribe reasonable operation and maintenance conditions for the control equipment; and,
(3) Prescribe other requirements as authorized by chapter 70A.15 RCW.

(c) Within 30 days of receipt of a Notice of Construction application under this rule the Agency will notify the applicant in writing that the application is complete or notify the applicant in writing of all additional information necessary to complete the application. Within thirty days of receipt of a complete NOC application under this rule the Agency will issue an order of approval or a proposed RACT determination for the proposed project.
(d) Construction must not commence on a project subject to review under this rule until the Agency issues a final order of approval. However, any NOC application filed under this rule will be deemed to be approved without conditions if the Agency takes no action within 30 days of receipt of a complete NOC application.
(e) Approval to replace or substantially alter emission control technology will become invalid if construction is not commenced within 18 months after receipt of such approval, if construction is discontinued for a period of 18 months or more, or if construction is not completed within a reasonable time. The Agency may extend the 18-month period upon satisfactory showing that an extension is justified. This provision does not apply to the period between construction of the approved phases of a phased construction project; each phase must commence construction within 18 months of the projected and approved commencement date.

[Adopted 08/17/06; Amended 08/17/19; 02/26/22]

Rule 6.1.11 Change of Conditions

(a) The owner or operator of a stationary source may request, at any time, a change in conditions of an approval order issued by the Agency and the Agency may approve the request provided the Agency finds that:

(1) The change in conditions will not cause the source to exceed an emissions standard;
(2) No ambient air quality standard or PSD increment will be exceeded because of the change;
(3) The change will not adversely impact the ability of the Agency to determine compliance with an emissions standard;
(4) The revised order continues to require BACT, as defined at the time of the original approval, for each new stationary source approved by the order except where the Federal Clean Air Act requires LAER; and
(5) The revised order meets the requirements of Rule 6.1, as applicable.
(6) If the order was issued under WAC 173-400-700 through 750 or WAC 173-400-800 through 860, the revised order will meet any applicable requirements of those sections.

(b) Actions taken under this rule are subject to the public involvement provisions of Rule 6.1.3.

(c) Requests must be made on forms provided by the Agency and must follow the procedures and timelines for an NOC application as specified in Rule 6.1. The fee schedule found in Rule 3.3 also applies to these requests.

(d) Changes involving construction, installation or establishment of a stationary source or modification of an existing source require approval under Rule 6.1(a).

[Adopted 08/17/06; Amended 02/26/22]

Rule 6.1.12 Voluntary Limits on Emissions

(a) Upon request by the owner or operator of a source, the Agency will issue a regulatory order that limits the source's potential to emit any air contaminant or contaminants to a level agreed to by the owner or operator and the Agency.

(b) A condition contained in an order issued under this rule must be less than the source's otherwise allowable annual emissions of a particular contaminant under all applicable requirements of the chapter 70A.15 RCW and the FCAA, including Washington State Implementation Plan. The term "condition" refers to limits on production or other limitations, in addition to emissions limitation.

(c) Any order issued under this rule must include monitoring, record keeping and reporting requirements to ensure that the source complies with any condition established under this rule. Monitoring requirements must use terms, test methods, units, averaging periods, and other statistical conventions consistent with the requirements of WAC 173-400-105.

(d) Any order issued under this rule is subject to the notice and comment procedures under Rule 6.1.3.

(e) The terms and conditions of a regulatory order issued under this rule are federally enforceable upon approval of this rule as an element of the Washington State Implementation Plan. Any proposed deviation from a condition contained in an order issued under this rule requires revision or revocation of the order.

[Adopted 08/17/06; Amended 02/26/22]

RULE 6.2 OUTDOOR BURNING

To maintain air quality at desirable levels, it is the policy of ORCAA to minimize to the greatest extent reasonably possible the burning of outdoor fires. Consistent with this policy, the Board declares that such fires should be allowed only on a limited basis under strict regulation and close control. The Board also encourages the fostering and development of an alternate technology or method of disposing of natural vegetation, which is reasonably economical and less harmful to the environment.

[Adopted 08/17/06; Repealed/Replaced 03/18/11; Amended 02/26/222]

Rule 6.2.1 The provisions of this rule apply to:

(a) Agricultural burning
(b) Fire training fires
(c) Land clearing burning
(d) Native American ceremonial fires
(e) Recreational fires
(f) Residential burning
(g) Storm and flood debris burning
(h) Weed abatement fires

[Adopted 03/18/11]

Rule 6.2.2 Definitions

When used in this Rule the following definitions apply:

“Agricultural burning” means the burning of vegetative debris from an agricultural operation necessary for disease or pest control, necessary for crop propagation and/or crop rotation, or where identified as a best management practice by the agricultural burning practices and research task force established in RCW 70A.15.5090 or other authoritative source on agricultural practices. Propane flaming of vegetative debris is considered commercial agricultural burning.

“Air Pollution Episode” means a period when a forecast, alert, warning, or emergency air pollution state is declared, as stated in chapter 173-435 WAC.

“Burn ban” means an “air pollution episode”, or a period of “impaired air quality” as defined in RCW 70A.15.3580.

“Extinguish” means to put out a fire completely. It must be cool to the touch and not smoldering or smoking.

“Firewood” means clean, dry, seasoned, untreated wood used as fuel in a Native American ceremonial fire or recreational fire.

“Land Clearing Burning” means outdoor burning of trees, stumps, shrubbery, or other natural vegetation from land clearing projects (i.e., projects that clear the land surface so it can be developed, used differently, or left unused).

“Outdoor Burning” means the combustion of material in an open fire or in an open container, without providing for the control of combustion or the control of the emissions from the combustion.

“Nuisance” means an emission that unreasonably interferes with the use and enjoyment of property.

“Recreational Fire” means cooking fires or campfires using firewood which occur in designated areas on public lands, or on private property. Fires used for disposal are not recreational fires.

“Residential Burning” means the outdoor burning of leaves, clippings, prunings, and other yard and gardening refuse originating on the maintained area of residential property (i.e., lands immediately adjacent and near a human dwelling) and burned on such lands by the property owner and/or another responsible person.

“Urban Growth Area” (UGA) means land, generally including land associated with an incorporated city, designated by a county for urban growth under RCW 36.70A.110.

[Adopted 03/18/11; Amended 02/26/22]

Rule 6.2.3 No Burn Areas:

No residential or land clearing burning is allowed in the following cities and/or UGAs:

Clallam	Grays Harbor	Jefferson	Mason	Pacific	Thurston
Carlsborg Clallam Bay Forks Joyce Port Angeles Sekiu Sequim	Aberdeen Hoquiam	Port Townsend Irondale Port Hadlock	Allyn Belfair Shelton	Ilwaco Long Beach Raymond Seaview South Bend	Bucoda Grand Mound Lacey Olympia Rainier Tenino Tumwater Yelm

[Adopted 03/18/11; Amended 02/04/12; Amended 02/26/22]

Rule 6.2.4 Summer Burn Restrictions

No residential or land clearing burning is allowed in Thurston County from July 15th through September 30th.
[Adopted 03/18/11; Amended 08/12/16]

Rule 6.2.5 Prohibitions and restrictions

(a) It is unlawful for any person to cause or allow an outdoor fire containing prohibited materials which include but are not limited to garbage, dead animals, asphalt, petroleum products, paints, rubber products, plastics, paper, cardboard, treated wood, processed wood, construction/ demolition debris, metal, or any substance which when burned releases toxic emissions, dense smoke, or obnoxious odors. A limited amount of paper may be used to start the fire. ORCAA may allow the limited burning of prohibited materials for fire training.

(b) It is illegal to burn vegetation originating in any area where burning is prohibited as listed in Rule 6.2.3.

(c) A person capable of extinguishing the fire must attend it at all times, and the fire must be extinguished before leaving it.

(d) Containers (not regulated under WAC 173-400-070(1)) used for outdoor burning, must be constructed of concrete or masonry with a completely enclosed combustion chamber and equipped with a permanently attached spark arrester constructed of iron, heavy wire mesh, or other noncombustible material with openings not larger than one-half inch.

(e) The use of burn barrels is illegal.

(f) A fire protection agency, county, conservation district, or other governing body may enforce its own regulations that are stricter than those set forth in this rule.

(g) It is unlawful for any person to cause or allow an emission from outdoor burning that is detrimental to the health, safety, or welfare of any person, that causes damage to property or business, or that causes a nuisance.

[Adopted 03/18/11; Amended 02/26/22]

Rule 6.2.6 Curtailment

(a) No outdoor fire can be ignited in a geographical area where an impaired air quality or episode has been declared.
(b) The person responsible for an outdoor fire must extinguish the fire when a burn ban is declared.
(c) Three (3) hours after a burn ban is declared smoke visible from all types of outdoor burning, except land clearing burning, constitutes prima facie evidence of unlawful outdoor burning.
(d) Eight (8) hours after a burn ban is declared smoke visible from land clearing burning constitutes prima facie evidence of unlawful outdoor burning.

[Adopted 03/18/11; Amended 02/26/22]

Rule 6.2.7 Recreational Burning

The following burn practices must be used for recreational burning where allowed.

(a) Maximum pile size is three (3) feet in diameter and two (2) feet high.
(b) Only dry, seasoned firewood or charcoal and enough clean paper necessary to start a fire may be burned.

[Adopted 03/18/11; Amended 02/26/22; 03/06/23]

Rule 6.2.8 Permit Program

ORCAA may consult with fire protection authorities, conservation districts, or counties to determine if any of these agencies are capable and willing to serve as the permitting agency and/or enforcing agency for specific types of burning. Permitting agencies may use, as appropriate, a verbal, electronic, written, or general permit established by rule, for any type of burning that requires a permit.

(a) Permitting agencies may deny an application or revoke a previously issued permit if it is determined that the application contained inaccurate information, failed to contain pertinent information or the permitted activity has caused a nuisance.
(b) Failure to comply with any term or condition of a permit constitutes a violation of this rule and is subject to penalties pursuant to RCW 70A.15.3150 and RCW 70A.15.3160.
(c) Types of burning that require a written permit.

  (1) Agricultural burning must abide by Rule 6.2 and all conditions of the written permit issued by ORCAA or another permitting agency.
  (2) Fire training fires, except as provided in RCW 52.12.150, may be conducted provided all the following requirements are met:

    (i) Fire training must not occur during a burn ban.
    (ii) The fire must be for training.
    (iii) The agency conducting the training fire must obtain any permits, licenses, or other approvals required by any entity for such training fires. All permits, licenses, and approvals must be kept on-site and available for inspection.

(3) Land Clearing Burning requires an approved written permit. Conditions of the written permit issued by ORCAA or another permitting agency are enforceable.

(4) Storm and flood debris resulting from a declared emergency by a governmental authority may be burned within two years of the event (storm). Burning must abide by Rule 6.2 and all conditions of the written permit issued by ORCAA or another permitting agency.

(5) Weed abatement fires.

(6) Residential fires in Thurston County.

The permit application for the above permits must be accompanied by the applicable fee, pursuant to Rule 3.4.

(d) Where residential burning is allowed and no written burn permits are issued, burning must abide by Rule 6.2 and the following:

(1) Maximum pile size is four (4) feet in diameter and three (3) feet high.

(2) Only one pile may be burned at a time, and each pile must be extinguished before lighting another.

(3) Only natural vegetation may be burned.

(4) No fires are to be within fifty (50) feet of structures or within five hundred (500) feet of forest slash.

(5) No tree stumps may be burned.

[Adopted 03/18/11; Amended 10/11/15; 02/26/22;03/06/23]

RULE 6.3 ASBESTOS

The Board of Directors of the ORCAA recognize asbestos is a serious health hazard. Any asbestos fibers released into the air can be inhaled and can cause lung cancer, pleural mesothelioma, peritoneal mesothelioma, or asbestosis. The Board has determined any asbestos emitted to the ambient air is air pollution. Because of the seriousness of the health hazard, the Board of Directors has adopted this regulation to control asbestos emissions from asbestos removal projects to protect public health. The Board adopted these regulations to coordinate with the EPA asbestos NESHAP, the OSHA asbestos regulation, the Washington Department of Labor and Industries asbestos regulations, the Washington Department of Ecology Dangerous Waste regulation, and the solid waste regulations of Clallam, Grays Harbor, Jefferson, Mason, Pacific, and Thurston counties.
[Adopted 08/17/06; Amended 09/19/08; 10/29/16; 02/26/22]

Rule 6.3.1 Definitions

When used in this Rule the following definitions apply:

Asbestos – The asbestiform varieties of serpentinite (chrysotile), riebeckite (crocidolite), cummingtonite-grunerite (amosite), anthophyllite, and actinolite-tremolite.

Asbestos-containing Materials (ACM) – Any material containing more than one percent (1%) asbestos as determined using the method specified in EPA *Method for the Determination of Asbestos in Building Materials* EPA/600/R-93/116, July 1993, or more effective method as approved or required by EPA. This definition includes all loose vermiculite used as insulation.

Asbestos-containing Waste Material – Any waste that contains or is contaminated with asbestos-containing material. Asbestos-containing waste material includes asbestos waste from control equipment, materials used to enclose the work area during an asbestos project, asbestos-containing material collected for disposal, asbestos-contaminated waste, debris, containers, bags, protective clothing, or HEPA filters. Asbestos-containing waste material does not include samples of asbestos-containing material taken for testing or enforcement purposes.

Asbestos Hazard Emergency Response Act (AHERA) Building Inspector – A person who has successfully completed the training requirements for a building inspector established by EPA Asbestos Model Accreditation Plan (40 CFR Part 763, Appendix C to Subpart E.I.B.3) and whose certification is current.

Asbestos Hazard Emergency Response Act (AHERA) Project Designer – A person who has successfully completed the training requirements for an abatement project designer established by EPA regulations (40 CFR 763.90(g)) and whose certification is current.

Asbestos Project – Any activity involving the abatement, renovation, demolition, removal, salvage, clean up, or disposal of asbestos-containing materials, or any other action that disturbs or is likely to disturb any asbestos-containing materials. It includes the removal and disposal of stored asbestos-containing materials or asbestos-containing waste material. This term does not include the application of duct tape, rewettable glass cloth, canvas, cement, paint, or other non-asbestos materials to seal or fill exposed areas where asbestos fibers may be released.

Asbestos Survey – A written report describing an inspection using the procedures contained in EPA regulations (40 CFR 763.86 and 40 CFR 763.87), or an alternate method that has received prior written approval from the Executive Director, or designee, to determine whether materials or buildings to be worked on, removed, disturbed, or demolished, contain asbestos.

Component – Any equipment, pipe, structural member, or other item covered or coated with, or manufactured from, asbestos-containing materials.

Demolition – Wrecking, razing, dismantling, burning via fire protection agency training, or removal of any load supporting structural member of a structure, including any related handling operations, making all or part of the structure permanently uninhabitable or unusable.

Friable Asbestos-containing Materials – Asbestos-containing materials that when dry can be crumbled, disintegrated, or reduced to powder by hand pressure or by the forces expected to act upon the materials during demolition, renovation, or disposal.

HEPA Filter – A High Efficiency Particulate Air filter found in some respirators and vacuum systems. HEPA filters must be capable of filtering 0.3 micrometer mean aerodynamic diameter particles with 99.97% efficiency.

Leak-Tight Container – A dust-tight and liquid-tight container that encloses asbestos-containing waste material and prevents solids or liquids from escaping or spilling out. Such containers may include sealed plastic bags, metal or fiber drums, and sealed polyethylene plastic.

Liquid Wetting Agent – Water in which a surfactant (detergent) has been added.

Non-friable Asbestos-containing Materials – Asbestos-containing materials that, when dry, cannot be crumbled, disintegrated, or reduced to powder by hand pressure or other forces expected to act on the materials during demolition, renovation, or disposal.

Renovation – To make changes or repairs, other than demolition, to a structure.

Single-Family Residence – Any structure containing space for use such as living, sleeping, food preparation and eating. This term includes houses, mobile homes, detached garages, houseboats, and houses with a “mother-in-law apartment” or “guest room”. This term does not include multiple-family units (such as apartments, duplexes, condominiums, etc.), nor does this term include any mixed-use building, structure, or installation that contains a residential unit.

Surfacing Material – Material sprayed or troweled on, or otherwise applied to surfaces including, but not limited to, acoustical plaster on ceilings, paints, fireproofing materials on structural members, or other materials on surfaces for decorative purposes.

Suspect Material – Material that has historically contained asbestos including, but not limited to, surfacing material, thermal system insulation, roofing material (except 3-tab composite roofing), fire barriers, gaskets, flooring material, and cement or concrete siding.

Thermal System Insulation – Material applied to pipes, fittings, boilers, tanks, ducts, or other structural components to prevent heat loss or gain.

Visible Asbestos Emissions – Any asbestos-containing materials that are visually detectable without the aid of instruments.

Waste Generator – Any owner or operator of a facility whose act or process produces asbestos-containing waste material.

Waste Shipment Record – The shipping document required to be originated and signed by the owner or operator, used to track, and substantiate the disposition of asbestos-containing waste material.

[Adopted 08/17/06; Amended 09/19/08; 10/29/16; 02/26/22]

Rule 6.3.2 Asbestos Survey Requirements

(a) Renovation. An asbestos survey is required for any renovation involving 48 square feet, or more, of suspect asbestos material. The property owner or the owner's agent must determine whether there are suspect asbestos-containing materials (ACM) in the work area and obtain an asbestos survey by an Asbestos Hazard Emergency Response Act (AHERA) building inspector. An AHERA building inspector is not required for asbestos surveys associated with the renovation of a single-family residence. In lieu of a survey, the owner of the residence may collect samples to have analyzed by a National Voluntary Laboratory Accreditation Program (NVLAP) certified lab per 40 CFR 763.87.

(1) A summary of the results of the asbestos survey must be available at the work site and communicated to all persons who may encounter the material.
(2) If there are no suspect materials in the work area, this determination must be available at the work site and communicated to all persons involved in the renovation.
(3) It is not required that an AHERA building inspector sample any material presumed to be ACM.

(b) Demolition. It is unlawful for any person to cause or allow any demolition unless the property owner or the owner's agent obtains an asbestos survey, by an AHERA building inspector, of the structure.

(1) It is not required that an AHERA building inspector evaluate any material presumed to be ACM.
(2) Only an AHERA building inspector may determine that a suspect material does not contain asbestos.
(3) A summary of the results of the asbestos survey must be available at the work site and communicated to all persons who may encounter the material.

[Adopted 08/17/06; Amended 09/19/08; 04/26/15; 10/29/16; 02/26/22]

Rule 6.3.3 Controlled and Regulated Substances

(a) It is unlawful to cause or allow visible asbestos emissions, including emissions from asbestos waste materials:

(1) On public or private lands, on developed or undeveloped properties and on any open uncontrolled and non-designated disposal sites;
(2) During the collection, processing, handling, packaging, transporting, storage, and disposal of any asbestos-containing waste material; or
(3) From any fugitive source.

[Adopted 08/17/06; Amended 09/19/08; 10/29/16; 02/26/22]

Rule 6.3.4 Notification Requirements

(a) It is unlawful for any person to cause or allow any work on an asbestos project or demolition unless a complete notification, including the required fee and any additional information requested by the Executive Director, or designee, has been submitted to the ORCAA on approved forms, in accordance with the notification period requirements contained in 6.3.4(c) Notification Period:

(1) Notification is required for all demolitions of structures with a footprint greater than 120 square feet, even if no ACM is present. All other demolition requirements remain in effect.

(2) Per Rule 3.5, the appropriate nonrefundable fee must accompany the notification.

(3) A copy of the notification, all amendments to the notification, the asbestos survey, and a work plan for an alternate means of compliance must be available for inspection at the asbestos project or demolition site.

(4) Notification for multiple asbestos projects or demolitions may be filed by a property owner or agent on one form if all the following criteria are met:

(i) The same contractor will perform the work continuously; and,

(ii) A work plan is submitted that includes: a map clearly identifying the structures involved in the project; the amount and type of ACM in each structure; and the schedule for performing asbestos project and demolition work; and,

(iii) The project must be bid as a group under the same contract; and

(iv) The structures must be on contiguous property.

(b) Exemptions from Notification

(1) Notification is not required for asbestos projects containing less than 10 linear feet on pipe or 48 square feet (per structure, per calendar year) of any ACM.

(2) Notification is not required for removal and disposal of non-friable caulking, window glazing and roofing.

(c) Notification Period

Project	Notification Period
Asbestos	10 days prior to commencement of work on project
Asbestos-NESHAP[1]	14 days prior to commencement of work on project
Asbestos Project Amendments	Prior Notice
Demolition	14 days prior to commencement of work on project
Emergency	Prior Notice

(1) The duration of an asbestos project must not exceed one year from date of submission of the original notification.

(2) The Executive Director, or designee, may waive the notification period, by written authorization, for disposal of unused and intact or abandoned (without the knowledge or consent of the property owner) ACM. All other asbestos project and demolition requirements remain in effect.

[Adopted 08/17/06; Amended 09/19/08; 10/29/16; 02/26/22]

[1] Projects subject to 40 CFR Part 61 Subpart M must comply with the 14-day notification period.

Rule 6.3.5 Annual Notification

(a) A property owner or agent may file one annual notification for asbestos projects on one or more structures, vessels, or buildings during each calendar year if all the following conditions are met:

(1) The annual notification must be filed with ORCAA before beginning work on any asbestos project included in the annual notification;
(2) The annual notification covers only those structures, vessels, or buildings from the same industrial grouping located on contiguous or adjacent properties and are under common ownership and control.
(3) The total amount of ACM removed is less than 260 linear feet on pipes or less than 160 square feet of any ACM; and
(4) The property owner or agent submits quarterly written reports to the Executive Director, or designee, on ORCAA-approved forms within 15 days after the end of each calendar quarter.

[Adopted 08/17/06; Amended 09/19/08; 10/29/16; 02/26/22]

Rule 6.3.6 Asbestos Project Amendments

(a) The original applicant will submit an amendment on or before the completion date on file to the Executive Director, or a designee, for the following changes in a project:

(1) Change in the quantity of asbestos to be removed; or
(2) Changes in the ACM that will be removed; or
(3) Change of contractor; or
(4) Changes in the start date, completion date, or work schedule, including hours of work.

[Adopted 10/29/16; Amended 02/26/22]

Rule 6.3.7 Emergencies—Exceptions to Advance Notification Period

(a) The Executive Director, or designee, may waive the advance notification period, if the property owner or agent submits a written request that demonstrates to the Executive Director, or designee, that an asbestos project or demolition must be conducted immediately because of any of the following:

(1) There was an event that resulted in a public health or safety hazard;
(2) The project must proceed immediately to protect equipment, ensure continuous vital utilities, or minimize property damage;
(3) ACM were encountered that were not identified during the asbestos survey; or,
(4) The project must proceed to avoid imposing an unreasonable burden.

[Adopted 10/29/16; Amended 02/26/22]

Rule 6.3.8 Asbestos Removal Requirements Prior to Renovation or Demolition

(a) Except as provided in Rule 6.3.8(b), it is unlawful for any person to cause or allow any demolition or renovation that may disturb ACM or damage a structure to preclude access to ACM for future removal, without first removing all ACM in accordance with the requirements of this regulation. ACM need not be removed from a component if the component can be removed, stored, or transported for reuse without disturbing or damaging the asbestos.

(b) Inaccessible Asbestos Removal Requirements. ACM may be removed during demolition, if the property owner demonstrates to the Executive Director, or designee, through a work plan, that the ACM is not accessible such as:

(1) Structures or buildings that are structurally unsound and in danger of imminent collapse;

(2) Conditions that are immediately dangerous to life and health;

(3) Unable to access all asbestos material prior to demolition.

(4) The owner must submit:

(i) written determination of the hazard by an authorized government official or a licensed structural engineer; and,

(ii) a work plan outlining the procedures that will be followed to control asbestos emissions during the demolition or renovation and disposal of the asbestos-containing waste material.

[Adopted 10/29/16; Amended 02/26/22]

Rule 6.3.9 Procedures for Asbestos Projects

(a) Training Requirements. It is unlawful for any person to cause or allow any work on an asbestos project unless it is performed by persons trained and certified in accordance with the standards established by the Washington State Department of Labor and Industries, the federal Occupational Safety and Health Administration, or the United States Environmental Protection Agency (whichever agency has jurisdiction) and whose certificate is current. This certification requirement does not apply to individuals who work on asbestos projects on their own single-family residence(s).

(b) Asbestos Work Practices. Except as provided in Rule 6.3.4(b)(2) of this Rule, it is unlawful for any person to cause or allow the removal of ACM unless all the following requirements are met:

(1) The asbestos project must be conducted in a controlled area, clearly marked by barriers and asbestos warning signs. Access to the controlled area must be restricted to authorized personnel only.

(2) If a negative pressure enclosure is employed it must be equipped with transparent viewing ports, if feasible, and must be maintained in good working order. Emissions from the negative air exhaust must be controlled by a HEPA filter.

(3) Absorbent ACM, such as surfacing material and thermal system insulation, must be saturated with a liquid wetting agent prior to removal. Any unsaturated absorbent ACM exposed during removal must be immediately saturated with a liquid wetting agent. All absorbent asbestos-containing waste material must be kept saturated with a liquid wetting agent until sealed in leak-tight containers. All asbestos-containing waste material must be sealed in leak-tight containers as soon as possible after removal but no later than the end of each work shift.

(4) Nonabsorbent ACM, such as cement asbestos board or vinyl asbestos tile, must be continuously coated with a liquid wetting agent on any exposed surface prior to and during removal. Any dry surfaces of nonabsorbent ACM exposed during removal must be immediately coated with a liquid wetting agent. All nonabsorbent asbestos-containing waste material must be kept coated with a liquid wetting agent until sealed in leak-tight containers.

(5) Metal components (such as valves and fire doors) that have internal ACM are exempt from the requirements of 6.3.4 if all access to the ACM is welded shut or the component has mechanical seals, which cannot be removed by hand, that separate the ACM from the environment.

(6) ACM that are being removed, have been removed, or may have fallen off components during an asbestos project must be carefully lowered to the ground or a lower floor, not dropped, thrown, slid, or otherwise damaged, unless enclosed inside a negative-pressure enclosure.

(7) The exterior of each leak-tight container must be free of all asbestos residue and permanently marked with the date the material was collected for disposal, the name of the waste generator, and the address at which the waste was generated. This marking must be readable without opening the container.

(8) It is unlawful to allow visible asbestos emission from an asbestos project. Leak-tight containers must not be dropped, thrown, slid, or otherwise damaged.

(9) The asbestos-containing waste material must be stored in a controlled area until transported to an approved waste disposal site.

(10) It is unlawful for any person to create or allow a condition that results in the disturbance, or likely disturbance, of ACM. Such unlawful activity includes but is not limited to: Not removing all ACM in a structure scheduled for demolition; partially removing ACM and leaving remaining ACM in a state making it more susceptible to being disturbed; or, leaving it on the ground, outside and open to the environment.

[Adopted 10/29/16; Amended 02/26/22]

Rule 6.3.10 Disposal of Asbestos-Containing Waste Material

(a) Except as provided in 6.3.10(c) of this Regulation, ACM must be transferred offsite within 10 days of removal. The ACM may be transferred to an approved temporary storage site or to a waste disposal site operated in accordance with 40 CFR 61.154 or 40 CFR 61.155.

(b) Temporary Storage Site. A person may establish a facility for collecting and temporarily storing asbestos-containing waste material if the facility is approved by the Executive Director, or designee, and all the following conditions are met:

(1) Accumulated asbestos-containing waste material must be kept in a controlled storage area posted with asbestos warning signs and accessible only to authorized persons;

(2) All asbestos-containing waste material must be stored in leak-tight containers and the leak-tight containers must be maintained in good condition;
(3) The storage area must be locked except during transfer of asbestos-containing waste material; and
(4) Storage, transportation, disposal, and return of the waste shipment record to the waste generator must not exceed 90 days.

(c) Disposal of Asbestos Cement Pipe. Asbestos cement water pipe used on a public right-of-way or public easement is excluded from the disposal requirements of Rule 6.3.10 if the following conditions are met:

(1) Asbestos cement pipe may be buried in place if the pipe is left intact (e.g., not moved, broken or disturbed) and covered with at least three (3) feet or more of non-asbestos fill material and the state, county or city authorities are notified in writing of buried asbestos cement pipe; and
(2) All asbestos-containing waste material, including asbestos cement water pipe fragments that are one (1) linear foot or less, protective clothing, HEPA filters, or other asbestos contaminated material, debris, or containers, will be subject to the requirements of Rule 6.3.

[Adopted 10/29/16; Amended 02/26/22]

Rule 6.3.11 Compliance with other Rules

Other government agencies have adopted rules that may apply to asbestos projects regulated under these rules including, but not limited to, the United States Environmental Protection Agency (EPA), the Occupational Safety and Health Administration (OSHA), and the Department of Labor and Industries. Nothing in the Agency's rules excuse any person from complying with any other applicable local, state, or federal requirement.

[Adopted 10/29/16; Amended 02/26/22]

RULE 6.4 NOTICE OF INTENT TO OPERATE

(a) A Notice of Intent to Operate may be filed with the Agency in lieu of a Notice of Construction for the following sources:
(1) Temporary Portable Stationary Sources. Relocation of temporary portable stationary sources having a valid Order of Approval from Ecology or a local air pollution control agency in the State of Washington.
(2) Stationary Sources based on Potential to Emit. Any stationary source that will have a combined uncontrolled potential to emit from all emission units less than:
(i) 0.5 tons per year of any criteria pollutant; and,
(ii) 1.0 tons per year of total criteria pollutants and VOC combined; and,
(iii) 0.005 tons per year of lead; and,
(iv) The de minimis emission rate specified for each Toxic Air Pollutant listed in WAC 173-460-150; and,
(v) 1.0 tons per year of ozone depleting substances combined.

(3) Gasoline Dispensing Facilities (GDF). Construction or modification of a gasoline dispensing facility, or replacement or substantial alteration of vapor recovery systems, provided that:

(i) The installed equipment is in accordance with the current California Air Resources Board (CARB) Executive Orders as defined in Rule 8.12 listed on the GDF Notification form effective at the time of the filing;
(ii) The GDF is not part of a stationary source subject to the Air Operating Program (Rule 5);
(iii) The GDF is not subject to any of the Stage II requirements in WAC 173-491-040(5); and
(iv) The project does not involve the removal of a Stage II vapor recovery system.

(b) A Notice of Intent to Operate must be filed with the agency for nonroad engines (as defined in WAC 173-400-035) as required by WAC 173-400-035.
(c) A complete Notice of Intent to Operate (NOI) application must be filed at least 15 days prior to starting operation of the source.
(d) NOI applications will be made on standard forms of the Agency and will include:

(1) All information requested in the applicable standard forms;
(2) If submitting a NOI for a stationary source qualifying for the exemption based on potential to emit under Rule 6.4(a)(2), documentation verifying the stationary source's potential to emit;
(3) If submitting a NOI for a nonroad engine, the notice must include all the information required by WAC 173-400-035(4) or (5), as applicable;
(4) Any additional information requested by the Agency to verify that operation of the stationary source will comply with applicable air pollution control requirements; and,
(5) Applicable fee per Rule 3.6.

(e) Condition of operation. The Agency may establish enforceable conditions of operation, through issuance of a regulatory Order, as are necessary to assure compliance with applicable air pollution control requirements.

(f) Temporary Portable Stationary Sources - Requirements for Operation. Sources submitting a Notice of Intent per Rule 6.4(a)(1) must meet the following requirements:

(1) The operation must not cause a violation of ambient air quality standards;
(2) If the operation is in a nonattainment area, it must not interfere with the scheduled attainment of ambient standards;
(3) The temporary source must operate in compliance with all applicable air pollution rules and regulations;
(4) A temporary portable stationary source that is considered a major stationary source within the meaning of WAC 173-400-710 or WAC 173-400-810 must also comply with the requirements in WAC 173-400-700

through 750 and WAC 173-400-800 through 860 and Rule 6.1.3(b) as applicable;

(5) Any operating condition in an Order previously issued to a temporary source will remain in effect upon relocating the source within ORCAA's jurisdiction unless specifically superseded by condition in a subsequent Order.

(g) Where work, for which a Notice of Intent to Operate is required, is commenced prior to making application and receiving approval, the Executive Director, or an authorized agent, may investigate as part of the Notice of Intent review. In such a case, an investigation fee, in addition to fees of Rule 3.3, may be assessed in an amount up to 3 times the Notice of Intent fees of Rule 3.3. Payment of the fees does not relieve any person from the requirement to comply with the regulations nor from any penalties for failure to comply.

[Adopted 02/26/22]

REGULATION 7 – PROHIBITIONS

RULE 7.1 INTERFERENCE OR OBSTRUCTION

It is unlawful for any person to willfully interfere with or obstruct the Executive Director or any Agency employee in performing any lawful duty.
[Adopted 08/17/06; Amended 02/26/22]

RULE 7.2 FALSE OR MISLEADING STATEMENTS

It is unlawful for any person to willfully make a false or misleading statement to the Board or its representative as to any matter within the jurisdiction of the Board.
[Adopted 08/17/06; Amended 02/26/22]

RULE 7.3 UNLAWFUL REPRODUCTION OR ALTERATION OF DOCUMENTS

It is unlawful for any person to reproduce or alter, or cause to be reproduced or altered, any order, registration certificate or other paper issued by the Agency if the purpose of such reproduction or alteration is to evade or violate any provision of these Regulations or any other law.
[Adopted 08/17/06; Amended 02/26/22]

RULE 7.4 DISPLAY OF ORDERS AND CERTIFICATES: REMOVAL OR MUTILATION PROHIBITED

(a) Any order or registration certificate required to be obtained by these Regulations must be available on the premises designated on the order or certificate.

(b) If the Agency requires an order or registration certificate to be displayed, it must be posted.

(c) It is unlawful for any person to mutilate, obstruct or remove any order or registration certificate unless authorized to do so by the Board or the Executive Director.

[Adopted 08/17/06; Amended 02/26/22]

RULE 7.5 EMISSION OF AIR CONTAMINANT – CONCEALMENT AND MASKING

(a) It is unlawful for any person to cause or allow the installation or use of any device or use of any means, which conceals or masks an emission of air contaminant, which would otherwise violate any provisions of ORCAA’s Regulations or chapter 173-400 WAC.

(b) It is unlawful for any person to cause or allow the installation or use of any device or use of any means designed to conceal or mask the emission of an air contaminant, which causes detriment to health, safety, or welfare of any person, or cause damage to property or business.

[Adopted 08/17/06; Amended 02/26/22]

RULE 7.6 EMISSIONS OF AIR CONTAMINANT OR WATER VAPOR: DETRIMENT TO PERSONS AND/OR PROPERTY

It is unlawful for any person to cause or allow the emission of an air contaminant or water vapor, including an air contaminant whose emission is not otherwise prohibited by these

Regulations, if the air contaminant or water vapor causes detriment to the health, safety, or welfare of any person, or causes damage to property or business.
[Adopted 08/17/06; Amended 02/26/22]

REGULATION 8 – PERFORMANCE STANDARDS

RULE 8.1 WOOD HEATING

The provisions of this rule apply to solid fuel burning devices in all areas within the jurisdiction of Olympic Region Clean Air Agency (ORCAA).
[Adopted 08/17/06; Amended 05/22/10]

Rule 8.1.1 Definitions

“Adequate Source of Heat” means a furnace or heating system, connected, or disconnected from its energy source, designed with the ability to maintain seventy degrees Fahrenheit (70°F) at a point three (3) feet above the floor in all normally inhabited areas of a dwelling. Garages are specifically excluded.

“Certified” means that a woodstove meets emission performance standards when tested by an accredited independent laboratory and labeled according to procedures specified by EPA in 40 CFR Part 60 Subpart AAA-Standards of Performance for Residential Wood Heaters as amended through July 1, 1990.

“Cook Stove” means an appliance designed with the primary function of cooking food and containing an integrally built-in oven, with an internal temperature indicator and oven rack, around which the fire is vented, as well as a shaker grate ash pan, and an ash cleanout below the firebox. Any device with a fan or heat channels used to dissipate heat into the room is not considered a cook stove.

“Fireplace” means a permanently installed masonry fireplace; or a factory-built metal solid fuel burning device designed to be used with an open combustion chamber and without features to control the air to fuel ratio.

“First Stage of Impaired Air Quality” means the same as Stage 1 burn ban and is declared when meteorological conditions are predicted to cause fine particulate levels to exceed 35 micrograms per cubic meter measured on a 24-hour average, within 48 hours.

“Second Stage of Impaired Air Quality” means the same as Stage 2 burn ban and is declared when a first stage of impaired air quality has been in force and has not been sufficient to reduce the increasing fine particulate pollution trend. A second stage burn ban may be called without calling a first stage burn ban only when all the following occur:

(a) Fine particulate levels have reached or exceeded 25 micrograms per cubic meter, measured on a 24-hour average:
(b) Meteorological conditions have caused fine particulate levels to rise rapidly;
(c) Meteorological conditions are predicted to cause fine particulate levels to exceed the 35 micrograms per cubic meter, measured on a 24-hour average, within 24 hours; and,
(d) Meteorological conditions are highly likely to prevent sufficient dispersion of fine particulate.

"Nonaffected Pellet Stove" means that a pellet stove has an air-to-fuel ratio equal to or greater than 35.0 when tested by an accredited laboratory in accordance with methods and procedures specified by the EPA in 40 CFR Part 60 Appendix A, Reference Method 28A-Measurement of Air to Fuel Ratio and minimum achievable burn rates for wood fired appliances as amended through July 1, 1990.

"Salt Laden Wood" means any species of wood that has been soaked in salt water.

"Seasoned Wood" means clean, untreated wood of any species that has been dried and contains twenty percent (20%), or less, moisture by weight.

"Solid Fuel Burning Device" means a device that burns seasoned wood, coal, or any other nongaseous or nonliquid fuels except those prohibited by Rule 8.1.3. This also includes devices used for aesthetic or a space heating purpose, which has heat input less than one million British thermal units per hour. A cook stove is specifically excluded from this definition.

"Treated Wood" mean wood of any species that has been chemically impregnated, painted, or similarly modified to improve structural qualities or resistance to weathering or deterioration.

"Woodstove" means an enclosed solid fuel burning device capable of and intended for space heating and/or domestic water heating.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

Rule 8.1.2 General Emission Standards

(a) It is unlawful for any person to cause or allow an emission from a solid fuel burning device that unreasonably interferes with the use and enjoyment of property or workplace.

(b) It is unlawful for any person to cause or allow emission of a smoke plume from any solid fuel burning device to exceed an average of twenty percent (20%) opacity as determined by EPA Method 9. The provision of this requirement will not apply during the starting of a new fire for a period not to exceed 20 minutes in any 4-hour period.

(c) Smoke visible from a chimney, flue, or exhaust duct, in excess of the opacity standard will constitute prima facie evidence of unlawful operation of an applicable solid fuel burning device. This presumption may be refuted by demonstration that the smoke was not caused by an applicable solid fuel burning device.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

Rule 8.1.3 Prohibited Fuel Types

It is unlawful for any person to cause or allow any of the following materials to be burned in a solid fuel burning device:

(a) Garbage;

(b) Treated wood;

(c) Plastic products;
(d) Rubber products;
(e) Animals;
(f) Asphalt products;
(g) Petroleum products;
(h) Paints and chemicals;
(i) Salt laden wood; or
(j) Any substance that normally emits dense smoke or obnoxious odors.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

Rule 8.1.4 Curtailment

(a) Whenever the Agency has declared a Stage 1 burn ban for a geographic area, a person within that geographic area with an adequate source of heat other than a solid fuel burning device must not operate any solid fuel burning device, unless the solid fuel burning device is one of the following:

(1) Certified; or
(2) A nonaffected pellet stove.

(b) Whenever the Agency has declared a Stage 2 burn ban for a geographic area, a person within that geographical area with an adequate source of heat other than a solid fuel burning device must not operate any solid fuel burning device.

(c) The affected geographic area of a declared Impaired Air Quality will be determined by the Executive Director or their designee.

(d) A person responsible for an applicable solid fuel burning device already in operation at the time Impaired Air Quality is declared must withhold new solid fuel for the duration of the Impaired Air Quality. Smoke visible from a chimney, flue, or exhaust duct after three hours has elapsed from the declaration of the Impaired Air Quality will constitute prima facie evidence of unlawful operation of an applicable solid fuel burning device. This presumption may be refuted by demonstration that the smoke was not caused by a solid fuel burning device.

(e) For the sole purpose of a contingency measure to meet the requirements of Section 172(c)(9) of the Federal Clean Air Act, the use of solid fuel burning devices, except fireplaces as defined in RCW 70A.15.3510(3), woodstoves meeting the standards set forth in RCW 70A.15.3530 or pellet stoves either certified or issued an exemption by the EPA in accordance with Title 40, Part 60 of the Code of Federal Regulations will be prohibited if the EPA, in consultation with Ecology and the Agency, makes written findings that:

(1) The area has failed to make reasonable further progress or attain or maintain a national ambient air quality standard; and,
(2) Emissions from solid fuel burning devices from a geographic area are a contributing factor to such failure to make reasonable further progress or attain or maintain a national ambient air quality standard.
(3) A prohibition issued under 8.1.4(e) will not apply to a person that does not have an adequate source of heat without burning wood.

(4) The area is to consist of all areas within the city limits of Lacey, Olympia, and Tumwater and unincorporated areas of Thurston County lying within or between the municipal boundaries.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

Rule 8.1.5 Exemptions

Written exemptions granted by the Agency are valid for one (1) year from date of issue. Exemptions may be canceled at any time if the original request is found to be incorrect, inaccurate, or fraudulent. Exemptions will apply only to the use of solid fuel burning device during an Impaired Air Quality and not to the other rules of this regulation or other applicable regulations.

(a) Emergency exemption. In an emergency the Agency may issue a written solid fuel burning device emergency exemption. An emergency may include, but is not limited to, a situation where a person demonstrates that their heating system, other than a solid fuel heating device, is inoperable for reasons other than their own actions or a situation where the heating system has been involuntarily disconnected by a utility company or other fuel supplier.

(b) Inadequate heat source. Written exemptions may be issued by the Agency if a person can demonstrate that:

(1) The structure was originally designed with a solid fuel burning device as the source of heat; or

(2) The existing heat source, fueled with other than solid fuel, will not provide adequate heat.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

Rule 8.1.6 Penalties

A person in violation of this Rule 8.1 may be subject to the provisions of Rule 2.5.

[Adopted 08/17/06; Amended 05/22/10]

Rule 8.1.7 Sale and Installation of Uncertified Woodstoves

It is unlawful to install, sell, offer for sale, advertise for sale, or otherwise transfer an uncertified solid fuel burning device unless the device has been rendered permanently inoperable as a combustion device.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

Rule 8.1.8 Disposal of Uncertified Woodstoves

When an uncertified solid fuel burning device is to be permanently removed from its location it must be rendered inoperable as a solid fuel burning device. A removed uncertified solid fuel burning device must not be sold, bartered, traded, or given away for a purpose other than recycling of the materials to form something other than an uncertified solid fuel burning device.

[Adopted 08/17/06; Amended 05/22/10; 02/26/22]

RULE 8.2 GENERAL STANDARDS FOR MAXIMUM VISUAL EMISSIONS

All facilities, sources and emissions units are required to meet the visual emission standards of this rule except when a visual emission standard is listed in another rule of these Regulations, or where a Notice of Construction lists a more stringent visual emission standard, or where an applicable State of Washington or Federal Regulation lists a visual emission standard that is more stringent, such standards will take precedent over a general emission standard listed in this rule.

(a) In equipment or facilities, including boilers using hogged fuel, regardless of their date of installation, it is unlawful for any person to cause or allow the emission to the outdoor atmosphere, for more than three (3) minutes in any one hour, of a gas stream containing air contaminants that are greater than 20% opacity.

(b) Observations must be made by trained and certified observers or by LIDAR instrumentation.

(c) The exceptions to Rule 8.2 are as follows:

> **(1)** Emission occurring due to soot blowing or grate cleaning may be greater than 20% opacity; providing the operator can demonstrate that soot blowing, or grate cleaning will not exceed a total of 15 minutes in any 8 consecutive hours. This practice, except for testing and troubleshooting, is to be scheduled for the same approximate times each day and ORCAA must be advised of the schedule.
>
> **(2)** When the owner or operator of a source supplies valid data to show that the presence of uncombined water is the only reason for the opacity to exceed 20%.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.3 GENERAL STANDARDS FOR MAXIMUM PARTICULATE MATTER

All sources and emission units are required to meet the emission standards of this rule, except when a standard is listed in another rule of these Regulations, or where a Notice of Construction Approval Order lists a more stringent standard, or where an applicable State of Washington or Federal Regulation lists a standard that is more stringent, such standards will take precedent over a general emission standard listed in this rule. Further, all existing emission units are required to use reasonably available control technology (RACT), which may be determined for some sources or source categories to be more stringent than the applicable emission limitations of ORCAA Regulations. When current controls are determined to be less than RACT, ORCAA will, on a case-by-case basis, define RACT for each source or source category and issue a regulatory order to the source or source category for installation of RACT. Particulate test procedures, on file at the Authority, will be used to determine compliance. The Agency requires the inclusion of condensable particulate matter, for determining compliance with the particulate matter standards in this rule.

(a) In equipment or facilities, except boilers using hog fuel, it is unlawful for any person to cause or allow the emission of particulate matter to the outdoor atmosphere from any single source in excess of 0.10 grains per standard cubic foot of gas (calculated at 7% oxygen). Particulate test procedures, on file at the Agency, will be used to determine compliance.

(b) Hogged Fuel Boilers: It is unlawful for any person to cause or allow the emission of particulate matter to the outdoor atmosphere from any single source in excess of 0.20 grains per standard cubic foot of gas (calculated at 7% oxygen). Particulate test procedures, on file at the Agency, will be used to determine compliance.

(c) Fugitive particulate material. Reasonable and/or appropriate precautions must be taken to prevent fugitive particulate material from becoming airborne;

(1) When handling, loading, unloading, transporting, or storing particulate material; or,

(2) When constructing, altering, repairing, or demolishing a building; or its appurtenance; or a road; or,

(3) From an untreated open area.

For this rule, fugitive particulate means particulate material which is generated incidental to an operation, process or procedure and is emitted into the open air from points other than an opening designed for emissions such as stacks or vents.

(d) It is unlawful for any person to cause or allow any construction, alteration, repair, maintenance, or demolition work without taking precautions to prevent air pollution.

(e) Fallout. It is unlawful for any person to cause or permit the emission of particulate matter from any source to be deposited beyond the property under direct control of the owner(s) or operator(s) of the source which interferes unreasonably with the use and enjoyment of the property upon which the material is deposited.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.4 INCINERATION OPERATION

(a) It is unlawful for any person to cause or allow any incineration operation within the Agency's jurisdiction except in an incinerator provided with emission control apparatus found by the Executive Director, or a duly designated agent, in advance of such use, to be effective for air pollution control.

(b) Operating Hours. It is unlawful for any person to cause or allow an incineration operation at any time other than daylight hours of the same day, except with written approval of the Executive Director.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.5 ODOR CONTROL MEASURES

(a) Reasonably available control technology (RACT) must be installed and operated to mitigate odor-bearing gases emitted into the atmosphere to a minimum, or, so as not to create air pollution.

(b) The Board may establish requirements that the building or equipment be enclosed and ventilated in such a way that all the air, gases and particulate matter are effectively treated for removal or destruction of odorous matter or other air contaminants before emission to the outdoor atmosphere.

(c) It is unlawful for any person to cause or allow the emission or generation of any odor from any source, which unreasonably interferes with another person's use, and enjoyment of their property.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.6 EMISSION OF TOXIC AIR POLLUTANTS

(a) Sources installed after June 18, 1991, must meet the requirements of chapter 173-460 WAC, New Sources of Toxic Air Pollutants. For sources installed after June 18, 1991, "Toxic Air Pollutant (TAP)" means any toxic air pollutant listed in WAC 173-460-150

(b) No person shall cause or allow the emission of formaldehyde into the ambient air beyond such person's property line, which will result in a concentration exceeding .05 ppm (parts per million) 1 hour average or 61 micrograms per cubic meter 1 hour average.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.7 REPORTING OF EXCESS EMISSIONS

(a) Excess emission must be reported to the Agency as soon as possible and within 24 hours unless the Agency has established alternative reporting timeline requirements for the source. Upon request by the Executive Director, the owner(s), or operator(s), of the source(s) must submit a full written report including the known causes, the corrective actions taken, and the preventative measures to be taken to minimize or eliminate the chance of recurrence.

(b) The owner or operator of a source has the burden of proving to the Agency that excess emissions were unavoidable.

(c) The following scenarios of excess emissions will be considered unavoidable:

(1) Excess emissions due to startup or shutdown conditions will be considered unavoidable provided the source reports as required under Rule 8.7(a) and adequately demonstrates the excess emissions could not have been prevented through careful planning and design and if a bypass of control equipment occurs, that such bypass is necessary to prevent loss of life, personal injury, or severe property damage.

(2) Excess emissions due to scheduled maintenance will be considered unavoidable if the source reports as required under Rule 8.7(a) and could not have been avoided through better design, scheduling for maintenance, or through better operation and maintenance practices.

(3) Excess emissions due to upsets will be considered unavoidable provided the source reports, as required under Rule 8.7(a), and demonstrates:

(i) The event was not caused by poor or inadequate design, operation, maintenance, or any other reasonably preventable condition;

(ii) The event was not of a recurring pattern indicative of inadequate design, operation, or maintenance; and

(iii) The operator took immediate and appropriate corrective action in a manner consistent with good air pollution control practice for minimizing emissions during and after the event, including slowing or shutting down the emission unit as necessary to minimize emissions, when the operator knew or should have known that an emission standard or permit condition was being exceeded.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.8 CONTROL EQUIPMENT – MAINTENANCE AND REPAIR

All air contaminant sources are required to keep any process and/or air pollution control equipment in good operating condition and repair.

[Adopted 08/17/06]

RULE 8.9 BURNING USED OIL IN LAND BASED FACILITIES

(RCW 70A.15.4510)

(a) Except as provided in Rule 8.9(b), a person may not burn used oil as fuel in a land-based facility or in state waters unless the used oil meets the following standards:

(1) Cadmium – 2 ppm maximum
(2) Chromium – 10 ppm maximum
(3) Lead – 100 ppm maximum
(4) Arsenic – 5 ppm maximum
(5) Total Halogens – 1000 ppm maximum
(6) Polychlorinated Biphenyls – 2 ppm maximum
(7) Ash - .1 percent maximum (0.1%)
(8) Sulfur – 1.0 percent maximum (1%)
(9) Flash point – 100 degrees Fahrenheit minimum (100ºF)

(b) This rule does not apply to:

(1) Used oil burned in space heaters if the space heater has a maximum heat output of not greater than 0.5 million BTUs per hour or used oil burned in facilities permitted by the Agency; or
(2) Ocean going vessels.

(c) This rule does not apply to persons in the business of collecting used oil from residences when under authorization by a city, county, or the utilities and transportation commission.

Test procedures for determining compliance for the above specifications must be approved by the Agency.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.10 FLUORIDES

(a) The following standards apply to forage:

(1) After sampling monthly, the yearly average fluoride content of the forage should not exceed 40 ppm Fluoride ion (ppm F), on a dry weight basis, or exceed 60 ppm F for more than two (2) consecutive months or exceed 80 ppm F for more than one (1) month.

(2) In areas where cattle are not grazed continually but are fed cured forage, as hay, for part of the year, the fluoride content of this hay will be used as it is fed to establish the yearly average. Computation of the yearly average, must take into consideration, periods when cattle may have been grazed outside the area.

(3) Inasmuch as the standards set forth in paragraph (1) are intended to protect livestock, all forage samples analyzed to determine compliance with such standards must be representative of forage consumed by livestock in the area. Also, in determining compliance in particular cases, consideration will be given to the supplemental feed of the livestock involved.

(b) The following standards apply to the outdoor atmosphere:

Table 8.10a Maximum Allowable Fluoride

Maximum Allowable Fluoride* Ground-level Concentrations	
Concentration**	Averaging Time
4.5 ppb	12 consecutive hours
3.5 ppb	24 consecutive hours
2.0 ppb	1 calendar year
1.0 ppb	1 calendar month
* as gaseous fluorides calculated as HF ** parts per billion by volume	

Because the standards set forth in Table 8.10 are intended to protect vegetation, the outdoor atmosphere analyzed to determine compliance with such standards must be from the area of the vegetation to be protected.

(c) Forage or air quality levels higher than those specified in paragraph (1) and Table 8.10 will be permitted to exist in an area where justified by local conditions and where such higher levels do not or will not be expected to result in significant adverse effects. Similarly, levels lower than those specified in paragraph (1) and Table 8.10 will be maintained in cases where significant adverse effects have occurred or can be expected to occur at the specified levels.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.11 RECORD KEEPING AND REPORTING

This rule requires owners or operators of stationary sources of air contaminants to maintain records of, and periodically report to the Olympic Region Clean Air Agency information on the nature and amounts of emissions and other information as may be necessary to determine whether such sources are in compliance with applicable emission limitations and other control measures.

This rule also provides for public availability of emission data reported to the Olympic Region Clean Air Agency by stationary source owners or operators or otherwise obtained by the Agency, as correlated with applicable emission limitations.

(a) The owner or operator of any stationary source in the geographical area of the Authority must, upon notification by the Executive Director, maintain records of the nature and amounts of emissions from such source and/or provide other information deemed necessary by the Control Officer to determine whether such source is in compliance with the applicable emission limitations and other control measures.

(b) When requested by the Agency, the information pursuant to Rule 8.11(a) must be reported on forms supplied by the Agency.

[Adopted 08/17/06; Amended 02/26/22]

RULE 8.12 GASOLINE DISPENSING FACILITIES

This regulation applies to all gasoline dispensing facilities.
[Adopted 08/17/06; Amended 08/17/19]

Rule 8.12.1 Definitions

Unless a different meaning is clearly required by context, the following words and phrases, as used in this Rule, will have the following meanings:

"CARB" means California Air Resources Board.

"CARB Certified" means a vapor recovery system, equipment, or any component thereof, for which the California Air Resources Board (CARB) has evaluated its performance and issued an Executive Order.

"CARB Executive Order" means a document issued by the Executive Officer of the California Air Resources Board that specified the requirements for specific vapor control equipment and the procedures used in installing, maintaining, inspecting, or testing vapor recovery systems.

"Enhanced Vapor Recovery (EVR)" means performance standards and specifications set forth in the CARB CP 201 (Certification Procedure for Vapor Recovery Systems at gasoline dispensing facilities) Sections 3 through 9.

"Gasoline" means a petroleum distillate, which is a liquid at standard conditions and has a true vapor pressure greater than four pounds per square inch absolute at 20°C and is used as a fuel for internal combustion engines. Any liquid sold as a vehicle fuel with a true vapor pressure greater than four pounds per square inch absolute at 20°C is considered 'gasoline' in this regulation.

"Gasoline Dispensing Facility" means any site dispensing gasoline from stationary storage tanks including facilities dispensing gasoline for automotive, aviation, and marine uses.

“Stage I” means gasoline vapor recovery during all gasoline marketing transfer operations except motor vehicle refueling.

“Stage II” means gasoline vapor recovery during motor vehicle refueling operations from stationary tanks.

“Submerged Fill Line” means any discharge pipe or nozzle designed to be within six (6) inches of the bottom of the tank and submerged at all times.

“Throughput” means the amount of gasoline passing through a facility.

“Vapor Recovery System” means equipment that reduces the emissions of volatile organic compounds to the ambient air.
[Adopted 08/17/06; Amended 08/17/19; 02/26/22]

Rule 8.12.2 General Requirements

(a) All gasoline dispensing facilities with gasoline storage tanks, regardless of size must:

  (1) Not allow gasoline to be handled in a manner that would result in vapor releases to the atmosphere for extended periods of time. Measures to be taken include, but are not limited to, the following:
    (i) Minimize gasoline spills;
    (ii) Clean up spills as soon as practicable;
    (iii) Cover all open gasoline containers and all gasoline storage tank fill-pipes with a gasketed seal when not in use; and
    (iv) Minimize gasoline sent to open waste collection systems that collect and transport gasoline to reclamation and recycling devises, such as oil/water separators.

(b) Gasoline storage tanks with a capacity of 2,000 gallons or more must be equipped with submerged fill lines.

(c) Gasoline dispensing facilities may be subject to registration per Rule 4.1.

(d) Gasoline dispensing facilities may be subject to Notice of Construction requirements per Rule 6.1.

[Adopted 08/17/06; Amended 08/17/19; 02/26/22]

Rule 8.12.3 Vapor Recovery Requirements

(a) CARB Certified Stage I Enhanced Vapor Recovery (EVR), or equivalent equipment as approved by the Agency, is required for any new or upgraded gasoline storage tank with a storage capacity of 2,000 gallons or more and located at a gasoline dispensing facility with a cumulative gasoline storage capacity of 10,000 gallons or more. Upgrading means replacing a gasoline storage tank, or substantially altering any component of the Stage I vapor recovery system. Prior to commencing construction, modifications, or upgrades, gasoline dispensing facilities must comply with the applicable requirements in Rule 6.1.

(b) Nothing in Rule 8.12 precludes the Agency from requiring installation of a Stage II vapor recovery system in conjunction with approval of a Notice of Constructing application if Stage II vapor recovery is necessary to assure compliance with applicable air regulations and standards.

[Adopted 08/17/06; Amended 08/17/19]

Rule 8.12.4 Testing Requirements

(a) The owner or operator of a gasoline dispensing facility with a cumulative storage capacity of 10,000 gallons or more and equipped with Stage I EVR must conduct the following performance tests:

- **(1)** Initial performance testing must be completed, for all performance tests listed in Table 1, after initial installation and prior to the facility dispensing fuel commercially; and,
- **(2)** Subsequent testing must be conducted according to the schedule in Table 1.

(b) The owner or operator of a gasoline dispensing facility with a cumulative gasoline storage capacity of 10,000 gallons or more that is equipped with Stage I, but not equipped with Stage I EVR, must conduct the appropriate Static Pressure Performance of Vapor Recovery Systems test in Table 1 at least once every 13 months.

(c) Tests must be conducted in accordance with the CARB test procedure specified, or CARB-approved equivalent test procedures.

(d) Tests must be performed by a third-party independent testing company trained in the testing methods.

(e) In the event of a failed performance test, the owner or operator must correct the cause of the failure in accordance with Rule 8.12.5(c) and retest within 30 days of the date of the failed test.

(f) The owner or operator must report to the Agency the results of all required performance testing within 30 days of the test date.

Table 1: Performance Testing

A	**An owner/operator of a facility with underground storage tanks must conduct the following tests…**	**After the initial testing, the owner/operator must conduct the subsequent tests…**
	A1. TP-201.3 – Static Pressure Performance of Vapor Recovery Systems	at least once every 13 months
	A2. TP-201.1E – Leak Rate and Cracking Pressure of P/V Vent Valves	at least once every 37 months
	A3. TP-201.3C – Determination of Vapor Piping Connection to Underground Gasoline Storage Tanks (Tie-Tank Test)	
	A4. TP-201.1B – Static Torque of Rotatable Stage I Adaptors	at least once every 13 months
	A5. TP-201.1C or **TP-201.1D**[1] – Leak Rate of Drop Tube/Drain Valve Assembly or Leak Rate of Drop Tube/Overfill Prevention Device	at least once every 13 months
B	**An owner/operator with aboveground storage tanks must conduct the following tests…**	**After the initial testing, the owner/operator must conduct the subsequent tests…**
	B1. TP-206.3 or TP-201.3B[2]– Static Pressure Performance of Vapor Recovery Systems	at least once every 13 months
	B2. TP-201.1B – Static Torque of Rotatable Stage I Adaptors[3]	at least once every 13 months
	B3. TP-201.1E – Leak Rate and Cracking Pressure of P/V Vent Valves	at least once every 37 months

[Adopted 08/17/06; Amended 08/17/19; 02/26/22]

[1] TP-201.1C has no overfill prevention device and TP-201.1D is required for drop tubes with overfill prevention
[2] TP-206.3 is required for aboveground storage tanks equipped with Stage I EVR
[3] TP-201.1B only required for aboveground storage tanks equipped with Rotatable Stage I Adaptors

Rule 8.12.5 Self-Inspection Requirements

(a) The owner or operator of a gasoline dispensing facility must complete self-inspections of the vapor recovery system. The inspection must occur at least once a week, or after each gasoline delivery, whichever is less frequent. At a minimum, the following items must be inspected:

- **(1)** All adaptors must be equipped with vapor-tight caps;
- **(2)** All fill and vapor recovery wells or boxes must be free of liquid gasoline;
- **(3)** All gasoline storage tank fill-pipes must have gasketed seals in good working condition;
- **(4)** All caps must have gasketed seals in good working condition; and,
- **(5)** Vapor recovery adaptors on the storage tanks must seal upon disconnect.

(b) The dates and results of the self-inspections must be recorded.

(c) No later than 15 days after discovery, the owner or operator must take corrective actions to repair, replace, or adjust defective equipment found during any of the following events:

- **(1)** Performance tests;
- **(2)** Routine maintenance checks;
- **(3)** Self-inspections; or,
- **(4)** Agency compliance inspections.

[Adopted 08/17/06; Amended 08/17/19; 02/26/22]

Rule 8.12.6 Recordkeeping Requirements

(a) The following records must be maintained on site for no less than five years from origination, and copies made available to the Agency upon request:

- **(1)** Records of all maintenance and repair activities;
- **(2)** Records of all self-inspections conducted per Rule 8.12.5;
- **(3)** Records of all performance tests required by Rule 8.12.4; and,
- **(4)** Monthly gasoline throughput records.

(b) The following records must be maintained on site for the life of the gasoline dispensing facility or the associated equipment, whichever is earlier:

- **(1)** Any determinations issued by the Agency per Rule 6.1;
- **(2)** Any GDF Notice of Intent to Operate submitted to the Agency per Rule 6.1(b)(3).

[Adopted 08/17/19; Amended 02/26/22]

RULE 8.13 (RESERVED)

RULE 8.14 ADOPTION OF FEDERAL NEW SOURCE PERFORMANCE STANDARDS (NSPS)

(a) The NSPS in 40 CFR Part 60 and its Appendices in effect on the date referenced in ORCAA Rule 1.11 are adopted by reference except for the subparts and sections listed in subsection (4). A current list of adopted federal standards is provided in Appendix A of ORCAA's Regulation.

(1) The term “Administrator” in 40 CFR Part 60 means the Administrator of EPA and the Executive Director of the Agency.

(2) Where EPA has delegated to the Agency the authority to receive reports under 40 CFR Part 60 the affected facility is required to provide such reports only to the Agency, unless otherwise requested in writing by EPA.

(3) This section does not apply to any source operating under a waiver granted by EPA or an exemption granted by the president of the United States.

(4) Exceptions. The following sections and subparts of 40 CRF Part 60 are not adopted:

(i) Subpart B – Adoption and Submittal of State Plans for Designated Facilities;

(ii) Subpart C – Emission Guidelines and Compliance Times;

(iii) Subpart Cb – Large Municipal Waste Combustors that are Constructed on or before September 20, 1994 (Emission Guidelines and Compliance Times);

(iv) Subpart Cc – Municipal Solid Waste Landfills (Emission Guidelines and Compliance Times);

(v) Subpart Cd – Sulfuric Acid Production Units (Emission Guidelines and Compliance Times);

(vi) Subpart Ce – Hospital/Medical/Infectious Waste Incinerators (Emission Guidelines and Compliance Times);

(vii) Subpart S – Primary Aluminum Reduction Plants;

(viii) Subpart BB – Kraft Paper Mills;

(ix) Subpart AAA – New Residential Wood Heaters – as it applies to non-Title V sources;

(x) Subpart BBBB - Small Municipal Waste Combustion Units Constructed on or before August 30, 1999 (Emission Guidelines and Compliance Times);

(xi) Subpart DDDD - Commercial and Industrial Solid Waste Incineration Units that Commenced Construction on or before November 30, 1999 (Emission Guidelines and Compliance Times);

(xii) Subpart FFFF - Emission Guidelines and Compliance Times for Other Solid Waste Incineration Units that Commenced Construction on or before December 9, 2004;

(xiii) Subpart IIII – Standards of Performance for Stationary Compression Ignition Internal Combustion Engines - as it applies to non-Title V sources;

(xiv) Subpart JJJJ – Standards of Performance for Stationary Spark Ignition Internal Combustion Engines - as it applies to non-Title V sources;

(xv) Subpart MMMM - Emission Guidelines and Compliance Times for Existing Sewage Sludge Incineration Units;

(xvi) Subpart QQQQ – Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces - as it applies to non-Title V sources;

(xvii) Subpart UUUU - Emission Guidelines for Greenhouse Gas Emissions and Compliance Times for Electric Utility Generating Units; and,

(xviii) Appendix G - Provisions for an Alternative Method of Demonstrating Compliance with 40 CFR 60.43 for the Newton Power Station of Central Illinois Public Service Company.

[Adopted 08/17/06; Amended 10/29/16; 02/26/22]

RULE 8.15 ADOPTION OF NATIONAL EMISSIONS STANDARDS FOR HAZARDOUS AIR POLLUTANTS (NESHAP)

(a) The NESHAP in 40 CFR Part 61 and its Appendices in effect on the date referenced in ORCAA Rule 1.11 are adopted by reference except for the subparts and sections listed in subsection (4). A current list of adopted federal standards is provided in Appendix A of ORCAA's Regulation.

(1) The term "Administrator" in 40 CFR Part 61 means the Administrator of EPA and the Executive Director of the Agency.

(2) Where EPA has delegated to the Agency the authority to receive reports under 40 CFR Part 61 the affected facility is required to provide such reports only to the Agency, unless otherwise requested in writing by EPA.

(3) This section does not apply to any source operating under a waiver granted by EPA or an exemption granted by the president of the United States.

(4) Exceptions. The following sections and subparts of 40 CFR Part 61 are not adopted:

(i) Subpart B - Radon from Underground Uranium Mines;

(ii) Subpart H - Radionuclide other than Radon from Dept. of Energy Facilities;

(iii) Subpart I - Radionuclide from Federal Facilities other than Nuclear Regulatory Commission Licensees and not covered by Subpart H;

(iv) Subpart K - Radionuclide from Elemental Phosphorus Plants;

(v) Subpart Q - Radon from Dept. of Energy Facilities;

(vi) Subpart R - Radon from Phosphogypsum Stacks;

(vii) Subpart T - Radon from Disposal Uranium Mill Tailings; and,

(viii) Subpart W - Radon from Operating Mill Tailings.

[Adopted 08/17/06; Amended 10/29/16; 02/26/22]

RULE 8.17 ADOPTION OF NATIONAL EMISSIONS STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

(a) The NESHAP for Source Categories in 40 CFR Part 63 and its Appendices in effect on the date referenced in ORCAA Rule 1.11 are adopted by reference except for the subparts and sections listed in subsection (4). A current list of adopted federal standards is provided in Appendix A of ORCAA's Regulation.

(1) The term "Administrator" in 40 CFR Part 63 means the Administrator of EPA and the Executive Director of the Agency.

(2) Where EPA has delegated to the Agency the authority to receive reports under 40 CFR Part 63 the affected facility is required to provide such reports only to the Agency, unless otherwise requested in writing by EPA.

(3) This section does not apply to any source operating under a waiver granted by EPA or an exemption granted by the president of the United States.

(4) Exceptions. The following sections and subparts of 40 CFR Part 63, as they apply to non-Title V sources, are not adopted:

- **(i)** Subpart M - National Perchloroethylene Emission Standards for Dry Cleaning Facilities;
- **(ii)** Subpart LL - National Emission Standard for Hazardous Air Pollutants for Primary Aluminum Reduction Plants;
- **(iii)** Subpart RRR - National Emission Standards for Hazardous Air Pollutants for Secondary Aluminum Production;
- **(iv)** Subpart ZZZZ - Stationary Reciprocating Internal Combustion Engines;
- **(v)** Subpart - BBBBBB National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Distribution Bulk Terminals, Bulk Plants, and Pipeline Facilities;
- **(vi)** Subpart HHHHHH - Paint Stripping and Miscellaneous Surface Coating Operations at Area Sources; and,
- **(vii)** Subpart XXXXXX - Area Source Standards for Nine Metal Fabrication and Finishing Source Categories.

[Adopted 10/29/16; Amended 02/26/22]

RULE 8.18 ADOPTION OF FEDERAL CONSOLIDATED REQUIREMENTS FOR THE SYNTHETIC ORGANIC CHEMICAL MANUFACTURING INDUSTRY

The Consolidated Requirements for the Synthetic Organic Chemical Manufacturing Industry in Section 2.18 of 40 CFR Part 65 in effect on the date referenced in ORCAA Rule 1.11 are adopted by reference.
[Adopted 10/29/16]

APPENDIX A - ADOPTED FEDERAL REGULATIONS AND STANDARDS

40 CFR Part 60 - Standards of Performance for New Stationary Sources

Subpart A	General Provisions
Subpart D	Fossil-Fuel-Fired Steam Generators for which Construction is Commenced after August 17, 1971
Subpart Da	Electric Utility Steam Generating Units for which Construction is Commenced after September 18, 1978
Subpart Db	Industrial-Commercial-Institutional Steam Generating Units
Subpart Dc	Small Industrial-Commercial-Institutional Steam Generating Units
Subpart E	Incinerators
Subpart Ea	Municipal Waste Combustors for which Construction is Commenced after December 20, 1989 and on or before September 20, 1994
Subpart Eb	Large Municipal Waste Combustors
Subpart Ec	Hospital/Medical/Infectious Waste Incinerators
Subpart F	Portland Cement Plants
Subpart G	Nitric Acid Plants
Subpart Ga	Nitric Acid Plants for which Construction, Reconstruction, or Modification Commenced after October 14, 2011
Subpart H	Sulfuric Acid Plants
Subpart I	Hot Mix Asphalt Facilities
Subpart J	Petroleum Refineries
Subpart Ja	Petroleum Refineries for which Construction, Reconstruction, or Modification Commenced After May 14, 2007
Subpart K	Storage Vessels for Petroleum Liquids for which Construction, Reconstruction, or Modification Commenced after June 11, 1973 and prior to May 19, 1978
Subpart Ka	Storage Vessels for Petroleum Liquids for which Construction, Reconstruction, or Modification Commenced after May 18, 1978 and prior to July 23, 1984
Subpart Kb	VOC Liquid Storage Vessels (including Petroleum Liquid Storage Vessels) for which Construction, Reconstruction, or Modification Commenced after July 23, 1984
Subpart L	Secondary Lead Smelters
Subpart M	Secondary Brass and Bronze Production Plants
Subpart N	Primary Emissions from Basic Oxygen Process Furnaces for which Construction is Commenced after June 11, 1973
Subpart Na	Secondary Emissions from Basic Oxygen Process Steel-making Facilities for which Construction is Commenced after January 20, 1983
Subpart O	Sewage Treatment Plants
Subpart P	Primary Copper Smelters
Subpart Q	Primary Zinc Smelters
Subpart R	Primary Lead Smelters
Subpart T	Phosphate Fertilizer Industry: Wet Process Phosphoric Acid Plants

Subpart U	Phosphate Fertilizer Industry: Superphosphoric Acid Plants
Subpart V	Phosphate Fertilizer Industry: Diammonium Phosphate Plants
Subpart W	Phosphate Fertilizer Industry: Triple Superphosphate Plants
Subpart X	Phosphate Fertilizer Industry: Granular Triple Superphosphate Storage Facilities
Subpart Y	Coal Preparation Plants
Subpart Z	Ferroalloy Production Facilities
Subpart AA	Steel Plants: Electric Arc Furnaces Constructed after October 21, 1974 and on or before August 17, 1983
Subpart AAa	Steel Plants: Electric Arc Furnaces and Argon-Oxygen Decarburization Vessels Constructed after August 7, 1983
Subpart CC	Glass Manufacturing Plants
Subpart DD	Grain Elevators
Subpart EE	Surface Coating of Metal Furniture
Subpart GG	Stationary Gas Turbines
Subpart HH	Lime Manufacturing Plants
Subpart KK	Lead-Acid Battery Manufacturing Plants
Subpart LL	Metallic Mineral Processing Plants
Subpart MM	Automobile and Light Duty Truck Surface Coating Operations
Subpart NN	Phosphate Rock Plants
Subpart PP	Ammonium Sulfate Manufacture
Subpart QQ	Graphic Arts Industry: Publication Rotogravure Printing
Subpart RR	Pressure Sensitive Tape and Label Surface Coating Standards
Subpart SS	Industrial Surface Coating: Large Appliances
Subpart TT	Metal Coil Surface Coating
Subpart UU	Asphalt Processing and Asphalt Roof Manufacture
Subpart VV	Equipment Leaks of VOC in Synthetic Organic Chemical Manufacturing Industry
Subpart VVa	Equipment Leaks of VOC in Synthetic Organic Chemical Manufacturing Industry for which Construction, Reconstruction, or Modification Commenced After November 7, 2006
Subpart WW	Beverage Can Surface Coating Industry
Subpart XX	Bulk Gasoline Terminals
Subpart AAA	New Residential Wood Heaters – Title V sources only
Subpart BBB	Rubber Tire Manufacturing Industry
Subpart DDD	VOC Emissions from Polymer Manufacturing Industry
Subpart FFF	Flexible Vinyl and Urethane Coating and Printing
Subpart GGG	Equipment Leaks of VOC in Petroleum Refineries
Subpart GGGa	Equipment Leaks of VOC in Petroleum Refineries for which Construction, Reconstruction, or Modification Commenced After January 4, 1983, And On Or Before November 7, 2006

Subpart HHH	Synthetic Fiber Production Facilities
Subpart III	VOC Emissions from Synthetic Organic Chemical Manufacturing Industry Air Oxidation Unit Processes
Subpart JJJ	Petroleum Dry Cleaners
Subpart KKK	Equipment Leaks of VOC from Onshore Natural Gas Processing Plants
Subpart LLL	Onshore Natural Gas Processing: SO2Emissions
Subpart NNN	VOC Emissions from Synthetic Organic Chemical Manufacturing Industry Distillation Operations
Subpart OOO	Nonmetallic Mineral Processing Plants
Subpart PPP	Wool Fiberglass Insulation Manufacturing Plants
Subpart QQQ	VOC Emissions from Petroleum Refinery Wastewater Systems
Subpart RRR	VOCs from Synthetic Organic Chemical Manufacturing Industry Reactor Processes
Subpart SSS	Magnetic Tape Coating Facilities
Subpart TTT	Industrial Surface Coating: Surface Coating of Plastic Parts for Business Machines
Subpart UUU	Calciners and Dryers in Mineral Industries
Subpart VVV	Polymeric Coating of Supporting Substrates Facilities
Subpart WWW	Municipal Solid Waste Landfills
Subpart AAAA	Small Municipal Waste Combustion Units for which Construction is Commenced after August 30, 1999 or for which Modification or Reconstruction is Commenced after June 6, 2001
Subpart CCCC	Commercial and Industrial Solid Waste Incineration Units for which Construction is Commenced after November 30, 1999 or for which Modification or Reconstruction is Commenced on or after June 1, 2001
Subpart EEEE	Standards of Performance for Other Solid Waste Incineration Units for Which Construction is Commenced After December 9, 2004, or for Which Modification or Reconstruction is Commenced on or After June 16, 2006
Subpart IIII	Standards of Performance for Stationary Compression Ignition Internal Combustion Engines – Title V sources only.
Subpart JJJJ	Standards of Performance for Stationary Spark Ignition Internal Combustion Engines – Title V sources only.
Subpart KKKK	Standards of Performance for Stationary Combustion Turbines
Subpart LLLL	Standards of Performance for New Sewage Sludge Incineration Units
Subpart OOOO	Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution
Subpart QQQQ	Standards of Performance for New Residential Hydronic Heaters and Forced-Air Furnaces – Title V sources only.
Subpart TTTT	Standards of Performance for Greenhouse Gas Emissions for Electric Generating Units

40 CFR Part 60	Appendix A
40 CFR Part 60	Appendix B
40 CFR Part 60	Appendix C
40 CFR Part 60	Appendix D
40 CFR Part 60	Appendix F
40 CFR Part 60	Appendix I

40 CFR Part 61 – National Emission Standards for Hazardous Air Pollutants

Subpart A	General Provisions
Subpart C	Beryllium
Subpart D	Beryllium Rocket Motor Firing
Subpart E	Mercury
Subpart F	Vinyl Chloride
Subpart J	Equipment Leaks of Benzene
Subpart L	Benzene from Coke By-Product Recovery Plants
Subpart M	Asbestos
Subpart N	Inorganic Arsenic from Glass Manufacturing Plants
Subpart O	Inorganic Arsenic from Primary Copper Smelters
Subpart P	Inorganic Arsenic emissions from Arsenic Trioxide and Metallic Arsenic Production Facilities
Subpart V	Equipment Leaks (Fugitive Sources)
Subpart Y	Benzene from Benzene Storage Vessels
Subpart BB	Benzene from Benzene Transfer Operations
Subpart FF	Benzene Waste Operations
40 CFR Part 61	Appendix A
40 CFR Part 61	Appendix B
40 CFR Part 61	Appendix C
40 CFR Part 61	Appendix D
40 CFR Part 61	Appendix E

40 CFR Part 63 – National Emission Standards for Hazardous Air Pollutants for Source Categories

Subpart A	General Provisions
Subpart B	Requirements for Control Technology Determinations for Major Sources in Accordance with Clean Air Act Sections, Sections 112(g) and 112(j)
Subpart C	List of Hazardous Air Pollutants, Petition Process, Lesser Quantity Designations, Source Category List
Subpart D	Regulations Governing Compliance Extensions for Early Reductions of Hazardous Air Pollutants
Subpart F	National Emission Standards for Organic Hazardous Air Pollutants from the Synthetic Organic Chemical Manufacturing Industry
Subpart G	National Emission Standards for Organic Hazardous Air Pollutants from the Synthetic Organic Chemical Manufacturing Industry Process Vents, Storage Vessels, Transfer Operations, and Wastewater

Subpart H	National Emission Standards for Organic Hazardous Air Pollutants for Equipment Leaks
Subpart I	National Emission Standards for Organic Hazardous Air Pollutants for Certain Processes Subject to the Negotiated Regulation for Equipment Leaks
Subpart J	National Emission Standards for Hazardous Air Pollutants for Polyvinyl Chloride and Copolymers Production
Subpart L	National Emission Standards for Coke Oven Batteries
Subpart M	National Perchloroethylene Air Emission Standards for Dry Cleaning Facilities – Title V sources only.
Subpart N	National Emission Standards for Chromium Emissions from Hard and Decorative Chromium Electroplating and Chromium Anodizing Tanks
Subpart O	Ethylene Oxide Emissions Standards for Sterilization Facilities
Subpart Q	National Emission Standards for Hazardous Air Pollutants for Industrial Process Cooling Towers
Subpart R	National Emission Standards for Gasoline Distribution Facilities (Bulk Gasoline Terminals and Pipeline Breakout Stations)
Subpart S	National Emission Standards for Hazardous Air Pollutants from the Pulp and Paper Industry
Subpart T	National Emission Standards for Halogenated Solvent Cleaning
Subpart U	National Emission Standards for Hazardous Air Pollutant Emissions: Group I Polymers and Resins
Subpart W	National Emission Standards for Hazardous Air Pollutants for Epoxy Resins Production and Non-Nylon Polyamides Production
Subpart X	National Emission Standards for Hazardous Air Pollutants from Secondary Lead Smelting
Subpart Y	National Emission Standards for Marine Tank Vessel Loading Operations
Subpart AA	National Emission Standards for Hazardous Air Pollutants from Phosphoric Acid Manufacturing Plants
Subpart BB	National Emission Standards for Hazardous Air Pollutants from Phosphate Fertilizers Production Plants
Subpart CC	National Emission Standards for Hazardous Air Pollutants from Petroleum Refineries
Subpart DD	National Emission Standards for Hazardous Air Pollutants from Off-Site Waste and Recovery Operations
Subpart EE	National Emission Standards for Magnetic Tape Manufacturing Operations
Subpart GG	National Emission Standards for Aerospace Manufacturing and Rework Facilities
Subpart HH	National Emission Standards for Hazardous Air Pollutants from Oil and Natural Gas Production Facilities
Subpart II	National Emission Standards for Shipbuilding and Ship

	Repair (Surface Coating)
Subpart JJ	National Emission Standards for Wood Furniture Manufacturing Operations
Subpart KK	National Emission Standard for the Printing and Publishing Industry
Subpart MM	National Emission Standard for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills
Subpart OO	National Emission Standards for Tanks -Level 1
Subpart PP	National Emission Standards for Containers
Subpart QQ	National Emission Standards for Surface Impoundments
Subpart RR	National Emission Standards for Individual Drain Systems
Subpart SS	National Emission Standards for Closed Vent Systems, Control Devices, Recovery Devices and Routing to a Fuel Gas System or a Process
Subpart TT	National Emission Standards for Equipment Leaks - Control Level 1
Subpart UU	National Emission Standards for Equipment Leaks - Control Level 2 Standards
Subpart VV	National Emission Standards for Oil-Water Separators and Organic-Water Separators
Subpart WW	National Emission Standards for Storage Vessels (Tanks) -Control Level 2
Subpart XX	National Emission Standards for Ethylene Manufacturing Process Units: Heat Exchange Systems and Waste Operations
Subpart YY	National Emission Standards for Hazardous Air Pollutants for Source Categories: Generic Maximum Achievable Control Technology Standards
Subpart CCC	National Emission Standards for Hazardous Air Pollutants for Steel Pickling--HCl Process Facilities and Hydrochloric Acid Regeneration Plants
Subpart DDD	National Emission Standards for Hazardous Air Pollutants for Mineral Wool Production
Subpart EEE	National Emission Standard for Hazardous Air Pollutants from Hazardous Waste Combustors
Subpart GGG	National Emission Standards Pharmaceuticals Production
Subpart HHH	National Emission Standards for Hazardous Air Pollutants from Natural Gas Transmission and Storage Facilities
Subpart III	National Emission Standards for Hazardous Air Pollutants for Flexible Polyurethane Foam Production
Subpart JJJ	National Emission Standard for Hazardous Air Pollutant Emissions: Group IV Polymers and Resins
Subpart LLL	National Emission Standards for Hazardous Air Pollutants from the Portland Cement Manufacturing Industry
Subpart MMM	National Emission Standards for Hazardous Air Pollutants for Pesticide Active Ingredient Production
Subpart NNN	National Emission Standards for Hazardous Air Pollutants

	for Wool Fiberglass Manufacturing
Subpart OOO	National Emission Standards for Hazardous Air Pollutants Emissions: Manufacture of Amino/Phenolic Resins
Subpart PPP	National Emission Standards for Hazardous Air Pollutants Emissions for Polyether Polyols Production
Subpart QQQ	National Emission Standards for Hazardous Air Pollutants for Primary Copper Smelting
Subpart RRR	National Emission Standards for Hazardous Air Pollutants for Secondary Aluminum Production – Title V sources only.
Subpart TTT	National Emission Standards for Hazardous Air Pollutants for Primary Lead Smelting
Subpart UUU	National Emission Standards for Hazardous Air Pollutants for Petroleum Refineries: Catalytic Cracking Units, Catalytic Reforming Units, and Sulfur Recovery Units.
Subpart VVV	National Emission Standard for Hazardous Air Pollutants: Publicly Owned Treatment Works
Subpart XXX	National Emission Standards for Hazardous Air Pollutants for Ferroalloys Production: Ferromanganese and Silicomanganese
Subpart AAAA	National Emission Standard for Hazardous Air Pollutants: Municipal Solid Waste Landfills
Subpart CCCC	National Emission Standard for Hazardous Air Pollutants: Manufacturing of Nutritional Yeast
Subpart DDDD	National Emission Standard for Hazardous Air Pollutants: Plywood and Composite Wood Products
Subpart EEEE	National Emission Standard for Hazardous Air Pollutants: Organic Liquids Distribution (Non-Gasoline)
Subpart FFFF	National Emission Standard for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing
Subpart GGGG	National Emission Standard for Hazardous Air Pollutants: Solvent Extractions for Vegetable Oil Production
Subpart HHHH	National Emission Standard for Hazardous Air Pollutants for Wet-Formed Fiberglass Mat Production
Subpart IIII	National Emission Standard for Hazardous Air Pollutants: Surface Coating of Automobiles and Light-Duty Trucks
Subpart JJJJ	National Emission Standard for Hazardous Air Pollutants: Paper and Other Web Coating
Subpart KKKK	National Emission Standard for Hazardous Air Pollutants: Surface Coating of Metal Cans
Subpart MMMM	National Emission Standard for Hazardous Air Pollutants for Surface Coating of Miscellaneous Metal Parts and Products
Subpart NNNN	National Emission Standard for Hazardous Air Pollutants: Surface Coating of Large Appliances
Subpart OOOO	National Emission Standard for Hazardous Air Pollutants: Printing, Coating, and Dyeing of Fabrics and Other Textiles

Subpart PPPP	National Emission Standards for Hazardous Air Pollutants for Surface Coating of Plastic Parts and Products
Subpart QQQQ	National Emission Standard for Hazardous Air Pollutants: Surface Coating of Wood Building Products
Subpart RRRR	National Emission Standard for Hazardous Air Pollutants: Surface Coating of Metal Furniture
Subpart SSSS	National Emission Standard for Hazardous Air Pollutants: Surface Coating of Metal Coil
Subpart TTTT	National Emission Standard for Hazardous Air Pollutants for Leather Finishing Operations
Subpart UUUU	National Emission Standard for Hazardous Air Pollutants for Cellulose Products Manufacturing
Subpart VVVV	National Emission Standard for Hazardous Air Pollutants for Boat Manufacturing
Subpart WWWW	National Emission Standard for Hazardous Air Pollutants: Reinforced Plastic Composites Production
Subpart XXXX	National Emission Standard for Hazardous Air Pollutants: Rubber Tire Manufacturing
Subpart YYYY	National Emission Standard for Hazardous Air Pollutants for Stationary Combustion Turbines
Subpart ZZZZ	National Emission Standard for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines – Title V sources only.
Subpart AAAAA	National Emission Standard for Hazardous Air Pollutants for Lime Manufacturing Plants
Subpart BBBBB	National Emission Standard for Hazardous Air Pollutants for Semiconductor Manufacturing
Subpart CCCCC	National Emission Standard for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks
Subpart DDDDD	National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters
Subpart EEEEE	National Emission Standard for Hazardous Air Pollutants for Iron and Steel Foundries
Subpart FFFFF	National Emission Standard for Hazardous Air Pollutants for Integrated Iron and Steel Manufacturing Facilities
Subpart GGGGG	National Emission Standard for Hazardous Air Pollutants: Site Remediation
Subpart HHHHH	National Emission Standard for Hazardous Air Pollutants: Miscellaneous Coating Manufacturing
Subpart IIIII	National Emission Standard for Hazardous Air Pollutants: Mercury Emissions from Mercury Cell Chlor-Alkali Plants
Subpart JJJJJ	National Emission Standard for Hazardous Air Pollutants for Brick and Structural Clay Products Manufacturing
Subpart KKKKK	National Emission Standard for Hazardous Air Pollutants for Clay Ceramics Manufacturing
Subpart LLLLL	National Emission Standard for Hazardous Air Pollutants: Asphalt Processing and Asphalt Roofing Manufacturing

Subpart MMMMM	National Emission Standard for Hazardous Air Pollutants: Flexible Polyurethane Foam Fabrication Operations
Subpart NNNNN	National Emission Standard for Hazardous Air Pollutants: Hydrochloric Acid Production
Subpart PPPPP	National Emission Standard for Hazardous Air Pollutants for Engine Test Cells/Stands
Subpart QQQQQ	National Emission Standard for Hazardous Air Pollutants for Friction Materials Manufacturing Facilities
Subpart RRRRR	National Emission Standard for Hazardous Air Pollutants: Taconite Iron Ore Processing
Subpart SSSSSS	National Emission Standard for Hazardous Air Pollutants for Refractory Products Manufacturing
Subpart TTTTT	National Emission Standard for Hazardous Air Pollutants for Primary Magnesium Refining
Subpart UUUUU	National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units
Subpart WWWWW	National Emission Standards for Hospital Ethylene Oxide Sterilizers
Subpart YYYYY	National Emission Standard for Hazardous Air Pollutants for Area/Sources: Electric Arc Furnace Steelmaking Facilities
Subpart ZZZZZ	National Emission Standard for Hazardous Air Pollutants for Iron and Steel Foundries Area Sources
Subpart BBBBBB	National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Distribution Bulk Terminals, Bulk Plants, and Pipeline Facilities – Title V sources only.
Subpart CCCCCC	National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Dispensing Facilities
Subpart DDDDDD	National Emission Standards for Hazardous Air Pollutants for Polyvinyl Chloride and Copolymers Production Area Sources
Subpart EEEEEE	National Emission Standards for Hazardous Air Pollutants for Primary Copper Smelting Area Sources
Subpart FFFFFF	National Emission Standards for Hazardous Air Pollutants for Secondary Copper Smelting Area Sources
Subpart GGGGGG	National Emission Standards for Hazardous Air Pollutants for Primary Nonferrous Metals Area Sources—Zinc, Cadmium, and Beryllium
Subpart HHHHHH	National Emission Standards for Hazardous Air Pollutants: Paint Stripping and Miscellaneous Surface Coating Operations at Area Sources – Title V sources only.
Subpart JJJJJJ	National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers Area Sources
Subpart LLLLLL	National Emission Standards for Hazardous Air Pollutants for Acrylic and Modacrylic Fibers Production Area Sources
Subpart MMMMMM	National Emission Standards for Hazardous Air Pollutants for Carbon Black Production Area Sources

Subpart NNNNNN	National Emission Standards for Hazardous Air Pollutants for Chemical Manufacturing Area Sources: Chromium Compounds
Subpart OOOOOO	National Emission Standards for Hazardous Air Pollutants for Flexible Polyurethane Foam Production and Fabrication Area Sources
Subpart PPPPPP	National Emission Standards for Hazardous Air Pollutants for Lead Acid Battery Manufacturing Area Sources
Subpart QQQQQQ	National Emission Standards for Hazardous Air Pollutants for Wood Preserving Area Sources
Subpart RRRRRR	National Emission Standards for Hazardous Air Pollutants for Clay Ceramics Manufacturing Area Sources
Subpart SSSSSS	National Emission Standards for Hazardous Air Pollutants for Glass Manufacturing Area Sources
Subpart TTTTTT	National Emission Standards for Hazardous Air Pollutants for Secondary Nonferrous Metals Processing Area Sources
Subpart VVVVVV	National Emission Standards for Hazardous Air Pollutants for Chemical Manufacturing Area Sources
Subpart WWWWWW	National Emission Standards for Hazardous Air Pollutants: Area Source Standards for Plating and Polishing Operations
Subpart XXXXXX	National Emission Standards for Hazardous Air Pollutants Area Source Standards for Nine Metal Fabrication and Finishing Source Categories – Title V sources only.
Subpart YYYYYY	National Emission Standards for Hazardous Air Pollutants for Area Sources: Ferroalloys Production Facilities
Subpart ZZZZZZ	National Emission Standards for Hazardous Air Pollutants Area Source Standards for Aluminum, Copper, and Other Nonferrous Foundries
Subpart AAAAAAA	National Emission Standards for Hazardous Air Pollutants for Area Sources: Asphalt Processing and Asphalt Roofing Manufacturing
Subpart BBBBBBB	National Emission Standards for Hazardous Air Pollutants for Area Sources: Chemical Preparations Industry
Subpart CCCCCCC	National Emission Standards for Hazardous Air Pollutants for Area Sources: Paints and Allied Products Manufacturing
Subpart DDDDDDD	National Emission Standards for Hazardous Air Pollutants: Area Source Standards for Prepared Feeds Manufacturing
Subpart EEEEEEE	National Emission Standards for Hazardous Air Pollutants: Gold Mine Ore Processing and Production Area Source Category
Subpart HHHHHHH	National Emission Standards for Hazardous Air Pollutant Emissions for Polyvinyl Chloride and Copolymers Production
40 CFR Part 63	Appendix A
40 CFR Part 63	Appendix B

40 CFR Part 63	Appendix C
40 CFR Part 63	Appendix D
40 CFR Part 63	Appendix E
Section 2.18 of 40 CFR Part 65	Consolidated Requirements for the Synthetic Organic Chemical Manufacturing Industry.

1. INTRODUCTION

Enviva Pellets Lucedale, LLC (Enviva) is proposing to construct a greenfield wood pellet manufacturing plant (referred to herein as "the Lucedale plant" or "the plant") in Lucedale, George County, Mississippi. It should be noted that on May 20, 2014, Green Circle Energy, Inc (Green Circle) received Construction Permit No. 0840-00022 authorizing construction of a proposed greenfield wood pellet manufacturing plant at the Lucedale site. This construction permit was transferred to Enviva on November 20, 2015; however, construction on the new plant was never initiated by Enviva or Green Circle. On June 16, 2017, Enviva submitted a request to Mississippi Department of Environmental Quality (MDEQ) to revoke Construction Permit No. 0840-00022. Since that time, business conditions have changed and Enviva is now re-starting the permitting process for a new construction permit for the Lucedale plant. The proposed new Lucedale plant will be designed to produce approximately 1,420,500 oven dried tons (ODT) per year of wood pellets utilizing up to 85% softwood. Construction will be completed in two phases with the initial construction phase allowing production of approximately 781,300 ODT per year. The second construction phase will be implemented within 18 months of completing the first construction phase and will allow the facility to achieve the final production capacity of approximately 1,420,500 ODT per year. The plant will include a Log Chipper, Bark Hog, Debarker, Green Screen, Green Hammermills, Rotary Dryers, Dry Hammermills, Pellet Presses and Coolers, product loadout operations and other ancillary activities.

The Lucedale plant will be a major source with respect to the Title V Operating Permit Program because facility-wide potential emissions of one or more criteria pollutants will exceed the major source threshold of 100 tons per year (tpy). Furthermore, the plant will be a major source of hazardous air pollutants (HAP) due to potential total HAP emissions and maximum individual HAP emissions above the major source thresholds of 25 tpy, and 10 tpy, respectively. However, the Lucedale plant will be a minor source with respect to the New Source Review (NSR) permitting programs because facility-wide potential emissions of all regulated pollutants will be below the major source threshold of 250 tpy.

Enviva is submitting this application for a State Permit to Construct to the Mississippi Department of Environmental Quality (MDEQ) Environmental Permits Division (EPD) in accordance with Title 11 of the Mississippi Administrative Code (Miss. Admin. Code) Part (Pt.) 2 Chapter (Ch.) 2 Rule (R.) 2.1.D. A description of the process is provided in Section 2 and methodologies used to quantify potential emissions are summarized in Section 3. Section 4 describes the applicability of federal and state permitting programs. Section 5 includes a detailed applicability analysis of both federal and state regulations.

2. PROCESS DESCRIPTION

Enviva manufactures wood pellets for use as a renewable fuel for energy generation and industrial customers. Enviva's customers use wood pellets in place of coal, significantly reducing emissions of pollutants such as lifecycle carbon dioxide (CO_2)/greenhouse gases (GHG), mercury (Hg), arsenic (As), and lead (Pb). The company is dedicated to improving the environmental profile of energy generation while promoting sustainable forestry in the southeastern United States. Enviva holds certifications from the Forest Stewardship Council (FSC), Sustainable Forestry Initiative (SFI), Programme for the Endorsement of Forest Certification (PEFC), and Sustainable Biomass Program (SBP). Enviva requires that all suppliers adhere to state-developed "Best Management Practices" (BMPs) in their activities to protect water quality and sensitive ecosystems. In addition, Enviva is implementing an industry leading "track and trace" system to further ensure that all fiber resources come from responsible harvests. Enviva pays particular attention to: land use change, use and effectiveness of BMPs, wetlands, biodiversity, and certification status. All of this combined ensures that Enviva's forestry activities contribute to healthy forests both today and in the future.[1] The following process description details the proposed operations at the Lucedale plant.

Wood fiber (round wood, green wood chips, bark, and dry shavings) will be delivered to the Lucedale plant via trucks where it will then be unloaded and stored. The plant will include three (3) chip truck dumps (ID# AA-004, Greenwood Handling Operations), one (1) bark truck dump (ID# Insignificant Activity, Bark Handling Operations), and one (1) dry shavings truck dump (ID # AA-021, Dry Shavings Handling). Round wood will be stored as whole logs and will be debarked (ID# AA-001, Debarker) and chipped (ID# AA-002, Log Chipping), as needed. Bark from the Debarker and purchased bark will be transferred to the Bark Hog (ID# AA-003, Bark Hog) via conveyor for further processing, after which it will be transferred to the Bark Storage Pile (ID# Insignificant Activity, Bark Storage Pile) via conveyor.[2] The bark removed from the round wood, along with purchased bark, will be used as fuel for the dryer furnaces. Conveyors will transport wood chips and fuel to the dryers and furnaces, respectively.[3]

Dry shavings, largely composed of wood planer shavings and sawdust, will be delivered by truck to the plant's dry shavings truck dump. From the dry shavings truck dump, the dry shavings will be transferred to the Dry Shavings Silo (ID# AA-020, Dry Shavings Silo) via an enclosed conveyor and bucket elevator. As the dry shavings will already be dried, they will bypass the dryers. The Dry Shavings Silo will be equipped with a baghouse for control of particulate matter (PM) emissions resulting from air displaced during silo loading.

The Lucedale plant will include three (3) Dryer lines (ID#s AA-007, AA-010, and AA-013, Wood-fired Direct Heat Drying System Nos. 1, 2, and 3), each consisting of a bark-fired furnace and a rotary drum dryer. The maximum design heat input rate of each dryer will be

[1] A detailed description of Enviva's Responsible Wood Supply Program can be found at: http://www.envivabiomass.com/sustainability/wood-sourcing/responsible-wood-supply-program/

[2] Bark handling and storage is considered an insignificant activity per 11 Miss. Admin. Code Pt. 2 Ch. 6 R. 6.7.B(13).

[3] Bark will be transferred from the Bark Fuel Storage Pile via a walking floor to a covered conveyor and then to the fully enclosed Bark Fuel Bin. Due to complete enclosure of the Bark Feed Bin, no emissions are expected from transfer of material into the bin.

168 million British thermal units per hour (MMBtu/hr). The products of combustion from each furnace will directly exhaust to the rotary drum dryers, which will dry wood chips conveyed from the Green Wood Storage Pile (ID# AA-006, Green Wood Storage Pile). Prior to drying, the chips will be processed by a Green Screen (ID# AA-005, Green Screen) and three (3) Green Hammermills (ID#s AA-007 and AA-010, Green Hammermills) as needed to ensure proper size.

From the dryers, an induced draft will carry all dried chips and hot air to high efficiency material handling cyclones to remove the wood fiber. The dryer is designed to recirculate a portion of the exhaust gas to improve fuel and drying efficiency and reduce emissions. The non-recirculated portion of each dryer exhaust will flow through a wet electrostatic precipitator (WESP) and a regenerative thermal oxidizer (RTO) (ID# AA-007, AA-010, and AA-013, WESP/RTO Nos. 1, 2, and 3), then out a stack to the atmosphere. Each dryer line will have a dedicated WESP and RTO. The RTO burners will combust natural gas, with propane as a back-up fuel. The Green Hammermills will be part of a closed loop system that will exhaust to the WESP and RTO on Dryer Line 1. In the event Dryer Line 1 is not operational, the exhaust will be routed to the WESP and RTO on Dryer Line 2.

As the flue gas exits the dryer and begins to cool, wood tar can condense and coat the inner walls of the dryer ducts creating a fire risk. In order to prevent condensation from occurring and thus reduce the fire risk, the two (2) ducts (herein referred to as double ducts) on each dryer system will be heated. The duct from the cyclone outlet to the ID fan will be heated by one (1) low-NO_x burner with a maximum heat input rating of 1 MMBtu/hr and a second 1 MMBtu/hr low-NO_x burner will be used to heat the duct used for exhaust gas recirculation and the WESP. The burners will combust natural gas, or propane as back-up, and will exhaust to the WESPs and RTOs (ID# AA-007, AA-010, and AA-013, WESP/RTO Nos. 1, 2, and 3).[4]

Bypass stacks for each furnace (ID# AA-009, AA-012, AA-015, Furnace Bypass Stacks) and rotary drum dryer (ID# AA-008, AA-011, AA-014, Dryer Bypass Stacks) will be used to exhaust hot gases during start-ups (for temperature control), shutdowns, and malfunctions. Specifically, the Furnace Bypass Stacks will be used in the following situations:

- **Cold Start-ups:** The furnace bypass stacks will be used when the furnace is started up from a cold shutdown until the refractory is sufficiently heated and can sustain operations at a low level. The bypass stack will then be closed and the furnace will slowly be brought up to a normal operating rate.
- **Malfunction:** The furnace itself can abort and open the bypass stack in the event of a malfunction. This may be caused by failsafe interlocks associated with the furnace or dryer and emissions control systems as well as utility supply systems (i.e., electricity, compressed air, water/fire protection). As soon as the furnace aborts it will automatically switch to "idle mode" (defined as operation at up to a maximum heat input rate of 5 MMBtu/hr). The fuel feed is stopped and the heat input rate drops rapidly.

[4] Combustion units with a rated input capacity less than 10 MMBtu/hr that are fueled by liquefied petroleum gas or natural gas supplied by a public utility are considered insignificant per 11 Miss. Admin. Code Pt. 2, Ch. 6 R. 6.7.B(2)

- **Planned Shutdown:** In the event of a planned shutdown the furnace heat input will be decreased and all remaining fuel will be moved through the system to prevent a fire. The remaining fuel will be combusted prior to opening the furnace bypass stack.

Conditions under which the Dryer Bypass Stacks will be used are as follows:

- **Malfunction:** The dryer system can abort due to power failure, equipment failure, or as a result of a furnace abort. If the RTO goes offline as a result of interlock failure, the dryer will immediately abort. This can occur if the dryer temperature is out of range or as a result of equipment or power failure. Dryer abort will also be triggered if a spark is detected.
- **Planned Shutdown:** During planned shutdowns, as the remaining fuel is combusted by the furnace, the Operator will reduce the chip input to the dryer. When only a small amount of chips remain, these will be emptied to clean the dryer drum out. The dryer bypass stack will then be opened and a purge air fan used to ensure no explosive build-up occurs in the drum. Emissions during this time will be minimal as the furnace and dryer are no longer operating.

Use of the Furnace and Dryer Bypass Stacks for start-up, shutdown, and malfunctions will not exceed 100 hours per year for each dryer line at full operating capacity (i.e., 50 hours of furnace bypass at full capacity and 50 hours of dryer bypass at full capacity).

Each furnace may also operate up to 500 hours per year in "idle mode" with emissions routed to the Furnace Bypass Stacks. The purpose of operation in "idle mode" is to maintain the temperature of the fire brick lining the furnaces which may be damaged if it cools too rapidly. Operation in "idle mode" also significantly reduces the amount of time required to restart the dryers.

Emissions from Furnace and Dryer start-up, shutdown and malfunctions, and emissions from Furnace idle mode operations, are quantified and included in maximum allowable emissions presented in this permit application.

The Lucedale plant will include two (2) pelletizing lines, each consisting of twenty-four (24) Dry Hammermills, twelve (12) Pellet Mills, and six (6) Pellet Coolers. Dried wood chips will be stored in the Dry Hammermill Feed Silo and dry shavings in the Dry Shavings Silo (ID# AA-020) prior to being processed by the Dry Hammermills (ID# AA-016, AA-017, Forty-Eight Dry Hammermills). The Dry Hammermills will reduce the dry wood chips to under 4 mm (0.16") in size. From the Dry Hammermills, the processed wood fiber will be conveyed to a Pellet Mill Feed Silo which will be kept under negative pressure by aspiration systems. These aspiration systems will be routed to a wet scrubber and regenerative catalytic oxidizer (RCO) (ID# AA-016, Wet Scrubber-1/RCO-1). The Dry Hammermill Feed Silo, Pellet Mill Feed Silo, and all associated conveyors and transfer points will be sealed and kept under negative pressure.

Aspiration systems will be used to remove heated moist air from the Dry Hammermills, Pellet Mills, and Pellet Coolers. These aspiration systems will be routed to high efficiency material handling cyclones and then to wet scrubbers and RCOs for control of PM, HAP, and volatile organic compounds (VOC). Emissions from Pelletizing Lines 1 and 2 will be controlled by two (2) wet scrubbers and two (2) RCOs. Wet Scrubber-1/RCO-1 (ID# AA-016) will control emissions from thirty-two (32) Dry Hammermills, sixteen (16) Pellet Mills, and eight (8) Pellet Coolers. Wet Scrubber-2/RCO-2 (ID# AA-017) will control emissions from sixteen (16)

Dry Hammermills, eight (8) Pellet Mills, and four (4) Pellet Coolers. The RCO burners will combust natural gas, with propane as a back-up fuel.

Processed wood from the Pellet Mill Feed Silo will be conveyed to the Pellet Mills where wood fiber will be compressed by rotating press rollers and will exit through a sizing die. Heat from the friction of compressing the wood through the die activates wood lignin in the fiber which effectively bonds the material into a durable pellet. No resin or chemical binder will be used in the process. A dry powder additive may be used which acts as a lubricant for the dies. This additive would be added to sized wood from the Dry Hammermills prior to transfer to the Pellet Presses. The dry powder contains no hazardous chemicals or VOC materials. It will be delivered by truck and pneumatically loaded into an Additive Storage Silo (ID# AA-019, Additive Handling and Storage) which will be equipped with a baghouse to control PM emissions from air displaced during silo loading. The additive will then be conveyed via screw conveyor from the Additive Storage Silo to the milled fiber conveyor which will transfer milled wood to the Pellet Presses.

Pellets exiting the Pellet Mills will be gravity fed to counter air flow Pellet Coolers. From the Pellet Coolers, pellets will be conveyed to two (2) storage bins (ID# AA-018, Finished Product Handling and Pellet Loadout Bins) located above the railcar loading area. The bins will provide approximately one hour of pellet storage and uniformly meter out the pellets for railcar loading. All conveyors will be sealed with dust aspiration air directed to a baghouse. A slight negative pressure will be maintained in the loadout building as a fire prevention measure to prevent any build-up of dust on surfaces within the building. This slight negative pressure will be produced via an induced draft fan that will exhaust to the Finished Product Handling baghouse (ID# AA-018).

The Lucedale plant will also include one (1) 131 horsepower (hp) diesel-fired fire water pump (ID# AA-023, 131 hp Diesel-fired Fire Water Pump) and associated 185 gallon diesel fuel storage tank (ID# Insignificant Activity, 185 Gallon Diesel Storage Tank), one (1) 500 kilowatt (kW) diesel-fired emergency generator (ID# AA-022, 500 kW Diesel-Fired Emergency Generator) and associated 500 gallon diesel fuel storage tank (ID# Insignificant Activity, 500 Gallon Diesel Storage Tank), one (1) additional 5,000 gallon diesel fuel storage tank (ID# Insignificant Activity, 5,000 Gallon Diesel Storage Tank), as well as emissions from paved roads (ID# AA-024, Paved Roads).[5]

A direct-fired Propane Vaporizer (ID# Insignificant Activity, Propane Vaporizer) will be located on-site to vaporize propane gas for combustion by the RTO burners, RCO burners, and burners for the dryer system double ducts.[6] The vaporizer will have a maximum heat input capacity of 1 MMBtu/hr and will combust propane. Natural gas will be the primary fuel for all burners; however, propane may be used as a back-up fuel.

An area map and site plan are provided in Appendix A and a process flow diagram is provided in Appendix B.

---

[5] Storage tanks used exclusively to store diesel are considered an insignificant activity per 11 Miss. Admin. Code Pt. 2 Ch. 1 R. 6.7.B(7).

[6] Combustion units with a rated input capacity less than 10 MMBtu/hr that are fueled by liquefied petroleum gas or natural gas supplied by a public utility are considered insignificant per 11 Miss. Admin. Code Pt. 2, Ch. 6 R. 6.7.B(2).

3. POTENTIAL EMISSIONS QUANTIFICATION

The following summarizes the data sources and calculation methodologies used in quantifying potential emissions from the proposed Lucedale plant. Detailed potential emissions calculations are provided in Appendix C.

3.1 Debarker (AA-001)

PM emissions will occur as a result of log debarking. Potential PM emissions from debarking were quantified based on an emission factor from EPA's *AIRS Facility Subsystem Source Classification Codes and Emission Factor Listing for Criteria Air Pollutants* for Source Classification Code (SCC) 3-07-008-01 (Log Debarking).[7] All PM was assumed to be larger than 2.5 microns in diameter. The debarking drum will be enclosed, except for the two ends where logs enter and material exits after debarking. Detailed potential emission calculations are included in Appendix C, Table 4.

3.2 Log Chipping (AA-002)

The chipping process will result in emissions of VOC and methanol. VOC and methanol emissions were quantified based on emission factors for log chipping from AP-42 Section 10.6.3, *Medium Density Fiberboard* and AP-42 Section 10.6.4, *Hardboard and Fiberboard*.[8] The Chipper will be located inside of a building. As such, there are no quantifiable particulate emissions. Detailed emission calculations are included in Appendix C, Table 5.

3.3 Bark Hog (AA-003)

Processing of bark by the Bark Hog will result in emissions of PM, VOC, and methanol. Particulate emission factors were not available for this specific operation; therefore, potential PM emissions were quantified based on an emission factor from EPA's *AIRS Facility Subsystem Source Classification Codes and Emission Factor Listing for Criteria Air Pollutants* for log debarking (SCC 3-07-008-01).[9] This emission factor is conservative given that the Bark Hog is primarily enclosed and thus will have minimal PM emissions. A belt will feed an infeed chute and the chute, hog, and outfeed will all be enclosed. VOC and methanol emissions were quantified based on emission factors for log chipping from AP-42 Section 10.6.3, *Medium Density Fiberboard*.[10] Detailed potential emission calculations are included in Appendix C, Table 6.

3.4 Green Wood Handling Operations (AA-004) and Bark Handling Operations (IA)

Fugitive PM emissions will result from unloading purchased chips and bark from trucks into hoppers and transfer of these materials to storage piles via conveyors. Fugitive PM emissions from chip and bark transfer operations were calculated based on AP-42 Section 13.2.4, *Aggregate Handling and Storage Piles*.[11] Detailed potential emission calculations are included in Appendix C, Table 7.

---

[8] U.S. EPA AP-42 Section 10.6.3, *Medium Density Fiberboard Manufacturing* (08/02).

[9] Ibid.

[10] Ibid.

[11] U.S. EPA AP-42 Section 13.2.4, *Aggregate Handling and Storage Piles* (11/06).

Green wood and bark contain a high moisture content approaching 50 percent water by weight. Therefore, Green Wood and Bark Handling will have minimal PM emissions. Per 11 Miss. Admin. Code Pt. 2, Ch. 6 R. 6.7.B(7) Bark Handling is an insignificant activity (IA).

3.5 Green Screen (AA-005)

Particulate emissions will occur during screening of green wood chips. Emissions from the Green Screen were calculated based on the potential throughput and an emission factor for chip screening from the National Council for Air and Stream Improvement (NCASI) Technical Bulleting No. 1020.[12] Detailed potential emission calculations are included in Appendix C, Table 8.

3.6 Green Wood Storage Pile (AA-006) and Bark Storage Pile (IA)

Particulate emission factors used to quantify emissions from storage pile wind erosion for the Green Wood Storage Pile and Bark Storage Pile were calculated based on EPA's *Control of Open Fugitive Dust Sources*.[13] The number of days with rainfall greater than 0.01 inch was obtained from AP-42 Section 13.2.2, *Unpaved Roads*[14], and the percentage of time that wind speed exceeds 12 miles per hour (mph) was determined based on meteorological data from the Mobile/Bates Field National Weather Service (NWS) Station (KMOB) for 2013-2017. The mean silt content of 8.4% for unpaved roads at lumber mills from AP-42 Section 13.2.2 was conservatively applied in the absence of site-specific data. The exposed surface area of the piles was calculated based on expected worst-case pile dimensions.

VOC emissions from storage piles were quantified based on the exposed surface area of the pile and emission factors from NCASI. NCASI emission factors range from 1.6 to 3.6 pounds (lb) VOC as carbon/acre-day; however, emissions were conservatively based on the maximum emission factor. Detailed potential emission calculations are included in Appendix C, Table 9.

Per 11 Miss. Admin. Code Pt. 2, Ch. 6 R. 6.7.B(7) bark storage is an insignificant activity.

3.7 Dryers, Green Wood Hammermills, and Dryer System Double Duct Burners (IA)

As described in Section 2, aside from normal operation there are several other potential operating conditions for the dryer lines. Emissions were quantified as described in the following subsections.

3.7.1 Normal Operation (AA-007, AA-010, AA-013)

During normal operation the exhaust from each dryer will be routed to a dedicated WESP and RTO for control of PM, VOC, and HAP. Exhaust from the Green Hammermills will be controlled by the WESP/RTO on Dryer Line 1 (ID# AA-007). If Dryer Line 1 is not operational, the Green Hammermill exhaust will be routed to the WESP/RTO on Dryer Line 2 (ID# AA-010). For purposes of potential emissions, emissions from the Green Hammermills are shown under Dryer Line 1 (ID# AA-007) only to avoid double-counting emissions. As shown in Appendix C, Tables 10a, 11a, and 12a, potential emissions of PM, PM less than 10

[12] National Council for Air and Stream Improvement, Inc. (NCASI). 2013. Compilation of criteria air pollutant emissions data for sources at pulp and paper mills including boilers – an update to Technical Bulletin No. 884. Technical Bulletin No. 1020. Research Triangle Park, NC: National Council for Air and Stream Improvement, Inc.

[13] U.S. EPA *Control of Open Fugitive Dust Sources*, Research Triangle Park, North Carolina, EPA-450/3-88-008. September 1988.

[14] U. S. EPA AP-42 Section 13.2.2, *Unpaved Roads* (11/06).

microns in diameter (PM_{10}), PM less than 2.5 microns in diameter ($PM_{2.5}$), carbon monoxide (CO) and oxides of nitrogen (NO_x), including NO_x and CO emissions generated during thermal oxidation, are based on vendor data, stack testing data from comparable Enviva facilities, and AP-42 factors where no other data were available. Potential emissions of sulfur dioxide (SO_2) were calculated based on an emission factor from AP-42 Section 10.6.2, *Particle Board Manufacturing*.[15] VOC emissions are based on data provided by the RTO vendor and stack testing conducted at Enviva facilities.

HAP emissions were calculated based on emission factors from several data sources including stack testing data from other similar facilities and emission factors from AP-42 Section 1.6, *Wood Residue Combustion in Boilers*.[16] HAP emissions from natural gas and propane combustion by the RTO burners were calculated based on AP-42 Section 1.4, *Natural Gas Combustion* and emission factors from the South Coast Air Quality Management District's (SCAQMD) Air Emissions Reporting (AER) Tool, respectively.[17,18]

Combustion of wood by the dryer furnaces and natural gas/propane by the RTO burners will also result in emissions of GHG. GHG emissions were quantified based on emission factors from AP-42, Section 10.6.1 for a rotary dryer with an RTO control device. The potential CO_2 emissions were conservatively calculated using the higher hardwood emission factor because the dryers at the Lucedale plant will use a combination of hardwood and softwood.

As previously described, two (2) low-NOx burners will be used to heat the dryer system ducts to prevent condensation of wood tar from occurring and thus reduce the risk of fire. There will be six (6) total burners (i.e., two for each dryer line). The burners will combust natural gas, or propane as back-up, resulting in emissions of criteria pollutants, HAP, and GHG. Emissions from the burners will be routed to the WESP and RTO on each dryer line. For the purposes of determining potential annual emissions, the worst-case between natural gas and propane was selected on a pollutant-by-pollutant basis.

Potential criteria pollutant emissions from the burners were quantified based on emission factors from AP-42 Section 1.4, *Natural Gas Combustion* and AP-42 Section 1.5, *Liquefied Petroleum Gas Combustion*. [19,20] Potential SO_2 emissions from propane combustion assume a sulfur content of 0.54 grains per 100 cubic feet for propane.[21]

Potential HAP emissions from propane combustion by the burners were quantified based on emission factors from the SCAQMD's AER Tool for external combustion equipment fired with

[15] U.S. EPA AP-42 Section 10.6.2, *Particle Board Manufacturing* (6/02).

[16] U.S. EPA AP-42 Section 1.6, *Wood Residue Combustion in Boilers* (09/03).

[17] U.S. EPA AP-42 Section 1.4, *Natural Gas Combustion* (07/98).

LPG.[22] Potential HAP emissions from natural gas combustion were quantified based on emission factors from AP-42 Section 1.4, *Natural Gas Combustion*.[23]

Potential GHG emissions from the burners were quantified based on emission factors from AP-42 Section 1.4, *Natural Gas Combustion* and AP-42 Section 1.5, *Liquefied Petroleum Gas Combustion*. [24,25] Emissions were converted to CO_2e based on Global Warming Potentials from Subpart A of 40 CFR 98. Potential emissions were quantified based on a rated capacity of 1 MMBtu/hr per burner and assume continuous operation (8,760 hours per year). A 95% control efficiency was applied to particulate and metal HAP which will be controlled by the WESPs and organic HAP which will be controlled by the RTO. Refer to Appendix C, Tables 10a, 11a, and 12a for detailed potential emission calculations.

The burners will be an insignificant activity per 11 Miss. Admin. Code Pt. 2, Ch. 6 R. 6.7.B(2).

3.7.2 Dryer Bypass (AA-008, AA-011, AA-014, Full Capacity)

Bypass stacks following each furnace (AA-009, AA-012, and AA-015, Furnace Bypass Stack Nos. 1, 2, and 3) and rotary drum dryer (AA-008, AA-011, and AA-014, Dryer Bypass Stack Nos. 1, 2, and 3) will be used to exhaust hot gases during start-up (for temperature control), shutdown, and malfunctions. Potential emissions associated with dryer bypass were calculated based on stack testing data from comparable Enviva facilities. Condensable PM and SO_2 emissions were calculated based on emission factors from AP-42 Section 1.6, *Wood Residue Combustion in Boilers*.[26] Filterable PM and HAP emissions were calculated based on stack testing data from a comparable Enviva plant. Emissions were based on the full capacity of the furnaces (168 MMBtu/hr) and 50 hours per year per dryer. Detailed potential emission calculations are included in Appendix C, Tables 10b, 11b, and 12b.

3.7.3 Furnace Bypass (AA-009, AA-012, AA-015, Full Capacity)

Potential emissions of CO, NO_x, SO_2, VOC and HAP for furnace bypass conditions were calculated based on emission factors from AP-42 Section 1.6, *Wood Residue Combustion in Boilers*.[27] Filterable PM emissions were calculated based on stack testing data from a comparable Enviva plant. Emissions were based on the full capacity of the furnaces (168 MMBtu/hr) and 50 hours per year per furnace. Detailed potential emission calculations are included in Appendix C, Tables 10c, 11c, and 12c.

3.7.4 Furnace Bypass (AA-009, AA-012, AA-015, Idle Mode)

Each furnace will operate up to 500 hours per year in "idle mode", which is defined as operation up to a maximum heat input rate of 5 MMBtu/hr. During this time, emissions will exhaust out of the furnace bypass stacks. Potential emissions of CO, NO_x, SO_2, VOC, and HAP were calculated based on emission factors from AP-42 Section 1.6, *Wood Residue*

[22] South Coast Air Quality Management District. AER Reporting tool. Emission factors available in the Help and Support Manual at: http://www.aqmd.gov/home/rules-compliance/compliance/annual-emission-reporting.

[24] U.S. EPA AP-42 Section 1.4 *Natural Gas Combustion* (07/98).

[25] U.S. EPA AP-42 Section 1.5 *Liquefied Petroleum Gas Production* (7/08).

[26] U.S. EPA AP-42, Section 1.6, *Wood Residue Combustion in Boilers*, (09/03).

[27] Ibid.

Combustion in Boilers.[28] Detailed potential emission calculations are included in Appendix C, Tables 10d, 11d, and 12d.

3.8 Pelletizing Lines (AA-016 and AA-017)

As previously described, the Lucedale plant will include two (2) pelletizing lines, each consisting of twenty-four (24) Dry Hammermills, twelve (12) Pellet Mills, and six (6) Pellet Coolers. Aspiration systems will be used to remove heated moist air from the Dry Hammermills, Pellet Mills, and Coolers. The aspiration systems will also keep the dried wood and Dry Hammermill outfeed conveyors and the Pellet Mill Feed Silo under negative pressure. These aspiration systems will be routed to material handling cyclones and then wet scrubbers and RCOs for emissions control.

The Dry Hammermill, Pellet Mill, and Pellet Cooler operations will generate PM, HAP, and VOC emissions during the sizing of wood chips and forming and cooling of wood pellets. VOC, HAP, and PM emissions from Pelletizing Lines 1 and 2 will be controlled by two (2) wet scrubbers and RCOs (ID# AA-016 and AA-017). PM and VOC emissions from the RCO outlets were calculated based on vendor data.

HAP emissions at the RCO outlets were quantified based on stack testing data from comparable Enviva plants. Controlled emissions were estimated based on a 96.3% control efficiency for the RCOs based on vendor data. NO_x and CO emissions resulting from thermal oxidation were calculated using AP-42 Section 1.4, *Natural Gas Combustion*, and the maximum high heating value of the anticipated VOC constituents.[29] Detailed calculations are provided in Appendix C, Tables 13 and 14.

Emissions of criteria pollutants and HAP from natural gas/propane combustion by the RCO burners were estimated using emission factors from AP-42 Section 1.4 and the SCAQMD's AER Tool.[30] Potential GHG emissions from natural gas/propane combustion were quantified based on emission factors from Subpart C of 40 CFR Part 98. Emissions were converted to carbon dioxide equivalent (CO_2e) based on Global Warming Potentials from Subpart A of 40 CFR 98.

3.9 Pellet Loadout Bins and Finished Product Handling (AA-018)

PM emissions will result from the transfer of finished product to the Pellet Loadout Bins. No emissions are anticipated from the transfer of pellets from the bins to railcars because wood pellets will be loaded into closed top railcars. PM emissions from Finished Product Handling and the two (2) Pellet Loadout Bins will be controlled by a baghouse (ID# AA-018). Potential PM emissions from the baghouse were calculated based on a maximum exit grain loading rate and the maximum exhaust flow rate of the baghouse. Detailed potential emissions calculations are provided in Appendix C, Table 15.

3.10 Additive Handling and Storage (AA-019)

A dry powder additive will be used in the pellet production process to serve as a lubricant for the dies. Additive will be pneumatically conveyed from trucks to a storage silo equipped with a baghouse. PM emissions from the baghouse were calculated based on an assumed exit

[28] Ibid.

[29] U.S. EPA AP-42 Section 1.4, *Natural Gas Combustion* (07/98).

[30] South Coast Air Quality Management District's (SCAQMD) Air Emissions Reporting (AER) Tool. Available online at: http://www3.aqmd.gov/webappl/help/newaer/index.html

grain loading rate and the maximum exhaust flow rate of the baghouse. Detailed potential emissions calculations are provided in Appendix C, Table 15.

3.11 Dry Shavings Silo (AA-020) and Dry Shavings Handling (AA-021)

Particulate emissions will occur during unloading of dry shavings from trucks and may also occur due to displacement of air during silo loading. Potential emissions from truck unloading (ID# AA-021) were calculated based on AP-42, Section 13.2.4, *Aggregate Handling and Storage Piles*.[31] Dry shavings will be transferred via an enclosed bucket elevator into the Dry Shavings Silo which will be equipped with a baghouse (ID# AA-020). PM emissions from the baghouse were calculated based on an assumed exit grain loading rate and the maximum exhaust flow rate of the baghouse. Detailed potential emission calculations are provided in Appendix C, Tables 7 and 15.

3.12 Emergency Generator (AA-022) and Fire Water Pump Engine (AA-023)

Operation of the Emergency Generator and Fire Water Pump will generate emissions of criteria pollutants, HAP, and GHG. Potential PM, NO_X, VOC, and CO emissions from operation of the Emergency Generator and Fire Water Pump Engine were calculated based on emission factors from their respective manufacturer specification sheets and the maximum horsepower rating of the engines. VOC emissions were calculated based on the manufacturer's emission factor for hydrocarbons. Potential SO_2 emissions were calculated based on the fuel sulfur restriction in NSPS Subpart IIII, assuming that all the sulfur present in the diesel fuel is emitted as SO_2.[32] Potential HAP emissions from the Emergency Generator and Fire Water Pump were quantified based on emission factors from AP-42 Sections 3.4, *Large Stationary Diesel and All Stationary Dual-fuel Engines* and 3.3, *Gasoline and Diesel Industrial Engines*, respectively.[33,34] Annual potential emissions were conservatively calculated based on operation of these sources for 500 hours per year.

Combustion of diesel fuel by the engines will also result in emissions of GHG. Potential GHG emissions from each engine were quantified based on emission factors from Subpart C of 40 CFR Part 98. Emissions were converted to CO_2e based on Global Warming Potentials from Subpart A of 40 CFR 98. Refer to Appendix C, Tables 16 and 17 for detailed potential emission calculations.

3.13 Diesel Storage Tanks (IA)

The storage of diesel in on-site storage tanks will generate emissions of VOC. VOC emissions from the three (3) Diesel Storage Tanks were calculated using EPA's TANKS 4.0 software based on actual tank characteristics (e.g., orientation, dimensions, etc.) and potential annual throughput. The storage tanks will exclusively store diesel fuel and are thus considered insignificant activities per 11 Miss. Admin. Code Pt. 2 Ch. 6 R. 6.7.B(7). Refer to Appendix C, Table 19 for detailed potential emission calculations.

3.14 Paved Roads (AA-024)

Fugitive PM emissions will occur as a result of trucks and employee vehicles traveling on paved roads on the Lucedale plant property. Emission factors were calculated based on

[31] U.S. EPA AP-42 Section 13.2.4, *Aggregate Handling and Storage Piles* (11/06).

[32] Sulfur content in accordance with Year 2010 standards of 40 CFR 80.510(b) as required by NSPS Subpart IIII.

[33] U.S. EPA AP-42 Section 3.4, *Large Stationary Diesel and All Stationary Dual-fuel Engines*, (10/96).

[34] U.S. EPA AP-42 Section 3.3, *Gasoline and Diesel Industrial Engines*, (10/96).

Equation 2 from AP-42 Section 13.2.1, *Paved Roads*[35] using the mean silt loading for quarries (8.2 g/m^2) and 110 days with rainfall greater than 0.01 inch based on Figure 13.2.1-2. A 90% control efficiency was applied for water/dust suppression activities followed by sweeping. This control efficiency is based on data from the *Air Pollution Engineering Manual* of the Air and Waste Management Association. Refer to Appendix C, Table 18 for detailed potential emissions calculations.

3.15 Propane Vaporizer (IA)

The direct-fired Propane Vaporizer will be used to heat liquid propane to convert it to a gas for combustion by the RTO burners, RCO burners, and dryer system double duct burners. Combustion of propane by the vaporizer's 1 MMBtu/hr burner will result in emissions of criteria pollutants, HAP, and GHG. Potential criteria pollutant emissions were quantified based on emission factors from AP-42 Section 1.5, *Liquefied Petroleum Gas Combustion*.[36] Potential SO_2 emissions assume a sulfur content of 0.54 grains per 100 cubic feet for propane.[37] Potential HAP emissions were quantified based on emission factors from the SCAQMD's AER Tool for external combustion equipment fired with LPG.[38]

Potential GHG emissions were quantified based on emission factors from AP-42 Section 1.5, *Liquefied Petroleum Gas Combustion*.[39] Emissions were converted to CO_2e based on Global Warming Potentials from Subpart A of 40 CFR 98. Potential emissions from the Propane Vaporizer were quantified based on a rated capacity of 1 MMBtu/hr and assume continuous operation (8,760 hours per year). Refer to Appendix C, Table 20 for detailed potential emission calculations.

The Propane Vaporizer will be an insignificant activity per 11 Miss. Admin. Code Pt. 2, Ch. 6 R. 6.7.B(2).

Notes:

[1] Bark storage and handling is considered an insignificant activity per 11 Miss. Admin. Code Pt. 2 Ch. 6 R. 6.7.B(13).
[2] The three (3) Green Hammermills will be controlled by the WESP and RTO on Dryer Line 1. If Dryer Line 1 is not operational, the Green Hammermill exhaust will be routed to the WESP/RTO on Dryer Line 2. For potential emissions purposes, emissions from the Green Hammermills are shown under Dryer Line 1 (AA-007) only to avoid double-counting emissions.
[3] The propane vaporizer and six (6) burners for the dryer line double duct systems are considered insignificant activities per 11 Miss. Admin. Code Pt. 2 Ch. 6 R. 6.7.B(2).
[4] Storage tanks used exclusively to store diesel are considered an insignificant activity per 11 Miss. Admin. Code Pt. 2 Ch. 1 R. 6.7.B(7).
[5] Fugitive emissions are not included in comparison against the major source threshold because the facility is not on the list of 28 source categories in 40 CFR 52.21.

Abbreviations:

CO - carbon monoxide
CO_2e - carbon dioxide equivalent
IA - Insignificant Activity
NO_x - nitrogen oxides
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
RCO - Regenerative Catalytic Oxidizer
RTO - Regenerative Thermal Oxidizer
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compounds
WESP - Wet Electrostatic Precipitator

Notes:
[1] Includes emissions at outlet of the RTO stack as well as emissions resulting from combustion of propane or natural gas by the RTO burners. Emissions from the Green Hammermills will be routed through the Dryer Line 1 WESP and RTO. If Dryer Line 1 is not operational, the Green Hammermill exhaust will be routed to the WESP/RTO on Dryer Line 3. For purposes of potential emissions, emissions from the Green Hammermills are shown under Dryer Line 1 only to avoid double-counting.
[2] Includes emissions at outlet of the RCO-1 (AA-016) stack as well as emissions resulting from combustion of propane or natural gas by the RCO-1 burners. RCO-1 will control emissions from thirty-two (32) dry hammermills, sixteen (16) pellet mills, and eight (8) pellet coolers.
[3] Includes emissions at outlet of the RCO-2 (AA-017) stack as well as emissions resulting from combustion of propane or natural gas by the RCO-2 burners. RCO-2 will control emissions from sixteen (16) dry hammermills, eight (8) pellet mills, and four (4) pellet coolers.
[4] Because benzo(a)pyrene and naphthalene emissions were presented individually and as components of total PAH emissions, the total HAP emissions presented here do not match the sum of all pollutant emissions to avoid double counting benzo(a)pyrene and naphthalene emissions.

Abbreviations:
HAP - hazardous air pollutant
IA - insignificant activity
RCO - regenerative catalytic oxidizer
RTO - regenerative thermal oxidizer
tpy - tons per year
WESP - wet electrostatic precipitator

Notes:
[1] PM emission factor based on U.S. EPA Control of Open Fugitive Dust Sources. Research Triangle Park, North Carolina, EPA-450/3-88-008. September 1988, Page 4-17.

$$E = 1.7\left(\frac{s}{1.5}\right)\left(\frac{365-p}{235}\right)\left(\frac{f}{15}\right)(lb/day/acre)$$

where:			
	s, silt content of wood chips (%):	8.4	s - silt content (%) for lumber sawmills (mean) from AP-42, Section 13.2.2 - Unpaved Roads, 11/06, Table 13.2.2-1
	p, number of days with rainfall greater than 0.01 inch:	110	Based on AP-42, Section 13.2.2 - Unpaved Roads, 11/06, Figure 13.2.1-2.
	f (time that wind exceeds 5.36 m/s - 12 mph) (%):	14.1	Based on meteorological data for 2013-2017 from the Mobile/Bates Field NWS station (KMOB).
	PM_{10}/TSP ratio:	50%	PM_{10} is assumed to equal 50% of TSP based on U.S. EPA Control of Open Fugitive Dust Sources, Research Triangle Park, North Carolina, EPA-450/3-88-008. September 1988.
	$PM_{2.5}$/TSP ratio:	7.5%	$PM_{2.5}$ is assumed to equal 7.5 % of TSP U.S. EPA Background Document for Revisions to Fine Fraction Ratios Used for AP-42 Fugitive Dust Emission Factors. November 2006.

[2] VOC emission factor obtained from NCASI document provided by the South Carolina Department of Health and Environmental Control (DHEC) for the calculation of fugitive VOC emissions from Douglas Fir wood storage piles. Emission factors ranged from 1.6 to 3.6 lb C/acre-day. The maximum emission factor has conservatively been selected.

[3] The exposed surface area of the pile is conservatively calculated as the lateral surface area of a cone $[\pi \cdot r \cdot (h^2+r^2)^{0.5}]$.

[4] Emission factor converted from as carbon to as propane by multiplying by 1.22.

[5] Bark storage and handling are considered an insignificant activity per 11 Miss. Admin. Code Pt. 2 Ch. 1 R. 6.7.B(13).

Abbreviations:
EPA - Environmental Protection Agency
ft - feet
ft² - square feet
IA - Insignificant Activity
lb - pound
mph - miles per hour
NCASI - National Council for Air and Stream Improvement, Inc.
NWS - National Weather Service
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
tpy - tons per year
TSP - Total Suspended Particulate
yr - year
VOC - volatile organic compound

Table 10a
Potential Emissions at Outlet of Dryer Line 1 RTO Stack
AA-007
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput (per Dyer line)	42 ODT/hr
Annual Throughput (per Dryer line)	367,920 ODT/yr
Hourly Heat Input Capacity (per furnace)	168 MMBtu/hr
Annual Heat Input Capacity (per furnace)	1,471,680 MMBtu/yr
Hourly Throughput (Total GHM)[1]	159 ODT/hr
Annual Throughput (Total GHM)[1]	1,390,475 ODT/yr
Hours of Operation	8,760 hr/yr
Number of RTO Burners (per RTO)	2 burners
RTO Burner Rating	8 MMBtu/hr
Dryer Double Duct System - Num. of Burners[2]	2 burners
Double Duct System Burner Rating[2]	1 MMBtu/hr
Propane Heating Value[3]	91.5 MMBtu/Mgal
Natural Gas Heating Value[4]	1,020 Btu/scf
Hourly Fuel Consumption (total)[5]	0.022 Mgal/hr propane
	0.0020 MMscf/hr natural gas
RTO Control Efficiency[6]	95%

Potential Criteria Pollutant and Greenhouse Gas Emissions - Dryer and Green Hammermills

Pollutant	Controlled Emission Factor	Units	Potential Emissions from Dryer and Green Hammermills[7] (lb/hr)	(tpy)
CO	14.2	lb/hr[8]	14.2	62.2
NO_x	17.0	lb/hr[9]	17.0	74.5
SO_2	0.025	lb/MMBtu[10]	4.20	18.4
VOC as Propane	11.4	lb/hr[8]	11.4	50.1
$PM/PM_{10}/PM_{2.5}$ (Filterable)	4.69	lb/hr[11]	4.69	20.5
$PM/PM_{10}/PM_{2.5}$ (Condensable)	0.017	lb/MMBtu[12]	2.86	12.5
$PM/PM_{10}/PM_{2.5}$ (Condensable - Nat. Gas)	0.00056	lb/MMBtu[13]	0.0089	0.039
CO_2	780	lb/ODT[14]	32,760	143,489

Notes:

1. Emissions from the Green Hammermills will be routed through the Dryer Line 1 WESP and RTO. If Dryer Line 1 is not operational, the Green Hammermill exhaust will be routed to the WESP/RTO on Dryer Line 2. For purposes of potential emissions, emissions from the Green Hammermills are shown under Dryer Line 1 (AA-007) only to avoid double-counting emissions.
2. Each dryer system will include two (2) ducts (i.e., double ducts) that will each be heated by a 1 MMBtu/hr burner. There will be a total of six (6) burners, two (2) per dryer line. The burners will fire natural gas, with propane as a back-up, and will be low-NO_x burners.
3. Propane heat content from AP-42 Section 1.5 - Liquefied Petroleum Gas Production, 7/08.
4. Natural gas heating value from AP-42 Section 1.4 - Natural Gas Combustion, 07/98.
5. Total hourly fuel consumption for both burners. The burners will fire natural gas, with propane as a back-up.
6. Control efficiency based on RTO vendor guarantee.
7. Exhaust from the dryers are routed to a WESP and then RTO for control of VOC, HAP, and particulates. Each of the three (3) dryer lines will have a dedicated WESP and RTO.
8. CO and VOC emission rates based on vendor data and stack testing at similar Enviva plants.
9. NO_x emission factor based on stack testing at similar Enviva plants.
10. No emission factor is provided in AP-42, Section 10.6.2 for SO_2 for rotary dryers. Enviva has conservatively calculated SO_2 emissions based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
11. Filterable particulate emission rate based on RTO vendor data.
12. Condensable particulate emission factor for biomass combustion obtained from AP-42 Section 1.6.
13. Natural gas combustion by the RTO burners will also result in emissions of condensable PM. Emission factor obtained from AP-42, Section 1.4 - Natural Gas Combustion, 07/98.
14. Emission factor for CO_2 from AP-42, Section 10.6.1 for rotary dryer with RTO control device. Enviva has conservatively calculated the CO_2 emissions using the hardwood emission factor because the dryers at the Lucedale plant will use a combination of hardwood and softwood and the hardwood emission factor is greater than the softwood emission factor.

Notes:

1 Two (2) low-NOx burners will be used to heat the dryer system ducts to prevent condensation of wood tar from occurring and thus reduce the fire risk. The burners will combust natural gas. Emissions from the burners will be routed to the WESP and RTO on each dryer line; therefore, a 95% control efficiency was applied to VOC and $PM/PM_{10}/PM_{2.5}$.

2 Emission factors for natural gas combustion from AP-42 Section 1.4 - Natural Gas Combustion, 07/98. Natural gas heating value of 1,020 Btu/scf assumed per AP-42.

3 Emission factors for NO_X and N_2O assume burners are low NO_X burners, per email from Kai Simonsen (Enviva) on August 8, 2018.

4 Emission factors for propane combustion obtained from AP-42 Section 1.5 - Liquefied Petroleum Gas Combustion, 07/08.

5 AP-42 Section 1.5 does not include an emission factor for low NO_X burners. Per AP-42 Section 1.4, low NO_X burners reduce NO_X emissions by accomplishing combustion in stages, reducing NO_X emissions 40 to 85% relative to uncontrolled emission levels. A conservative control efficiency of 50% was applied to the uncontrolled NO_X emission factor from AP-42 Section 1.5. This reduction is consistent with the magnitude of reduction between the uncontrolled and low NO_X emission factors in AP-42 Section 1.4.

6 SO_2 emissions are based on an assumed fuel sulfur content of 0.54 grains/100 ft^3 per *A National Methodology and Emission Inventory for Residential Fuel Combustion*.

Potential HAP Emissions - RTO Burners and Dryer System Double Duct Burners

Pollutant	VOC	Emission Factor[9]	Units	RTO Burners Potential Emissions		Double Duct Burners Potential Emissions[3,4]	
				(lb/hr)	(tpy)	(lb/hr)	(tpy)
Propane Combustion							
Benzene	Y	7.10E-04	lb/MMBtu	0.011	0.050	7.10E-05	3.11E-05
Formaldehyde	Y	1.51E-03	lb/MMBtu	0.024	0.11	1.51E-04	6.61E-05
PAHs	N	4.00E-05	lb/MMBtu	6.40E-04	0.0028	8.00E-05	7.01E-04
Total HAP Emissions (Propane Combustion)[9]				**0.036**	**0.16**	**3.02E-04**	**7.98E-04**

Notes:

1. Emission factor derived based on stack testing data from comparable Enviva facilities.
2. Emission factors for wood combustion in a stoker boiler from AP-42 Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
3. A control efficiency of 95% for the RTOs is applied to all organic HAP for those emission factors that are not derived from Enviva stack test data.
4. A 95% control efficiency for the wet electrostatic precipitator (WESP) is applied to all metal HAP.
5. The WESP will employ a caustic solution in its operation in which hydrochloric acid will have high water solubility. This caustic solution will neutralize the acid and effectively control it by 90%, per conversation on October 18, 2011 with Steven A. Jaasund, P.E. of Lundberg Associates, a manufacturer of WESPs.
6. Emissions from the Green Hammermills will be routed through the Dryer Line 1 WESP and RTO. If Dryer Line 1 is not operational, the Green Hammermill exhaust will be routed to the WESP/RTO on Dryer Line 2. For purposes of potential emissions, emissions from the Green Hammermills are shown under Dryer Line 1 (AA-007) only to avoid double-counting.
7. Emission factors for natural gas combustion from AP-42 Section 1.4 - Natural Gas Combustion, 07/98. Natural gas heating value of 1,020 Btu/scf assumed per AP-42.
8. The RTO burners and burners for the dryer system double ducts will fire natural gas with propane as a back-up; however, propane is worst-case for HAP emissions.
9. Emission factors for propane combustion from the South Coast Air Quality Management District's Air Emissions Reporting Tool for external combustion equipment fired with LPG.

Abbreviations:

CAS - chemical abstract service
CH_4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
CO_2e - carbon dioxide equivalent
GHM - Green Hammermill
HAP - hazardous air pollutant
hr - hour
kg - kilogram
lb - pound
MMBtu - Million British thermal units
NO_X - nitrogen oxides
N_2O - nitrous oxide
ODT - oven dried tons
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
RTO - regenerative thermal oxidizer
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
WESP - wet electrostatic precipitator
yr - year

N_2O	0.0036	kg/MMBtu[6]	1.33	0.033
CO_2e			35,205	880

Notes:

1. During startup and shutdown (for temperature control) or malfunction, emissions will be vented out either the dryer bypass stacks or the furnace bypass stacks. Use of each bypass stack at full capacity will not exceed 50 hours per 12-month rolling period for each dryer line.
2. CO, NO_X, and VOC emission rates based on vendor data.
3. No emission factor is provided in AP-42, Section 10.6.2 for SO_2 for rotary dryers. Enviva has conservatively calculated SO_2 emissions based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
4. Emission factor for condensable PM based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
5. Uncontrolled filterable PM emission factor is based on testing at a comparable Enviva facility.
6. Emission factors for biomass combustion (dryer) from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Pentachlorophenol	5.10E-08	lb/MMBtu	3	8.57E-06	2.14E-07
Perchloroethylene	3.80E-05	lb/MMBtu	3	6.38E-03	1.60E-04
Phosphorus metal, yellow or white	2.70E-05	lb/MMBtu	3	4.54E-03	1.13E-04
Polychlorinated biphenyls	8.15E-09	lb/MMBtu	3	1.37E-06	3.42E-08
Total PAH (POM)	1.25E-04	lb/MMBtu	3	0.021	5.25E-04
Dichloropropane, 1,2-	3.30E-05	lb/MMBtu	3	5.54E-03	1.39E-04
Selenium compounds	2.80E-06	lb/MMBtu	3	4.70E-04	1.18E-05
Tetrachlorodibenzo-p-dioxin, 2,3,7,8-	8.60E-12	lb/MMBtu	3	1.44E-09	3.61E-11
Trichloroethylene	3.00E-05	lb/MMBtu	3	5.04E-03	1.26E-04
Trichlorophenol, 2,4,6-	2.20E-08	lb/MMBtu	3	3.70E-06	9.24E-08
Vinyl chloride	1.80E-05	lb/MMBtu	3	3.02E-03	7.56E-05
			Total HAP Emissions	**20.2**	**0.50**

Notes:

1. During dryer bypass emissions are not controlled by the WESP and RTO; however, combustion in the furnace still results in a reduction in organic HAP emission rates.
2. Organic HAP emissions rates were derived based on stack testing data from Cottondale and other similar Enviva plants.
3. Emission factors for wood combustion in a stoker boiler from AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.

RAMBOLL

Table 10b
Potential Emissions - Dryer 1 Bypass (Full Capacity)[1]
AA-008
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Abbreviations:

CH_4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
CO_2e - carbon dioxide equivalent
HAP - hazardous air pollutant
hr - hour
kg - kilogram
lb - pound
MMBtu - Million British thermal units
NO_X - nitrogen oxides
N_2O - nitrous oxide
ODT - oven dried tons
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
RTO - regenerative thermal oxidizer
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
WESP - wet electrostatic precipitator
yr - year

Table 10c
Potential Emissions - Furnace 1 Bypass (Full Capacity)[1]
AA-009
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput	42 ODT/hr
Hourly Heat Input Capacity	168 MMBtu/hr
Annual Heat Input Capacity	8,400 MMBtu/yr
Hours of Operation[1]	50 hr/yr

Potential Criteria Pollutant and Greenhouse Gas Emissions - Furnace Bypass Full Capacity

Pollutant	Controlled Emission Factor	Units	Potential Emissions	
			(lb/hr)	(tpy)
CO	0.60	lb/MMBtu[2]	101	2.52
NO_X	0.22	lb/MMBtu[2]	37.0	0.92
SO_2	0.025	lb/MMBtu[2]	4.20	0.11
VOC	0.017	lb/MMBtu[2]	2.86	0.071
Total $PM/PM_{10}/PM_{2.5}$	0.56	lb/MMBtu[3]	94.1	2.35
CO_2	93.8	lb/MMBtu[4]	34,741	869
CH_4	0.0072	lb/MMBtu[4]	2.67	0.067
N_2O	0.0036	lb/MMBtu[4]	1.33	0.033
CO_2e			35,205	880

Notes:

1. During startup and shutdown (for temperature control) or malfunction, emissions will be vented out either the dryer bypass stacks or the furnace bypass stacks. Use of each bypass stack at full capacity will not exceed 50 hours per 12-month rolling period for each dryer line.
2. CO, NO_X, SO_2, and VOC emission rates based on AP-42, Chapter 1.6 - Wood Residue Combustion in Boilers, 09/03 for bark/bark and wet wood/wet wood-fired boilers. VOC emission factor excludes formaldehyde.
3. Emission factor based on vendor data.
4. Emission factors for biomass combustion from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Table 11a
Potential Emissions at Outlet of Dryer Line 2 RTO Stack[1]
AA-010
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput (per line)	42	ODT/hr
Annual Throughput (per line)	367,920	ODT/yr
Hourly Heat Input Capacity (per furnace)	168	MMBtu/hr
Annual Heat Input Capacity (per furnace)	1,471,680	MMBtu/yr
Hours of Operation	8,760	hr/yr
Number of RTO Burners (per RTO)	2	burners
RTO Burner Rating	8	MMBtu/hr
Dryer Double Duct System - Num. of Burners[2]	2	burners
Double Duct System Burner Rating[2]	1	MMBtu/hr
Propane Heating Value[3]	91.5	MMBtu/Mgal
Natural Gas Heating Value[4]	1,020	Btu/scf
Hourly Fuel Consumption (total)[5]	0.022	Mgal/hr propane
	0.0020	MMscf/hr natural gas
RTO Control Efficiency[6]	95%	

Potential Criteria Pollutant and Greenhouse Gas Emissions

Pollutant	Controlled Emission Factor	Units	Potential Emissions from Dryer[7] (lb/hr)	(tpy)
CO	14.2	lb/hr[8]	14.2	62.2
NO_X	17.0	lb/hr[9]	17.0	74.5
SO_2	0.025	lb/MMBtu[10]	4.20	18.4
VOC as Propane	8.75	lb/hr[8]	8.75	38.3
$PM/PM_{10}/PM_{2.5}$ (Filterable)	4.69	lb/hr[11]	4.69	20.5
$PM/PM_{10}/PM_{2.5}$ (Condensable)	0.017	lb/MMBtu[12]	2.86	12.5
$PM/PM_{10}/PM_{2.5}$ (Condensable - Nat. Gas)	0.00056	lb/MMBtu[13]	0.0089	0.039
CO_2	780	lb/ODT[14]	32,760	143,489

Notes:

1 Emissions from the Green Hammermills will be routed through the Dryer Line 1 WESP and RTO. If Dryer Line 1 is not operational, the Green Hammermill exhaust will be routed to the WESP/RTO on Dryer Line 2. For purposes of potential emissions, emissions from the Green Hammermills are shown under Dryer Line 1 (AA-007) only to avoid double-counting emissions.
2 Each dryer system will include two (2) ducts (i.e., double ducts) that will each be heated by a 1 MMBtu/hr burner. There will be a total of six (6) burners, two (2) per dryer line. The burners will fire natural gas, with propane as a back-up, and will be low-NO_X burners.
3 Propane heat content from AP-42 Section 1.5 - Liquefied Petroleum Gas Production, 7/08.
4 Natural gas heating value from AP-42 Section 1.4 - Natural Gas Combustion, 07/98.
5 Total hourly fuel consumption for both burners. The burners will fire natural gas, with propane as a back-up.
6 Control efficiency based on RTO vendor guarantee.
7 Exhaust from the dryers are routed to a WESP and then RTO for control of VOC, HAP, and particulates. Each of the three (3) dryer lines will have a dedicated WESP and RTO. Emissions for Dryer Lines 1 and 3 are calculated separately.
8 CO and VOC emission rates based on vendor data.
9 NO_x emission factor based on stack testing at similar Enviva plants.
10 No emission factor is provided in AP-42, Section 10.6.2 for SO_2 for rotary dryers. Enviva has conservatively calculated SO_2 emissions based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
11 Filterable particulate emission rate based on RTO vendor data.
12 Condensable particulate emission factor for biomass combustion obtained from AP-42 Section 1.6.
13 Natural gas combustion by the RTO burners will also result in emissions of condensable PM. Emission factor obtained from AP-42, Section 1.4 - Natural Gas Combustion, 07/98.
14 Emission factor for CO_2 from AP-42, Section 10.6.1 for rotary dryer with RTO control device. Enviva has conservatively calculated the CO_2 emissions using the hardwood emission factor because the dryers at the Lucedale plant will use a combination of hardwood and softwood and the hardwood emission factor is greater than the softwood emission factor.

Table 11a
Potential Emissions at Outlet of Dryer Line 2 RTO Stack[1]
AA-010
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Potential Criteria Pollutant and Greenhouse Gas Emissions - Dryer System Double Duct Burners[1]

CH_4	2.30	0.0045	0.020	0.20	0.0044	0.019
N_2O[2]	0.64	0.0013	0.0055	0.90	0.020	0.0862
CO_2e	--	236	1,033	--	279	1,223

Notes:

1. Two (2) low-NOx burners will be used to heat the dryer system ducts to prevent condensation of wood tar from occurring and thus reduce the fire risk. The burners will combust natural gas. Emissions from the burners will be routed to the WESP and RTO on each dryer line; therefore, a 95% control efficiency was applied to VOC and $PM/PM_{10}/PM_{2.5}$.
2. Emission factors for natural gas combustion from AP-42 Section 1.4 - Natural Gas Combustion, 07/98. Natural gas heating value of 1,020 Btu/scf assumed per AP-42.
3. Emission factors for NO_x and N_2O assume burners are low NO_x burners, per email from Kai Simonsen (Enviva) on August 8, 2018.
4. Emission factors for propane combustion obtained from AP-42 Section 1.5 - Liquefied Petroleum Gas Combustion, 07/08.
5. AP-42 Section 1.5 does not include an emission factor for low NO_x burners. Per AP-42 Section 1.4, low NO_x burners reduce NO_x emissions by accomplishing combustion in stages, reducing NO_x emissions 40 to 85% relative to uncontrolled emission levels. A conservative control efficiency of 50% was applied to the uncontrolled NO_x emission factor from AP-42 Section 1.5. This reduction is consistent with the magnitude of reduction between the uncontrolled and low NO_x emission factors in AP-42 Section 1.4.
6. SO_2 emissions are based on an assumed fuel sulfur content of 0.54 grains/100 ft^3 per *A National Methodology and Emission Inventory for Residential Fuel Combustion*.

Total HAP Emissions (Propane Combustion)[7]				**0.036**	**0.16**	**3.02E-04**	**7.98E-04**

Notes:

1. Emission factor derived based on stack testing data from comparable Enviva facilities.
2. Emission factors for wood combustion in a stoker boiler from AP-42 Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
3. A control efficiency of 95% for the RTOs is applied to all organic HAP for those emission factors that are not derived from Enviva stack test data.
4. A 95% control efficiency for the wet electrostatic precipitator (WESP) is applied to all metal HAP.
5. The WESP will employ a caustic solution in its operation in which hydrochloric acid will have high water solubility. This caustic solution will neutralize the acid and effectively control it by 90%, per conversation on October 18, 2011 with Steven A. Jaasund, P.E. of Lundberg Associates, a manufacturer of WESPs.
6. Emission factors for natural gas combustion from AP-42 Section 1.4 - Natural Gas Combustion, 07/98. Natural gas heating value of 1,020 Btu/scf assumed per AP-42.
7. The RTO burners and burners for the dryer system double ducts will fire natural gas with propane as a back-up; however, propane is worst-case for HAP emissions.
8. Emission factors for propane combustion from the South Coast Air Quality Management District's Air Emissions Reporting Tool for external combustion equipment fired with LPG.

Abbreviations:

CAS - chemical abstract service
CH_4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
CO_2e - carbon dioxide equivalent
HAP - hazardous air pollutant
hr - hour
kg - kilogram
lb - pound
MMBtu - Million British thermal units
NO_X - nitrogen oxides
N_2O - nitrous oxide
ODT - oven dried tons
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
RTO - regenerative thermal oxidizer
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
WESP - wet electrostatic precipitator
yr - year

VOC	14.0	lb/hr[2]	14.0	0.35
$PM/PM_{10}/PM_{2.5}$ Condensable	0.017	lb/MMBtu[4]	2.86	0.071
$PM/PM_{10}/PM_{2.5}$ Filterable	0.33	lb/MMBtu[5]	55.4	1.39
Total $PM/PM_{10}/PM_{2.5}$			58.3	1.46
CO_2	93.8	kg/MMBtu[6]	34,741	869
CH_4	0.0072	kg/MMBtu[6]	2.67	0.067
N_2O	0.0036	kg/MMBtu[6]	1.33	0.033
CO_2e			35,205	880

Notes:

1. During startup and shutdown (for temperature control) or malfunction, emissions will be vented out either the dryer bypass stacks or the furnace bypass stacks. Use of each bypass stack at full capacity will not exceed 50 hours per 12-month rolling period for each dryer line.
2. CO, NOX, and VOC emission rates based on vendor data.
3. No emission factor is provided in AP-42, Section 10.6.2 for SO_2 for rotary dryers. Enviva has conservatively calculated SO_2 emissions based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
4. Emission factor for condensable PM based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
5. Uncontrolled filterable PM emission factor is based on testing at a comparable Enviva facility.
6. Emission factors for biomass combustion (dryer) from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Vinyl chloride	1.80E-05	lb/MMBtu	3	3.02E-03	7.56E-05
			Total HAP Emissions	**20.2**	**0.50**

Notes:

1. During dryer bypass emissions are not controlled by the WESP and RTO; however, combustion in the furnace still results in a reduction in organic HAP emission rates.
2. Organic HAP emissions rates were derived based on stack testing data from Cottondale and other similar Enviva plants.
3. Emission factors for wood combustion in a stoker boiler from AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.

MMBtu - Million British thermal units
NO_X - nitrogen oxides
N_2O - nitrous oxide
ODT - oven dried tons
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
RTO - regenerative thermal oxidizer
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
WESP - wet electrostatic precipitator
yr - year

Table 11c
Potential Emissions - Furnace 2 Bypass (Full Capacity)[1]
AA-012
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput	42 ODT/hr
Hourly Heat Input Capacity	168 MMBtu/hr
Annual Heat Input Capacity	8,400 MMBtu/yr
Hours of Operation[1]	50 hr/yr

Potential Criteria Pollutant and Greenhouse Gas Emissions - Furnace Bypass Full Capacity

Pollutant	Controlled Emission Factor	Units	Potential Emissions	
			(lb/hr)	(tpy)
CO	0.60	lb/MMBtu[2]	101	2.52
NO_x	0.22	lb/MMBtu[2]	37.0	0.92
SO_2	0.025	lb/MMBtu[2]	4.20	0.11
VOC	0.017	lb/MMBtu[2]	2.86	0.071
Total $PM/PM_{10}/PM_{2.5}$	0.56	lb/MMBtu[3]	94.1	2.35
CO_2	93.8	lb/MMBtu[4]	34,741	869
CH_4	0.0072	lb/MMBtu[4]	2.67	0.067
N_2O	0.0036	lb/MMBtu[4]	1.33	0.033
CO_2e			35,205	880

Notes:

1. During startup and shutdown (for temperature control) or malfunction, emissions will be vented out either the dryer bypass stacks or the furnace bypass stacks. Use of each bypass stack at full capacity will not exceed 50 hours per 12-month rolling period for each dryer line.
2. CO, NO_X, SO_2, and VOC emission rates based on AP-42, Chapter 1.6 - Wood Residue Combustion in Boilers, 09/03 for bark/bark and wet wood/wet wood-fired boilers. VOC emission factor excludes formaldehyde.
3. Emission factor based on vendor data.
4. Emission factors for biomass combustion from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Annual Heat Input Capacity	2,500 MMBtu/yr
Hours of Operation[1]	500 hr/yr

Potential Criteria Pollutant and Greenhouse Gas Emissions - Furnace Bypass "Idle Mode"

Pollutant	Controlled Emission Factor	Units	Potential Emissions	
			(lb/hr)	(tpy)
CO	0.60	lb/MMBtu[2]	3.00	0.75
NO_X	0.22	lb/MMBtu[2]	1.10	0.28
SO_2	0.025	lb/MMBtu[2]	0.13	0.031
VOC	0.017	lb/MMBtu[2]	0.085	0.021
Total PM	0.56	lb/MMBtu[3]	2.80	0.70
Total PM_{10}	0.52	lb/MMBtu[2]	2.59	0.65
Total $PM_{2.5}$	0.45	lb/MMBtu[2]	2.24	0.56
CO_2	93.8	kg/MMBtu[4]	1,034	258
CH_4	0.0072	kg/MMBtu[4]	0.079	0.020
N_2O	0.0036	kg/MMBtu[4]	0.040	0.010
CO_2e			1,048	262

Notes:

1. Idle mode is defined as operation at up to a maximum heat input rate of 5 MMBtu/hr.
2. CO, NO_X, SO_2, PM_{10}, $PM_{2.5}$, and VOC emission rates based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03 for bark/bark and wet wood/wet wood-fired boilers. PM_{10} and $PM_{2.5}$ factors equal to the sum of the filterable and condensable factors from Table 1.6-1. VOC emission factor excludes formaldehyde.
3. Emission factor based on vendor data.
4. Emission factors for biomass combustion from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Table 12a
Potential Emissions at Outlet of Dryer Line 3 RTO Stack
AA-013
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput (per line)	42	ODT/hr
Annual Throughput (per line)	367,920	ODT/yr
Hourly Heat Input Capacity (per furnace)	168	MMBtu/hr
Annual Heat Input Capacity (per furnace)	1,471,680	MMBtu/yr
Hours of Operation	8,760	hr/yr
Number of RTO Burners (per RTO)	2	burners
RTO Burner Rating	8	MMBtu/hr
Dryer Double Duct System - Num. of Burners[1]	2	burners
Double Duct System Burner Rating[1]	1	MMBtu/hr
Propane Heating Value[2]	91.5	MMBtu/Mgal
Natural Gas Heating Value[3]	1,020	Btu/scf
Hourly Fuel Consumption (total)[4]	0.022	Mgal/hr propane
	0.0020	MMscf/hr natural gas
RTO Control Efficiency[5]	95%	

Potential Criteria Pollutant and Greenhouse Gas Emissions

Pollutant	Controlled Emission Factor	Units	Potential Emissions from Dryer[6]	
			(lb/hr)	(tpy)
CO	14.2	lb/hr[7]	14.2	62.2
NO_X	17.0	lb/hr[8]	17.0	74.5
SO_2	0.025	lb/MMBtu[9]	4.20	18.4
VOC as Propane	8.75	lb/hr[7]	8.75	38.3
$PM/PM_{10}/PM_{2.5}$ (Filterable)	4.69	lb/hr[10]	4.69	20.5
$PM/PM_{10}/PM_{2.5}$ (Condensable)	0.017	lb/MMBtu[11]	2.86	12.5
$PM/PM_{10}/PM_{2.5}$ (Condensable - Nat. Gas)	0.00056	lb/MMBtu[12]	0.0089	0.039
CO_2	780	lb/ODT[13]	32,760	143,489

Notes:

1. Each dryer system will include two (2) ducts (i.e., double ducts) that will each be heated by a 1 MMBtu/hr burner. There will be a total of six (6) burners, two (2) per dryer line. The burners will fire natural gas, with propane as a back-up, and will be low-NO_X burners.
2. Propane heat content from AP-42 Section 1.5 - Liquefied Petroleum Gas Production, 7/08.
3. Natural gas heating value from AP-42 Section 1.4 - Natural Gas Combustion, 07/98.
4. Total hourly fuel consumption for both burners. The burners will fire natural gas, with propane as a back-up.
5. Control efficiency based on RTO vendor guarantee.
6. Exhaust from the dryers are routed to a WESP and then RTO for control of VOC, HAP, and particulates. Each of the three (3) dryer lines will have a dedicated WESP and RTO. Emissions for Dryer Lines 1 and 2 are calculated separately.
7. CO and VOC emission rates based on vendor data.
8. NO_x emission factor based on stack testing at similar Enviva plants.
9. No emission factor is provided in AP-42, Section 10.6.2 for SO_2 for rotary dryers. Enviva has conservatively calculated SO_2 emissions based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
10. Filterable particulate emission rate based on RTO vendor data.
11. Condensable particulate emission factor for biomass combustion obtained from AP-42 Section 1.6.
12. Natural gas combustion by the RTO burners will also result in emissions of condensable PM. Emission factor obtained from AP-42, Section 1.4 - Natural Gas Combustion, 07/98.
13. Emission factor for CO_2 from AP-42, Section 10.6.1 for rotary dryer with RTO control device. Enviva has conservatively calculated the CO_2 emissions using the hardwood emission factor because the dryers at the Lucedale plant will use a combination of hardwood and softwood and the hardwood emission factor is greater than the softwood emission factor.

Table 12a
Potential Emissions at Outlet of Dryer Line 3 RTO Stack
AA-013
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Potential Criteria Pollutant and Greenhouse Gas Emissions - Dryer System Double Duct Burners[1]

Pollutant	Natural Gas Emission Factor[2,3] (lb/MMscf)	Potential Emissions - Natural Gas Combustion		Propane Emission Factor[4,5,6] (lb/Mgal)	Potential Emissions - Propane Combustion	
		(lb/hr)	(tpy)		(lb/hr)	(tpy)
CO	84.0	0.16	0.72	7.50	0.16	0.72
NO_X	50.0	0.10	0.43	6.50	0.14	0.62
SO_2	0.60	0.0012	0.0052	0.054	0.0012	0.0052
VOC	5.50	5.39E-04	0.0024	1.00	0.0011	0.0048
$PM/PM_{10}/PM_{2.5}$ Condensable	5.70	5.59E-04	0.0024	0.50	5.46E-04	0.0024
$PM/PM_{10}/PM_{2.5}$ Filterable	1.90	1.86E-04	0.0008	0.20	2.19E-04	0.0010
Total $PM/PM_{10}/PM_{2.5}$	--	7.45E-04	0.0033	--	7.65E-04	0.0034
CO_2	120,000	235	1,031	12,500	273	1,197
CH_4	2.30	0.0045	0.020	0.20	0.0044	0.019
N_2O[2]	0.64	0.0013	0.0055	0.90	0.020	0.0862
CO_2e	--	236	1,033	--	279	1,223

Notes:
1 Two (2) low-NOx burners will be used to heat the dryer system ducts to prevent condensation of wood tar from occurring and thus reduce the fire risk. The burners will combust natural gas. Emissions from the burners will be routed to the WESP and RTO on each dryer line; therefore, a 95% control efficiency was applied to VOC and $PM/PM_{10}/PM_{2.5}$.
2 Emission factors for natural gas combustion from AP-42 Section 1.4 - Natural Gas Combustion, 07/98. Natural gas heating value of 1,020 Btu/scf assumed per AP-42.
3 Emission factors for NO_X and N_2O assume burners are low NO_X burners, per email from Kai Simonsen (Enviva) on August 8, 2018.
4 Emission factors for propane combustion obtained from AP-42 Section 1.5 - Liquefied Petroleum Gas Combustion, 07/08.
5 AP-42 Section 1.5 does not include an emission factor for low NO_X burners. Per AP-42 Section 1.4, low NO_X burners reduce NO_X emissions by accomplishing combustion in stages, reducing NO_X emissions 40 to 85% relative to uncontrolled emission levels. A conservative control efficiency of 50% was applied to the uncontrolled NO_X emission factor from AP-42 Section 1.5. This reduction is consistent with the magnitude of reduction between the uncontrolled and low NO_X emission factors in AP-42 Section 1.4.
6 SO_2 emissions are based on an assumed fuel sulfur content of 0.54 grains/100 ft^3 per *A National Methodology and Emission Inventory for Residential Fuel Combustion*.

Lucedale, George County, Mississippi

Potential HAP Emissions

Pollutant	VOC	Emission Factor[8]	Units	RTO Burners Potential Emissions		Double Duct Burners Potential Emissions[3,4]	
				(lb/hr)	(tpy)	(lb/hr)	(tpy)
RTO Burners - Propane Combustion							
Benzene	Y	7.10E-04	lb/MMBtu	0.011	0.050	7.10E-05	3.11E-05
Formaldehyde	Y	1.51E-03	lb/MMBtu	0.024	0.11	1.51E-04	6.61E-05
PAHs	N	4.00E-05	lb/MMBtu	6.40E-04	0.0028	8.00E-05	7.01E-04
Total HAP Emissions (Propane Combustion)[7]				**0.036**	**0.16**	**3.02E-04**	**7.98E-04**

Notes:

1 Emission factor derived based on stack testing data from comparable Enviva facilities.
2 Emission factors for wood combustion in a stoker boiler from AP-42 Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
3 A control efficiency of 95% for the RTOs is applied to all organic HAP for those emission factors that are not derived from Enviva stack test data.
4 A 95% control efficiency for the wet electrostatic precipitator (WESP) is applied to all metal HAP.
5 The WESP will employ a caustic solution in its operation in which hydrochloric acid will have high water solubility. This caustic solution will neutralize the acid and effectively control it by 90%, per conversation on October 18, 2011 with Steven A. Jaasund, P.E. of Lundberg Associates, a manufacturer of WESPs.
6 Emission factors for natural gas combustion from AP-42 Section 1.4 - Natural Gas Combustion, 07/98. Natural gas heating value of 1,020 Btu/scf assumed per AP-42.
7 The RTO burners and burners for the dryer system double ducts will fire natural gas with propane as a back-up; however, propane is worst-case for HAP emissions.
8 Emission factors for propane combustion from the South Coast Air Quality Management District's Air Emissions Reporting Tool for external combustion equipment fired with LPG.

Abbreviations:

CAS - chemical abstract service
CH_4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
CO_2e - carbon dioxide equivalent
HAP - hazardous air pollutant
hr - hour
kg - kilogram
lb - pound
MMBtu - Million British thermal units
NO_X - nitrogen oxides
N_2O - nitrous oxide
ODT - oven dried tons
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
RTO - regenerative thermal oxidizer
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
WESP - wet electrostatic precipitator
yr - year

$PM/PM_{10}/PM_{2.5}$ Condensable	0.017	lb/MMBtu[4]	2.86	0.071
$PM/PM_{10}/PM_{2.5}$ Filterable	0.33	lb/MMBtu[5]	55.4	1.39
Total $PM/PM_{10}/PM_{2.5}$			58.3	1.46
CO_2	93.8	kg/MMBtu[6]	34,741	869
CH_4	0.0072	kg/MMBtu[6]	2.67	0.067
N_2O	0.0036	kg/MMBtu[6]	1.33	0.033
CO_2e			35,205	880

Notes:
1. During startup and shutdown (for temperature control) or malfunction, emissions will be vented out either the dryer bypass stacks or the furnace bypass stacks. Use of each bypass stack at full capacity will not exceed 50 hours per 12-month rolling period for each dryer line.
2. CO, NO_X, and VOC emission rates based on vendor data.
3. No emission factor is provided in AP-42, Section 10.6.2 for SO_2 for rotary dryers. Enviva has conservatively calculated SO_2 emissions based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
4. Emission factor for condensable PM based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.
5. Uncontrolled filterable PM emission factor is based on testing at a comparable Enviva facility.
6. Emission factors for biomass combustion (dryer) from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Trichlorophenol, 2,4,6-	2.2E-08	lb/MMBtu	3	3.70E-06	9.24E-08
Vinyl chloride	1.8E-05	lb/MMBtu	3	3.02E-03	7.56E-05
		Total HAP Emissions		**20.2**	**0.50**

Notes:

1. During dryer bypass emissions are not controlled by the WESP and RTO; however, combustion in the furnace still results in a reduction in organic HAP emission rates.
2. Organic HAP emissions rates were derived based on stack testing data from Cottondale and other similar Enviva plants.
3. Emission factors for wood combustion in a stoker boiler from AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.

Total HAP Emissions (Biomass Combustion)			**5.28**	**0.13**

Notes:
[1] Emission factors for wood combustion in a stoker boiler from AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03.

Abbreviations:
CH_4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
CO_2e - carbon dioxide equivalent
HAP - hazardous air pollutant
hr - hour
lb - pound
MMBtu - Million British thermal units
NO_X - nitrogen oxides
N_2O - nitrous oxide
ODT - oven dried tons
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
yr - year

AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03

Table 12d
Potential Emissions - Furnace 2 Bypass (Idle Mode)[1]
AA-015
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput	42 ODT/hr
Hourly Heat Input Capacity	5 MMBtu/hr
Annual Heat Input Capacity	2,500 MMBtu/yr
Hours of Operation[1]	500 hr/yr

Potential Criteria Pollutant and Greenhouse Gas Emissions - Furnace Bypass "Idle Mode"

Pollutant	Controlled Emission Factor	Units	Potential Emissions	
			(lb/hr)	(tpy)
CO	0.60	lb/MMBtu[2]	3.00	0.75
NO_X	0.22	lb/MMBtu[2]	1.10	0.28
SO_2	0.025	lb/MMBtu[2]	0.13	0.031
VOC	0.017	lb/MMBtu[2]	0.085	0.021
Total PM	0.56	lb/MMBtu[3]	2.80	0.70
Total PM_{10}	0.52	lb/MMBtu[2]	2.59	0.65
Total $PM_{2.5}$	0.45	lb/MMBtu[2]	2.24	0.56
CO_2	93.8	kg/MMBtu[4]	1,034	258
CH_4	0.0072	kg/MMBtu[4]	0.079	0.020
N_2O	0.0036	kg/MMBtu[4]	0.040	0.010
CO_2e			1,048	262

Notes:

1. Idle mode is defined as operation at up to a maximum heat input rate of 5 MMBtu/hr.
2. CO, NO_X, SO_2, PM_{10}, $PM_{2.5}$, and VOC emission rates based on AP-42, Section 1.6 - Wood Residue Combustion in Boilers, 09/03 for bark/bark and wet wood/wet wood-fired boilers. PM_{10} and $PM_{2.5}$ factors equal to the sum of the filterable and condensable factors from Table 1.6-1. VOC emission factor excludes formaldehyde.
3. Emission factor based on vendor data.
4. Emission factors for biomass combustion from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Table 13

Potential VOC and HAP Emissions at Outlet of RCO-1 Stack

AA-016

Enviva Pellets Lucedale, LLC

Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput	108 ODT/hr
Annual Throughput	947,026 ODT/yr
Hours of Operation	8,760 hr/yr
Propane Heating Value[1]	91.5 MMBtu/Mgal
Natural Gas Heating Value[2]	1,020 Btu/scf
Number of Burners	1 burners
RCO Burner Rating	9.8 MMBtu/hr
RCO Control Efficiency[3]	96.3%

Pellet Coolers, Pellet Mills, and Dry Hammermills Potential VOC and HAP Emissions

Pollutant	CAS No.	Controlled Emission Factor[4,5]	Units	Emissions at RCO Outlet[6]	
				(lb/hr)	(tpy)
Acetaldehyde	75-07-0	0.00065	lb/ODT	0.070	0.31
Acrolein	107-02-8	0.0023	lb/ODT	0.24	1.07
Formaldehyde	50-00-0	0.0015	lb/ODT	0.16	0.69
Methanol	67-56-1	0.0092	lb/ODT	1.00	4.37
Phenol	108-95-2	0.0011	lb/ODT	0.12	0.51
Propionaldehyde	123-38-6	0.0011	lb/ODT	0.12	0.52
		Total HAP Emissions		**1.70**	**7.47**
Total VOC as propane	--	7.73	lb/hr	7.73	33.9
$PM/PM_{10}/PM_{2.5}$ (Filterable + Condensable)		2.13	lb/hr	2.13	9.34

Notes:

1. Propane heat content from AP-42 Section 1.5 - Liquefied Petroleum Gas Production, 7/08.
2. Natural gas heating value from AP-42 Section 1.4 - Natural Gas Combustion, 07/98.
3. A 96.3% control efficiency for the RCO is applied to VOC and organic HAP emissions per vendor data provided by Kai Simonsen (Enviva) via email on June 26, 2018.
4. HAP emission factors were derived based on stack testing data from comparable Enviva facilities.
5. VOC emissions (as propane) and PM emissions based on vendor data.
6. Includes emissions at outlet of the RCO-1 (AA-010) stack as well as emissions resulting from combustion of natural gas by the RCO-1 (AA-010) burners. RCO-1 (AA-010) will control emissions from thirty-two (32) dry hammermills, sixteen (16) pellet mills, and eight (8) pellet coolers.

Table 13
Potential VOC and HAP Emissions at Outlet of RCO-1 Stack
AA-016
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Thermally Generated Potential Criteria Pollutant Emissions

Maximum high heating value of VOC constituents	0.018 MMBtu/lb
Uncontrolled VOC emissions	915 tons/yr
Heat input of uncontrolled VOC emissions	33,864 MMBtu/yr

Pollutant	Emission Factor	Units	Potential Emissions	
			(lb/hr)	(tpy)
CO	0.082	lb/MMBtu[1]	0.32	1.39
NO_x	0.10	lb/MMBtu[1]	0.38	1.66

$PM/PM_{10}/PM_{2.5}$ Condensable	5.59E-03	lb/MMBtu	0.055	0.24
Total $PM/PM_{10}/PM_{2.5}$			0.073	0.32
CO_2	66.9	kg/MMBtu	1,445	6,329
CH_4	1.00E-03	kg/MMBtu	0.022	0.095
N_2O	1.00E-04	kg/MMBtu	0.0022	0.0095
CO_2e			1,446	6,334

Pollutant	Emission Factor[3]	Units	Potential Emissions	
			(lb/hr)	(tpy)
RCO Burners - Propane Combustion				
CO	7.50	lb/Mgal	0.80	3.52
NO_x	6.50	lb/Mgal	0.70	3.05
SO_2[4]	0.054	lb/Mgal	0.0058	0.025
VOC	1.00	lb/Mgal	0.11	0.47
$PM/PM_{10}/PM_{2.5}$ Condensable	0.50	lb/Mgal	0.054	0.23
$PM/PM_{10}/PM_{2.5}$ Filterable	0.20	lb/Mgal	0.021	0.094
Total $PM/PM_{10}/PM_{2.5}$			0.075	0.33
CO_2	12,500	lb/Mgal	1,339	5,864
CH_4	0.20	lb/Mgal	0.021	0.094
N_2O	0.90	lb/Mgal	0.10	0.42
CO_2e			1,339	5,864

Notes:

1. Emission factors from AP-42, Section 1.4 - Natural Gas Combustion, 07/98. Emission factors converted from lb/MMscf to lb/MMBtu based on assumed heating value of 1,020 Btu/scf for natural gas per AP-42 Section 1.4.
2. NO_x emissions from combustion of natural gas by the RCO burners are based on vendor data with additional contingency applied for conservatism.
3. Emission factors for propane combustion obtained from AP-42 Section 1.5 - Liquefied Petroleum Gas Combustion, 07/08.
4. SO_2 emissions are based on an assumed fuel sulfur content of 0.54 grains/100 ft^3 per *A National Methodology and Emission Inventory for Residential Fuel Combustion*.

Table 14
Potential VOC and HAP Emissions at Outlet of RCO-2 Stack
AA-017
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Hourly Throughput	54 ODT/hr
Annual Throughput	473,513 ODT/yr
Hours of Operation	8,760 hr/yr
Propane Heating Value[1]	91.5 MMBtu/Mgal
Natural Gas Heating Value[2]	1,020 Btu/scf
Number of Burners	1 burners
RCO Burner Rating	4.6 MMBtu/hr
RCO Control Efficiency[3]	96.3%

Pellet Coolers, Pellet Mills, and Dry Hammermills Potential VOC and HAP Emissions

Pollutant	CAS No.	Controlled Emission Factor[4,5]	Units	Emissions at RCO Outlet[6]	
				(lb/hr)	(tpy)
Acetaldehyde	75-07-0	0.00065	lb/ODT	0.035	0.15
Acrolein	107-02-8	0.0023	lb/ODT	0.12	0.54
Formaldehyde	50-00-0	0.0015	lb/ODT	0.078	0.34
Methanol	67-56-1	0.0092	lb/ODT	0.50	2.18
Phenol	108-95-2	0.0011	lb/ODT	0.059	0.26
Propionaldehyde	123-38-6	0.0011	lb/ODT	0.059	0.26
			Total HAP Emissions	**0.85**	**3.73**
Total VOC as propane	--	3.87	lb/hr	3.87	16.9
$PM/PM_{10}/PM_{2.5}$ (Filterable + Condensable)		1.07	lb/hr	1.07	4.67

Notes:

1. Propane heat content from AP-42 Section 1.5 - Liquefied Petroleum Gas Production, 7/08.
2. Natural gas heating value from AP-42 Section 1.4 - Natural Gas Combustion, 07/98.
3. A 96.3% control efficiency for the RCO is applied to VOC and organic HAP emissions per vendor data provided by Kai Simonsen (Enviva) via email on June 26, 2018.
4. HAP emission factors were derived based on stack testing data from comparable Enviva facilities.
5. VOC emissions (as propane) and PM emissions based on vendor data.
6. Includes emissions at outlet of the RCO-2 (AA-011) stack as well as emissions resulting from combustion of natural gas by the RCO-2 (AA-011) burners. RCO-2 (AA-011) will control emissions from sixteen (16) dry hammermills, eight (8) pellet mills, and four (4) pellet coolers.

Summary of Potential Emissions from Baghouses
AA-018, AA-019, AA-020
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Emission Unit ID	Source Description	Control Device Description	Exhaust Flow Rate[1]	Exit Grain Loading	Particulate Speciation		Potential Emissions					
							PM		PM_{10}		$PM_{2.5}$	
			(cfm)	(gr/cf)	PM_{10} (% of PM)	$PM_{2.5}$ (% of PM)	(lb/hr)	(tpy)	(lb/hr)	(tpy)	(lb/hr)	(tpy)
AA-018	Finished Product Handling Two (2) Pellet Loadout Bins	One (1) baghouse[2]	3,000	0.004	91%	1.7%	0.10	0.45	0.094	0.41	0.0017	0.0077
AA-019	Additive Handling and Storage	One (1) baghouse[3]	1,000	0.004	100%	100%	0.034	0.15	0.034	0.15	0.034	0.15
AA-020	Dry Shavings Silo	One (1) baghouse[3]	1,000	0.004	100%	100%	0.034	0.15	0.034	0.15	0.034	0.15

Notes:
1. Control device flow rate (cfm) based on data provided by Kai Simonsen (Enviva) on June 25, 2018 and July 3, 2018.
2. Finished product handling particulate speciation based on April 2014 testing conducted at Enviva's Southampton plant.
3. No speciation data is available; therefore, all PM is conservatively assumed to be $PM_{2.5}$.

Abbreviations:
cf - cubic feet
cfm - cubic feet per minute
gr - grain
hr - hour
lb - pound
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
tpy - tons per year

Table 16
Emergency Generator Potential Emissions
AA-022
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Engine Output	500 kW
Horsepower Rating	671 brake hp
Diesel Heating Value	19,300 Btu/lb
Hours of Operation	500 hr/yr
Conversion factor	2,545 Btu/hr/hp
Hourly Fuel Consumption	31.9 gal/hr[1]
Energy Input	4.37 MMBtu/hr[2]

Notes:
1. Fuel consumption calculated using a factor of 0.0476 gal/hr-hp. Advanced Environmental Interface, Inc. (1998). General Permits for Emergency Engines. INSIGHTS, 98-2, 3.
2. Energy calculated on a fuel consumption basis, using an energy factor of 0.137 MMBtu/gal.

Potential Criteria Pollutant Emissions

Pollutant	Emission Factor	Units	Potential Emissions[1] (lb/hr)	Potential Emissions[1] (tpy)
CO[2]	0.39	g/hp-hr	0.58	0.14
NO_x[2]	6.65	g/hp-hr	9.83	2.46
SO_2[3]	15	ppmw	0.0027	0.00066
VOC[2]	0.01	lb/hp-hr	6.71	1.68
PM[2]	0.021	g/hp-hr	0.031	0.0078
PM_{10}[2]	0.021	g/hp-hr	0.031	0.0078
$PM_{2.5}$[2]	0.021	g/hp-hr	0.031	0.0078
CO_2	74.0	kg/MMBtu[4]	713	178
CH_4	3.0E-03	kg/MMBtu[4]	0.029	0.0072
N_2O	6.0E-04	kg/MMBtu[4]	0.0058	0.0014
CO_2e			715	179

Notes:
1. NSPS allows for only 100 hrs/yr of non-emergency operation of these engines. Potential emissions for the emergency generator are conservatively based on 500 hr/yr.
2. Emission factors for Particulate Matter ($TSP/PM_{10}/PM_{2.5}$), Nitrous Oxide (NO_x), Volatile Organic Matter (VOC), and Carbon Monoxide (CO) obtained from generator's spec sheet. The generator's spec sheet does not include an emission factor for VOC so the hydrocarbon (HC) emission factor was used as a surrogate for VOC.
3. Sulfur content in accordance with Year 2013 standards of 40 CFR 80.510(a) as required by NSPS Subpart IIII.
4. Emission factors from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Potential HAP Emissions

Pollutant	CAS No.	VOC	Emission Factor[1] (lb/MMBtu)	Potential Emissions[2] (lb/hr)	Potential Emissions[2] (tpy)
Acetaldehyde	75-07-0	Y	2.52E-05	1.10E-04	2.75E-05
Acrolein	107-02-8	Y	7.88E-06	3.45E-05	8.61E-06
Benzene	71-43-2	Y	7.76E-04	3.39E-03	8.48E-04
Benzo(a)pyrene[3]	50-32-8	Y	2.57E-07	1.12E-06	2.81E-07
Formaldehyde	50-00-0	Y	7.89E-05	3.45E-04	8.62E-05
Naphthalene[3]	91-20-3	Y	1.30E-04	5.68E-04	1.42E-04
Total PAH (POM)	--	Y	2.12E-04	9.27E-04	2.32E-04
Toluene	108-88-3	Y	2.81E-04	1.23E-03	3.07E-04
Xylene	1330-20-7	Y	1.93E-04	8.44E-04	2.11E-04
			Total HAP Emissions	**6.88E-03**	**1.72E-03**

Notes:
1. Emission factors obtained from AP-42 Section 3.4 - Large Stationary Diesel and All Stationary Duel-fuel Engines, 10/96, Table 3.4-3 and Table 3.4-4.
2. NSPS allows for only 100 hrs/yr of non-emergency operation of these engines. Potential emissions for the emergency generator are conservatively based on 500 hr/yr.
3. Benzo(a)pyrene and naphthalene are included as HAPs in Total PAH.

Table 16
Emergency Generator Potential Emissions
AA-022
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Abbreviations:

Btu - British thermal unit
CAS - chemical abstract service
CH_4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
CO_2e - carbon dioxide equivalent
g - gram
gal - gallon
HAP - hazardous air pollutant
hp - horsepower
hr - hour
kg - kilogram
kW - kilowatt
lb - pound
MW - megawatt
MMBtu - Million British thermal units
NO_X - nitrogen oxides
N_2O - nitrous oxide
ODT - oven dried tons
PAH - polycyclic aromatic hydrocarbon
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
POM - polycyclic organic matter
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
yr - year

Table 17
Fire Pump Potential Emissions
AA-023
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Engine Output	0.10 MW
Horsepower Rating	131 hp
Diesel Density[1]	7.1 lb/gal
Hours of Operation	500 hr/yr
Hourly Fuel Consumption	9 gal/hr[1]
Energy Input	1.23 MMBtu/hr[2]

Notes:
1. Diesel density from AP-42 Section 3.4 - Large Stationary Diesel and All Stationary Dual-fuel Engines, 10/96, Table 3.4-1, footnote a.
2. Energy calculated on a fuel consumption basis, using an energy factor of 0.137 MMBtu/gal.

Potential Criteria Pollutant Emissions

Pollutant	Emission Factor	Units	Potential Emissions[1] (lb/hr)	(tpy)
CO[2]	1.3	g/kW-hr	0.28	0.070
NO_X[2]	3.4	g/kW-hr	0.72	0.18
SO_2[3]	15	ppmw	0.0019	4.79E-04
VOC[2]	0.15	g/kW-hr	0.032	0.0081
PM[2]	0.17	g/kW-hr	0.037	0.0092
PM_{10}[2]	0.17	g/kW-hr	0.037	0.0092
$PM_{2.5}$[2]	0.17	g/kW-hr	0.037	0.0092
CO_2	74	kg/MMBtu[4]	201	50.3
CH_4	3.0E-03	kg/MMBtu[4]	0.0082	0.0020
N_2O	6.0E-04	kg/MMBtu[4]	0.0016	4.08E-04
CO_2e			202	50.4

Notes:
1. NSPS allows for only 100 hrs/yr of non-emergency operation. Potential emissions for the fire pump are conservatively based on 500 hr/yr.
2. Emissions factors for $PM/PM_{10}/PM_{2.5}$, NO_X, hydrocarbons, and CO obtained from generator's spec sheet.
3. Sulfur content in accordance with Year 2013 standards of 40 CFR 80.510(a) as required by NSPS Subpart IIII.
4. Emission factors from Table C-1 and C-2 of 40 CFR Part 98 and Global Warming Potentials from Table A-1.

Potential HAP Emissions

Pollutant	CAS No.	VOC	Emission Factor[1] (lb/hp-hr)	Potential Emissions[2] (lb/hr)	(tpy)
Acetaldehyde	75-07-0	Y	5.4E-06	7.03E-04	1.76E-04
Acrolein	107-02-8	Y	6.5E-07	8.48E-05	2.12E-05
Benzene	71-43-2	Y	6.5E-06	8.56E-04	2.14E-04
Benzo(a)pyrene	50-32-8	Y	1.3E-09	1.72E-07	4.31E-08
1,3-Butadiene	106-99-0	Y	2.7E-07	3.59E-05	8.96E-06
Formaldehyde	50-00-0	Y	8.3E-06	1.08E-03	2.71E-04
Naphthalene	91-20-3	Y	5.9E-07	7.78E-05	1.95E-05
Total PAH (POM)[3]	--	Y	1.2E-06	1.54E-04	3.85E-05
Toluene	108-88-3	Y	2.9E-06	3.75E-04	9.38E-05
Xylene	1330-20-7	Y	2.0E-06	2.61E-04	6.53E-05
			Total HAP Emissions	**3.55E-03**	**8.88E-04**

Notes:
1. Emission factor obtained from AP-42 Section 3.3 - Stationary Internal Combustion Engines, 10/96, Table 3.3-2.
2. NSPS allows for only 100 hrs/yr of non-emergency operation. Potential emissions for the fire pump are conservatively based on 500 hr/yr.
3. The PAH emission factor includes all the PAH compounds listed in AP-42. Emissions for naphthalene and benzo(a)pyrene are also calculated separately. For the purposes of calculating total HAP emissions, the naphthalene and benzo(a)pyrene are not included separately to avoid double counting these emissions.

											Total Emissions:	**74.4**	**8.81**	**14.9**	**1.76**	**3.65**	**0.43**

Notes:

[1] Distance traveled per round trip and daily trip counts provided by Enviva.

[2] Emission factors calculated based on Equation 2 from AP-42 Section 13.2.1 - Paved Roads, 01/11.

where

E = emission factor (lb/ton)
k = particle size multiplier (dimensionless) for PM 0.011
k = particle size multiplier (dimensionless) for PM_{10} 0.0022
k = particle size multiplier (dimensionless) for $PM_{2.5}$ 0.00054
sL - mean road surface silt loading from AP-42 Table 13.2.1-3 for quarries (g/m^2) 8.2
P - No. days with rainfall greater than 0.01 inch 110 Per AP-42, Section 13.2.1, Figure 13.2.1-2 (Lucedale, MS)

[3] Potential emissions calculated from appropriate emission factor times vehicle miles traveled with control efficiency of 90% for water / dust suppression activities followed by sweeping. Per Table 5 in Chapter 4 of the Air Pollution Engineering Manual, Air and Waste Management Association, page 141. Control efficiency (%) = 96-0.263*V, where V is the number of vehicle passes since application of water.

Abbreviations:

ft - feet
hr - hour
lb - pound
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
tpy - tons per year
yr - year
VMT - vehicle miles traveled
VOC - volatile organic compound

Air Pollution Engineering Manual, Air and Waste Management Association

Table 19
Diesel Storage Tanks
IAs
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Source ID[1]	Description	Design Volume[2]	Working Volume[3]	Tank Dimensions		Orientation	Throughput[3]	Turnovers	VOC Emissions[4]	
				Diameter	Length					
		(gal)	(gal)	(ft)	(ft)		(gal/yr)		(lb/hr)	(tpy)
IA	Emergency Generator Fuel Storage Tank	500	450	4.0	6	Horizontal	300	0.67	4.79E-05	2.10E-04
IA	Fire Pump Fuel Storage Tank[5]	185	93	3.3	3.3	Horizontal	4,500	48.6	4.22E-05	1.85E-04
IA	Mobile Fuel Diesel Storage Tank	5,000	2,500	6.0	23.7	Horizontal	200,000	80.0	8.76E-04	3.84E-03
								Total Emissions:	**9.66E-04**	**4.23E-03**

Notes:

1. Storage tanks used exclusively to store diesel are considered an insignificant activity per 11 Miss. Admin. Code Pt. 2 Ch. 1 R. 6.7.B(7).
2. Conservative design specifications.
3. Working volumes and throughputs provided by Kai Simonsen (Enviva) via email June 25, 2018.
4. Emissions calculated using EPA TANKS 4.0 software.
5. The TANKS program has a minimum allowable tank length of 5 feet. As such, emissions for the Fire Pump Fuel Storage tank are based on a length of 5 feet.

Abbreviations:

EPA - Environmental Protection Agency
ft - feet
gal - gallon
IA - Insignificant Activity
lb - pound
yr - year
VOC - volatile organic compound

Table 20
Propane Vaporizer Potential Emissions
IA[1]
Enviva Pellets Lucedale, LLC
Lucedale, George County, Mississippi

Calculation Basis

Propane Heating Value[2]	91.5 MMBtu/Mgal
Hours of Operation	8,760 hr/yr
Maximum Heat Input Rate	1.00 MMBtu/hr
Hourly Fuel Consumption	0.011 Mgal/hr

Notes:
1. The propane vaporizer is considered an insignificant activity per 11 Miss. Admin. Code Pt. 2 Ch. 6 R. 6.7.B(2).
2. Propane heat content from AP-42 Section 1.5 - Liquefied Petroleum Gas Production, 7/08.

Potential Criteria Pollutant and Greenhouse Gas Emissions

Pollutant	Emission Factor[1]	Units	Potential Emissions	
			(lb/hr)	(tpy)
CO	7.50	lb/Mgal	0.082	0.36
NO_x	13.0	lb/Mgal	0.14	0.62
SO_2[2]	0.054	lb/Mgal	5.90E-04	0.0026
VOC	1.00	lb/Mgal	0.011	0.048
$PM/PM_{10}/PM_{2.5}$ Condensable	0.50	lb/Mgal	0.0055	0.024
$PM/PM_{10}/PM_{2.5}$ Filterable	0.20	lb/Mgal	0.0022	0.010
Total $PM/PM_{10}/PM_{2.5}$			0.0077	0.034
CO_2	12,500	lb/Mgal	137	598
CH_4	0.20	lb/Mgal	0.0022	0.010
N_2O	0.90	lb/Mgal	0.010	0.043
CO_2e			140	611

Notes:
1. Emission factors obtained from AP-42 1.5- Liquefied Petroleum Gas Combustion, 07/08, Table 1.5-1.
2. SO_2 emissions are based on an assumed fuel sulfur content of 0.54 grains/100 ft^3 per *A National Methodology and Emission Inventory for Residential Fuel Combustion*.

Potential HAP Emissions

Pollutant	CAS No.	VOC	Emission Factor[1]	Potential Emissions	
			(lb/MMBtu)	(lb/hr)	(tpy)
Benzene	71-43-2	Y	7.10E-04	7.10E-04	3.11E-03
Formaldehyde	50-00-0	Y	1.50E-03	1.50E-03	6.57E-03
PAHs	--	N	4.00E-05	4.00E-05	1.75E-04
			Total HAP Emissions	**2.21E-03**	**9.86E-03**

Notes:
1. Emission factors for propane combustion from the South Coast Air Quality Management District's Air Emissions Reporting Tool for external combustion equipment fired with LPG.

Abbreviations:

Btu - British thermal unit
CAS - chemical abstract service
CH_4 - methane
CO - carbon monoxide
CO2 - carbon dioxide
CO_2e - carbon dioxide equivalent
gal - gallon
HAP - hazardous air pollutant
hr - hour
lb - pound
LPG - liquified petroleum gas
MMBtu - Million British thermal units
Mgal - Thousand gallons
NO_x - nitrogen oxides
N_2O - nitrous oxide
PAH - polycyclic aromatic hydrocarbon
PM - particulate matter
PM_{10} - particulate matter with an aerodynamic diameter less than 10 microns
$PM_{2.5}$ - particulate matter with an aerodynamic diameter of 2.5 microns or less
SO_2 - sulfur dioxide
tpy - tons per year
VOC - volatile organic compound
yr - year

DISPOSITION OF SECTIONS FORMERLY CODIFIED IN THIS CHAPTER

173-400-080 Compliance schedules. [Statutory Authority: RCW 70.94.331. WSR 80-11-059 (Order DE 80-14), § 173-400-080, filed 8/20/80. Statutory Authority: RCW 43.21A.080 and 70.94.331.

	WSR 79-06-012 (Order DE 78-21), § 173-400-080, filed 5/8/79; Order DE 76-38, § 173-400-080, filed 12/21/76. Formerly WAC 18-04-080.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.
173-400-090	Sensitive area designation. [Statutory Authority: RCW 70.94.331. WSR 80-11-059 (Order DE 80-14), § 173-400-090, filed 8/20/80; Order DE 76-38, § 173-400-090, filed 12/21/76. Formerly WAC 18-04-090.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.
173-400-130	Regulatory actions. [Statutory Authority: RCW 43.21A.080 and 70.94.331. WSR 79-06-012 (Order DE 78-21), § 173-400-130, filed 5/8/79; Order DE 76-38, § 173-400-130, filed 12/21/76. Formerly WAC 18-04-130.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.
173-400-135	Criminal penalties. [Statutory Authority: RCW 43.21A.080 and 70.94.331. WSR 79-06-012 (Order DE 78-21), § 173-400-135, filed 5/8/79.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.
173-400-140	Appeals. [Order DE 76-38, § 173-400-140, filed 12/21/76. Formerly WAC 18-04-140.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.
173-400-141	Prevention of significant deterioration (PSD). [Statutory Authority: Chapter 70.94 RCW, RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. WSR 01-17-062 (Order 99-06), § 173-400-141, filed 8/15/01, effective 9/15/01. Statutory Authority: Chapter 70.94 RCW. WSR 96-19-054 (Order 94-35), § 173-400-141, filed 9/13/96, effective 10/14/96; WSR 93-18-007 (Order 93-03), § 173-400-141, filed 8/20/93, effective 9/20/93; WSR 91-05-064 (Order 90-06), § 173-400-141, filed 2/19/91, effective 3/22/91.] Repealed by WSR 05-03-033 (Order 03-07), filed 1/10/05, effective 2/10/05. Statutory Authority: RCW 70.94.152.
173-400-150	Variance. [Statutory Authority: RCW 43.21A.080 and 70.94.331. WSR 79-06-012 (Order DE 78-21), § 173-400-150, filed 5/8/79; Order DE 76-38, § 173-400-150, filed 12/21/76. Formerly WAC 18-04-150.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.
173-400-160	Maintenance of pay. [Statutory Authority: RCW 43.21A.080 and 70.94.331. WSR 79-06-012 (Order DE 78-21), § 173-400-160, filed 5/8/79.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.
173-400-170	Requirements for boards and director. [Statutory Authority: RCW 43.21A.080 and 70.94.331. WSR 79-06-012 (Order DE 78-21), § 173-400-170, filed 5/8/79.] Repealed by WSR 83-09-036 (Order DE 83-13), filed 4/15/83. Statutory Authority: Chapters 43.21A and 70.94 RCW.

WAC 173-400-010 Policy and purpose. (1) It is the policy of the department of ecology (ecology) under the authority vested in it by chapter 43.21A RCW to provide for the systematic control of air pollution from air contaminant sources and for the proper development of the state's natural resources.

(2) It is the purpose of this chapter to establish technically feasible and reasonably attainable standards and to establish rules generally applicable to the control and/or prevention of the emission of air contaminants.

[Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-010, filed 2/19/91, effective 3/22/91. Statutory Authority: Chapters 43.21A and 70.94 RCW. WSR 83-09-036 (Order DE 83-13), § 173-400-010, filed 4/15/83; Order DE 76-38, § 173-400-010, filed 12/21/76. Formerly WAC 18-04-010.]

EPA effective: 6/2/95 (60 FR 28726, 6/2/95)

WAC 173-400-020 Applicability. (1) The provisions of this chapter shall apply statewide, except for specific subsections where a local authority has adopted and implemented corresponding local rules that apply only to sources subject to local jurisdiction as provided under RCW 70.94.141 and 70.94.331.

(2) An authority may enforce this chapter and may also adopt standards or requirements. These standards or requirements may not be less stringent than the current state air quality rules and may be more stringent than the current regulations. Unless properly delegated by ecology, authorities do not have jurisdiction over the following sources:

(a) Specific source categories over which the state, by separate regulation, has assumed or hereafter does assume jurisdiction.

(b) Automobiles, trucks, aircraft.

(c) Those sources under the jurisdiction of the energy facility site evaluation council.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-020, filed 11/28/12, effective 12/29/12; WSR 91-05-064 (Order 90-06), § 173-400-020, filed 2/19/91, effective 3/22/91. Statutory Authority: Chapters 43.21A and 70.94 RCW. WSR 83-09-036 (Order DE 83-13), § 173-400-020, filed 4/15/83. Statutory Authority: RCW 70.94.331. WSR 80-11-059 (Order DE 80-14), § 173-400-020, filed 8/20/80. Statutory Authority: RCW 43.21A.080 and 70.94.331. WSR 79-06-012 (Order DE 78-21), § 173-400-020, filed 5/8/79; Order DE 76-38, § 173-400-020, filed 12/21/76. Formerly WAC 18-04-020.]

EPA effective: 11/3/14 (79 FR 59653, 10/3/14)

WAC 173-400-025 Adoption of federal rules. Federal rules mentioned in this rule are adopted as they exist on January 24, 2018. Adopted or adopted by reference means the federal rule applies as if it was copied into this rule.

[Statutory Authority: Chapter 70.94 RCW. WSR 18-17-111 (Order 15-07), § 173-400-025, filed 8/16/18, effective 9/16/18. Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-025, filed 5/31/16, effective 7/1/16.]

EPA effective: 3/25/20 (85 FR 10301, 2/24/20)

WAC 173-400-030 Definitions. The definitions in this section apply statewide except where a permitting authority has redefined a specific term. Except as provided elsewhere in this chapter, the definitions in this section apply throughout the chapter:

(1) **"Actual emissions"** means the actual rate of emissions of a pollutant from an emission unit, as determined in accordance with (a) through (c) of this subsection.

(a) In general, actual emissions as of a particular date shall equal the average rate, in tons per year, at which the emissions unit actually emitted the pollutant during a two-year period which precedes the particular date and which is representative of normal source operation. Ecology or an authority shall allow the use of a different time period upon a determination that it is more representative of normal source operation. Actual emissions shall be calculated using the emissions unit's actual operating hours, production rates, and types of materials processed, stored, or combusted during the selected time period.

(b) Ecology or an authority may presume that source-specific allowable emissions for the unit are equivalent to the actual emissions of the emissions unit.

(c) For any emissions unit which has not begun normal operations on the particular date, actual emissions shall equal the potential to emit of the emissions unit on that date.

(2) **"Adverse impact on visibility"** is defined in WAC 173-400-117.

(3) **"Air contaminant"** means dust, fumes, mist, smoke, other particulate matter, vapor, gas, odorous substance, or any combination thereof. "Air pollutant" means the same as "air contaminant."

(4) **"Air pollution"** means the presence in the outdoor atmosphere of one or more air contaminants in sufficient quantities, and of such characteristics and duration as is, or is likely to be, injurious to human health, plant or animal life, or property, or which unreasonably

interferes with enjoyment of life and property. For the purposes of this chapter, air pollution shall not include air contaminants emitted in compliance with chapter 17.21 RCW, the Washington Pesticide Application Act, which regulates the application and control of the use of various pesticides.

(5) **"Allowable emissions"** means the emission rate of a source calculated using the maximum rated capacity of the source (unless the source is subject to federally enforceable limits which restrict the operating rate, or hours of operation, or both) and the most stringent of the following:

(a) The applicable standards as in 40 C.F.R. Part 60, 61, 62, or 63;

(b) Any applicable SIP emissions standard including those with a future compliance date; or

(c) The emissions rate specified as a federally enforceable approval condition, including those with a future compliance date.

~~(6) **"Alternative emission limit"** or **"alternative emission limitation"** means an emission limitation that applies to a source or an emissions unit only during a specifically defined transient mode of operation. An alternative emission limitation is a component of a continuously applicable emission limit. An alternative emission limit may be a numerical limit or a design characteristic of the emission unit and associated emission controls, work practices, or other operational standard, such as a control device operating range.~~

(7) **"Ambient air"** means the surrounding outside air.

(8) **"Ambient air quality standard"** means an established concentration, exposure time, and frequency of occurrence of air contaminant(s) in the ambient air which shall not be exceeded.

(9) **"Approval order"** is defined in **"order of approval."**

(10) **"Attainment area"** means a geographic area designated by EPA at 40 C.F.R. Part 81 as having attained the National Ambient Air Quality Standard for a given criteria pollutant.

(11) **"Authority"** means any air pollution control agency whose jurisdictional boundaries are coextensive with the boundaries of one or more counties.

(12) **"Begin actual construction"** means, in general, initiation of physical on-site construction activities on an emission unit that are of a permanent nature. Such activities include, but are not limited to, installation of building supports and foundations, laying underground pipe work and construction of permanent storage structures. With respect to a change in method of operations, this term refers to those on-site activities other than preparatory activities which mark the initiation of the change.

(13) **"Best available control technology (BACT)"** means an emission limitation based on the maximum degree of reduction for each air pollutant subject to regulation under chapter 70.94 RCW emitted from or which results from any new or modified stationary source, which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application of production processes and available methods, systems, and techniques, including fuel cleaning, clean fuels, or treatment or innovative fuel combustion techniques for control of each such pollutant. In no event shall application of the "best available control technology" result in emissions of any pollutants which will exceed the emissions allowed by any applicable standard under 40 C.F.R. Part 60 and Part 61. Emissions from any source utilizing clean fuels, or any other means, to comply

with this paragraph shall not be allowed to increase above levels that would have been required under the definition of BACT in the federal Clean Air Act as it existed prior to enactment of the Clean Air Act Amendments of 1990.

(14) **"Best available retrofit technology (BART)"** means an emission limitation based on the degree of reduction achievable through the application of the best system of continuous emission reduction for each pollutant which is emitted by an existing stationary facility. The emission limitation must be established, on a case-by-case basis, taking into consideration the technology available, the costs of compliance, the energy and nonair quality environmental impacts of compliance, any pollution control equipment in use or in existence at the source, the remaining useful life of the source, and the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology.

(15) **"Brake horsepower (BHP)"** means the measure of an engine's horsepower without the loss in power caused by the gearbox, alternator, differential, water pump, and other auxiliary components.

(16) **"Bubble"** means a set of emission limits which allows an increase in emissions from a given emissions unit in exchange for a decrease in emissions from another emissions unit, pursuant to RCW 70.94.155 and WAC 173-400-120.

(17) **"Capacity factor"** means the ratio of the average load on equipment or a machine for the period of time considered, to the manufacturer's capacity rating of the machine or equipment.

(18) **"Class I area"** means any area designated under section 162 or 164 of the federal Clean Air Act (42 U.S.C., Sec. 7472 or 7474) as a Class I area. The following areas are the Class I areas in Washington state:

(a) Alpine Lakes Wilderness;
(b) Glacier Peak Wilderness;
(c) Goat Rocks Wilderness;
(d) Mount Adams Wilderness;
(e) Mount Rainier National Park;
(f) North Cascades National Park;
(g) Olympic National Park;
(h) Pasayten Wilderness; and
(i) Spokane Indian Reservation.

(19) **"Combustion and incineration units"** means units using combustion for waste disposal, steam production, chemical recovery or other process requirements; but excludes outdoor burning.

(20)(a) **"Commence"** as applied to construction, means that the owner or operator has all the necessary preconstruction approvals or permits and either has:

(i) Begun, or caused to begin, a continuous program of actual onsite construction of the source, to be completed within a reasonable time; or

(ii) Entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of actual construction of the source to be completed within a reasonable time.

(b) For the purposes of this definition, "necessary preconstruction approvals" means those permits or orders of approval required under federal air quality control laws and regulations, including state, local and federal regulations and orders contained in the SIP.

(21) **"Concealment"** means any action taken to reduce the observed or measured concentrations of a pollutant in a gaseous effluent while, in fact, not reducing the total amount of pollutant discharged.

(22) **"Criteria pollutant"** means a pollutant for which there is established a National Ambient Air Quality Standard at 40 C.F.R. Part 50. The criteria pollutants are carbon monoxide (CO), particulate matter, ozone (O_3) sulfur dioxide (SO_2), lead (Pb), and nitrogen dioxide (NO_2).

(23) **"Director"** means director of the Washington state department of ecology or duly authorized representative.

(24) **"Dispersion technique"** means a method that attempts to affect the concentration of a pollutant in the ambient air other than by the use of pollution abatement equipment or integral process pollution controls.

(25) **"Ecology"** means the Washington state department of ecology.

(26) **"Electronic means"** means email, fax, FTP site, or other electronic method approved by the permitting authority.

(27) **"Emission"** means a release of air contaminants into the ambient air.

(28) **"Emission reduction credit (ERC)"** means a credit granted pursuant to WAC 173-400-131. This is a voluntary reduction in emissions.

(29) **"Emission standard," "emission limitation"** and **"emission limit"** means a requirement established under the federal Clean Air Act or chapter 70.94 RCW which limits the quantity, rate, or concentration of emissions of air contaminants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction and any design, equipment, work practice, or operational standard adopted under the federal Clean Air Act or chapter 70.94 RCW.

(30) **"Emission threshold"** means an emission of a listed air contaminant at or above the following rates:

Air Contaminant	Annual Emission Rate
Carbon monoxide:	100 tons per year
Fluorides:	3 tons per year
Hydrogen sulfide (H_2S):	10 tons per year
Lead:	0.6 tons per year
Nitrogen oxides:	40 tons per year
Particulate matter (PM):	25 tons per year of PM HPLVVLRQV
	10 tons per year of PM-2.5
	15 tons per year of PM-10 emissions
Reduced sulfur compounds (including H_2S):	10 tons per year
Sulfur dioxide:	40 tons per year
Sulfuric acid mist:	7 tons per year
7otal reduced sulfur (including H_2S):	10 tons per year
9olatile organic compounds:	40 tons per year

(31) **"Emissions unit"** or **"emission unit"** means any part of a stationary source or source which emits or would have the potential to

emit any pollutant subject to regulation under the federal Clean Air Act, chapter 70.94 or 70.98 RCW.

~~(32) **"Excess emissions"** means emissions of an air pollutant in excess of any applicable emission standard or an emission limit established in a permit or order, including an alternative emission limit.~~

(33) **"Excess stack height"** means that portion of a stack which exceeds the greater of sixty-five meters or the calculated stack height described in WAC 173-400-200(2).

(34) **"Existing stationary facility (facility)"** is defined in WAC 173-400-151.

(35) **"Federal Clean Air Act (FCAA)"** means the federal Clean Air Act, also known as Public Law 88-206, 77 Stat. 392, December 17, 1963, 42 U.S.C. 7401 et seq., as last amended by the Clean Air Act Amendments of 1990, P.L. 101-549, November 15, 1990.

(36) **"Federal Class I area"** means any federal land that is classified or reclassified Class I. The following areas are federal Class I areas in Washington state:

(a) Alpine Lakes Wilderness;

(b) Glacier Peak Wilderness;

(c) Goat Rocks Wilderness;

(d) Mount Adams Wilderness;

(e) Mount Rainier National Park;

(f) North Cascades National Park;

(g) Olympic National Park; and

(h) Pasayten Wilderness.

(37) **"Federal land manager"** means the secretary of the department with authority over federal lands in the United States.

~~(38) **"Federally enforceable"** means all limitations and conditions which are enforceable by EPA, including those requirements developed under 40 C.F.R. Parts 60, 61, 62 and 63, requirements established within the Washington SIP, requirements within any approval or order established under 40 C.F.R. 52.21 or under a SIP approved new source review regulation, emissions limitation orders issued under WAC 173-400-081(4), 173-400-082, or 173-400-091.~~

(39) **"Fossil fuel-fired steam generator"** means a device, furnace, or boiler used in the process of burning fossil fuel for the primary purpose of producing steam by heat transfer.

(40) **"Fugitive dust"** means a particulate emission made airborne by forces of wind, man's activity, or both. Unpaved roads, construction sites, and tilled land are examples of areas that originate fugitive dust. Fugitive dust is a type of fugitive emission.

(41) **"Fugitive emissions"** means emissions that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

(42) **"General process unit"** means an emissions unit using a procedure or a combination of procedures for the purpose of causing a change in material by either chemical or physical means, excluding combustion.

(43) **"Good engineering practice (GEP)"** refers to a calculated stack height based on the equation specified in WAC 173-400-200 (2)(a)(ii).

(44) **"Greenhouse gases (GHGs)"** includes carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride.

~~(45) **"Hog fuel"** (hogged fuel) means waste wood that is reduced in size to facilitate burning.~~

(46) **"Incinerator"** means a furnace used primarily for the thermal destruction of waste.

(47) **"In operation"** means engaged in activity related to the primary design function of the source.

(48) **"Mandatory Class I federal area"** means any area defined in Section 162(a) of the federal Clean Air Act (42 U.S.C., 7472(a)). The following areas are the mandatory Class I federal areas in Washington state:

(a) Alpine Lakes Wilderness;

(b) Glacier Peak Wilderness;

(c) Goat Rocks Wilderness;

(d) Mount Adams Wilderness;

(e) Mount Rainier National Park;

(f) North Cascades National Park;

(g) Olympic National Park; and

(h) Pasayten Wilderness;

(49) **"Masking"** means the mixing of a chemically nonreactive control agent with a malodorous gaseous effluent to change the perceived odor.

(50) **"Materials handling"** means the handling, transporting, loading, unloading, storage, and transfer of materials with no significant chemical or physical alteration.

(51) **"Modification"** means any physical change in, or change in the method of operation of, a stationary source that increases the amount of any air contaminant emitted by such source or that results in the emissions of any air contaminant not previously emitted. The term modification shall be construed consistent with the definition of modification in Section 7411, Title 42, United States Code, and with rules implementing that section.

(52) **"National Ambient Air Quality Standard (NAAQS)"** means an ambient air quality standard set by EPA at 40 C.F.R. Part 50 and includes standards for carbon monoxide (CO), particulate matter, ozone (O_3), sulfur dioxide (SO_2), lead (Pb), and nitrogen dioxide (NO_2).

(53) **"National Emission Standards for Hazardous Air Pollutants (NESHAP)"** means the federal rules in 40 C.F.R. Part 61.

(54) **"National Emission Standards for Hazardous Air Pollutants for Source Categories"** means the federal rules in 40 C.F.R. Part 63.

(55) **"Natural conditions"** means naturally occurring phenomena that reduce visibility as measured in terms of light extinction, visual range, contrast, or coloration.

(56) **"New source"** means:

(a) The construction or modification of a stationary source that increases the amount of any air contaminant emitted by such source or that results in the emission of any air contaminant not previously emitted; and

(b) Any other project that constitutes a new source under the federal Clean Air Act.

(57) **"New Source Performance Standards (NSPS)"** means the federal rules in 40 C.F.R. Part 60.

(58) **"Nonattainment area"** means a geographic area designated by EPA at 40 C.F.R. Part 81 as exceeding a National Ambient Air Quality Standard (NAAQS) for a given criteria pollutant. An area is nonattainment only for the pollutants for which the area has been designated nonattainment.

(59) **"Nonroad engine"** means:

(a) Except as discussed in (b) of this subsection, a nonroad engine is any internal combustion engine:

(i) In or on a piece of equipment that is self-propelled or serves a dual purpose by both propelling itself and performing another function (such as garden tractors, off-highway mobile cranes and bulldozers); or

(ii) In or on a piece of equipment that is intended to be propelled while performing its function (such as lawnmowers and string trimmers); or

(iii) That, by itself or in or on a piece of equipment, is portable or transportable, meaning designed to be and capable of being carried or moved from one location to another. Indicia of transportability include, but are not limited to, wheels, skids, carrying handles, dolly, trailer, or platform.

(b) An internal combustion engine is not a nonroad engine if:

(i) The engine is used to propel a motor vehicle or a vehicle used solely for competition, or is subject to standards promulgated under section 202 of the federal Clean Air Act (42 U.S.C., Sec. 7521); or

(ii) The engine is regulated by a New Source Performance Standard promulgated under section 111 of the federal Clean Air Act (42 U.S.C., Sec. 7411); or

(iii) The engine otherwise included in (a)(iii) of this subsection remains or will remain at a location for more than twelve consecutive months or a shorter period of time for an engine located at a seasonal source. A location is any single site at a building, structure, facility, or installation. Any engine (or engines) that replaces an engine at a location and that is intended to perform the same or similar function as the engine replaced will be included in calculating the consecutive time period. An engine located at a seasonal source is an engine that remains at a seasonal source during the full annual operating period of the seasonal source. A seasonal source is a stationary source that remains in a single location on a permanent basis (i.e., at least two years) and that operates at that single location approximately three months (or more) each year. This paragraph does not apply to an engine after the engine is removed from the location.

(60) **"Notice of construction application"** means a written application to allow construction of a new source, modification of an existing stationary source or replacement or substantial alteration of control technology at an existing stationary source.

(61) **"Opacity"** means the degree to which an object seen through a plume is obscured, stated as a percentage.

(62) **"Outdoor burning"** means the combustion of material in an open fire or in an outdoor container, without providing for the control of combustion or the control of the emissions from the combustion. Waste wood disposal in wigwam burners or silo burners is not considered outdoor burning.

(63) **"Order"** means any order issued by ecology or a local air authority pursuant to chapter 70.94 RCW, including, but not limited to RCW 70.94.332, 70.94.152, 70.94.153, 70.94.154, and 70.94.141(3), and includes, where used in the generic sense, the terms order, corrective action order, order of approval, and regulatory order.

(64) **"Order of approval"** or **"approval order"** means a regulatory order issued by a permitting authority to approve the notice of construction application for a proposed new source or modification, or

the replacement or substantial alteration of control technology at an existing stationary source.

(65) **"Ozone depleting substance"** means any substance listed in Appendices A and B to Subpart A of 40 C.F.R. Part 82.

(66) **"Particulate matter"** or **"particulates"** means any airborne finely divided solid or liquid material with an aerodynamic diameter smaller than 100 micrometers.

(67) **"Particulate matter emissions"** means all finely divided solid or liquid material, other than uncombined water, emitted to the ambient air as measured by applicable reference methods, or an equivalent or alternative method specified in Title 40, chapter I of the Code of Federal Regulations or by a test method specified in the SIP.

(68) **"Parts per million (ppm)"** means parts of a contaminant per million parts of gas, by volume, exclusive of water or particulates.

(69) **"Permitting authority"** means ecology or the local air pollution control authority with jurisdiction over the source.

(70) **"Person"** means an individual, firm, public or private corporation, association, partnership, political subdivision, municipality, or government agency.

(71) **"PM-10"** means particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers as measured by a reference method based on 40 C.F.R. Part 50 Appendix J and designated in accordance with 40 C.F.R. Part 53 or by an equivalent method designated in accordance with 40 C.F.R. Part 53.

(72) **"PM-10 emissions"** means finely divided solid or liquid material, including condensable particulate matter, with an aerodynamic diameter less than or equal to a nominal 10 micrometers emitted to the ambient air as measured by an applicable reference method, or an equivalent or alternate method, specified in 40 C.F.R. Part 51, Appendix M (in effect on the date in WAC 173-400-025) or by a test method specified in the SIP.

(73) **"PM-2.5"** means particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers as measured by a reference method based on 40 C.F.R. Part 50 Appendix L and designated in accordance with 40 C.F.R. Part 53 or by an equivalent method designated in accordance with 40 C.F.R. Part 53.

(74) **"PM-2.5 emissions"** means finely divided solid or liquid material, including condensable particulate matter, with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers emitted to the ambient air as measured by an applicable reference method, or an equivalent or alternate method, specified in 40 C.F.R. Part 51 (in effect on the date in WAC 173-400-025) or by a test method specified in the SIP.

(75) **"Portable source"** means a type of stationary source which emits air contaminants only while at a fixed location but which is capable of being transported to various locations. Examples include a portable asphalt plant or a portable package boiler.

(76) **"Potential to emit"** means the maximum capacity of a source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design only if the limitation or the effect it would have on emissions is enforceable. Secondary emissions do not count in determining the potential to emit of a source.

(77) **"Prevention of significant deterioration (PSD)"** means the program in WAC 173-400-700 to 173-400-750.

(78) **"Projected width"** means that dimension of a structure determined from the frontal area of the structure, projected onto a plane perpendicular to a line between the center of the stack and the center of the building.

(79) **"Reasonably attributable"** means attributable by visual observation or any other technique the state deems appropriate.

(80) **"Reasonably available control technology (RACT)"** means the lowest emission limit that a particular source or source category is capable of meeting by the application of control technology that is reasonably available considering technological and economic feasibility. RACT is determined on a case-by-case basis for an individual source or source category taking into account the impact of the source upon air quality, the availability of additional controls, the emission reduction to be achieved by additional controls, the impact of additional controls on air quality, and the capital and operating costs of the additional controls. RACT requirements for any source or source category shall be adopted only after notice and opportunity for comment are afforded.

(81) **"Regulatory order"** means an order issued by a permitting authority that requires compliance with:

(a) Any applicable provision of chapter 70.94 RCW or rules adopted there under; or

(b) Local air authority regulations adopted by the local air authority with jurisdiction over the sources to whom the order is issued.

(82) **"Secondary emissions"** means emissions which would occur as a result of the construction or operation of a major stationary source or major modification, but do not come from the major stationary source or major modification itself. Secondary emissions must be specific, well defined, quantifiable, and impact the same general area as the major stationary source or major modification which causes the secondary emissions. Secondary emissions include emissions from any off-site support facility which would not be constructed or increase its emissions except as a result of the construction or operation of the major stationary source or major modification. Secondary emissions do not include any emissions which come directly from a mobile source such as emissions from the tailpipe of a motor vehicle, from a train, or from a vessel.

~~(83) **"Shutdown"** means, generally, the cessation of operation of a stationary source or emission unit for any reason.~~

(84) **"Source"** means all of the emissions unit(s) including quantifiable fugitive emissions, that are located on one or more contiguous or adjacent properties, and are under the control of the same person or persons under common control, whose activities are ancillary to the production of a single product or functionally related groups of products.

(85) **"Source category"** means all sources of the same type or classification.

(86) **"Stack"** means any point in a source designed to emit solids, liquids, or gases into the air, including a pipe or duct.

(87) **"Stack height"** means the height of an emission point measured from the ground-level elevation at the base of the stack.

(88) **"Standard conditions"** means a temperature of 20°C (68°F) and a pressure of 760 mm (29.92 inches) of mercury.

~~(89) **"Startup"** means, generally, the setting in operation of a stationary source or emission unit for any reason.~~

(90) **"State implementation plan (SIP)"** or **"Washington SIP"** means the Washington SIP in 40 C.F.R. Part 52, Subpart WW. The SIP contains state, local and federal regulations and orders, the state plan and compliance schedules approved and promulgated by EPA, for the purpose of implementing, maintaining, and enforcing the National Ambient Air Quality Standards.

(91) **"Stationary source"** means any building, structure, facility, or installation which emits or may emit any air contaminant. This term does not include emissions resulting directly from an internal combustion engine for transportation purposes or from a nonroad engine or nonroad vehicle as defined in Section 216(11) of the federal Clean Air Act (42 U.S.C., 7550(11)).

(92) **"Sulfuric acid plant"** means any facility producing sulfuric acid by the contact process by burning elemental sulfur, alkylation acid, hydrogen sulfide, or acid sludge.

(93) **"Synthetic minor"** means any source whose potential to emit has been limited below applicable thresholds by means of an enforceable order, rule, or approval condition.

(94) **"Total reduced sulfur (TRS)"** means the sum of the sulfur compounds hydrogen sulfide, mercaptans, dimethyl sulfide, dimethyl disulfide, and any other organic sulfides emitted and measured by 40 C.F.R. Part 60, Appendix A, Test Method 16 (in effect on the date in WAC 173-400-025) or an EPA approved equivalent method and expressed as hydrogen sulfide.

(95) **"Total suspended particulate"** means particulate matter as measured by the method described in 40 C.F.R. Part 50 Appendix B.

~~(96) **"Toxic air pollutant (TAP)"** or **"toxic air contaminant"** means any toxic air pollutant listed in WAC 173-460-150. The term toxic air pollutant may include particulate matter and volatile organic compounds if an individual substance or a group of substances within either of these classes is listed in WAC 173-460-150. The term toxic air pollutant does not include particulate matter and volatile organic compounds as generic classes of compounds.~~

~~(97) **"Transient mode of operation"** means a short-term operating period of a source or an emission unit with a specific beginning and end, such as startup, shutdown, or maintenance.~~

(98) **"Unclassifiable area"** means an area that cannot be designated attainment or nonattainment on the basis of available information as meeting or not meeting the National Ambient Air Quality Standard for the criteria pollutant and that is listed by EPA at 40 C.F.R. Part 81.

(99) **"United States Environmental Protection Agency (USEPA)"** shall be referred to as EPA.

~~(100) **"Useful thermal energy"** means energy (steam, hot water, or process heat) that meets the minimum operating temperature, flow, and/or pressure required by any system that uses energy provided by the affected boiler or process heater.~~

(101) **"Visibility impairment"** means any humanly perceptible change in visibility (light extinction, visual range, contrast, or coloration) from that which would have existed under natural conditions.

(102) **"Volatile organic compound (VOC)"** means any carbon compound that participates in atmospheric photochemical reactions.

(a) Exceptions. The following compounds are not a VOC: Acetone; carbon monoxide; carbon dioxide; carbonic acid; metallic carbides or carbonates; ammonium carbonate, methane; ethane; methylene chloride (dichloromethane); 1,1,1-trichloroethane (methyl chloroform); 1,1,2-trichloro-1,2,2-trifluoroethane (CFC-113); trichlorofluoromethane (CFC-11); dichlorodifluoromethane (CFC-12); chlorodifluoromethane (HCFC-22); trifluoromethane (HFC-23); 1,2-dichloro 1,1,2,2-tetrafluoroethane (CFC-114); chloropentafluoroethane (CFC-115); 1,1,1-trifluoro 2,2-dichloroethane (HCFC-123); 1,1,1,2-tetrafluoroethane (HFC-134a); 1,1-dichloro 1-fluoroethane (HCFC-141b); 1-chloro 1,1-difluoroethane (HCFC-142b); 2-chloro 1,1,1,2-tetrafluoroethane (HCFC-124); pentafluoroethane (HFC-125); 1,1,2,2-tetrafluoroethane (HFC-134); 1,1,1-trifluoroethane (HFC-143a); 1,1-difluoroethane (HFC-152a); parachlorobenzotrifluoride (PCBTF); cyclic, branched, or linear completely methylated siloxanes; perchloroethylene (tetrachloroethylene); 3,3-dichloro-1,1,1,2,2-pentafluoropropane (HCFC-225ca); 1,3-dichloro-1,1,2,2,3-pentafluoropropane (HCFC-225cb); 1,1,1,2,3,4,4,5,5,5-decafluoropentane (HFC 43-10mee); difluoromethane (HFC-32); ethylfluoride (HFC-161); 1,1,1,3,3,3-hexafluoropropane (HFC-236fa); 1,1,2,2,3-pentafluoropropane (HFC-245ca); 1,1,2,3,3-pentafluoropropane (HFC-245ea); 1,1,1,2,3-pentafluoropropane (HFC-245eb); 1,1,1,3,3-pentafluoropropane (HFC-245fa); 1,1,1,2,3,3-hexafluoropropane (HFC-236ea); 1,1,1,3,3-pentafluorobutane (HFC-365mfc); chlorofluoromethane (HCFC-31); 1 chloro-1-fluoroethane (HCFC-151a); 1,2-dichloro-1,1,2-trifluoroethane (HCFC-123a); 1,1,1,2,2,3,3,4,4-nonafluoro-4-methoxy-butane ($C_4F_9OCH_3$ or HFE-7100); 2-(difluoromethoxymethyl)-1,1,1,2,3,3,3-heptafluoropropane ($(CF_3)_2CFCF_2OCH_3$); 1-ethoxy-1,1,2,2,3,3,4,4,4-nonafluorobutane ($C_4F_9OC_2H_5$ or HFE-7200); 2-(ethoxydifluoromethyl)-1,1,1,2,3,3,3-heptafluoropropane ($(CF_3)_2CFCF_2OC_2H_5$); methyl acetate; 1,1,1,2,2,3,3-heptafluoro-3-methoxy-propane (n-$C_3F_7OCH_3$ or HFE-7000); 3-ethoxy-1,1,1,2,3,4,4,5,5,6,6,6-dodecafluoro-2-(trifluoromethyl) hexane (HFE-7500); 1,1,1,2,3,3,3-heptafluoropropane (HFC 227ea); methyl formate ($HCOOCH_3$); 1,1,1,2,2,3,4,5,5,5-decafluoro-3-methoxy-4-trifluoromethyl-pentane (HFE-7300); dimethyl carbonate; propylene carbonate; trans-1,3,3,3-tetrafluoropropene; HCF2OCF2H (HFE-134); HCF2OCF2OCF2H (HFE-236cal2); HCF2OCF2CF2OCF2H (HFE-338pcc13); HCF2OCF2OCF2CF2OCF2H (H-Galden 1040x or H-Galden ZT 130 (or 150 or 180)); trans 1-chloro-3,3,3-trifluoroprop-1-ene; 2,3,3,3-tetrafluoropropene; 2-amino-2-methyl-1-propanol; t-butyl acetate; 1,1,2,2- tetrafluoro -1-(2,2,2-trifluoroethoxy) ethane; and perfluorocarbon compounds that fall into these classes:

(i) Cyclic, branched, or linear completely fluorinated alkanes;

(ii) Cyclic, branched, or linear completely fluorinated ethers with no unsaturations;

(iii) Cyclic, branched, or linear completely fluorinated tertiary amines with no unsaturations; and

(iv) Sulfur containing perfluorocarbons with no unsaturations and with sulfur bonds only to carbon and fluorine.

(b) For the purpose of determining compliance with emission limits, VOC will be measured by the appropriate methods in 40 C.F.R. Part 60, Appendix A (in effect on the date in WAC 173-400-025). Where the method also measures compounds with negligible photochemical reactivity, these negligibly reactive compounds may be excluded as VOC if the amount of the compounds is accurately quantified, and the exclusion is approved by ecology, the authority, or EPA.

(c) As a precondition to excluding these negligibly reactive compounds as VOC or at any time thereafter, ecology or the authority may require an owner or operator to provide monitoring or testing methods and results demonstrating, to the satisfaction of ecology, the authority, or EPA the amount of negligibly reactive compounds in the source's emissions.

~~(103) **"Wigwam"** or **"silo burner"** means a cone-shaped or cylindrical structure that burns waste wood for disposal. A silo burner is a cylinder and may be made with refractory material rather than metal.~~

~~(104) **"Wood-fired boiler"** means an enclosed device using controlled flame combustion of wood or waste wood with the primary purpose of recovering thermal energy in the form of a steam or hot water boiler that burns wood or waste wood for fuel for the primary purpose of producing hot water or steam by heat transfer. Controlled flame combustion refers to a steady-state, or near steady-state, process wherein fuel and/or air feed rates are controlled.~~

(105) **"Waste wood"** means wood pieces or particles generated as a by-product or waste from the manufacturing of wood products, and the handling and storage of raw materials, trees, and stumps. This includes, but is not limited to, sawdust, chips, shavings, bark, pulp, log sort yard waste, and wood materials from forest health logging, land clearing or pruning, but does not include wood pieces or particles containing chemical preservatives such as creosote, pentachlorophenol, or copper-chrome-arsenate.

[Statutory Authority: Chapter 70.94 RCW. EPA effective: 3/25/20 (85 FR 10301, 2/24/20)

173-400-030 Definitions.

(30) "Excess emissions" means emissions of an air pollutant in excess of any applicable emission standard.

(36) "Federally enforceable" means all limitations and conditions which are enforceable by EPA, including those requirements developed under 40 C.F.R. Parts 60, 61, 62 and 63, requirements established within the Washington SIP, requirements within any approval or order established under 40 C.F.R. 52.21 or under a SIP approved new source review regulation, and emissions limitation orders issued under WAC 173-400-091.

State effective: 12/29/12; EPA effective: 11/3/14 (79 FR 59653,10/3/14)

WAC 173-400-036 Relocation of portable sources. (1) **Applicability.**

(a) Portable sources that meet the requirements of this section may without obtaining a site-specific or permitting authority-specific order of approval relocate and operate in any jurisdiction in which the permitting authority has adopted this section by reference. The owner or operator of a portable source may file a new notice of construction application in compliance with WAC 173-400-110 each time the portable source relocates in lieu of participating in the inter-jurisdictional provisions in this section.

(b) Permitting authority participation in the inter-jurisdictional provisions of this section is optional. This section applies only in those jurisdictions where the permitting authority has adopted it. Nothing in this section affects a permitting authority's ability to enter into an agreement with another permitting authority to allow inter-jurisdictional relocation of a portable source under conditions other than those listed here except that subsection (2) of this section applies statewide.

(c) This section applies to sources that move from the jurisdiction of one permitting authority to the jurisdiction of another permitting authority, inter-jurisdictional relocation. This section does not apply to intra-jurisdictional relocation.

(d) Engines subject to WAC 173-400-035 Nonroad engines are not portable sources subject to this section.

(2) **Portable sources in nonattainment areas.** If a portable source is locating in a nonattainment area and if the source emits the pollutants or pollutant precursors for which the area is classified as nonattainment, then the source must acquire a site-specific order of approval.

(3) **Major stationary sources.** If a portable source is a major stationary source then it must also comply with WAC 173-400-700 through 173-400-750 as applicable.

(4) **Relocation requirements.** Portable sources are allowed to operate at a new location without obtaining an order of approval from the permitting authority with jurisdiction over the new location provided that:

(a) A permitting authority in Washington state issued a notice of construction order of approval for the portable source after July 1, 2010, identifying the emission units as a "portable source";

(b) The owner/operator of the portable source submits a relocation notice on a form provided by the permitting authority and a copy of the applicable portable source order of approval to the permitting authority with jurisdiction over the intended operation location a minimum of fifteen calendar days before the portable source begins operation at the new location;

(c) The owner/operator submits the emission inventory required under WAC 173-400-105 to each permitting authority in whose jurisdiction the portable source operated during the preceding year. The data must be sufficient in detail to enable each permitting authority to calculate the emissions within its jurisdiction and the yearly aggregate.

(d) Operation at any location under this provision is limited to one year or less. Operations lasting more than one year must obtain a site specific order of approval.

(5) **Enforcement of the order of approval.** The permitting authority with jurisdiction over the location where a portable source is operating has authority to enforce the conditions of the order of appro-

val that authorizes the portable source operation, regardless of which permitting authority issued the order of approval. All persons who receive an order of approval must comply with all approval conditions contained in the order of approval.

(6) **Change of conditions to orders of approval.** To change the conditions in an order of approval, the owner/operator must obtain a new order of approval from the permitting authority with jurisdiction over the portable source.

(7) **Portable source modification.** Prior to beginning actual construction or installation of a modification of a portable source, the owner/operator must obtain a new order of approval from the permitting authority with jurisdiction over the portable source.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-036, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-036, filed 3/1/11, effective 4/1/11.]'

EPA effective: 5/29/15 (80 FR 23721, 4/29/15)

WAC 173-400-040 General standards for maximum emissions. (1) **General requirements.**

(a) All sources and emissions units are required to meet the emission standards of this chapter. Where an emission standard listed in another chapter is applicable to a specific emissions unit, such standard takes precedence over a general emission standard listed in this chapter.

(b) When two or more emissions units are connected to a common stack and the operator elects not to provide the means or facilities to sample emissions from the individual emissions units, and the relative contributions of the individual emissions units to the common discharge are not readily distinguishable, then the emissions of the common stack must meet the most restrictive standard of any of the connected emissions units.

(c) All emissions units are required to use reasonably available control technology (RACT) which may be determined for some sources or source categories to be more stringent than the applicable emission limitations of any chapter of Title 173 WAC. Where current controls are determined to be less than RACT, the permitting authority shall, as provided in RCW 70.94.154, define RACT for each source or source category and issue a rule or regulatory order requiring the installation of RACT.

~~(2) **Visible emissions.** No person shall cause or allow the emission for more than three minutes, in any one hour, of an air contaminant from any emissions unit which at the emission point, or within a reasonable distance of the emission point, exceeds twenty percent opacity as determined by ecology method 9A. The following are exceptions to this standard:~~

~~(a) Soot blowing or grate cleaning alternate visible emission standard.~~

~~(i) This provision is in effect until the effective date of EPA's removal of the September 20, 1993, version of WAC 173-400-107 from the SIP. The opacity emission standard in subsection (2) of this section shall apply except when the emissions occur due to soot blowing/grate cleaning and the operator can demonstrate that the emissions will not exceed twenty percent opacity for more than fifteen minutes in any eight consecutive hours. The intent of this provision is to allow the soot blowing and grate cleaning necessary to the operation of boiler facilities. This practice, except for testing and trouble shooting, is~~

~~to be scheduled for the same approximate times each day and the permitting authority must be advised of the schedule.~~'

~~(ii) This provision takes effect on the effective date of EPA's removal of the September 20, 1993, version of WAC 173-400-107 from the SIP. For emissions that occur due to soot blowing or grate cleaning of a hog fuel or wood-fired boiler: Visible emissions (as determined by ecology method 9A) shall not exceed twenty percent opacity; except that opacity shall not exceed forty percent for up to a fifteen minute period in any eight consecutive hours. For this provision to apply, the owner or operator must:~~

~~(A) Schedule the soot blowing and/or grate cleaning for the same approximate time(s) each day;~~

~~(B) Notify the permitting authority in writing of the schedule before using the forty percent standard; and~~

~~(C) Maintain contemporaneous records sufficient to demonstrate compliance. Records must include the date, start time, and stop time of each episode, and the results of opacity readings conducted during this time.~~

~~(b) When the owner or operator of a source supplies valid data to show that the presence of uncombined water is the only reason for the opacity to exceed twenty percent or an alternative opacity standard established in this section.~~

~~(c) When two or more emission units are connected to a common stack, the permitting authority may allow or require the use of an alternate time period if it is more representative of normal operations.~~

~~(d) When an alternative opacity limit has been established per RCW 70.94.331 (2)(c), WAC 173-400-081(4) or 173-400-082.~~

~~(e) Alternative visible emission standard for a hog fuel or wood-fired boiler in operation before January 24, 2018. This provision takes effect on the effective date of EPA's removal of the September 20, 1993, version of WAC 173-400-107 from the SIP. For emissions that occur due to planned startup or shutdown of a hog fuel or wood-fired boiler with dry particulate matter controls, an owner or operator may use the alternative standard in this subsection when all of the following requirements are met.~~

~~Note: This subsection does not apply to a combustion unit with wet particulate matter controls.~~

~~(i) A planned startup or shutdown means that the owner or operator notifies the permitting authority:~~

~~(A) At least twenty-four hours prior to the planned boiler startup or shutdown; or~~

~~(B) Within two hours after restarting the boiler for a startup within twenty-four hours after the end of an unplanned shutdown (i.e., malfunction or upset).~~

~~Note: A shutdown due to a malfunction is part of the malfunction.~~

~~(ii) Startup begins when fuel is ignited in the boiler fire box.~~

~~(iii) Startup ends:~~

~~(A) When the boiler starts supplying useful thermal energy; or~~

~~(B) Four hours after the boiler starts supplying useful thermal energy if the facility follows the work practices in (e)(vi)(B) of this subsection.~~

~~(iv) Shutdown begins when the boiler no longer supplies useful thermal energy, or when no fuel is being fed to the boiler or process heater, whichever is earlier.~~

~~(v) Shutdown ends when the boiler or process heater no longer supplies useful thermal energy and no fuel is being combusted in the boiler.~~

~~(vi) The facility complies with one of the following requirements:~~

~~(A) Visible emissions during startup or shutdown shall not exceed forty percent opacity for more than three minutes in any hour, as determined by ecology method 9A; or~~

~~(B) During startup or shutdown, the owner or operator shall:~~

~~(I) Operate all continuous monitoring systems;~~

~~(II) In the boiler, use only clean fuel identified in 5.b. in Table 3 in 40 C.F.R. Part 63, Subpart DDDDD;~~

~~(III) Engage all applicable control devices so as to comply with the twenty percent opacity standard within four hours of the start of supplying useful thermal energy;~~

~~(IV) Engage and operate particulate matter control within one hour of first feeding fuels that are not clean fuels; and~~

~~(V) Develop and implement a written startup and shutdown plan. The plan must minimize the startup period according to the manufacturer's recommended procedure. In the absence of manufacturer's recommendation, the owner or operator shall use the recommended startup procedure for a unit of a similar design. The plan must be maintained onsite and available upon request for public inspection.~~

~~(vii) The facility maintains records sufficient to demonstrate compliance with (e)(i) through (v) of this subsection. The records must include the following:~~

~~(A) The date and time of notification of the permitting authority;~~

~~(B) The date and time when startup and shutdown began;~~

~~(C) The date and time when startup and shutdown ended;~~

~~(D) The compliance option in (e)(vi) of this subsection that was chosen (either (A) or (B)) and documentation of how the conditions of that option were met.~~

~~(f) Furnace refractory alternative visible emission standard. This provision takes effect on the effective date of EPA's removal of the September 20, 1993, version of WAC 173-400-107 from the SIP. For emissions that occur during curing of furnace refractory in a lime kiln or boiler, visible emissions (as determined by ecology method 9A) shall not exceed forty percent opacity for more than three minutes in any hour, except when (b) of this subsection applies. For this provision to apply, the owner or operator must meet all of the following requirements:~~

~~(i) The total duration of refractory curing shall not exceed thirty-six hours; and~~

~~(ii) Use only clean fuel identified in 5.b. in Table 3 in 40 C.F.R. Part 63, Subpart DDDDD; and~~

~~(iii) The owner or operator provides a copy of the manufacturer's instructions on curing refractory to the permitting authority; and~~

~~(iv) The manufacturer's instructions on curing refractory must be followed, including all instructions on temperature increase rates and holding temperatures and time; and~~

~~(v) The emission controls must be engaged as soon as possible during the curing process; and~~

~~(vi) The permitting authority must be notified at least one working day prior to the start of the refractory curing process.~~

~~(g) Visible emissions reader certification testing. Visible emissions from the "smoke generator" used during testing and certifying visible emission readers are exempt from the twenty percent opacity limit. Testing must follow testing and certification requirements in 40 C.F.R. Part 60, Appendix A, Test Method 9 (in effect on the date in~~

~~WAC 173-400-025) and Source Test Methods 9A and 9B in *Source Test Manual - Procedures for Compliance Testing*, state of Washington, department of ecology, as of September 20, 2004, on file at ecology.~~

~~(h) Military training exercises. Visible emissions during military obscurant training exercises are exempt from the twenty percent opacity limit when the following requirements are met:~~

~~(i) No visible emissions shall cross the boundary of the military training site/reservation.~~

~~(ii) The operation shall have in place methods, which have been reviewed and approved by the permitting authority, to detect changes in weather that would cause the obscurant to cross the site boundary either during the course of the exercise or prior to the start of the exercise. The approved methods shall include provisions that result in cancellation of the training exercise, cease the use of obscurants during the exercise until weather conditions would allow such training to occur without causing obscurant to leave the site boundary of the military site/reservation.~~

~~(i) Firefighter training. Visible emissions from fixed and mobile firefighter training facilities occurring during the training of firefighters are exempt from the twenty percent opacity limit. Compliance with chapter 173-425 WAC is required.~~

~~(3) **Fallout.** No person shall cause or allow the emission of particulate matter from any source to be deposited beyond the property under direct control of the owner or operator of the source in sufficient quantity to interfere unreasonably with the use and enjoyment of the property upon which the material is deposited.~~

(4) **Fugitive emissions.** The owner or operator of any emissions unit engaging in materials handling, construction, demolition or other operation which is a source of fugitive emission:

(a) If located in an attainment area and not impacting any nonattainment area, shall take reasonable precautions to prevent the release of air contaminants from the operation.

(b) If the emissions unit has been identified as a significant contributor to the nonattainment status of a designated nonattainment area, the owner or operator shall be required to use reasonable and available control methods, which shall include any necessary changes in technology, process, or other control strategies to control emissions of the air contaminants for which nonattainment has been designated.

~~(5) **Odors.** Any person who shall cause or allow the generation of any odor from any source or activity which may unreasonably interfere with any other property owner's use and enjoyment of her or his property must use recognized good practice and procedures to reduce these odors to a reasonable minimum.~~

(6) **Emissions detrimental to persons or property.** No person shall cause or allow the emission of any air contaminant from any source if it is detrimental to the health, safety, or welfare of any person, or causes damage to property or business.

(7) **Sulfur dioxide.** No person shall cause or allow the emission of a gas containing sulfur dioxide from any emissions unit in excess of one thousand ppm of sulfur dioxide on a dry basis, corrected to seven percent oxygen for combustion sources, and based on the average of any period of sixty consecutive minutes.

(8) **Concealment and masking.** No person shall cause or allow the installation or use of any means which conceals or masks an emission of an air contaminant which would otherwise violate any provisions of this chapter.

(9) **Fugitive dust.**

(a) The owner or operator of a source or activity that generates fugitive dust must take reasonable precautions to prevent that fugitive dust from becoming airborne and must maintain and operate the source to minimize emissions.

(b) The owner or operator of any existing source or activity that generates fugitive dust that has been identified as a significant contributor to a PM-10 or PM-2.5 nonattainment area is required to use reasonably available control technology to control emissions. Significance will be determined by the criteria found in WAC 173-400-113(4).

EPA effective: 3/25/20 (85 FR 10301, 2/24/20)

173-400-040 General Standards for Maximum Emissions.

(2) Visible emissions. No person shall cause or allow the emission for more than three minutes, in any one hour, of an air contaminant from any emissions unit which at the emission point, or within a reasonable distance of the emission point, exceeds twenty percent opacity except:

(a) When the emissions occur due to soot blowing/grate cleaning and the operator can demonstrate that the emissions will not exceed twenty percent opacity for more than fifteen minutes in any eight consecutive hours. The intent of this provision is to allow the soot blowing and grate cleaning necessary to the operation of boiler facilities. This practice, except for testing and trouble shooting, is to be scheduled for the same approximate times each day and the permitting authority must be advised of the schedule.

(b) When the owner or operator of a source supplies valid data to show that the presence of uncombined water is the only reason for the opacity to exceed twenty percent.

~~(c) When two or more emission units are connected to a common stack, the permitting authority may allow or require the use of an alternate time period if it is more representative of normal operations.~~

~~(d) When an alternate opacity limit has been established per RCW 70.94.331 (2)(c).~~

(e) Exemptions from twenty percent opacity standard.

(i) Visible emissions reader certification testing. Visible emissions from the "smoke generator" used for testing and certification of visible emissions readers per the requirements of 40 C.F.R. Part 60, Appendix A, test method 9 (in effect on the date in WAC 173-400-025) and ecology methods 9A and 9B shall be exempt from compliance with the twenty percent opacity limitation while being used for certifying visible emission readers.

(ii) Military training exercises. Visible emissions resulting from military obscurant training - exercises are exempt from compliance with the twenty percent opacity limitation provided the - following criteria are met: -

(A) No visible emissions shall cross the boundary of the military training site/reservation.

(B) The operation shall have in place methods, which have been reviewed and approved by the permitting authority, to detect changes in weather that would cause the obscurant to cross the site boundary either during the course of the exercise or prior to the start of the exercise. The approved methods shall include provisions that result in cancellation of the training exercise, cease the use of obscurants during the exercise until weather conditions would allow such training to occur without causing obscurant to leave the site boundary of the military site/reservation.

(iii) Firefighter training. Visible emissions from fixed and mobile firefighter training facilities while being used to train firefighters and while complying with the requirements of chapter 173-425 WAC.

State effective: 07/01/16, EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

~~(9) **Fugitive dust.**~~

~~(a) The owner or operator of a source or activity that generates fugitive dust must take reasonable precautions to prevent that fugitive dust from becoming airborne and must maintain and operate the source to minimize emissions.~~

~~(b) The owner or operator of any existing source or activity that generates fugitive dust that has been identified as a significant contributor to a PM-10 or PM-2.5 nonattainment area is required to use reasonably available control technology to control emissions. Significance will be determined by the criteria found in WAC 173-400-113(4).~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 18-17-111 (Order 15-07), § 173-400-040, filed 8/16/18, effective 9/16/18. Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WAC 173-400-050 Emission standards for combustion and incineration units. (1) Combustion and incineration emissions units must meet all requirements of WAC 173-400-040 and, in addition, no person shall cause or allow emissions of particulate matter in excess of 0.23 gram per dry cubic meter at standard conditions (0.1 grain/dscf), except, for an emissions unit combusting waste wood for the production of steam. No person shall allow the emission of particulate matter in excess of 0.46 gram per dry cubic meter at standard conditions (0.2 grain/dscf), as measured by 40 C.F.R. Part 60, Appendix A, Test Method 5 (in effect on the date in WAC 173-400-025) or approved procedures in *Source Test Manual - Procedures for Compliance Testing*, state of Washington, department of ecology, as of September 20, 2004, on file at ecology.

~~(2) For any incinerator, no person shall cause or allow emissions in excess of one hundred ppm of total carbonyls as measured by Source Test Method 14 procedures in *Source Test Manual - Procedures for Compliance Testing*, state of Washington, department of ecology, as of September 20, 2004, on file at ecology. An applicable EPA reference method or other procedures to collect and analyze for the same compounds collected in the ecology method may be used if approved by the permitting authority prior to its use.~~

~~(a) **Incinerators** not subject to the requirements of chapter 173-434 WAC or WAC 173-400-050 (4) or (5), or requirements in WAC 173-400-075 (40 C.F.R. Part 63, Subpart EEE in effect on the date in WAC 173-400-025) and WAC 173-400-115 (40 C.F.R. Part 60, Subparts E, Ea, Eb, Ec, AAAA, and CCCC (in effect on the date in WAC 173-400-025)) shall be operated only during daylight hours unless written permission to operate at other times is received from the permitting authority.~~

~~(b) Total carbonyls means the concentration of organic compounds containing the =C=O radical as collected by Source Test Method 14 procedures in *Source Test Manual - Procedures for Compliance Testing*, state of Washington, department of ecology, as of September 20, 2004, on file at ecology.~~

(3) Measured concentrations for combustion and incineration units shall be adjusted for volumes corrected to seven percent oxygen, except when the permitting authority determines that an alternate oxygen correction factor is more representative of normal operations such as the correction factor included in an applicable NSPS or NESHAP, actual operating characteristics, or the manufacturer's specifications for the emission unit.

~~(4) **Commercial and industrial solid waste incineration units** constructed on or before November 30, 1999.~~'

~~Note: Subsection (2) of this section (a state-only provision) does not apply to a unit subject to this subsection because this section is based on federal requirements.~~

~~(a) Definitions.~~

~~(i) "Commercial and industrial solid waste incineration (CISWI) unit" means any combustion device that combusts commercial and industrial waste, as defined in this subsection. The boundaries of a CISWI unit are defined as, but not limited to, the commercial or industrial solid waste fuel feed system, grate system, flue gas system, and bottom ash. The CISWI unit does not include air pollution control equipment or the stack. The CISWI unit boundary starts at the commercial and industrial solid waste hopper (if applicable) and extends through two areas:~~

~~(A) The combustion unit flue gas system, which ends immediately after the last combustion chamber.~~

~~(B) The combustion unit bottom ash system, which ends at the truck loading station or similar equipment that transfers the ash to final disposal. It includes all ash handling systems connected to the bottom ash handling system.~~

~~(ii) "Commercial and industrial solid waste" means solid waste combusted in an enclosed device using controlled flame combustion without energy recovery that is a distinct operating unit of any commercial or industrial facility (including field erected, modular, and custom built incineration units operating with starved or excess air), or solid waste combusted in an air curtain incinerator without energy recovery that is a distinct operating unit of any commercial or industrial facility.~~

(b) Applicability. This section applies to incineration units that meet all three criteria:

(i) The incineration unit meets the definition of CISWI unit in this subsection.

(ii) The incineration unit commenced construction on or before November 30, 1999.

(iii) The incineration unit is not exempt under (c) of this sub-' section.'

(c) The following types of incineration units are exempt from this subsection:

(i) *Pathological waste incineration* *units*. Incineration units burning 90 percent or more by weight (on a calendar quarter basis and excluding the weight of auxiliary fuel and combustion air) of pathological waste, low-level radioactive waste, and/or chemotherapeutic waste as defined in 40 C.F.R. 60.2265 (in effect on the date in WAC 173-400-025) are not subject to this section if you meet the two requirements specified in (c)(i)(A) and (B) of this subsection.

(A) Notify the permitting authority that the unit meets these criteria.

(B) Keep records on a calendar quarter basis of the weight of pathological waste, low-level radioactive waste, and/or chemotherapeutic waste burned, and the weight of all other fuels and wastes burned in the unit.

(ii) *Agricultural waste incineration* *units*. Incineration units burning 90 percent or more by weight (on a calendar quarter basis and excluding the weight of auxiliary fuel and combustion air) of agricultural wastes as defined in 40 C.F.R. 60.2265 (in effect on the date in WAC 173-400-025) are not subject to this section if you meet the two requirements specified in (c)(ii)(A) and (B) of this subsection.

(A) Notify the permitting authority that the unit meets these criteria.

(B) Keep records on a calendar quarter basis of the weight of agricultural waste burned, and the weight of all other fuels and wastes burned in the unit.

(iii) *Municipal waste combustion* *units*. Incineration units that meet either of the two criteria specified in (c)(iii)(A) and (B) of this subsection.

(A) Units are regulated under 40 C.F.R. Part 60, Subpart Ea or Subpart Eb (in effect on the date in WAC 173-400-025); Spokane County Air Pollution Control Authority Regulation 1, Section 6.17 (in effect on February 13, 1999); 40 C.F.R. Part 60, Subpart AAAA (in effect on the date in WAC 173-400-025); or WAC 173-400-050(5).

(B) Units burn greater than 30 percent municipal solid waste or refuse-derived fuel, as defined in 40 C.F.R. Part 60 (in effect on the date in WAC 173-400-025), Subparts Ea, Eb, and AAAA, and WAC 173-400-050(5), and that have the capacity to burn less than 35 tons (32 megagrams) per day of municipal solid waste or refuse-derived fuel, if you meet the two requirements in (c)(iii)(B)(I) and (II) of this subsection.

(I) Notify the permitting authority that the unit meets these criteria.

(II) Keep records on a calendar quarter basis of the weight of municipal solid waste burned, and the weight of all other fuels and wastes burned in the unit.

(iv) *Medical waste incineration units*. Incineration units regulated under 40 C.F.R. Part 60, Subpart Ec (Standards of Performance for Hospital/Medical/Infectious Waste Incinerators for Which Construction

~~is Commenced After June 20, 1996) (in effect on the date in WAC 173-400-025);~~

~~(v) *Small power production facilities*. Units that meet the three requirements specified in (c)(v)(A) through (C) of this subsection.~~

~~(A) The unit qualifies as a small power-production facility under section 3 (17)(C) of the Federal Power Act (16 U.S.C. 796 (17)(C)).~~

~~(B) The unit burns homogeneous waste (not including refuse-derived fuel) to produce electricity.~~

~~(C) You notify the permitting authority that the unit meets all of these criteria.~~

~~(vi) *Cogeneration facilities*. Units that meet the three requirements specified in (c)(vi)(A) through (C) of this subsection.~~

~~(A) The unit qualifies as a cogeneration facility under section 3 (18)(B) of the Federal Power Act (16 U.S.C. 796 (18)(B)).~~

~~(B) The unit burns homogeneous waste (not including refuse-derived fuel) to produce electricity and steam or other forms of energy used for industrial, commercial, heating, or cooling purposes.~~

~~(C) You notify the permitting authority that the unit meets all of these criteria.~~

~~(vii) *Hazardous waste combustion units*. Units that meet either of the two criteria specified in (c)(vii)(A) or (B) of this subsection.~~

~~(A) Units for which you are required to get a permit under section 3005 of the Solid Waste Disposal Act.~~

~~(B) Units regulated under 40 C.F.R. Part 63, Subpart EEE (National Emission Standards for Hazardous Air Pollutants from Hazardous Waste Combustors) (in effect on the date in WAC 173-400-025).~~

~~(viii) *Materials recovery units*. Units that combust waste for the primary purpose of recovering metals, such as primary and secondary smelters;~~

~~(ix) *Air curtain incinerators*. Air curtain incinerators that burn only the materials listed in (c)(ix)(A) through (C) of this subsection are only required to meet the requirements under "Air Curtain Incinerators" in 40 C.F.R. 60.2245 through 60.2260 (in effect on the date in WAC 173-400-025).~~

~~(A) 100 percent wood waste, as defined in 40 C.F.R. 60.2265.~~

~~(B) 100 percent clean lumber.~~

~~(C) 100 percent mixture of only wood waste, clean lumber, and/or yard waste, as these terms are defined in 40 C.F.R. 60.2265.~~

~~(x) *Cyclonic barrel burners*. See 40 C.F.R. 60.2265 (in effect on the date in WAC 173-400-025).~~

~~(xi) *Rack, part, and drum reclamation units*. See 40 C.F.R. 60.2265 (in effect on the date in WAC 173-400-025).~~

~~(xii) *Cement kilns*. Kilns regulated under 40 C.F.R. Part 63, Subpart LLL (National Emission Standards for Hazardous Air Pollutants from the Portland Cement Manufacturing Industry) (in effect on the date in WAC 173-400-025).~~

~~(xiii) *Sewage sludge incinerators*. Incineration units regulated under 40 C.F.R. Part 60, Subpart O (Standards of Performance for Sewage Treatment Plants) (in effect on the date in WAC 173-400-025).~~

~~(xiv) *Chemical recovery units*. Combustion units burning materials to recover chemical constituents or to produce chemical compounds where there is an existing commercial market for such recovered chemical constituents or compounds. The seven types of units described in (c)(xiv)(A) through (G) of this subsection are considered chemical recovery units.~~

(A) Units burning only pulping liquors (i.e., black liquor) that are reclaimed in a pulping liquor recovery process and reused in the pulping process.

(B) Units burning only spent sulfuric acid used to produce virgin sulfuric acid.

(C) Units burning only wood or coal feedstock for the production of charcoal.

(D) Units burning only manufacturing by-product streams/residues containing catalyst metals which are reclaimed and reused as catalysts or used to produce commercial grade catalysts.

(E) Units burning only coke to produce purified carbon monoxide that is used as an intermediate in the production of other chemical compounds.

(F) Units burning only hydrocarbon liquids or solids to produce hydrogen, carbon monoxide, synthesis gas, or other gases for use in other manufacturing processes.

(G) Units burning only photographic film to recover silver.

(xv) *Laboratory analysis units.* Units that burn samples of materials for the purpose of chemical or physical analysis.

(d) Exceptions.

(i) Physical or operational changes to a CISWI unit made primarily to comply with this section do not qualify as a "modification" or "reconstruction" (as defined in 40 C.F.R. 60.2815) (in effect on the date in WAC 173-400-025).

(ii) Changes to a CISWI unit made on or after June 1, 2001, that meet the definition of "modification" or "reconstruction" as defined in 40 C.F.R. 60.2815 (in effect on the date in WAC 173-400-025) mean the CISWI unit is considered a new unit and subject to WAC 173-400-115, which adopts 40 C.F.R. Part 60, Subpart CCCC (in effect on the date in WAC 173-400-025).

(e) A CISWI unit must comply with 40 C.F.R. 60.2575 through 60.2875 (in effect on the date in WAC 173-400-025). The federal rule contains these major components:

• Increments of progress towards compliance in 60.2575 through 60.2630;'

• Waste management plan requirements in 60.2620 through 60.2630;'

• Operator training and qualification requirements in 60.2635 through 60.2665;

• Emission limitations and operating limits in 60.2670 through 60.2685;'

• Performance testing requirements in 60.2690 through 60.2725;'

• Initial compliance requirements in 60.2700 through 60.2725;'

• Continuous compliance requirements in 60.2710 through 60.2725;'

• Monitoring requirements in 60.2730 through 60.2735;'

• Recordkeeping and reporting requirements in 60.2740 through 60.2800;'

• Title V operating permits requirements in 60.2805;'

• Air curtain incinerator requirements in 60.2810 through 60.2870;'

• Definitions in 60.2875; and'

• Tables in 60.2875. In Table 1, the final control plan must be submitted before June 1, 2004, and final compliance must be achieved by June 1, 2005.

(i) Exception to adopting the federal rule. For purposes of this section, "administrator" includes the permitting authority.

(ii) Exception to adopting the federal rule. For purposes of this section, "you" means the owner or operator.

~~(iii) Exception to adopting the federal rule. For purposes of this section, each reference to "the effective date of state plan approval" means July 1, 2002.~~

~~(iv) Exception to adopting the federal rule. The Title V operating permit requirements in 40 C.F.R. 60.2805(a) are not adopted. Each CISWI unit, regardless of whether it is a major or nonmajor unit, is subject to the air operating permit regulation, chapter 173-401 WAC, beginning on July 1, 2002. See WAC 173-401-500 for the permit application requirements and deadlines.~~

~~(v) Exception to adopting the federal rule. The following compliance dates apply:~~

~~(A) The final control plan (Increment 1) must be submitted no later than July 1, 2003. (See Increment 1 in Table 1.)~~

~~(B) Final compliance (Increment 2) must be achieved no later than July 1, 2005. (See Increment 2 in Table 1.)~~

~~(5) **Small municipal waste combustion units** constructed on or before August 30, 1999.~~

~~(a) Definition. "Municipal waste combustion unit" means any setting or equipment that combusts, liquid, or gasified municipal solid waste including, but not limited to, field-erected combustion units (with or without heat recovery), modular combustion units (starved air- or excess-air), boilers (for example, steam generating units), furnaces (whether suspension-fired, grate-fired, mass-fired, air-curtain incinerators, or fluidized bed-fired), and pyrolysis/combustion units. Two criteria further define municipal waste combustion units:~~

~~(i) Municipal waste combustion units do not include the following units:~~

~~(A) Pyrolysis or combustion units located at a plastics or rubber recycling unit as specified under the exemptions in this subsection (5)(c)(viii) and (ix).~~

~~(B) Cement kilns that combust municipal solid waste as specified under the exemptions in this subsection (5)(c)(x).~~

~~(C) Internal combustion engines, gas turbines, or other combustion devices that combust landfill gases collected by landfill gas collection systems.~~

~~(ii) The boundaries of a municipal waste combustion unit are defined as follows. The municipal waste combustion unit includes, but is not limited to, the municipal solid waste fuel feed system, grate system, flue gas system, bottom ash system, and the combustion unit water system. The municipal waste combustion unit does not include air pollution control equipment, the stack, water treatment equipment, or the turbine-generator set. The municipal waste combustion unit boundary starts at the municipal solid waste pit or hopper and extends through three areas:~~

~~(A) The combustion unit flue gas system, which ends immediately after the heat recovery equipment or, if there is no heat recovery equipment, immediately after the combustion chamber.~~

~~(B) The combustion unit bottom ash system, which ends at the truck loading station or similar equipment that transfers the ash to final disposal. It includes all ash handling systems connected to the bottom ash handling system.~~

~~(C) The combustion unit water system, which starts at the feed water pump and ends at the piping that exits the steam drum or superheater.~~

~~(b) Applicability. This section applies to a municipal waste combustion unit that meets these three criteria:~~

(i) The municipal waste combustion unit has the capacity to combust at least 35 tons per day of municipal solid waste but no more than 250 tons per day of municipal solid waste or refuse-derived fuel.

(ii) The municipal waste combustion unit commenced construction on or before August 30, 1999.

(iii) The municipal waste combustion unit is not exempt under (c) of this section.

(c) Exempted units. The following municipal waste combustion units are exempt from the requirements of this section:

(i) *Small municipal waste combustion units that combust less than 11 tons per day.* Units are exempt from this section if four requirements are met:

(A) The municipal waste combustion unit is subject to a federally enforceable order or order of approval limiting the amount of municipal solid waste combusted to less than 11 tons per day.

(B) The owner or operator notifies the permitting authority that the unit qualifies for the exemption.

(C) The owner or operator of the unit sends a copy of the federally enforceable order or order of approval to the permitting authority.

(D) The owner or operator of the unit keeps daily records of the amount of municipal solid waste combusted.

(ii) *Small power production units.* Units are exempt from this section if four requirements are met:

(A) The unit qualifies as a small power production facility under section 3 (17)(C) of the Federal Power Act (16 U.S.C. 796 (17)(C)).

(B) The unit combusts homogeneous waste (excluding refuse-derived fuel) to produce electricity.

(C) The owner or operator notifies the permitting authority that the unit qualifies for the exemption.

(D) The owner or operator submits documentation to the permitting authority that the unit qualifies for the exemption.

(iii) *Cogeneration units.* Units are exempt from this section if four requirements are met:

(A) The unit qualifies as a small power production facility under section 3 (18)(C) of the Federal Power Act (16 U.S.C. 796 (18)(C)).

(B) The unit combusts homogeneous waste (excluding refuse-derived fuel) to produce electricity and steam or other forms of energy used for industrial, commercial, heating, or cooling purposes.

(C) The owner or operator notifies the permitting authority that the unit qualifies for the exemption.

(D) The owner or operator submits documentation to the permitting authority that the unit qualifies for the exemption.

(iv) *Municipal waste combustion units that combust only tires.* Units are exempt from this section if three requirements are met:

(A) The municipal waste combustion unit combusts a single-item waste stream of tires and no other municipal waste (the unit can cofire coal, fuel oil, natural gas, or other nonmunicipal solid waste).

(B) The owner or operator notifies the permitting authority that the unit qualifies for the exemption.

(C) The owner or operator submits documentation to the permitting authority that the unit qualifies for the exemption.

(v) *Hazardous waste combustion units.* Units are exempt from this section if the units have received a permit under section 3005 of the Solid Waste Disposal Act.

~~(vi) *Materials recovery units.* Units are exempt from this section if the units combust waste mainly to recover metals. Primary and secondary smelters may qualify for the exemption.~~

~~(vii) *Cofired units.* Units are exempt from this section if four requirements are met:~~

~~(A) The unit has a federally enforceable order or order of approval limiting municipal solid waste combustion to no more than 30 percent of total fuel input by weight.~~

~~(B) The owner or operator notifies the permitting authority that the unit qualifies for the exemption.~~

~~(C) The owner or operator submits a copy of the federally enforceable order or order of approval to the permitting authority.~~

~~(D) The owner or operator records the weights, each quarter, of municipal solid waste and of all other fuels combusted.~~

~~(viii) *Plastics/rubber recycling units.* Units are exempt from this section if four requirements are met:~~

~~(A) The pyrolysis/combustion unit is an integrated part of a plastics/rubber recycling unit as defined in 40 C.F.R. 60.1940 (in effect on the date in WAC 173-400-025).~~

~~(B) The owner or operator of the unit records the weight, each quarter, of plastics, rubber, and rubber tires processed.~~

~~(C) The owner or operator of the unit records the weight, each quarter, of feed stocks produced and marketed from chemical plants and petroleum refineries.~~

~~(D) The owner or operator of the unit keeps the name and address of the purchaser of the feed stocks.~~

~~(ix) *Units that combust fuels made from products of plastics/rubber recycling plants.* Units are exempt from this section if two requirements are met:~~'

~~(A) The unit combusts gasoline, diesel fuel, jet fuel, fuel oils, residual oil, refinery gas, petroleum coke, liquefied petroleum gas, propane, or butane produced by chemical plants or petroleum refineries that use feed stocks produced by plastics/rubber recycling units.~~

~~(B) The unit does not combust any other municipal solid waste.~~

~~(x) *Cement kilns.* Cement kilns that combust municipal solid waste are exempt.~~

~~(xi) *Air curtain incinerators.* If an air curtain incinerator as defined under 40 C.F.R. 60.1910 combusts 100 percent yard waste, then those units must only meet the requirements under 40 C.F.R. 60.1910 through 60.1930 (in effect on the date in WAC 173-400-025).~~

~~(d) Exceptions.~~

~~(i) Physical or operational changes to an existing municipal waste combustion unit made primarily to comply with this section do not qualify as a modification or reconstruction, as those terms are defined in 40 C.F.R. 60.1940 (in effect on the date in WAC 173-400-025).~~

~~(ii) Changes to an existing municipal waste combustion unit made on or after June 6, 2001, that meet the definition of modification or reconstruction, as those terms are defined in 40 C.F.R. 60.1940 (in effect on the date in WAC 173-400-025), mean the unit is considered a new unit and subject to WAC 173-400-115, which adopts 40 C.F.R. Part 60, Subpart AAAA (in effect on the date in WAC 173-400-025).~~

~~(e) Municipal waste combustion units are divided into two subcategories based on the aggregate capacity of the municipal waste combustion plant as follows:~~

~~(i) Class I units. Class I units are small municipal waste combustion units that are located at municipal waste combustion plants~~

with an aggregate plant combustion capacity greater than 250 tons per day of municipal solid waste. See the definition of "municipal waste combustion plant capacity" in 40 C.F.R. 60.1940 (in effect on the date in WAC 173-400-025) for the specification of which units are included in the aggregate capacity calculation.

(ii) Class II units. Class II units are small municipal waste combustion units that are located at municipal waste combustion plants with an aggregate plant combustion capacity less than or equal to 250 tons per day of municipal solid waste. See the definition of "municipal waste combustion plant capacity" in 40 C.F.R. 60.1940 (in effect on the date in WAC 173-400-025) for the specification of which units are included in the aggregate capacity calculation.

(f) Compliance option 1.

(i) A municipal solid waste combustion unit may choose to reduce, by the final compliance date of June 1, 2005, the maximum combustion capacity of the unit to less than 35 tons per day of municipal solid waste. The owner or operator must submit a final control plan and the notifications of achievement of increments of progress as specified in 40 C.F.R. 60.1610 (in effect on the date in WAC 173-400-025).

(ii) The final control plan must, at a minimum, include two items:

(A) A description of the physical changes that will be made to accomplish the reduction.

(B) Calculations of the current maximum combustion capacity and the planned maximum combustion capacity after the reduction. Use the equations specified in 40 C.F.R. 60.1935 (d) and (e) (in effect on the date in WAC 173-400-025) to calculate the combustion capacity of a municipal waste combustion unit.

(iii) An order or order of approval containing a restriction or a change in the method of operation does not qualify as a reduction in capacity. Use the equations specified in 40 C.F.R. 60.1935 (d) and (e) (in effect on the date in WAC 173-400-025) to calculate the combustion capacity of a municipal waste combustion unit.

(g) Compliance option 2. The municipal waste combustion unit must comply with 40 C.F.R. 60.1585 through 60.1905, and 60.1935 (in effect on the date in WAC 173-400-025).

(i) The rule contains these major components:

(A) Increments of progress towards compliance in 60.1585 through 60.1640;

(B) Good combustion practices - Operator training in 60.1645 through 60.1670;

(C) Good combustion practices - Operator certification in 60.1675 through 60.1685;

(D) Good combustion practices - Operating requirements in 60.1690 through 60.1695;

(E) Emission limits in 60.1700 through 60.1710;

(F) Continuous emission monitoring in 60.1715 through 60.1770;

(G) Stack testing in 60.1775 through 60.1800;

(H) Other monitoring requirements in 60.1805 through 60.1825;

(I) Recordkeeping reporting in 60.1830 through 60.1855;

(J) Reporting in 60.1860 through 60.1905;

(K) Equations in 60.1935;

(L) Tables 2 through 8.

(ii) Exception to adopting the federal rule. For purposes of this section, each reference to the following is amended in the following manner:

(A) "State plan" in the federal rule means WAC 173-400-050(5).

~~(B) "You" in the federal rule means the owner or operator.~~

~~(C) "Administrator" includes the permitting authority.~~

~~(D) "The effective date of the state plan approval" in the federal rule means December 6, 2002.~~

~~(h) Compliance schedule.~~

~~(i) Small municipal waste combustion units must achieve final compliance or cease operation not later than December 1, 2005.~~

~~(ii) Small municipal waste combustion units must achieve compliance by May 6, 2005 for all Class II units, and by November 6, 2005 for all Class I units.~~

~~(iii) Class I units must comply with these additional requirements:~~

~~(A) The owner or operator must submit the dioxins/furans stack test results for at least one test conducted during or after 1990. The stack test must have been conducted according to the procedures specified under 40 C.F.R. 60.1790 (in effect on the date in WAC 173-400-025).~~

~~(B) Class I units that commenced construction after June 26, 1987, must comply with the dioxins/furans and mercury limits specified in Tables 2 and 3 in 40 C.F.R. Part 60, Subpart BBBB (in effect on the date in WAC 173-400-025) by the later of two dates:~~

~~(I) December 6, 2003; or~~

~~(II) One year following the issuance of an order of approval (revised construction approval or operation permit) if an order or order of approval or operation modification is required.~~

~~(i) Air operating permit. Applicability to chapter 173-401 WAC, the air operating permit regulation, begins on July 1, 2002. See WAC 173-401-500 for the permit application requirements and deadlines.~~

~~(6) **Hazardous/medical/infectious waste incinerators** constructed on or before December 1, 2008. Hospital/medical/infectious waste incinerators constructed on or before December 1, 2008, must comply with the requirements in 40 C.F.R. Part 62, Subpart HHH (in effect on the date in WAC 173-400-025).~~

EPA effective: 3/25/20 (85 FR 10301, 2/24/20)

WAC 173-400-060 Emission standards for general process units. General process units are required to meet all applicable provisions of WAC 173-400-040 and, no person shall cause or allow the emission of particulate material from any general process operation in excess of 0.23 grams per dry cubic meter at standard conditions (0.1 grain/dscf) of exhaust gas. Test methods from 40 C.F.R. Parts 51, 60, 61, and 63 (in effect on the date in WAC 173-400-025) and any other approved test procedures in ecology's "*Source Test Manual - Procedures For Compliance Testing*" as of September 20, 2004, must be used to determine compliance.

[Statutory Authority: Chapter 70.94 RCW, RCW 70.94.151, 70.94.153, and 70.94.892. WSR 18-22-006 (Order 16-09), § 173-400-060, filed 10/25/18, effective 11/25/18. ~~173-400-060 Emission Standards for General Process Units.~~

~~General process units are required to meet all applicable provisions of WAC 173-400-040 and, no person shall cause or allow the emission of particulate material from any general process operation in excess of 0.23 grams per dry cubic meter at standard conditions (0.1 grain/dscf) of exhaust gas. Test methods (in effect on the date in WAC 173-400-025) from 40 C.F.R. Parts 51, 60, 61, and 63 and any other approved test procedures in ecology's "Source Test Manual - Procedures For Compliance Testing" as of September 20, 2004, will be used to determine compliance.~~

~~*State effective: 07/01/16; EPA effective: 11/07/16 (81 FR 69385, October 6, 2016)*~~

173-400-070 Emission Standards for Certain Source Categories.

Ecology finds that the reasonable regulation of sources within certain categories requires separate standards applicable to such categories. The standards set forth in this section shall be the maximum allowable standards for emissions units within the categories listed. Except as specifically provided in this section, such emissions units shall not be required to meet the provisions of WAC 173-400-040, 173-400-050 and 173-400-060.

(1) Wigwam and silo burners.

(a) All wigwam and silo burners designed to dispose of wood waste must meet all provisions of WAC 173-400-040 (3), (4), (5), (6), (7), (8), and WAC 173-400-050(4) or 173-400-115 (40 C.F.R. Part 60, subpart DDDD in effect on the date in WAC 173-400-025) as applicable.

(b) All wigwam and silo burners must use RACT. All emissions units shall be operated and maintained to minimize emissions. These requirements may include a controlled tangential vent overfire air system, an adequate underfire system, elimination of all unnecessary openings, a controlled feed and other modifications determined necessary by ecology or the permitting authority.

(c) It shall be unlawful to install or increase the existing use of any burner that does not meet all requirements for new sources including those requirements specified in WAC 173-400-040 and 173-400-050, except operating hours.

(d) The permit authority may establish additional requirements for wigwam and silo burners. These requirements may include, but shall not be limited to:

(i) A requirement to meet all provisions of WAC 173-400-040 and 173-400-050. Wigwam and silo burners will be considered to be in compliance if they meet the requirements contained in WAC 173-400-040(2), visible emissions. An exception is made for a startup period not to exceed thirty minutes in any eight consecutive hours.

(ii) A requirement to apply BACT.

(iii) A requirement to reduce or eliminate emissions if ecology establishes that such emissions unreasonably interfere with the use and enjoyment of the property of others or are a cause of violation of ambient air standards.

(2) Hog fuel boilers.

(a) Hog fuel boilers shall meet all provisions of WAC 173-400-040 and 173-400-050(1), except that emissions may exceed twenty percent opacity for up to fifteen consecutive minutes once in any eight hours. The intent of this provision is to allow soot blowing and grate cleaning necessary to the operation of these units. This practice is to be scheduled for the same specific times each day and the permitting authority shall be notified of the schedule or any changes.

(b) All hog fuel boilers shall utilize RACT and shall be operated and maintained to minimize emissions.

(3) Orchard heating.

(a) Burning of rubber materials, asphaltic products, crankcase oil or petroleum wastes, plastic, or garbage is prohibited.

(b) It is unlawful to burn any material or operate any orchard-heating device that causes a visible emission exceeding twenty percent opacity, except during the first thirty minutes after such device or material is ignited.

(4) Grain elevators.

Any grain elevator which is primarily classified as a materials handling operation shall meet all the provisions of WAC 173-400-040 (2), (3), (4), and (5).

(5) Catalytic cracking units.

(a) All existing catalytic cracking units shall meet all provisions of WAC 173-400-040 (2), (3), (4), (5), (6), and (7) and:

(i) No person shall cause or allow the emission for more than three minutes, in any one hour, of an air contaminant from any catalytic cracking unit which at the emission point, or within a reasonable distance of the emission point, exceeds forty percent opacity.

(ii) No person shall cause or allow the emission of particulate material in excess of 0.46 grams per dry cubic meter at standard conditions (0.20 grains/dscf) of exhaust gas.

(b) All new catalytic cracking units shall meet all provisions of WAC 173-400-115.

(6) Other wood waste burners.

(a) Wood waste burners not specifically provided for in this section shall meet all applicable provisions of WAC 173-400-040. In addition, wood waste burners subject to WAC 173-400-050(4) or 173-400-115 (40 C.F.R. Part 60 subpart DDDD in effect on the date in WAC 173-400-025) must meet all applicable provisions of those sections.

(b) Such wood waste burners shall utilize RACT and shall be operated and maintained to minimize emissions.

~~(7) Sulfuric acid plants.~~

~~No person shall cause to be discharged into the atmosphere from a sulfuric acid plant, any gases which contain acid mist, expressed as H2SO4, in excess of 0.15 pounds per ton of acid produced. Sulfuric acid production shall be expressed as one hundred percent H2SO4.~~

~~(8) Municipal solid waste landfills constructed, reconstructed, or modified before May 30, 1991. A municipal solid waste landfill (MSW landfill) is an entire disposal facility in a contiguous geographical space where household waste is placed in or on the land. A MSW landfill may also receive other types of waste regulated under Subtitle D of the Federal Recourse Conservation and Recovery Act including the following: Commercial solid waste, nonhazardous sludge, conditionally exempt small quantity generator waste, and industrial solid waste. Portions of an MSW landfill may be separated by access roads. A MSW landfill may be either publicly or privately owned. A MSW landfill may be a new MSW landfill, an existing MSW landfill, or a lateral expansion. All references in this subsection to 40 C.F.R. Part 60 rules mean those rules in effect on the date in WAC 173-400-025.~~

~~(a) Applicability. These rules apply to each MSW landfill constructed, reconstructed, or modified before May 30, 1991; and the MSW landfill accepted waste at any time since November 8, 1987 or the landfill has additional capacity for future waste deposition. (See WAC~~

~~173-400-115 for the requirements for MSW landfills constructed, reconstructed, or modified on or after May 30, 1991.) Terms in this subsection have the meaning given them in 40 C.F.R. 60.751, except that every use of the word "administrator" in the federal rules referred to in this subsection includes the "permitting authority."~~

~~(b) Exceptions. Any physical or operational change to an MSW landfill made solely to comply with these rules is not considered a modification or rebuilding.~~

~~(c) Standards for MSW landfill emissions.~~

~~(i) A MSW landfill having a design capacity less than 2.5 million megagrams or 2.5 million cubic meters must comply with the requirements of 40 C.F.R. 60.752(a) in addition to the applicable requirements specified in this section.~~

~~(ii) A MSW landfill having design capacity equal to or greater than 2.5 million megagrams and 2.5 million cubic meters must comply with the requirements of 40 C.F.R. 60.752(b) in addition to the applicable requirements specified in this section.~~

~~(d) Recordkeeping and reporting. A MSW landfill must follow the recordkeeping and reporting requirements in 40 C.F.R. 60.757 (submittal of an initial design capacity report) and 40 C.F.R. 60.758 (recordkeeping requirements), as applicable, except as provided for under (d)(i) and (ii).~~

~~(i) The initial design capacity report for the facility is due before September 20, 2001.~~

~~(ii) The initial nonmethane organic compound (NMOC) emissions rate report is due before September 20, 2001.~~

~~(e) Test methods and procedures.~~

~~(i) A MSW landfill having a design capacity equal to or greater than 2.5 million megagrams and 2.5 million cubic meters must calculate the landfill nonmethane organic compound emission rates following the procedures listed in 40 C.F.R. 60.754, as applicable, to determine whether the rate equals or exceeds 50 megagrams per year.~~

~~(ii) Gas collection and control systems must meet the requirements in 40 C.F.R. 60.752 (b)(2)(ii) through the following procedures:~~

~~(A) The systems must follow the operational standards in 40 C.F.R. 60.753.~~

~~(B) The systems must follow the compliance provisions in 40 C.F.R. 60.755 (a)(1) through (a)(6)~~

~~to determine whether the system is in compliance with 40 C.F.R. 60.752 (b)(2)(ii).~~

~~(C) The system must follow the applicable monitoring provisions in 40 C.F.R. 60.756.~~

~~(f) Conditions. Existing MSW landfills that meet the following conditions must install a gas collection and control system:~~

~~(i) The landfill accepted waste at any time since November 8, 1987, or the landfill has additional design capacity available for future waste deposition;~~

~~(ii) The landfill has design capacity greater than or equal to 2.5 million megagrams or 2.5 million cubic meters. The landfill may calculate design capacity in either megagrams or cubic meters for comparison with the exception values. Any density conversions shall be documented and submitted with the report; and~~

~~(iii) The landfill has a nonmethane organic compound (NMOC) emission rate of 50 megagrams per year or greater.~~

~~(g) Change in conditions. After the adoption date of this rule, a landfill that meets all three conditions in (e) of this subsection must comply with all the requirements of this section within thirty months of the date when the conditions were met. This change will usually occur because the NMOC emission rate equaled or exceeded the rate of 50 megagrams per year.~~

~~(h) Gas collection and control systems.~~

~~(i) Gas collection and control systems must meet the requirements in 40 C.F.R. 60.752 (b)(2)(ii).~~

~~(ii) The design plans must be prepared by a licensed professional engineer and submitted to the permitting authority within one year after the adoption date of this section.~~

~~(iii) The system must be installed within eighteen months after the submittal of the design plans.~~

~~(iv) The system must be operational within thirty months after the adoption date of this section.~~

~~(v) The emissions that are collected must be controlled in one of three ways:~~

~~(A) An open flare designed and operated according to 40 C.F.R. 60.18;~~

~~(B) A control system designed and operated to reduce NMOC by 98 percent by weight; or~~

~~(C) An enclosed combustor designed and operated to reduce the outlet NMOC concentration to 20 parts per million as hexane by volume, dry basis to three percent oxygen, or less.~~

~~(i) Air operating permit.~~

~~(i) A MSW landfill that has a design capacity less than 2.5 million megagrams or 2.5 million cubic meters on January 7, 2000, is not subject to the air operating permit regulation, unless the landfill is subject to chapter 173-401 WAC for some other reason. If the design capacity of an exempted MSW landfill subsequently increases to equal or exceed 2.5 million megagrams or 2.5 million cubic meters by a change that is not a modification or reconstruction, the landfill is subject to chapter 173-401 WAC on the date the amended design capacity report is due.~~

~~(ii) A MSW landfill that has a design capacity equal to or greater than 2.5 million megagrams or 2.5 million cubic meters on January 7, 2000, is subject to chapter 173-401 WAC beginning on the effective date of this section. (Note: Under 40 C.F.R. 62.14352(e), an applicable MSW landfill must have submitted its application so that by April 6, 2001, the permitting authority was able to determine that it was timely and complete. Under 40 C.F.R. 70.7(b), no source may operate after the time that it is required to submit a timely and complete application.)~~

~~(iii) When a MSW landfill is closed, the owner or operator is no longer subject to the requirement to maintain an operating permit for the landfill if the landfill is not subject to chapter 173-401 WAC for some other reason and if either of the following conditions are met:~~

~~(A) The landfill was never subject to the requirement for a control system under 40 C.F.R. 62.14353; or~~

~~(B) The landfill meets the conditions for control system removal specified in 40 C.F.R. 60.752 (b)(2)(v).~~

State effective: 07/01/16; EPA effective: 11/07/16 (81 FR 69385, October 6, 2016)

173-400-081 Startup and Shutdown.

(1) In promulgating technology-based emission standards and making control technology determinations (e.g., BACT, RACT, LAER, BART) the permitting authorities will consider any physical constraints on the ability of a source to comply with the applicable standard during startup or shutdown.

(2) Where the permitting authority determines that the source or source category, when operated and maintained in accordance with good air pollution control practice, is not capable of

achieving continuous compliance with an emission standard during startup or shutdown, the permitting authority must include in the standard appropriate emission limitations, operating parameters, or other criteria to regulate the performance of the source during startup or shutdown conditions.

(3) In modeling the emissions of a source for purposes of demonstrating attainment or maintenance of national ambient air quality standards, the permitting authorities shall take into account any incremental increase in allowable emissions under startup or shutdown conditions authorized by an emission limitation or other operating parameter adopted under this rule.

(4) Any emission limitation or other parameter adopted under this rule which increases allowable emissions during startup or shutdown conditions over levels authorized in Washington's state implementation plan shall not take effect until approved by EPA as a SIP amendment.

State effective: 4/1/11; EPA effective: 11/3/14 79 FR 59653, 10/3/14

~~(e) Monitoring, recordkeeping and reporting requirements sufficient to ensure that the source complies with each condition in the order.~~

~~(6) Fees. A permitting authority may assess and collect fees for processing the request for an alternative emission limit according to its fee schedule for processing a permit application.~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 18-17-111 (Order 15-07), § 173-400-082, filed 8/16/18, effective 9/16/18.]~~

WAC 173-400-091 Voluntary limits on emissions. (1) Upon request by the owner or operator of a new or existing source or stationary source, the permitting authority with jurisdiction over the source shall issue a regulatory order that limits the potential to emit any air contaminant or contaminants to a level agreed to by the owner or operator and the permitting authority with jurisdiction.

(2) A condition contained in an order issued under this section shall be less than the source's or stationary source's otherwise allowable annual emissions of a particular contaminant under all applicable requirements of the chapter 70.94 RCW and the FCAA, including any standard or other requirement provided for in the Washington state implementation plan. The term "condition" refers to limits on production or other limitations, in addition to emission limitations.

(3) Any order issued under this section shall include monitoring, recordkeeping and reporting requirements sufficient to ensure that the source or stationary source complies with any condition established under this section. Monitoring requirements shall use terms, test methods, units, averaging periods, and other statistical conventions consistent with the requirements of WAC 173-400-105.

(4) Any order issued under this section must comply with WAC 173-400-171.

(5) The terms and conditions of a regulatory order issued under this section are enforceable. Any proposed deviation from a condition contained in an order issued under this section shall require revision or revocation of the order.

[Statutory Authority: Chapter 70.94 RCW. WSR 11-06-060 (Order 09-01), § 173-400-091, filed 3/1/11, effective 4/1/11; WSR 93-18-007 (Order 93-03), § 173-400-091, filed 8/20/93, effective 9/20/93.]

EPA effective: 11/3/14 (79 FR 59653, 10/3/14)

~~**WAC 173-400-099 Registration program.** (1) Program purpose.~~

~~(a) The registration program is a program to develop and maintain a current and accurate record of air contaminant sources. Information collected through the registration program is used to evaluate the effectiveness of air pollution control strategies and to verify source compliance with applicable air pollution requirements.~~

~~(b) Permit program sources, as defined in RCW 70.94.030(18), are not required to comply with the registration requirements of WAC 173-400-100 through 173-400-104.~~

~~(2) Program components. The components of the registration program consist of:~~

~~(a) Initial registration and annual or other periodic reports from stationary source owners providing information on location, size, height of contaminant outlets, processes employed, nature and quantity of the air contaminant emissions, and other information that is rele-~~

~~filed 1/10/05, effective 2/10/05. Statutory Authority: [RCW 70.94.331, 70.94.510 and chapter 70.94 RCW.] WSR 00-23-130 (Order 98-27), § 173-400-104, filed 11/22/00, effective 12/23/00. Statutory Authority: Chapter 70.94 RCW. WSR 95-07-126 (Order 93-40), § 173-400-104, filed 3/22/95, effective 4/22/95.]~~

WAC 173-400-105 Records, monitoring, and reporting. The owner or operator of a source must upon notification by ecology, maintain records on the type and quantity of emissions from the source and other information deemed necessary to determine whether the source is in compliance with applicable emission limitations and control measures.

(1) **Emission inventory.** The owner and operator of an air contaminant source must submit an inventory of emissions from the source each year. The inventory must include stack and fugitive emissions of particulate matter, PM-10, PM-2.5, sulfur dioxide, oxides of nitrogen, carbon monoxide, total reduced sulfur compounds (TRS), fluorides, lead, VOCs, ammonia, and other contaminants. Sources must provide registration information in a manner prescribed by the permitting authority for the submittal of these inventories. When the permitting authority requests emission inventory information for a calendar year, the owner or operator must submit the emissions inventory no later than April 15th after the end of the calendar year for which the emissions inventory was requested. If April 15th falls on a weekend, then the deadline to file shall be the next business day. The owner and operator must maintain records of information necessary to substantiate any reported emissions, consistent with the averaging times for the applicable standards. The owner or operator may base emission estimates used in the inventory on the most recent published EPA emission factors for a source category, or other information available to the owner and operator, whichever is the better estimate.

(2) **Monitoring.** Ecology must conduct a continuous surveillance program to monitor the quality of the ambient atmosphere as to concentrations and movements of air contaminants. As a part of this program, the director of ecology or an authorized representative may require any source under the jurisdiction of ecology to conduct stack and/or ambient air monitoring and to report the results to ecology.

(3) **Investigation of conditions.** Upon presentation of appropriate credentials, for the purpose of investigating conditions specific to the control, recovery, or release of air contaminants into the atmosphere, personnel from ecology or an authority must have the power to enter at reasonable times upon any private or public property, excepting nonmultiple unit private dwellings housing one or two families.

(4) **Source testing.** To demonstrate compliance, the permitting authority may conduct or require that the owner or operator of a source conduct a test using approved test methods from 40 C.F.R. Parts 51, 60, 61, 62, 63, 75 and 1065, as applicable (in effect on the date in WAC 173-400-025) or procedures contained in "*Source Test Manual - Procedures for Compliance Testing*," state of Washington, department of ecology, as of September 20, 2004, on file at ecology. The permitting authority may require the operator of a source to provide the necessary platform and sampling ports for ecology personnel or others to perform a test of an emissions unit. The source owner or operator must allow the permitting authority to obtain a sample from any emissions unit. The permitting authority shall give the operator of the source an opportunity to observe the sampling and to obtain a sample at the same time.

(5) **Continuous monitoring and recording.** Owners and operators of the following categories of sources must install, calibrate, maintain and operate equipment for continuously monitoring and recording those emissions specified.

(a) Fossil fuel-fired steam generators.

(i) Opacity, except where:

(A) Steam generator capacity is less than two hundred fifty million BTU per hour heat input; or

(B) Only gaseous fuel is burned.

(ii) Sulfur dioxide, except where steam generator capacity is less than two hundred fifty million BTU per hour heat input or if sulfur dioxide control equipment is not required.

(iii) Percent oxygen or carbon dioxide where such measurements are necessary for the conversion of sulfur dioxide continuous emission monitoring data.
