(iv) General exception. These requirements do not apply to a fossil fuel-fired steam generator with an annual average capacity factor of less than thirty percent, as reported to the Federal Power Commission for calendar year 1974, or as otherwise demonstrated to ecology or the authority by the owner(s) or operator(s).

(b) **Sulfuric acid plants.** Sulfur dioxide where production capacity is more than three hundred tons per day, expressed as one hundred percent acid, except for those facilities where conversion to sulfuric acid is used primarily as a means of preventing emissions to the atmosphere of sulfur dioxide or other sulfur compounds.

(c) Fluid bed catalytic cracking units catalyst regenerators at petroleum refineries. Opacity where fresh feed capacity is more than twenty thousand barrels per day.

(d) Wood residue fuel-fired steam generators.

(i) Opacity, except where steam generator capacity is less than one hundred million BTU per hour heat input.

(ii) Continuous monitoring equipment. The requirements of (e) of this subsection do not apply to wood residue fuel-fired steam generators, but continuous monitoring equipment required by (d) of this subsection must be subject to approval by ecology.

(e) Owners and operators of those sources required to install continuous monitoring equipment under this subsection must demonstrate to ecology or the authority, compliance with the equipment and performance specifications and observe the reporting requirements contained in 40 C.F.R. Part 51, Appendix P, Sections 3, 4 and 5 (in effect on the date in WAC 173-400-025).

(f) Special considerations. If for reason of physical plant limitations or extreme economic situations, ecology determines that continuous monitoring is not a reasonable requirement, the permitting authority will establish alternative monitoring and reporting procedures on an individual basis. These will generally take the form of stack tests conducted at a frequency sufficient to establish the emission levels over time and to monitor deviations in these levels.

(g) Exemptions. This subsection (5) does not apply to any emission unit which is:

(i) Required to continuously monitor emissions due to a standard or requirement contained in 40 C.F.R. Parts 60, 61, 62, 63, or 75 (all in effect on the date in WAC 173-400-025) or a permitting authority's adoption by reference of the federal standards. Emission units and sources subject to those standards must comply with the data collection requirements that apply to those standards.

(ii) Not subject to an applicable emission standard.

(6) No person shall make any false material statement, representation or certification in any form, notice or report required under chapter 70.94 or 70.120 RCW, or any ordinance, resolution, regulation, permit or order in force pursuant thereto.

(7) Continuous emission monitoring system operating requirements. All continuous emission monitoring systems (CEMS) required by 40 C.F.R. Parts 60, 61, 62, 63, or 75 (all in effect on the date in WAC 173-400-025), or a permitting authority's adoption of those federal standards must meet the continuous emission monitoring systems (CEMS) performance specifications and data recovery requirements imposed by those standards. All CEMS required under an order, PSD permit, or regulation issued by a permitting authority and not subject to CEMS performance specifications and data recovery requirements imposed by 40 C.F.R. Parts 60, 61, 62, 63, or 75 must follow the continuous emission monitoring rule of the permitting authority, or if the permitting authority does not have a continuous emission monitoring rule, must meet the following requirements:

(a) The owner or operator must recover valid hourly monitoring data for at least ninety-five percent of the hours that the equipment (required to be monitored) is operated during each calendar month except for periods of monitoring system downtime, provided that the owner or operator demonstrated that the downtime was not a result of inadequate design, operation, or maintenance, or any other reasonably preventable condition, and the source conducts any necessary repairs to the monitoring system in a timely manner.

Note: This means that a continuous emissions monitor (CEM) must provide valid data for all but thirty-six hours for each month (ninety-five percent standard).

(b) The owner or operator must install a continuous emission monitoring system that meets the performance specification in 40 C.F.R. Part 60, Appendix B in effect at the time of its installation, and must operate this monitoring system in accordance with the quality assurance procedures in Appendix F of 40 C.F.R. Part 60 (in effect on the date in WAC 173-400-025), and EPA's "Recommended Quality Assurance Procedures for Opacity Continuous Monitoring Systems" (EPA) 340/1-86-010.

(c) An owner or operator must reduce monitoring data commencing on the clock hour and containing at least forty-five minutes of monitoring data to one hour averages. An owner or operator must reduce monitoring data for opacity six minute block averages unless otherwise specified in the order of approval or permit. An owner or operator must include all monitoring data in these averages except for data collected during calibration drift tests and cylinder gas audits, and for data collected subsequent to a failed quality assurance test or audit. After a failed quality assurance test or audit, a source must collect no valid data until the monitoring system passes a quality assurance test or audit.

(d) An owner or operator must maintain continuous operation of all continuous monitoring systems except for instances of system breakdowns, repairs, calibration checks, and zero and span adjustments required under (a) of this subsection.

(i) Continuous monitoring systems for measuring opacity shall complete a minimum of one cycle of sampling and analyzing for each successive ten second period and one cycle of data recording for each successive six minute period.

(ii) Continuous monitoring systems for measuring emissions other than opacity must complete a minimum of one cycle of sampling, analyzing, and recording for each successive fifteen minute period.

(e) The owner or operator must retain all monitoring data averages for at least five years, including copies of all reports submitted to the permitting authority and records of all repairs, adjustments, and maintenance performed on the monitoring system.

(f) The owner or operator must submit a monthly report (or other frequency as directed by terms of an order, air operating permit or regulation) to the permitting authority within thirty days after the end of the month (or other specified reporting period) in which the owner or operator recorded the data. The owner or operator may combine the report required by this section with any excess emission report required by WAC 173-400-108. This report must include:

(i) The number of hours that the monitored emission unit operated each month and the number of valid hours of monitoring data that the monitoring system recovered each month;

(ii) The date, time period, and cause of each failure to meet the data recovery requirements of (a) of this subsection and any actions taken to ensure adequate collection of such data;

(iii) The date, time period, and cause of each failure to recover valid hourly monitoring data for at least ninety percent of the hours that the equipment (required to be monitored) was operated each day;

Note: A continuous emissions monitor (CEM) must provide valid data for all but two hours per day (ninety percent standard).

(iv) The results of all cylinder gas audits conducted during the month; and

(v) A certification of truth, accuracy, and completeness signed by an authorized representative of the owner or operator.

(8) No person shall render inaccurate any monitoring device or method required under chapter 70.94 or 70.120 RCW, or any ordinance, resolution, regulation, permit, or order in force pursuant thereto.

[Statutory Authority: Chapter 70.94 RCW, RCW 70.94.151, 70.94.153, and 70.94.892. WSR 18-22-006 (Order 16-09), § 173-400-105, filed 10/25/18, effective 11/25/18. EPA effective: 3/25/20 (85 FR 10301, 2/24/20)

~~**WAC 173-400-107 Excess emissions.** This section is in effect until the effective date of EPA's removal of the September 20, 1993, version of this section from the SIP. This section is not effective starting on that date.~~

~~(iii) The date, time period, and cause of each failure to recover valid hourly monitoring data for at least 90 percent of the hours that the equipment (required to be monitored) was operated each day;~~

~~(iv) The results of all cylinder gas audits conducted during the month; and~~

~~(v) A certification of truth, accuracy, and completeness signed by an authorized representative of the owner or operator.~~

~~(8) No person shall render inaccurate any monitoring device or method required under chapter 70.94 or 70.120 RCW, or any ordinance, resolution, regulation, permit, or order in force pursuant thereto.~~

~~*State effective: 07/01/16; EPA effective: 11/07/16 (81 FR 69385, October 6, 2016)*~~

173-400-107 Excess Emissions.

(1) The owner or operator of a source shall have the burden of proving to ecology or the authority or the decision-making authority in an enforcement action that excess emissions were unavoidable. This demonstration shall be a condition to obtaining relief under subsections (4), (5) and (6) of this section.

(2) Excess emissions determined to be unavoidable under the procedures and criteria in this section shall be excused and not subject to penalty.

(3) Excess emissions which represent a potential threat to human health or safety or which the owner or operator of the source believes to be unavoidable shall be reported to ecology or the authority as soon as possible. Other excess emissions shall be reported within thirty days after the end of the month during which the event occurred or as part of the routine emission monitoring reports. Upon request by ecology or the authority, the owner(s) or operator(s) of the source(s) shall submit a full written report including the known causes, the corrective actions taken, and the preventive measures to be taken to minimize or eliminate the chance of recurrence.

(4) Excess emissions due to startup or shutdown conditions shall be considered unavoidable provided the source reports as required under subsection (3) of this section and adequately demonstrates that the excess emissions could not have been prevented through careful planning and design and if a bypass of control equipment occurs, that such bypass is necessary to prevent loss of life, personal injury, or severe property damage.

(5) Maintenance. Excess emissions due to scheduled maintenance shall be considered unavoidable if the source reports as required under subsection (3) of this section and adequately demonstrates that the excess emissions could not have been avoided through reasonable design, better scheduling for maintenance or through better operation and maintenance practices.

(6) Excess emissions due to upsets shall be considered unavoidable provided the source reports as required under subsection (3) of this section and adequately demonstrates that:

(a) The event was not caused by poor or inadequate design, operation, maintenance, or any other reasonably preventable condition;

(b) The event was not of a recurring pattern indicative of inadequate design, operation, or maintenance; and

(c) The operator took immediate and appropriate corrective action in a manner consistent with good air pollution control practice for minimizing emissions during the event, taking into account the total emissions impact of the corrective action, including slowing or shutting down the emission unit as necessary to minimize emissions, when the operator knew or should have known that an emission standard or permit condition was being exceeded.

~~**173-400-110 New Source Review (NSR) for Sources and Portable Sources.**~~

~~(1) Applicability.~~

~~(a) WAC 173-400-110, 173-400-111, 173-400-112, and 173-400-113 apply statewide except where a permitting authority has adopted its own new source review regulations.~~

~~(b) This section applies to new sources and stationary sources as defined in RCW 70.94.030, and WAC 173-400-030, but does not include nonroad engines.~~

~~(c) For purposes of this section:~~

~~(i) "Establishment" means to begin actual construction;~~

~~(ii) "New source" includes:~~

~~(A) A modification to an existing stationary source, as "modification" is defined in WAC 173-400-030;~~

~~(B) The construction, modification, or relocation of a portable source as defined in WAC 173-400-030, except those relocating in compliance with WAC 173-400-036;~~

~~(C) The establishment of a new or modified toxic air pollutant source, as defined in WAC 173-460-020; and~~

~~(D) A major modification to an existing major stationary source, as defined in WAC 173-400-710 and 173-400-810.~~

~~(d) New source review of a modification is limited to the emission unit or units proposed to be modified and the air contaminants whose emissions would increase as a result of the~~

~~(i) A violation subject to WAC 173-400-230 (3), (4), and (6); but~~
~~(ii) Not subject to civil penalty under WAC 173-400-230(2).~~

~~Note: Nothing in a state rule limits a federal court's jurisdiction or discretion to determine the appropriate remedy in an enforcement action.~~

~~(2) The owner or operator of a source shall have the burden of proving to the permitting authority in an enforcement action that excess emissions were unavoidable. This demonstration shall be a condition to obtaining relief under subsection (5) of this section.~~

~~(3) This section does not apply to an exceedance of an emission standard in 40 C.F.R. Parts 60, 61, 62, 63, and 72, or a permitting authority's adoption by reference of these federal standards.~~

~~(4) Excess emissions that occur due to an upset or malfunction during a startup or shutdown event are treated as an upset or malfunction under subsection (5) of this section.~~

~~(5) Excess emissions due to an upset or malfunction will be considered unavoidable provided the source reports as required by WAC 173-400-108 and adequately demonstrates to the permitting authority that:~~

~~(a) The event was not caused by poor or inadequate design, operation, maintenance, or any other reasonably preventable condition;~~

~~(b) The event was not of a recurring pattern indicative of inadequate design, operation, or maintenance;~~

~~(c) When the operator knew or should have known that an emission standard or other permit condition was being exceeded, the operator took immediate and appropriate corrective action in a manner consistent with safety and good air pollution control practice for minimizing emissions during the event, taking into account the total emissions impact of the corrective action. Actions taken could include slowing or shutting down the emission unit as necessary to minimize emissions;~~

~~(d) If the emitting equipment could not be shutdown during the malfunction or upset to prevent the loss of life, prevent personal injury or severe property damage, or to minimize overall emissions, repairs were made in an expeditious fashion;~~

~~(e) All emission monitoring systems and pollution control systems were kept operating to the extent possible unless their shutdown was necessary to prevent loss of life, personal injury, or severe property damage;~~

~~(f) The amount and duration of the excess emissions (including any bypass) were minimized to the maximum extent possible; and~~

~~(g) All practicable steps were taken to minimize the impact of the excess emissions on ambient air quality.~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 18-17-111 (Order 15-07), § 173-400-109, filed 8/16/18, effective 9/16/18; WSR 11-06-060 (~~Order 09-01), § 173-400-109, filed 3/1/11, effective 4/1/11.]

WAC 173-400-110 New source review (NSR) for sources and portable sources. (1) **Applicability.**

(a) WAC 173-400-110, 173-400-111, 173-400-112, and 173-400-113 apply statewide except where a permitting authority has adopted its own new source review regulations.

(b) This section applies to new sources and stationary sources as defined in RCW 70.94.030, and WAC 173-400-030, but does not include nonroad engines.

(c) For purposes of this section:

(i) "Establishment" means to begin actual construction;

(ii) "New source" includes:

(A) A modification to an existing stationary source, as "modification" is defined in WAC 173-400-030:

(B) The construction, modification, or relocation of a portable source as defined in WAC 173-400-030, except those relocating in compliance with WAC 173-400-036;

~~(C) The establishment of a new or modified toxic air pollutant source, as defined in WAC 173-460-020; and~~

(D) A major modification to an existing major stationary source, as defined in WAC 173-400-710 and 173-400-810.

(d) New source review of a modification is limited to the emission unit or units proposed to be modified and the air contaminants whose emissions would increase as a result of the modification. Review of a major modification must comply with WAC 173-400-700 through 173-400-750 or 173-400-800 through 173-400-860, as applicable.

~~(e) The procedural requirements pertaining to NOC applications and orders of approval for new sources that are not major stationary sources, as defined in WAC 173-400-710 and 173-400-810, shall not apply to any person conducting a remedial action at a facility pursuant to a consent decree, order, or agreed order issued pursuant to chapter 70.105D RCW, Model Toxics Control Act, or to the department of ecology when it conducts a remedial action under chapter 70.105D RCW. The department of ecology shall ensure compliance with the substantive requirements of this chapter through the consent decree, order, or agreed order issued pursuant to chapter 70.105D RCW using the procedures outlined in WAC 173-340-710(9) or during a department-conducted remedial action, through the procedures outlined in WAC 173-340-710(9).~~

(2) **Preconstruction approval requirements.** The applicant must evaluate the proposed project and submit an application addressing all applicable new source review requirements of this chapter.

(a) A notice of construction application must be filed and an order of approval must be issued by the permitting authority prior to the establishment of any new source or modification except for those new sources or modifications exempt from permitting under subsections (4), (5), and (6) of this section.

(b) If the proposed project is a new major stationary source or a major modification, located in a designated nonattainment area, and if the project emits the air pollutant or precursors of the air pollutant for which the area is designated nonattainment, and the project meets the applicability criteria in WAC 173-400-820, then the project is subject to the permitting requirements of WAC 173-400-800 through 173-400-860.

(c) If the proposed project is a new major stationary source or a major modification that meets the applicability criteria of WAC 173-400-720, then the project is subject to the PSD permitting requirements of WAC 173-400-700 through 173-400-750.

~~(d) If the proposed project will increase emissions of toxic air pollutants regulated under chapter 173-460 WAC, then the project must meet all applicable requirements of that program.~~

(3) **Modifications.**

New source review is required for any modification to a stationary source that requires:

(a) An increase in a plant-wide cap; or

(b) An increase in an emission unit or activity specific emission limit.

(4) **Emission unit and activity exemptions.**

The construction or modification of emission units or an activity in one of the categories listed below is exempt from new source review, provided that the modified unit continues to fall within one of the listed categories. The construction or modification of an emission unit or an activity exempt under this subsection does not require the filing of a notice of construction application.

(a) Maintenance/construction:

(i) Cleaning and sweeping of streets and paved surfaces;

(ii) Concrete application, and installation;

(iii) Dredging wet spoils handling and placement;

(iv) Paving application and maintenance. This provision does not exempt asphalt plants from this chapter;

(v) Plant maintenance and upkeep activities (grounds keeping, general repairs, house keeping, plant painting, welding, cutting, brazing, soldering, plumbing, retarring roofs, etc.);

(vi) Plumbing installation, plumbing protective coating application and maintenance activities;

(vii) Roofing application and maintenance;

(viii) Insulation application and maintenance;

(ix) Janitorial services and consumer use of janitorial products;

(x) Construction activities that do not result in new or modified stationary sources or portable stationary sources.

(b) Storage tanks:

Note: It can be difficult to determine requirements for storage tanks. Ecology strongly recommends that an owner or operator contact the permitting authority to determine the exemption status of storage tanks prior to their installation.

(i) Lubricating oil storage tanks. This provision does not exempt wholesale distributors of lubricating oils from this chapter;

(ii) Polymer tanks and storage devices and associated pumping and handling equipment, used for solids dewatering and flocculation;

(iii) Storage tanks, reservoirs, pumping and handling equipment of any size containing soaps, vegetable oil, grease, animal fat, and nonvolatile aqueous salt solutions;

(iv) Process and white water storage tanks;

(v) Operation, loading and unloading of storage tanks and storage vessels, with lids or other appropriate closure and less than 260-gallon capacity (35 cubic feet);

(vi) Operation, loading and unloading of storage tanks, ≤ 1100 gallon capacity, with lids or other appropriate closure, ~~not for use with materials containing toxic air pollutants, as listed in chapter 173-460 WAC~~, max. VP 550 mm mercury at 21°C;

(vii) Operation, loading and unloading storage of butane, propane, or liquefied petroleum gas with a vessel capacity less than 40,000 gallons;

(viii) Tanks, vessels and pumping equipment, with lids or other appropriate closure for storage or dispensing of aqueous solutions of inorganic salts, bases and acids.

(c) New or modified emission units with combined aggregate heat inputs to combustion units (excluding emergency engines exempted by subsection (4)(h)(xxxix) of this section), less than or equal to all of the following, as applicable:

(i) ≤ 500,000 Btu/hr using coal with ≤ 0.5% sulfur or other solid fuels with ≤ 0.5% sulfur;

(ii) ≤ 500,000 Btu/hr using used oil, per the requirements of RCW 70.94.610;

(iii) ≤ 400,000 Btu/hr using wood waste or paper;

(iv) $\leq$ 1,000,000 Btu/hr using gasoline, kerosene, #1, or #2 fuel oil and with $\leq$0.05% sulfur;'

(v) $\leq$ 4,000,000 Btu/hr using natural gas, propane, or LPG.'

(d) Material handling:'

(i) Continuous digester chip feeders;'

(ii) Grain elevators not licensed as warehouses or dealers by either the Washington state department of agriculture or the U.S. Department of Agriculture;

(iii) Storage and handling of water based lubricants for metal working where organic content of the lubricant is $\leq$ 10%;

(iv) Equipment used exclusively to pump, load, unload, or store high boiling point organic material in tanks less than one million gallon, material with initial atmospheric boiling point not less than 150°C or vapor pressure not more than 5 mm mercury at 21°C, with lids or other appropriate closure.

(e) Water treatment:

(i) Septic sewer systems, not including active wastewater treatment facilities;

(ii) NPDES permitted ponds and lagoons used solely for the purpose of settling suspended solids and skimming of oil and grease;

(iii) De-aeration (oxygen scavenging) of water ~~where toxic air pollutants as defined in chapter 173-460 WAC are not emitted;~~'

(iv) Process water filtration system and demineralizer vents;'

(v) Sewer manholes, junction boxes, sumps and lift stations associated with wastewater treatment systems;

(vi) Demineralizer tanks;

(vii) Alum tanks;

(viii) Clean water condensate tanks.

(f) Environmental chambers and laboratory equipment:

(i) Environmental chambers and humidity chambers using only gases ~~that are not toxic air pollutants listed in chapter 173-460 WAC;~~

(ii) Gas cabinets using only gases that are not toxic air pollutants regulated under chapter 173-460 WAC;

(iii) Installation or modification of a single laboratory fume hood;

(iv) Laboratory research, experimentation, analysis and testing at sources whose primary purpose and activity is research or education. To be exempt, these sources must not engage in the production of products, or in providing commercial services, for sale or exchange for commercial profit except in a de minimis manner. Pilot-plants or pilot scale processes at these sources are not exempt.

(v) Laboratory calibration and maintenance equipment.

(g) Monitoring/quality assurance/testing:

(i) Equipment and instrumentation used for quality control/assurance or inspection purpose;

(ii) Hydraulic and hydrostatic testing equipment;

(iii) Sample gathering, preparation and management;

(iv) Vents from emission monitors and other analyzers.

(h) Miscellaneous:

(i) Single-family residences and duplexes;

(ii) Plastic pipe welding;

(iii) Primary agricultural production activities including soil preparation, planting, fertilizing, weed and pest control, and harvesting;'

(iv) Comfort air conditioning;'

(v) Flares used to indicate danger to the public;'

(vi) Natural and forced air vents and stacks for bathroom/toilet activities;

(vii) Personal care activities;

(viii) Recreational fireplaces including the use of barbecues, campfires, and ceremonial fires;

(ix) Tobacco smoking rooms and areas;

(x) Noncommercial smokehouses;

(xi) Blacksmith forges for single forges;

(xii) Vehicle maintenance activities, not including vehicle surface coating;

(xiii) Vehicle or equipment washing (see (c) of this subsection for threshold for boilers);

(xiv) Wax application;

(xv) Oxygen, nitrogen, or rare gas extraction and liquefaction equipment not including internal and external combustion equipment;

(xvi) Ozone generators and ozonation equipment;

(xvii) Solar simulators;

(xviii) Ultraviolet curing processes, ~~to the extent that toxic air pollutant gases as defined in chapter 173-460 WAC are not emitted;~~

(xix) Electrical circuit breakers, transformers, or switching equipment installation or operation;

(xx) Pulse capacitors;

(xxi) Pneumatically operated equipment, including tools and hand held applicator equipment for hot melt adhesives;

(xxii) Fire suppression equipment;

(xxiii) Recovery boiler blow-down tank;

(xxiv) Screw press vents;

(xxv) Drop hammers or hydraulic presses for forging or metal working;

(xxvi) Production of foundry sand molds, unheated and using binders less than 0.25% free phenol by sand weight;

(xxvii) Kraft lime mud storage tanks and process vessels;

(xxviii) Lime grits washers, filters and handling;

(xxix) Lime mud filtrate tanks;

(xxx) Lime mud water;

(xxxi) Stock cleaning and pressurized pulp washing down process of the brown stock washer;

(xxxii) Natural gas pressure regulator vents, excluding venting at oil and gas production facilities and transportation marketing facilities;

(xxxiii) Solvent cleaners less than 10 square feet air-vapor interface with solvent vapor pressure not more than 30 mm mercury at 21°C ~~where no toxic air pollutants as listed under chapter 173-460 WAC are emitted~~;

(xxxiv) Surface coating, aqueous solution or suspension containing ≤ 1% (by weight) VOCs, ~~or ≤ 1% (by weight) toxic air pollutants as listed in chapter 173-460 WAC~~;

(xxxv) Cleaning and stripping activities and equipment using solutions having ≤ 1% VOCs (by weight) ~~or ≤ 1% (by weight) toxic air pollutants~~. Acid solutions used on metallic substances are not exempt;

(xxxvi) Dip coating operations, using materials less than 1% VOCs (by weight) ~~or ≤ 1% (by weight) toxic air pollutants as listed in chapter 173-460 WAC~~.

(xxxvii) Abrasive blasting performed inside a booth or hangar designed to capture the blast grit or overspray.

(xxxviii) For structures or items too large to be reasonably handled indoors, abrasive blasting performed outdoors that employs control measures such as curtailment during windy periods and enclosure of the area being blasted with tarps and uses either steel shot or an abrasive containing less than one percent (by mass) which would pass through a No. 200 sieve.

(xxxix) Stationary emergency internal combustion engines with an aggregate brake horsepower that is less than or equal to 500 brake horsepower.

(xl) Gasoline dispensing facilities with annual gasoline throughputs less than those specified in WAC 173-491-040 (4)(a). ~~Gasoline dispensing facilities subject to chapter 173-491 WAC are exempt from toxic air pollutant analysis pursuant to chapter 173-460 WAC.~~

(5) **Exemptions based on emissions.**

(a) Except as provided in this subsection:

(i) Construction of a new emissions unit that has a potential to emit below each of the levels listed in Table 110(5) Exemption levels is exempt from new source review.

(ii) A modification to an existing emissions unit that increases the unit's actual emissions by less than each of the threshold levels listed in Table 110(5) Exemption levels of this subsection is exempt from new source review.

(b) Greenhouse gas emissions are exempt from new source review requirements except to the extent required under WAC 173-400-720, prevention of significant deterioration. The owner or operator of a source or emission unit, may request that the permitting authority impose emission limits and/or operation limitations for greenhouse gas in any new source review order of approval.

Table 110(5) Exemption levels:

POLLUTANT	LEVEL (TONS PER YEAR)
Carbon monoxide	5.0
/HDG	0.005
Nitrogen oxides	2.0
PM-10	0.75
PM-2.5	0.5
7otal suspended particulates	1.25
Sulfur dioxide	2.0
9olatile Organic Compounds, total	2.0
Ozone Depleting Substances, total	1.0
~~7oxic Air Pollutants~~	~~The de minimis emission rate specified for each 7AP in WAC 173-460-150.~~

(6) **Portable source with order of approval.** A portable source is authorized to operate without obtaining a site-specific or a permitting authority specific approval order to relocate if the portable source complies with the provisions of WAC 173-400-036.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-110, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-110, filed 3/1/11, effective 4/1/11. EPA effective: 11/28/16 (81 FR 66825, 9/29/16)

WAC 173-400-111 Processing notice of construction applications for sources, stationary sources and portable sources. WAC 173-400-110, 173-400-111, 173-400-112, and 173-400-113 apply statewide except where a permitting authority has adopted its own new source review regulations.

(1) Completeness determination.

(a) Within thirty days after receiving a notice of construction application, the permitting authority must either notify the applicant in writing that the application is complete or notify the applicant in writing of all additional information necessary to complete the application.

(b) A complete application contains all the information necessary for processing the application. At a minimum, the application must provide information on the nature and amounts of emissions to be emitted by the proposed new source or increased as part of a modification, as well as the location, design, construction, and operation of the new source as needed to enable the permitting authority to determine that the construction or modification will meet the requirements of WAC 173-400-113. Designating an application complete for purposes of permit processing does not preclude the reviewing authority from requesting or accepting any additional information.

(c) For a project subject to the special protection requirements for federal Class I areas under WAC 173-400-117(2), a completeness determination includes a determination that the application includes all information required for review of that project under WAC 173-400-117(3). The applicant must send a copy of the application and all amendments to the application to the EPA and the responsible federal land manager.

(d) For a project subject to the major new source review requirements in WAC 173-400-800 through 173-400-860, the completeness determination includes a determination that the application includes all information required for review under those sections.

(e) An application is not complete until any permit application fee required by the permitting authority has been paid.

(2) Coordination with chapter 173-401 WAC, operating permit regulation. A person seeking approval to construct or modify a source that

requires an operating permit may elect to integrate review of the operating permit application or amendment required under chapter 173-401 WAC and the notice of construction application required by this section. A notice of construction application designated for integrated review must be processed in accordance with operating permit program procedures and deadlines in chapter 173-401 WAC and must comply with WAC 173-400-171.

(3) Criteria for approval of a notice of construction application. An order of approval cannot be issued until the following criteria are met as applicable:

(a) The requirements of WAC 173-400-112;

(b) The requirements of WAC 173-400-113;

(c) The requirements of WAC 173-400-117;

(d) The requirements of WAC 173-400-171;

(e) The requirements of WAC 173-400-200 and 173-400-205;

(f) The requirements of WAC 173-400-700 through 173-400-750;

(g) The requirements of WAC 173-400-800 through 173-400-860;

~~(h) The requirements of chapter 173-460 WAC;~~ and

(i) All fees required under chapter 173-455 WAC (or the applicable new source review fee table of the local air pollution control authority) have been paid.

(4) Final determination - Time frame and signature authority.

(a) Within sixty days of receipt of a complete notice of construction application, the permitting authority must either:

(i) Issue a final decision on the application; or

(ii) Initiate notice and comment for those projects subject to WAC 173-400-171 followed as promptly as possible by a final decision.

(b) Every final determination on a notice of construction application must be reviewed and signed prior to issuance by a professional engineer or staff under the direct supervision of a professional engineer in the employ of the permitting authority.

(5) Distribution of the final decision.

(a) The permitting authority must promptly provide copies of each order approving or denying a notice of construction application to the applicant and to any other party who submitted timely comments on the application, along with a notice advising parties of their rights of appeal to the pollution control hearings board.

(b) If the new source is a major stationary source or the change is a major modification subject to the requirements of WAC 173-400-800 through 173-400-860, the permitting authority must:

(i) Submit any control technology (LAER) determination included in a final order of approval to the RACT/BACT/LAER clearinghouse maintained by EPA; and

(ii) Send a copy of the final approval order to EPA.

(6) Appeals. Any conditions contained in an order of approval, or the denial of a notice of construction application may be appealed to the pollution control hearings board as provided under chapters 43.21B RCW and 371-08 WAC.

(7) Construction time limitations.

(a) Approval to construct or modify a stationary source becomes invalid if construction is not commenced within eighteen months after receipt of the approval, if construction is discontinued for a period of eighteen months or more, or if construction is not completed within a reasonable time. The permitting authority may extend the eighteen-month period upon a satisfactory showing by the permittee that an extension is justified.

(b) The extension of a project that is either a major stationary source, as defined in WAC 173-400-810, in a nonattainment area or a major modification, as defined in WAC 173-400-810, of a major stationary source in a nonattainment area must also require LAER, for the pollutants for which the area is classified as nonattainment, as LAER exists at the time of the extension for the pollutants that were subject to LAER in the original approval.

(c) This provision does not apply to the time period between construction of the approved phases of a phased construction project. Each phase must commence construction within eighteen months of the projected and approved commence construction date.

(8) Change of conditions or revisions to orders of approval.

(a) The owner or operator may request, at any time, a change in the conditions of an approval order and the permitting authority may approve the request provided the permitting authority finds that:

(i) The change in conditions will not cause the source to exceed an emissions standard set by regulation or rule;

(ii) No ambient air quality standard will be exceeded as a result of the change;

(iii) The change will not adversely impact the ability of the permitting authority to determine compliance with an emissions standard;

(iv) The revised order will continue to require BACT for each new source approved by the order except where the Federal Clean Air Act requires LAER; and

(v) The revised order meets the requirements of WAC 173-400-111, 173-400-112, 173-400-113, 173-400-720, 173-400-830, ~~and 173-460-040,~~ as applicable.

(b) Actions taken under this subsection are subject to the public involvement provisions of WAC 173-400-171 or the permitting authority's public notice and comment procedures.

(c) The applicant must consider the criteria in 40 C.F.R. 52.21 (r)(4) (in effect on the date in WAC 173-400-025) or 173-400-830(3), as applicable, when determining which new source review approvals are required.

~~(9) Fees. Chapter 173-455 WAC lists the required fees payable to ecology for various permit actions.~~

(10) Enforcement. All persons who receive an order of approval must comply with all approval conditions contained in the order of approval.

[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-111, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-111, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-111, filed 3/1/11, effective 4/1/11.]

EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

WAC 173-400-112 Requirements for new sources in nonattainment areas—Review for compliance with regulations. WAC 173-400-110, 173-400-111, 173-400-112, and 173-400-113 apply statewide except where a permitting authority has adopted its own new source review regulations. The permitting authority that is reviewing an application required by WAC 173-400-110(2) to establish a new source in a nonattainment area shall issue the order of approval if it determines that the proposed project satisfies each of the following requirements:

(1) The proposed new source or modification will comply with all applicable new source performance standards, national emission standards for hazardous air pollutants, national emission standards for hazardous air pollutants for source categories, emission standards adopted under chapter 70.94 RCW and, for sources regulated by an authority, the applicable emission standards of that authority.

(2) The proposed new source or modification will achieve LAER for any air contaminants for which:

(a) The area has been designated nonattainment; and

(b)(i) The proposed new source is major; or

(ii) The existing source is major and the major modification is significant.

(3) The proposed new source will employ BACT for those air contaminants not subject to LAER that the new source will emit or for which the proposed modification will cause an emissions increase.

(4) The proposed new source or modification will not cause any ambient air quality standard to be exceeded, will not violate the requirements for reasonable further progress established by the SIP and will comply with WAC 173-400-113 (3) and (4) for all air contaminants for which the area has not been designated nonattainment.

(5) If the proposal is a new major stationary source or a major modification as those terms are defined in WAC 173-400-810 then it must also comply with WAC 173-400-800 through 173-400-860.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-112, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-112, filed 3/1/11, effective 4/1/11. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-112, filed 1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW, RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. WSR 01-17-062 (Order 99-06), § 173-400-112, filed 8/15/01, effective 9/15/01. Statutory Authority: Chapter 70.94 RCW. WSR 93-18-007 (Order 93-03), § 173-400-112, filed 8/20/93, effective 9/20/93.]

EPA effective: 11/28/16 (81 FR 66825, 9/29/16)

WAC 173-400-113 New sources in attainment or unclassifiable areas—Review for compliance with regulations. WAC 173-400-110, 173-400-111, 173-400-112, and 173-400-113 apply statewide except where a permitting authority has adopted its own new source review regulations. The permitting authority that is reviewing an application to establish a new source or modification in an attainment or unclassifiable area shall issue an order of approval if it determines that the proposed project satisfies each of the following requirements:

(1) The proposed new source or modification will comply with all applicable new source performance standards, national emission standards for hazardous air pollutants, national emission standards for hazardous air pollutants for source categories, emission standards adopted under chapter 70.94 RCW and, for sources regulated by an authority, the applicable emission standards of that authority.

(2) The proposed new source or modification will employ BACT for all pollutants not previously emitted or whose emissions would increase as a result of the new source or modification.

(3) Allowable emissions from the proposed new source or the increase in emissions from the proposed modification will not cause or contribute to a violation of any ambient air quality standard. ~~If the modeled concentrations of allowable emissions from the proposed new source or the increase in emissions from the proposed modification are below the levels in Table 4a, the proposed source does not contribute to a violation of an ambient air quality standard.~~

(4)(a) If the projected impact of the allowable emissions from the proposed new major stationary source (as defined in WAC 173-400-810) or the projected impact of the increase in allowable emissions from the proposed major modification (as defined in WAC 173-400-810) at any location within a nonattainment area does not exceed the following levels for the pollutants for which the area has been designated nonattainment, then the proposed new source or modification will not be considered to cause or contribute to a violation of an ambient air quality standard:

Table 4a:
Cause or Contribute Threshold Values for Nonattainment Area Impacts

3ROOXWDQW	Annual $YHUDJH	24-Hour $YHUDJH	8-Hour $YHUDJH	3-Hour $YHUDJH	1-Hour $YHUDJH
CO-	-		0.5 mg/m^3	-	2 mg/m^3
62 2	1.0 µg/m^3	5 µg/m^3	-	25 µg/m^3	30 µg/m^3
30 10	1.0 µg/m^3	5 µg/m^3	-	-	-
30 2.5	0.3 µg/m^3	1.2 µg/m^3			
12 2	1.0 µg/m^3	-	-	-	-

(b) If the projected impact of the allowable emissions from the proposed new major stationary source (as defined in WAC 173-400-810) or the projected impact of the increase in allowable emissions from the proposed major modification (as defined in WAC 173-400-810) results in a projected impact at any location inside a nonattainment area above the appropriate value in Table 4a of this section may use an offsetting emission reduction or other method identified in 40 C.F.R. Part 51 Appendix S, Sections III and IV.A which reduce the projected impacts to the above values or less. If the owner or operator of the proposed new major stationary source or major source proposed to be modified is unable to reduce emissions or obtain offsetting emissions reductions adequate to reduce modeled impacts below the values in Table 4a of this section, then the permitting authority shall deny approval to construct and operate the proposed new major stationary source or major modification.

(5) If the proposal is a new major stationary source or a major modification as defined in WAC 173-400-720, then it must also comply with WAC 173-400-700 through 173-400-750.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-113, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-113, filed 3/1/11, effective 4/1/11. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-113, filed 1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW, RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. WSR 01-17-062 (Order 99-06), § 173-400-113, filed 8/15/01, effective 9/15/01. Statutory Authority: Chapter 70.94 RCW. WSR 93-18-007 (Order 93-03), § 173-400-113, filed 8/20/93, effective 9/20/93.]

EPA effective: 5/29/15 (80 FR 23721, 4/29/15)

~~**WAC 173-400-114 Requirements for replacement or substantial alteration of emission control technology at an existing stationary source.** (1) Any **person** proposing to replace or substantially alter the **emission** control technology installed on an existing **stationary source** or **emission unit** shall file a **notice of construction application** with the appropriate **authority**, or with **ecology** in areas or for **sources** over which **ecology** has jurisdiction. Replacement or substantial alteration of control technology does not include routine maintenance, repair or similar parts replacement.~~

~~(2) A project to replace or substantially alter emission control technology at an existing stationary source that results in an increase in emissions of any air contaminant is subject to new source review as provided in WAC 173-400-110. For any other project to replace or significantly alter control technology the permitting **authority** may:~~

~~(a) Require that the owner or operator employ **RACT** for the affected **emission unit;**~~

~~(b) Prescribe reasonable operation and maintenance conditions for the control equipment; and~~

~~(c) Prescribe other requirements as authorized by chapter 70.94 RCW.~~

~~(3) Within thirty days of receipt of a **notice of construction application** under this section **ecology** or the **authority** shall either notify the applicant in writing that the application is complete or notify the applicant in writing of all additional information necessary to complete the application. Within thirty days of receipt of a complete **notice of construction application** under this section **ecology** or the **authority** shall either issue an **order of approval** or a proposed **RACT** determination for the proposed project.~~

~~(4) Construction shall not **"commence,"** as defined in WAC 173-400-030, on a project subject to review under this section until **ecology** or the **authority** issues a final **order of approval**. However, any **notice of construction application** filed under this section shall be deemed to be approved without conditions if **ecology** or the **authority** takes no action within thirty days of receipt of a complete **notice of construction application.**~~

~~(5) Approval to replace or substantially alter **emission** control technology shall become invalid if construction is not **commenced** within eighteen months after receipt of such approval, if construction is discontinued for a period of eighteen months or more, or if construction is not completed within a reasonable time. **Ecology** or the **authority** may extend the eighteen-month period upon a satisfactory showing that an extension is justified. This provision does not apply to the time period between construction of the approved phases of a phased construction project; each phase must commence construction within eighteen months of the projected and approved commencement date.~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-114, filed 11/28/12, effective 12/29/12. Statutory Authority: Chapter 70.94 RCW, RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. WSR 01-17-062 (Order 99-06), § 173-400-114, filed 8/15/01, effective 9/15/01. Statutory Authority: Chapter 70.94 RCW. WSR 93-18-007 (Order 93-03), § 173-400-114, filed 8/20/93, effective 9/20/93.]~~

~~**WAC 173-400-115 Standards of performance for new sources. NSPS.** Standards of performance for new sources are called New Source Performance Standards, or NSPS.~~

~~(1) **Adoption of federal rules.**~~

~~(a) 40 C.F.R. Part 60 and Appendices (in effect on the date in WAC 173-400-025) are adopted. Exceptions are listed in (b) of this subsection.~~

~~(b) Exceptions to adopting 40 C.F.R. Part 60.~~

~~(i) The term "administrator" in 40 C.F.R. Part 60 includes the permitting authority.~~

~~(ii) The following sections and subparts of 40 C.F.R. Part 60 are not adopted:~~

~~(A) 40 C.F.R. 60.5 (determination of construction or modification);~~

~~(B) 40 C.F.R. 60.6 (review of plans);~~

~~(C) 40 C.F.R. Part 60, subpart B (Adoption and Submittal of State Plans for Designated Facilities), and subparts C, Cb, Cc, Cd, Ce, BBBB, DDDD, FFFF, MMMM, UUUU (emission guidelines); and~~

~~(D) 40 C.F.R. Part 60, Appendix G, Provisions for an Alternative Method of Demonstrating Compliance With 40 C.F.R. 60.43 for the Newton Power Station of Central Illinois Public Service Company.~~

~~(2) Where EPA has delegated to the permitting authority, the authority to receive reports under 40 C.F.R. Part 60, from the affected facility in lieu of providing such report to EPA, the affected facility is required to provide such reports only to the permitting authority unless otherwise requested in writing by the permitting authority or EPA.~~

~~Note: Under RCW 80.50.020(14), larger energy facilities subject to subparts D, Da, GG, J, K, Kb, Y, KKK, LLL, and QQQ are regulated by the HQHU facility site evaluation council (EFSEC).~~

~~[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-115, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WAC 173-400-116 Increment protection. This section takes effect on the effective date of EPA's incorporation of this section into the Washington state implementation plan.

(1) Ecology will periodically review increment consumption. Within sixty days of the time that information becomes available to ecology that an applicable increment is or may be violated, ecology will review the state implementation plan for its adequacy to protect the increment from being exceeded. The plan will be revised to correct any inadequacies identified or to correct the increment violation. Any changes to the state implementation plan resulting from the review will be subject to public involvement in accordance with WAC 173-400-171 and EPA approval.

(2) PSD increments are published in 40 C.F.R. 52.21(c) (in effect on the date in WAC 173-400-025).

(3) Exclusions from increment consumption. The following concentrations are excluded when determining increment consumption:'

(a) Concentrations of particulate matter, PM-10, or PM-2.5, attributable to the increase in emissions from construction or other temporary emission-related activities of new or modified sources;

(b) The increase in concentrations attributable to new sources outside the United States over the concentrations attributable to existing sources which are included in the baseline concentration; and

(c) Concentrations attributable to the temporary increase in emissions of sulfur dioxide, particulate matter, or nitrogen oxides from stationary sources, which are affected by a revision to the SIP approved by EPA. Such a revision must:

(i) Specify the time over which the temporary emissions increase of sulfur dioxide, particulate matter, or nitrogen oxides would occur. Such time is not to exceed two years in duration unless a longer time is approved by EPA.

(ii) Specify that the time period for excluding certain contributions in accordance with (c)(i) of this subsection is not renewable;'

(iii) Allow no emissions increase from a stationary source, which would:

(A) Impact a Class I area or an area where an applicable increment is known to be violated; or

(B) Cause or contribute to the violation of a national ambient air quality standard.

(iv) Require limitations to be in effect by the end of the time period specified in accordance with (c)(i) of this subsection, which would ensure that the emissions levels from stationary sources affected by the plan revision would not exceed those levels occurring from such sources before the plan revision was approved.

[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-116, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

WAC 173-400-117 Special protection requirements for federal Class I areas. (1) **Definitions.** The following definitions apply to this section:

(a) **"Adverse impact on visibility"** means visibility impairment that interferes with the management, protection, preservation, or enjoyment of the visitor's visual experience of the federal Class I area. This determination must be made on a case-by-case basis taking into account the geographic extent, intensity, duration, frequency, and time of visibility impairment, and how these factors correlate with:

(i) Times of visitor use of the federal Class I area; and

(ii) The frequency and timing of natural conditions that reduce visibility.

(b) The terms "major stationary source," "major modification," and "net emissions increase" are defined in WAC 173-400-720 for projects located in areas designated as attainment or unclassifiable for the pollutants proposed to increase as a result of the project and are defined in WAC 173-400-810 for projects located in areas designated as nonattainment for the pollutants proposed to increase as a result of the project.

(2) **Applicability.** The requirements of this section apply to all of the following permitting actions:

(a) A PSD permit application for a new major stationary source or a major modification; or

(b) A notice of construction application for a major stationary source or a major modification to a stationary source in a nonattainment area, as either of those terms are defined in WAC 173-400-810.

(3) **Contents and distribution of application.**

(a) The application shall include an analysis of the anticipated impacts of the project on visibility in any federal Class I area.

(b) The applicant must mail a copy of the application for the project and all amendments to the application to the permitting authority, EPA and to the responsible federal land managers. Ecology will provide a list of the names and addresses of the federal land manager.

(4) **Notice to federal land manager.**

(a) The permitting authority shall send a copy of the completeness determination to the responsible federal land manager.

(b) If, prior to receiving a notice of construction application or a PSD permit application, the permitting authority receives notice of a project described in subsection (2) of this section that may affect visibility in a federal Class I area, the permitting authority shall notify the responsible federal land manager within thirty days of the notification.

(5) **Analysis by federal land manager.**

(a) The permitting authority will consider any demonstration presented by the responsible federal land manager that emissions from a proposed new major stationary source or the net emissions increase from a proposed major modification described in subsection (2) of this section would have an adverse impact on visibility in any federal Class I area, provided that the demonstration is received by the permitting authority within thirty days of the federal land manager's receipt of the complete application.

(b) If the permitting authority concurs with the federal land manager's demonstration, the PSD permit or approval order for the project either shall be denied, or conditions shall be included in the approval order to prevent the adverse impact.

(c) If the permitting authority finds that the federal land manager's analysis does not demonstrate that the project will have an adverse impact on visibility in a federal Class I area, the permitting authority shall explain its decision in compliance with the notice requirements of WAC 173-400-171 for those permits subject to WAC 173-400-800 through 173-400-860. For permits subject to the prevention of significant deterioration program, the permitting authority shall state in the public notice required by WAC 173-400-740 that an explanation of the decision appears in the Technical Support Document for the proposed permit.

(6) **Additional requirements for projects that require a PSD permit.**

(a) For sources impacting federal Class I areas, the permitting authority shall provide notice to EPA of every action related to consideration of the PSD permit.

(b) The permitting authority shall consider any demonstration received from the responsible federal land manager prior to the close of the public comment period on a proposed PSD permit that emissions from the proposed new major stationary source or the net emissions increase from a proposed major modification would have an adverse impact on the air quality-related values (including visibility) of any mandatory Class I federal area.

(c) If the permitting authority concurs with the demonstration, the PSD permit either shall be denied, or conditions shall be included in the PSD permit to prevent the adverse impact.

(7) **Additional requirements for projects located in nonattainment areas.** In reviewing a PSD permit application or notice of construction application for a new major stationary source or major modification proposed for construction, as those terms are defined in WAC 173-400-810, in an area classified as nonattainment, the permitting authority must ensure that the proposed new source's emissions or the proposed modification's increase in emissions will be consistent with making reasonable progress toward meeting the national goal of preventing any future, and remedying any existing, impairment of visibility by human-caused air pollution in mandatory Class I federal areas. In determining the need for approval order conditions to meet this requirement, the permitting authority may take into account the costs of compliance, the time necessary for compliance, the energy and nonair quality environmental impacts of compliance, and the useful life of the source.

(8) **Monitoring.** The permitting authority may require post-construction monitoring of the impact from the project. The monitoring shall be limited to the impacts on visibility in any federal Class I area near the proposed project.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-117, filed 11/28/12, effective 12/29/12. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-117, filed

1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW, RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. WSR 01-17-062 (Order 99-06), § 173-400-117, filed 8/15/01, effective 9/15/01.]

EPA effective: 5/29/15 (80 FR 23721, 4/29/15)

WAC 173-400-118 Designation of Class I, II, and III areas. (1) **Designation.**

(a) Lands within the exterior boundaries of Indian reservations may be proposed for redesignation by an Indian governing body or EPA. This restriction does not apply to nontrust lands within the 1873 Survey Area of the Puyallup Indian Reservation.

(b) All areas of the state must be designated either Class I, II or III.

(i) The following areas are the Class I areas in Washington state:

(A) Alpine Lakes Wilderness;

(B) Glacier Peak Wilderness;

(C) Goat Rocks Wilderness;

(D) Adams Wilderness;

(E) Mount Rainier National Park;

(F) North Cascades National Park;

(G) Olympic National Park;

(H) Pasayten Wilderness; and

(I) Spokane Indian Reservation.[1]

(ii) All other areas of the state are Class II, but may be redesignated as provided in subsections (2) and (3) of this section.

1. (3 A redesignated this land based on a request from the Spokane 7ribal Council. See 40 C.F.R. 52.2497 and 56 FR 14862, April 12, 1991, for details.

(2) **Restrictions on area classifications.**

(a) Except for the Spokane Indian Reservation, the Class I areas listed in subsection (1) of this section may not be redesignated.

(b) Except as provided in (a) of this subsection, the following areas that exceed 10,000 acres in size may be redesignated as Class I or II:

(i) Areas in existence on August 7, 1977:

(A) A national monument;

(B) A national primitive area;

(C) A national preserve;

(D) A national wild and scenic river;

(E) A national wildlife refuge;

(F) A national lakeshore or seashore; or

(G) A national recreation area.

(ii) Areas established after August 7, 1977:

(A) A national park;

(B) A national wilderness area; or

(C) Areas proposed by ecology for designation or redesignation.

(3) **Redesignation of area classifications.**

(a) Ecology shall propose the redesignation of an area classification as a revision to the SIP.

(b) Ecology may submit to EPA a proposal to redesignate areas of the state as Class I or II if:

(i) Ecology followed the public involvement procedures in WAC 173-400-171(12);

(ii) Ecology explained the reasons for the proposed redesignation, including a description and analysis of the health, environmental, economic, social, and energy effects of the proposed redesignation;

(iii) Ecology made available for public inspection at least thirty days before the hearing the explanation of the reasons for the proposed redesignation;

(iv) Ecology notified other states, tribal governing bodies, and federal land managers (as defined in 40 C.F.R. 52.21 (b)(24)) whose lands may be affected by the proposed redesignation at least thirty days prior to the public hearing;

(v) Ecology consulted with the elected leadership of local governments in the area covered by the proposed redesignation before proposing the redesignation; and

(vi) Ecology followed these procedures when a redesignation includes any federal lands:

(A) Ecology notified in writing the appropriate federal land manager on the proposed redesignation. Ecology allowed forty-five days for the federal land manager to confer with ecology and to submit written comments.

(B) Ecology responded to any written comments from the federal land manager that were received within forty-five days of notification. Ecology's response was available to the public in advance of the notice of the hearing.

(I) Ecology sent the written comments of the federal land manager, along with ecology's response to those comments, to the public location as required in WAC 173-400-171 (2)(a).

(II) If ecology disagreed with the federal land manager's written comments, ecology published a list of any inconsistency between the redesignation and the comments of the federal land manager, together with the reasons for making the redesignation against the recommendation of the federal land manager.

(c) Ecology may submit to EPA a proposal to redesignate any area other than an area to which subsection (1) of this section applies as Class III if:

(i) The redesignation followed the public involvement requirements of WAC 173-400-171 and 173-400-118(3);

(ii) The redesignation has been specifically approved by the governor of Washington state, after consultation with the appropriate committees of the legislature if it is in session, or with the leadership of the legislature, if it is not in session;

(iii) The redesignation has been approved by local governments representing a majority of the residents of the area to be redesignated. The local governments enacted legislation or passed resolutions concurring in the redesignation;

(iv) The redesignation would not cause, or contribute to, a concentration of any air contaminant which would exceed any maximum allowable increase permitted under the classification of any other area or any National Ambient Air Quality Standard; and

(v) A PSD permit under WAC 173-400-720 for a new major stationary source or major modification could be issued only if the area in question were redesignated as Class III, and material submitted as part of that application was available for public inspection prior to any public hearing on redesignation of the area as Class III.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-118, filed 11/28/12, effective 12/29/12. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-118, filed 1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW,

RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. WSR 01-17-062 (Order 99-06), § 173-400-118, filed 8/15/01, effective 9/15/01.]

EPA effective: 11/3/14 (79 FR 59653, 10/3/14)

~~**WAC 173-400-120 Bubble rules.** (1) Applicability. The owner(s) or operator(s) of any source(s) may apply for a bubble for any contaminant regulated by state or federal law for which the emission requirement may be stated as an allowable limit in weight of contaminant per unit time for the emissions units involved.~~

~~(2) Conditions. A bubble may be authorized provided the following conditions have been demonstrated to the satisfaction of the permitting authority.~~

~~(a) The contaminants exchanged must be of the same type, that is, PM_{10} for PM_{10}, sulfur dioxide for sulfur dioxide, etc.~~

~~(b) The bubble will not interfere with the attainment and maintenance of air quality standards. No bubble shall be authorized in a nonattainment area unless there is an EPA-approved SIP which demonstrates attainment for that area.~~

~~(c) The bubble will not result in a delay in compliance by any source, nor a delay in any existing enforcement action.~~

~~(d) The bubble will not supersede NSPS, NESHAPS, BACT, or LAER. The emissions of hazardous contaminants shall not be increased.~~

~~(e) The bubble will not result in an increase in the sum of actual emission rates of the contaminant involved from the emissions units involved.~~

~~(f) A bubble may not be authorized only for opacity limits. However, if the emission limit for particulates for a given emissions unit is increased as part of a bubble, the opacity limit for the given emissions unit may be increased subject to the following limitations:~~

~~(i) The new opacity limit shall be specific for the given emissions unit;~~

~~(ii) The new opacity limit shall be consistent with the new particulates limit;~~

~~(iii) An opacity greater than sixty percent shall never be authorized;~~

~~(iv) If the given emissions unit emits or has the potential to emit one hundred tons per year or more of particulate matter, the opacity shall be monitored continuously.~~

~~(g) The emission limits of the bubble are equivalent to existing limits in enforceability.~~

~~(h) Concurrent with or prior to the authorization of a bubble, each emission unit involved in a bubble shall receive or have received a regulatory order or permit that establishes total allowable emissions from the source for the contaminant being bubbled, expressed as weight of the contaminant per unit time.~~

~~(i) There will be no net adverse impact upon air quality from the establishment of new emission requirements for a specific source or emissions unit. Determination of net adverse impact shall include but not be limited to public perception of opacity and public perception of odorous contaminants.~~

~~(j) Specific situations may require additional demonstration as requested by the permitting authority.~~

~~(3) Jurisdiction. Whenever a bubble application involves emissions units, some of which are under the jurisdiction of an authority, approval will require concurrence by both authorities. The new emis-~~

~~sion limits for each emissions unit will be enforced by the authority of original jurisdiction.~~

~~(4) Additional information. Within thirty days, after the receipt of a bubble application and all supporting data and documentation, the permitting authority may require the submission of additional information needed to review the application.~~

~~(5) Approval. Within thirty days after all the required information has been received, the permitting authority shall approve or deny the application, based on a finding that conditions in subsection (2)(a) through (j) of this section have been satisfied or not. If the application is approved, a regulatory order or equivalent document shall be issued which includes new allowable emissions limits expressed in weight of pollutant per unit time for each emissions unit affected by the bubble. The regulatory order or equivalent document shall include any conditions required to assure that subsection (2)(a) through (j) of this section will be satisfied. If the bubble depends in whole or in part upon the shutdown of equipment, the regulatory order or equivalent document must prohibit operation of the affected equipment. The regulatory order establishing the bubble is subject to the public involvement requirements of WAC 173-400-171.~~

~~[Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-120, filed 1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW. WSR 93-18-007 (Order 93-03), § 173-400-120, filed 8/20/93, effective 9/20/93; WSR 91-05-064 (Order 90-06), § 173-400-120, filed 2/19/91, effective 3/22/91. Statutory Authority: Chapters 43.21A and 70.94 RCW. WSR 89-02-055 (Order 88-39), § 173-400-120, filed 1/3/89; WSR 83-09-036 (Order DE 83-13), § 173-400-120, filed 4/15/83. Statutory Authority: RCW 70.94.331. WSR 80-11-059 (Order DE 80-14), § 173-400-120, filed 8/20/80. Statutory Authority: RCW 43.21A.080 and 70.94.331. WSR 79-06-012 (Order DE 78-21), § 173-400-120, filed 5/8/79; Order DE 76-38, § 173-400-120, filed 12/21/76. Formerly WAC 18-04-120.]~~

WAC 173-400-131 Issuance of emission reduction credits. (1) **Applicability.** The owner or operator of any source may apply to the permitting authority for an emission reduction credit (ERC) if the source proposes to reduce its actual emissions rate for any contaminant regulated by state or federal law for which the emission requirement may be stated as an allowable limit in weight of contaminant per unit time for the emissions units involved.

(2) **Time of application.** The application for an ERC must be made prior to or within one hundred eighty days after the emission reduction has been accomplished.

(3) **Conditions.** An ERC may be authorized provided the following conditions have been demonstrated to the satisfaction of the permitting authority.

(a) The quantity of emissions in the ERC shall be less than or equal to the old allowable emissions rate or the old actual emissions rate, whichever is the lesser, minus the new allowable emissions rate. The old actual emissions rate is the average emissions rate occurring during the most recent twenty-four-month period preceding the request for an ERC. An alternative twenty-four-month period from within the previous five years may be accepted by the permitting authority if the owner or operator of the source demonstrates to the satisfaction of the permitting authority that the alternative period is more representative of actual operations of the unit or source.

(b) The ERC application must include a description of all the changes that are required to accomplish the claimed emissions reduction, such as, new control equipment, process modifications, limitation of hours of operation, permanent shutdown of equipment, specified control practices, etc.

(c) The reduction must be: Greater than otherwise required by an applicable emission standard, order of approval, or regulatory order and be permanent, quantifiable, and federally enforceable.

(d) The reduction must be large enough to be readily quantifiable relative to the source strength of the emissions unit(s) involved.

(e) No part of the emission reductions claimed for credit shall have been used as part of a determination of net emission increase, nor as part of an offsetting transaction under WAC 173-400-113(4) or 173-400-830, nor as part of a bubble transaction under WAC 173-400-120.

(f) No part of the emission reduction was included in the emission inventory used to demonstrate attainment or for reasonable further progress in an amendment to the state implementation plan.

(g) Concurrent with or prior to the authorization of an ERC, the applicant shall receive (have received) a federally enforceable regulatory order or permit that establishes total allowable emissions from the source or emissions unit of the contaminant for which the ERC is requested, expressed as weight of contaminant per unit time.

(h) The use of any ERC shall be consistent with all other federal, state, and local requirements of the program in which it is used.

(4) **Additional information.** Within thirty days after the receipt of an ERC application and all supporting data and documentation, the permitting authority may require the submission of additional information needed to review the application.

(5) **Approval.** Within thirty days after all required information has been received, the permitting authority shall approve or deny the application, based on a finding that conditions in subsection (3)(a) through (h) of this section have been satisfied or not. If the application is approved, the permitting authority shall:

(a) Issue a regulatory order or equivalent document to assure that the emissions from the source will not exceed the allowable emission rates claimed in the ERC application, expressed in weight of pollutant per unit time for each emission unit involved. The regulatory order or equivalent document shall include any conditions required to assure that subsection (3)(a) through (h) of this section will be satisfied. If the ERC depends in whole or in part upon the shutdown of equipment, the regulatory order or equivalent document must prohibit operation of the affected equipment; and

(b) Issue a certificate of emission reduction credit. The certificate shall specify the issue date, the contaminants involved, the emission decrease expressed as weight of pollutant per unit time, the nonattainment area involved, if applicable, and the person to whom the certificate is issued. The emission reduction credit listed in the certificate shall be less than the amount of emission reduction achieved by the source. The difference between the emission reduction and the emission reduction credit must be a decrease of at least one ton per year or one percent of the emission reduction, whichever decrease is greater.

(c) The certificate of emission reduction credit shall include the expiration date of the credit.

[Statutory Authority: Chapter 70.94 RCW. WSR 11-06-060 (Order 09-01), § 173-400-131, filed 3/1/11, effective 4/1/11. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-131, filed 1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW, RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. EPA effective: 12/8/14 (79 FR 66291, 11/7/14)

WAC 173-400-136 Use of emission reduction credits (ERC). (1) **Permissible use.** An ERC may be used to:

(a) Satisfy the requirements for authorization of a bubble under WAC 173-400-120;

(b) As an offsetting reduction to satisfy the requirements for new source review in WAC 173-400-830 or 173-400-113(4);

(c) Or if the reduction meets the criteria to be a creditable contemporaneous emission reduction, to demonstrate a creditable contemporaneous emission reduction for determining a net emissions increase under WAC 173-400-700 through 173-400-750 and 173-400-800 through 173-400-860.

(2) **Surrender of ERC certificate.** When an ERC is used under subsection (1) of this section, the certificate for the ERC must be surrendered to the permitting authority. If only a portion of the ERC is used, the amended certificate will be returned to the owner.

(3) **Conditions of use.**

(a) An ERC may be used only for the air contaminants for which it was issued.

(b) The permitting authority may impose additional conditions of use to account for temporal and spatial differences between the emissions units that generated the ERC and the emissions units that use the ERC.

(4) **Sale of an ERC.** An ERC may be sold or otherwise transferred to a person other than the person to whom it was originally issued. Within thirty days after the transfer of ownership, the certificate must be surrendered to the issuing authority. After receiving the certificate, the issuing authority shall reissue the certificate to the new owner.

(5) **Redemption period.** An unused ERC expires ten years after date of original issue.

(6) **Discount due to change in SIP.** If reductions in emissions beyond those identified in the SIP are required to meet an ambient air quality standard, issued ERCs may be discounted as necessary to reach attainment.

(a) Issued ERCs may be discounted if:

(i) Reductions in emissions beyond those identified in the SIP are required to meet an ambient air quality standard;

(ii) The ambient standard cannot be met through controls on operating sources; and

(iii) The plan must be revised.

(b) The discount shall not exceed the percentage of additional emission reduction needed to reach attainment.

(c) ERCs may be discounted by the permitting authority only after notice to the public according to WAC 173-400-171 and the owners of affected ERCs.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-136, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-136, filed 3/1/11, effective 4/1/11. EPA effective: 12/8/14 (79 FR 66291, 11/7/14)

WAC 173-400-151 Retrofit requirements for visibility protection. (1) The requirements of this section apply to an existing stationary facility. An "existing stationary facility" means a stationary source of air contaminants that meets all of these conditions:

(a) The stationary source must have the potential to emit 250 tons per year or more of any air contaminant. Fugitive emissions, to the extent quantifiable, must be counted in determining the potential to emit; and

(b) The stationary source was not in operation prior to August 7, 1962, and was in existence on August 7, 1977; and

(c) Is in one of the following 26 source categories:

Fossil-fuel fired steam electric plants of more than 250 million British thermal units per hour heat input,	Coke oven batteries,
Coal cleaning plants (thermal dryers),	Sulfur recovery plants,
Kraft pulp mills,	Carbon black plants (furnace process),
Portland cement plants,	Primary lead smelters,
Primary zinc smelters,	Fuel conversion plants,
Iron and steel mill plants,	Sintering plants,
Primary aluminum ore reduction plants,	Secondary metal production facilities,
Primary copper smelters,	Chemical process plants,
Municipal incinerators capable of charging more than 250 tons of refuse per GD\	Fossil-fuel boilers of more than 250 million British thermal units per hour heat input,
Hydrofluoric, sulfuric, and nitric acid plants,	Petroleum storage and transfer facilities with a capacity exceeding 300,000 barrels,
Petroleum refineries,	7aconite ore processing facilities,
Lime plants,	Glass fiber processing plants, and
Phosphate rock processing plants,	Charcoal production facilities.

(d) For purposes of determining whether a stationary source is an existing stationary facility, the term "building, structure, facility, or installation" means all of the pollutant-emitting activities which belong to the same industrial grouping, are located on one or more contiguous or adjacent properties, and are under the control of the same person (or persons under common control). Pollutant-emitting activities shall be considered as part of the same major group (i.e., which have the same two digit code) as described in the *Standard Industrial Classification Manual, 1972*, as amended in the 1977 supplement.

(2) Ecology shall identify each existing stationary facility which may reasonably be anticipated to cause or contribute to visibility impairment in any mandatory Class 1 federal area in Washington and any adjacent state.

(3) For each existing stationary facility identified under subsection (2) of this section, ecology, in consultation with the permitting authority shall determine BART for each air contaminant of concern and any additional air pollution control technologies that are to be required to reduce impairment from the existing stationary facility.

(4) Each existing stationary facility shall apply BART as new technology for control of the air contaminant becomes reasonably available if:

(a) The existing stationary facility emits the air contaminant contributing to visibility impairment;

(b) Controls representing BART for that air contaminant have not previously been required under this section; and

(c) The impairment of visibility in any mandatory Class 1 federal area is reasonably attributable to the emissions of the air contaminant.

[Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-151, filed 1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW, RCW 70.94.141, [70.94.]152, [70.94.]331, [70.94.]510 and 43.21A.080. WSR 01-17-062 (Order 99-06), § 173-400-151, filed 8/15/01, effective 9/15/01. Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-151, filed 2/19/91, effective 3/22/91.]

EPA effective: 11/3/14 (79 FR 59653, 10/3/14)

WAC 173-400-161 Compliance schedules. (1) **Issuance.** Whenever a source is found to be in violation of an emission standard or other provision of this chapter, ecology or the authority may issue a regulatory order requiring that the source be brought into compliance within a specified time. The order shall contain a schedule for installation, with intermediate benchmark dates and a final completion date, and shall constitute a compliance schedule. Requirements for public involvement (WAC 173-400-171) must be met.

(2) **Federal action.** A source shall be considered to be in compliance with this chapter if all the provisions of its individual compliance schedule included with a regulatory order are being met. Such compliance does not preclude federal enforcement action by the EPA until and unless the schedule is submitted and adopted as an amendment to the state implementation plan.

(3) **Penalties for delayed compliance.** Sources on a compliance schedule but not meeting emissions standards may be subject to penalties as provided in the Federal Clean Air Act.

[Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-161, filed 2/19/91, effective 3/22/91.]

EPA effective: 6/2/95 (60 FR 28726, 6/2/95)

WAC 173-400-171 Public notice and opportunity for public comment. The purpose of this section is to specify the requirements for notifying the public about air quality actions and to provide opportunities for the public to participate in those actions. This section applies statewide except that the requirements of WAC 173-400-171 (1) through (11) do not apply where the permitting authority has adopted its own public notice provisions.

(1) **Applicability to prevention of significant deterioration, and relocation of portable sources.** This section does not apply to:

(a) A notice of construction application designated for integrated review with actions regulated by WAC 173-400-700 through 173-400-750. In such cases, compliance with the public notification requirements of WAC 173-400-740 is required.

(b) Portable source relocation notices as regulated by WAC 173-400-036, relocation of portable sources.

(2) **Internet notice of application.**

(a) For those applications and actions not subject to a mandatory public comment period per subsection (3) of this section, the permitting authority must post an announcement of the receipt of notice of construction applications and other proposed actions on the permitting authority's internet web site.

(b) The internet posting must remain on the permitting authority's web site for a minimum of fifteen consecutive days.

(c) The internet posting must include a notice of the receipt of the application, the type of proposed action, and a statement that the public may request a public comment period on the proposed action.

(d) Requests for a public comment period must be submitted to the permitting authority in writing via letter, or electronic means during the fifteen-day internet posting period.

(e) A public comment period must be provided for any application or proposed action that receives such a request. Any application or proposed action for which a public comment period is not requested may be processed without further public involvement at the end of the fifteen-day internet posting period.

(3) **Actions subject to a mandatory public comment period.** The permitting authority must provide public notice and a public comment period before approving or denying any of the following types of applications or other actions:

(a) Any application, order, or proposed action for which a public comment period is requested in compliance with subsection (2) of this section.

(b) Any notice of construction application for a new or modified source, including the initial application for operation of a portable source, if there is an increase in emissions of any air pollutant at a rate above the emission threshold rate (defined in WAC 173-400-~~030) or any increase in emissions of a toxic air pollutant above the acceptable source impact level for that toxic air pollutant as regulated under chapter 173-460 WAC~~; or

(c) Any use of a modified or substituted air quality model, other than a guideline model in Appendix W of 40 C.F.R. Part 51 (in effect on the date in WAC 173-400-025) as part of review under WAC 173-400-110, 173-400-113, or 173-400-117; or

(d) Any order to determine reasonably available control technology, RACT; or

(e) An order to establish a compliance schedule issued under WAC 173-400-161, or a variance issued under WAC 173-400-180; or

Note: Mandatory notice is not required for compliance orders issued under WAC 173-400-230.

(f) An order to demonstrate the creditable height of a stack which exceeds the good engineering practice, GEP, formula height and sixty-five meters, by means of a fluid model or a field study, for the purposes of establishing an emission limit; or

(g) An order to authorize a bubble; or

(h) An action to discount the value of an emission reduction credit, ERC, issued to a source per WAC 173-400-136; or

(i) A regulatory order to establish best available retrofit technology, BART, for an existing stationary facility; or

(j) A notice of construction application or regulatory order used to establish a creditable emission reduction; or

(k) An order issued under WAC 173-400-091 that establishes limitations on a source's potential to emit; or

(l) The original issuance and the issuance of all revisions to a general order of approval issued under WAC 173-400-560 (this does not include coverage orders); or

(m) An extension of the deadline to begin actual construction of a "major stationary source" or "major modification" in a nonattainment area; or

(n) An application or other action for which the permitting authority determines that there is significant public interest; or

~~(o) An order issued under WAC 173-400-081(4) or 173-400-082 that establishes an emission limitation that exceeds a standard in the SIP.~~

(4) **Advertising the mandatory public comment period.**

(a) Public notice of all applications, orders, or actions listed in subsection (3) of this section must be posted on the permitting authority web site for the duration of the public comment period.

(i) The permitting authority may supplement this method of notification by advertising in a newspaper of general circulation in the area of the proposed action or by other methods appropriate to notify the local community. The applicant or other initiator of the action must pay the publishing cost for all supplemental noticing.

(ii) A permitting authority must publish a notice of the public comment period in a newspaper of general circulation in the area of the proposed action until June 30, 2019. We recommend that a permitting authority continue publishing a notice in a newspaper for a project with high interest. The applicant or other initiator of the action must pay this publishing cost.

(b) This public notice can be posted or given only after all of the information required by the permitting authority has been submitted and after the applicable preliminary determinations, if any, have been made.

(c) The notice must be posted or given before any of the applications or other actions listed in subsection (3) of this section are approved or denied.

(5) **Information available for public review.**

(a) Administrative record. The information submitted by the applicant, and any applicable preliminary determinations, including analyses of the effects on air quality, must be available for public inspection. A permitting authority may comply with this requirement by making these materials available on its web site or in at least one physical location near the proposed project.

(b) The permitting authority must post the following information on its web site for the duration of the public comment period:

(i) Public notice complying with subsection (6) of this section;

(ii) Draft permit, order, or action; and

(iii) Information on how to access the administrative record.

(c) Exemptions from this requirement include information protected from disclosure under any applicable law including, but not limited to, RCW 70.94.205 and chapter 173-03 WAC.

(6) **Public notice components.**

(a) The notice must include:

(i) The date the notice is posted;

(ii) The name and address of the owner or operator and the facility;

(iii) A brief description of the proposal and the type of facility, including a description of the facility's processes subject to the permit;

(iv) A description of the air contaminant emissions including the type of pollutants and quantity of emissions that would increase under the proposal;

(v) The location where those documents made available for public inspection may be reviewed;

(vi) Start date and end date for a public comment period consistent with subsection (7) of this section;

(vii) A statement that a public hearing will be held if the permitting authority determines that there is significant public interest;

(viii) The name, address, and telephone number and email address of a person at the permitting authority from whom interested persons may obtain additional information, including copies of the permit draft, the application, all relevant supporting materials, including any compliance plan, permit, and monitoring and compliance certification report, and all other materials available to the permitting authority that are relevant to the permit decision, unless the information is exempt from disclosure;

(b) For projects subject to special protection requirements for federal Class I areas, as required by WAC 173-400-117, public notice must include an explanation of the permitting authority's draft decision or state that an explanation of the draft decision appears in the support document for the proposed order of approval.

(7) **Length of the public comment period.**

(a) The public comment period must consist of a minimum of thirty days and start at least thirty days prior to any hearing. The first day of the public comment period begins on the next calendar day after the permitting authority posts the public notice on their web site.

(b) If a public hearing is held, the public comment period must extend through the hearing date.

(c) The final decision cannot be issued until the public comment period has ended and any comments received during the public comment period have been considered.

(8) **Requesting a public hearing.** The applicant, any interested governmental entity, any group, or any person may request a public

hearing within the public comment period. All hearing requests must be submitted to the permitting authority in writing via letter, or electronic means. A request must indicate the interest of the entity filing it and why a hearing is warranted.

(9) **Setting the hearing date and providing hearing notice.** If the permitting authority determines that significant public interest exists, then it will hold a public hearing. The permitting authority will determine the location, date, and time of the public hearing.

(10) **Notice of public hearing.**

(a) At least thirty days prior to the hearing the permitting authority must provide notice of the hearing as follows:

(i) Post the public hearing notice on the permitting authority web site as directed by subsections (4) and (7) of this section;

(ii) The permitting authority may supplement the web posting by advertising in a newspaper of general circulation in the area of the proposed source or action, or by other methods appropriate to notify the local community; and

(iii) Distribute by electronic means or via the United States postal service the notice of public hearing to any person who submitted written comments on the application or requested a public hearing and in the case of a permit action, to the applicant.

(b) This notice must include the date, time and location of the public hearing and the information described in subsection (6) of this section.

(c) In the case of a permit action, the applicant must pay all supplemental notice costs when the permitting authority determines a supplemental notice is appropriate. Supplemental notice may include, but is not limited to, publication in a newspaper of general circulation in the area of the proposed project.

(11) **Notifying the EPA.** The permitting authority must distribute by electronic means or via the United States postal service a copy of the notice for all actions subject to a mandatory public comment period to the EPA Region 10 regional administrator.

~~(12) **Special requirements for ecology only actions.**~~

~~(a) This subsection applies to ecology only actions including:~~

~~(i) A Washington state recommendation to EPA for the designation of an area as attainment, nonattainment or unclassifiable after EPA promulgation of a new or revised ambient air quality standard or for the redesignation of an unclassifiable or attainment area to nonattainment;~~

~~(ii) A Washington state submittal of a SIP revision to EPA for approval including plans for attainment and maintenance of ambient air quality standards, plans for visibility protection, requests for revision to the boundaries of attainment and maintenance areas, requests for redesignation of Class I, II, or III areas under WAC 173-400-118, and rules to strengthen the SIP.~~

~~(b) Ecology must provide a public hearing or an opportunity for requesting a public hearing on an ecology only action. The notice providing the opportunity for a public hearing must specify the manner and date by which a person may request the public hearing and either provide the date, time and place of the proposed hearing or specify that ecology will publish a notice specifying the date, time and place of the hearing at least thirty days prior to the hearing. When ecology provides the opportunity for requesting a public hearing, the hearing must be held if requested by any person. Ecology may cancel the hearing if no request is received.~~

~~(c) The public notice for ecology only actions must comply with the requirements of 40 C.F.R. 51.102 (in effect on the date in WAC 173-400-025).~~

(13) **Other requirements of law.** Whenever procedures permitted or mandated by law will accomplish the objectives of public notice and opportunity for comment, those procedures may be used in lieu of the provisions of this section.

[Statutory Authority: Chapter 70.94 RCW. WSR 18-17-111 (Order 15-07), § 173-400-171, filed 8/16/18, effective 9/16/18. Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. EPA effective: 11/3/14 (79 FR 59653, 10/3/14)

~~**WAC 173-400-180 Variance.** Any person who owns or is in control of a plant, building, structure, establishment, process, or equipment may apply to ecology for a variance from provisions of this chapter governing the quality, nature, duration, or extent of discharges of air contaminants in accordance with the provisions of RCW 70.94.181.~~

~~(1) **Jurisdiction.** Sources in any area over which a local air pollution control authority has jurisdiction shall make application to that authority rather than ecology. Variances to state rules shall require ecology's approval prior to being issued by an authority. Ecology or the authority may grant such variance, but only after public involvement per WAC 173-400-171.~~

~~(2) **Full faith and credit.** Variances granted in compliance with state and federal laws by an authority for sources under their jurisdiction will be accepted as variances to this regulation.~~

~~(3) **EPA concurrence.** No variance or renewal shall be construed to set aside or delay any requirements of the Federal Clean Air Act except with the approval and written concurrence of the USEPA.~~

~~(4) Fees relating to this section can be found in chapter 173-455 WAC.~~

EPA effective: 6/2/95 (60 FR 28726, 6/2/95)

WAC 173-400-200 Creditable stack height and dispersion techniques. (1) Applicability. These provisions shall apply to all sources except:

(a) Stacks for which construction had commenced on or before December 31, 1970, except where pollutants are being emitted from such stacks used by sources which were constructed, or reconstructed, or for which major modifications were carried out after December 31, 1970;

(b) Coal-fired steam electric generating units subject to the provisions of Section 118 of the Federal Clean Air Act, which commenced operation before July 1, 1957, and for whose stacks construction commenced before February 8, 1974;

(c) Flares;

(d) Outdoor burning for agricultural or silvicultural purposes as covered under the smoke management plan;

(e) Residential wood combustion and open burning for which episodic restrictions apply.

These provisions shall not be construed to limit the actual stack height.

(2) Prohibitions. No source may use dispersion techniques or excess stack height to meet ambient air quality standards or PSD increment limitations.

(a) Excess stack height. Excess stack height is that portion of a stack which exceeds the greater of:

(i) Sixty-five meters, measured from the ground level elevation at the base of the stack; or

(ii) $H_g = H + 1.5L$

where: H_g "good engineering practice" (GEP) stack height, measured from the ground level elevation at the base of the stack,

H = height of nearby structure(s) measured from the ground level elevation at the base of the stack,

L = lesser dimension, height or projected width, of nearby structure(s), subject to the proviso below.

"Nearby," as used in this subsection for purposes of applying the GEP formula means that distance up to five times the lesser of the height or the width dimension of a structure, but not greater than 0.8 kilometer (1/2 mile).

(b) Dispersion techniques. Increasing final exhaust gas plume rise by manipulating source process parameters, exhaust gas parameters, stack parameters, or combining exhaust gases from several existing stacks into one stack; or other selective handling of exhaust gas streams so as to increase the exhaust gas plume rise. This does not include:

(i) The reheating of a gas stream, following the use of a pollution control system, for the purpose of returning the gas to the temperature at which it was originally discharged from the facility generating the gas stream;

(ii) The merging of gas streams where:

(A) The source was originally designed and constructed with such merged gas streams, as demonstrated by the source owner(s) or operator(s).

(B) Such merging is part of a change in operation at the facility that includes the installation of pollution controls and is accompanied by a net reduction in the allowable emissions of a pollutant. This exclusion shall apply only to the emission limitation for the pollutant affected by such change in operation.

(C) Before July 8, 1985, such merging was part of a change in operation at the facility that included the installation of emissions control equipment or was carried out for sound economic or engineering reasons, and not primarily motivated by an intent to gain emissions credit for greater dispersion.

(3) Exception. EPA, ecology, or a permitting authority may require the use of a field study or fluid model to verify the creditable stack height for the source. This also applies to a source seeking credit after the effective date of this rule for an increase in existing stack height up to that established by the GEP formula. A fluid model or field study shall be performed according to the procedures described in the EPA Guideline for Determination of Good Engineering Practice Height (Technical Support Document of the Stack Height Regulations). The creditable height demonstrated by a fluid model or field study shall ensure that the emissions from a stack do not result in excessive concentrations of any air pollutant as a result of atmospheric downwash, wakes, or eddy effects created by the source itself, nearby structures or nearby terrain features.

(a) "Nearby," as used in this subsection for conducting a field study or fluid model, means not greater than 0.8 km, except that the portion of a terrain feature may be considered to be nearby which falls within a distance of up to ten times the maximum height of the feature, not to exceed two miles if such feature achieves a height 0.8 km from the stack that is at least forty percent of the GEP stack height or twenty-six meters, whichever is greater, as measured from the ground-level elevation at the base of the stack. The height of the structure or terrain feature is measured from the ground-level elevation at the base of the stack.

(b) "Excessive concentration" is defined for the purpose of determining creditable stack height under this subsection and means a maximum ground-level concentration owing to a significant downwash effect which contributes to excursion over an ambient air quality standard. For sources subject to PSD review (WAC 173-400-720 and 40 C.F.R. 52.21) an excessive concentration alternatively means a maximum ground-level concentration owing to a significant downwash effect which contributes to excursion over a PSD increment. The emission rate used in this demonstration shall be the emission rate specified in the state implementation plan, or in the absence of such, the actual emission rate of the source. "Significant downwash effect" means a maximum ground-level concentration due to emissions from a stack due in whole or in part to downwash, wakes, and eddy effects produced by nearby structures or nearby terrain features which individually is at least forty percent in excess of the maximum concentration experienced in the absence of such downwash, wakes, or eddy effects.

[Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-200, filed 1/10/05, effective 2/10/05. Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-200, filed 2/19/91, effective 3/22/91.]

EPA effective: 11/3/14 (79 FR 59653, 10/3/14)

WAC 173-400-205 Adjustment for atmospheric conditions. Varying the rate of emission of a pollutant according to atmospheric conditions or ambient concentrations of that pollutant is prohibited, except as directed according to air pollution episode regulations.

[Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-205, filed 2/19/91, effective 3/22/91.]

EPA effective: 6/2/95 (60 FR 28726, 6/2/95)

WAC 173-400-210 Emission requirements of prior jurisdictions. Any emissions unit that was under the jurisdiction of an authority and now is under the jurisdiction of ecology, shall meet all emission requirements that were applicable prior to transfer of jurisdiction if those standards are more stringent than the standards of this chapter or the specific chapter relating to that source.

[Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-210, filed 2/19/91, effective 3/22/91.]

EPA effective: 6/2/95 (60 FR 28726, 6/2/95)

~~**WAC 173-400-220 Requirements for board members.** (1) **Public interest.** A majority of the members of any ecology or authority board shall represent the public interest. A majority of the members of such boards, shall not derive any significant portion of their income from persons subject to enforcement orders pursuant to the state and federal clean air acts. An elected public official and the board shall be presumed to represent the public interest. In the event that a member derives a significant portion of his/her income from persons subject to enforcement orders, he/she shall delegate sole responsibility for administration of any part of the program which involves these persons to an assistant.~~

~~(2) **Disclosure.** Each member of any ecology or authority board shall adequately disclose any potential conflict of interest in any matter prior to any action or consideration thereon, and the member shall remove themselves from participation as a board member in any action or voting on such matter.~~

~~(3) **Define significant income.** For the purposes of this section, "significant portion of income" shall mean twenty percent of gross personal income for a calendar year. In the case of a retired person, "significant portion of income" shall mean fifty percent of income in the form of pension or retirement benefits from a single source other than Social Security. Income derived from employment with local or state government shall not be considered in the determination of "significant portion of income."~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-220, filed 2/19/91, effective 3/22/91.]~~

~~**WAC 173-400-230 Regulatory actions.** Ecology may take any of the following regulatory actions to enforce this chapter to meet the provisions of RCW 43.21B.300 which is incorporated by reference.~~

~~(1) **Enforcement actions by ecology—Notice to violators.** At least thirty days prior to the commencement of any formal enforcement action under RCW 70.94.430 and 70.94.431, the department of ecology shall cause written notice to be served upon the alleged violator or violators. The notice shall specify the provision of this chapter or the rule or regulation alleged to be violated, and the facts alleged to constitute a violation thereof, and may include an order that necessary corrective action be taken within a reasonable time. In lieu of an order, ecology may require that the alleged violator or violators appear before it for the purpose of providing ecology information pertaining to the violation or the charges complained of. Every notice of violation shall offer to the alleged violator an opportunity to meet with ecology prior to the commencement of enforcement action.~~

~~(2) **Civil penalties.**~~

~~(a) In addition to or as an alternate to any other penalty provided by law, any person who violates any of the provisions of chapter 70.94 or 70.120 RCW, or any of the rules in force under such chapters may incur a civil penalty in an amount as set forth in RCW 70.94.431. Each such violation shall be a separate and distinct offense, and in case of a continuing violation, each day's continuance shall be a separate and distinct violation.~~

~~Any person who fails to take action as specified by an order issued pursuant to this chapter shall be liable for a civil penalty as set forth by RCW 70.94.431 for each day of continued noncompliance.~~

~~(b) Penalties incurred but not paid shall accrue interest, beginning on the ninety-first day following the date that the penalty becomes due and payable, at the highest rate allowed by RCW 19.52.020 on the date that the penalty becomes due and payable. If violations or penalties are appealed, interest shall not begin to accrue until the thirty-first day following final resolution of the appeal.~~

~~The maximum penalty amounts established in RCW 70.94.431 may be increased annually to account for inflation as determined by the state office of the economic and revenue forecast council.~~

~~(c) Each act of commission or omission which procures, aids, or abets in the violation shall be considered a violation under the provisions of this section and subject to the same penalty. The penalties provided in this section shall be imposed pursuant to RCW 43.21B.300.~~

~~(d) All penalties recovered under this section by ecology shall be paid into the state treasury and credited to the air pollution control account established in RCW 70.94.015 or, if recovered by the authority, shall be paid into the treasury of the authority and credited to its funds. If a prior penalty for the same violation has been paid to a local authority, the penalty imposed by ecology under subsection (a) of this section shall be reduced by the amount of the payment.~~

~~(e) To secure the penalty incurred under this section, the state or the authority shall have a lien on any vessel used or operated in violation of this chapter which shall be enforced as provided in RCW 60.36.050.~~

~~(f) Public or private entities that are recipients or potential recipients of ecology grants, whether for air quality related activities or not, may have such grants rescinded or withheld by ecology for failure to comply with provisions of this chapter.~~

~~(g) In addition to other penalties provided by this chapter, persons knowingly under-reporting emissions or other information used to set fees, or persons required to pay emission or permit fees who are more than ninety days late with such payments may be subject to a penalty equal to three times the amount of the original fee owed.~~

~~(3) **Assurance of discontinuance.** Personnel of ecology or an authority may accept an assurance of discontinuance of any act or practice deemed in violation of this chapter. Any such assurance shall specify a time limit during which discontinuance is to be accomplished. Failure to perform the terms of any such assurance shall constitute prima facie proof of a violation of this chapter or any order issued thereunder which make the alleged act or practice unlawful for the purpose of securing an injunction or other relief from the superior court.~~

~~(4) **Restraining orders, injunctions.** Whenever any person has engaged in, or is about to engage in, any acts or practices which constitute or will constitute a violation of any provision of this chapter, the director, after notice to such person and an opportunity to comply, may petition the superior court of the county wherein the violation is alleged to be occurring or to have occurred for a restraining order or a temporary or permanent injunction or another appropriate order.~~

~~(5) **Emergency episodes.** Ecology may issue such orders as authorized by chapter 173-435 WAC via chapter 70.94 RCW, whenever an air pollution episode forecast is declared.~~

~~(6) **Compliance orders.** Ecology may issue a compliance order in conjunction with a notice of violation. The order shall require the recipient of the notice of violation either to take necessary corrective action or to submit a plan for corrective action and a date when such action will be initiated.~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 93-05-044 (Order 92-34), § 173-400-230, filed 2/17/93, effective 3/20/93; WSR 91-05-064 (Order 90-06), § 173-400-230, filed 2/19/91, effective 3/22/91.]~~

~~**WAC 173-400-240 Criminal penalties.** Persons in violation of Title 173 WAC may be subject to the provisions of RCW 70.94.430.~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-240, filed 2/19/91, effective 3/22/91.]~~

~~**WAC 173-400-250 Appeals.** Decisions and orders of ecology or an authority may be appealed to the pollution control hearings board pursuant to chapter 43.21B RCW and chapter 371-08 WAC.~~

~~[Statutory Authority: Chapter 70.94 RCW. WSR 93-18-007 (Order 93-03), § 173-400-250, filed 8/20/93, effective 9/20/93; WSR 91-05-064 (Order 90-06), § 173-400-250, filed 2/19/91, effective 3/22/91.]~~

~~**WAC 173-400-260 Conflict of interest.** All board members and officials acting or voting on decisions affecting air pollution sources, must comply with the Federal Clean Air Act, as it pertains to conflict of interest (Section 128).~~

~~[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-260, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 91-05-064 (Order 90-06), § 173-400-260, filed 2/19/91, effective 3/22/91.]~~

WAC 173-400-560 General order of approval. In lieu of filing a notice of construction application under WAC 173-400-110, the owner or operator may apply for coverage under a general order of approval issued under this section. Coverage under a general order of approval satisfies the requirement for new source review under RCW 70.94.152.

(1) **Issuance of general orders of approval.** A permitting authority may issue a general order of approval applicable to a specific type of emission unit or source, not including nonroad engines as defined in section 216 of the Federal Clean Air Act, subject to the conditions in this section. A general order of approval shall identify criteria by which an emission unit or source may qualify for coverage under the associated general order of approval and shall include terms and conditions under which the owner or operator agrees to install and/or operate the covered emission unit or source. At a minimum, these terms and conditions shall include:

(a) Applicable emissions limitations and/or control requirements;

(b) Best available control technology;

(c) Appropriate operational restrictions, such as:

(i) Criteria related to the physical size of the unit(s) covered;

(ii) Criteria related to raw materials and fuels used;

(iii) Criteria related to allowed or prohibited locations; and

(iv) Other similar criteria determined by a permitting authority;

(d) Monitoring, reporting and recordkeeping requirements to ensure compliance with the applicable emission limits and control requirements;

(e) Appropriate initial and periodic emission testing requirements;

(f) Compliance with ~~chapter 173-460 WAC,~~ WAC 173-400-112 and 173-400-113 as applicable;

(g) Compliance with 40 C.F.R. Parts 60, 61, 62, and 63; and

(h) The application and approval process to obtain coverage under the specific general order of approval.

(2) **Public comment.** Compliance with WAC 173-400-171 is required for a proposed new general order of approval or modification of an existing general order of approval.

(3) **Modification of general orders of approval.** A permitting authority may review and modify a general order of approval at any time. Only the permitting authority that issued a general order of approval may modify that general order of approval. Modifications to general orders of approval shall follow the procedures of this regulation and shall only take effect prospectively.

(4) **Application for coverage under a general order of approval.**

(a) In lieu of applying for an individual order of approval under WAC 173-400-110, an owner or operator of an emission unit or source may apply for and receive coverage from a permitting authority under a general order of approval if:

(i) The owner or operator of the emission unit or source applies for coverage under a general order of approval in accordance with this regulation and any conditions of the approval related to application for and granting coverage under the general order of approval;

(ii) The emission unit or source meets all the qualifications listed in the requested general order of approval;

(iii) The requested emission unit or source is not part of a new major stationary source or major modification of a major stationary source subject to the requirements of WAC 173-400-113 (3) and (4), 173-400-700 through 173-400-750 or 173-400-800 through 173-400-860; and

(iv) The requested emission unit or source does not trigger applicability of the operating permit program under chapter 173-401 WAC or trigger a required modification of an existing operating permit.

(b) Owners or operators of emission units or sources applying for coverage under a general order of approval shall do so using the forms supplied by a permitting authority and include the required fee. The application must include all information necessary to determine qualification for, and to assure compliance with, a general order of approval.

(c) An application shall be incomplete until a permitting authority has received any required fees.

(d) The owner or operator of a new source or modification of an existing source that qualifies for coverage under a general order of approval may not begin actual construction of the new source or modification until its application for coverage has been approved or accepted under the procedures established in subsection (5) of this section.

(5) **Processing applications for coverage under a general order of approval.** Each general order of approval shall include a section on how an applicant is to request coverage and how the permitting authority will grant coverage. The section of the general order of approval will include either the method in (a) or (b) of this subsection to describe the process for the applicant to be granted coverage.

(a) Within thirty days of receipt of an application for coverage under a general order of approval, the permitting authority shall notify an applicant in writing that the application is incomplete, approved, or denied. If an application is incomplete, the permitting authority shall notify an applicant of the information needed to complete the application. If an application is denied, the permitting authority shall notify an applicant of the reasons why the application is denied. Coverage under a general order of approval is effective as of the date of issuance of approval by the permitting authority.

(b) The applicant is approved for coverage under the general order of approval thirty-one days after an application for coverage is received by the permitting authority, unless the owner or operator receives a letter from the permitting authority, postmarked within thirty days of when the application for coverage was received by the permitting authority, notifying the owner or operator that the emissions unit or source does not qualify for coverage under the general order of approval. The letter denying coverage shall notify the applicant of the disqualification and the reasons why coverage is denied.

(6) **Termination of coverage under a general order of approval.** An owner or operator who has received approval of an application for coverage under a general order of approval may later request to be excluded from coverage under that general order of approval by applying to the same permitting authority for an individual order of approval, un-

der WAC 173-400-110, or for coverage under another general order of approval. If the same permitting authority issues an individual order of approval or other permit or order serving the same purpose as the original general order of approval, or approves coverage under a different general order of approval, coverage under the original general order of approval is automatically terminated, effective on the effective date of the individual order of approval, order or permit or new general order of approval.

(7) **Failure to qualify or comply.** An owner or operator who requests and is granted approval for coverage under a general order of approval shall be subject to enforcement action for establishment of a new source in violation of WAC 173-400-110 if a decision to grant coverage under a general order of approval was based upon erroneous information submitted by the applicant.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-560, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-560, filed 3/1/11, effective 4/1/11. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-560, filed 1/10/05, effective 2/10/05.]

EPA effective: 5/29/15 (80 FR 23721, 4/29/15)

PERMITTING OF MAJOR STATIONARY SOURCES AND MAJOR MODIFICATIONS TO MAJOR STATIONARY SOURCES

WAC 173-400-700 Review of major stationary sources of air pollution. (1) The following sections are to be used by ecology when reviewing and permitting new major stationary sources and major modifications to major stationary sources located in attainment or unclassified areas in Washington.

(2) WAC 173-400-700 through 173-400-750 apply statewide except:

(a) Where the authority has received delegation of the federal PSD program from EPA or has a SIP approved PSD program.

(b) To projects under the jurisdiction of the energy facility site evaluation council site certification process pursuant to chapter 80.50 RCW.

(3) The construction of a major stationary source or major modification subject to the permitting requirements of the following section might also be subject to the permitting programs in WAC 173-400-110 and 173-400-800 through 173-400-860.

[Statutory Authority: Chapter 70.94 RCW. WSR 11-06-060 (Order 09-01), § 173-400-700, filed 3/1/11, effective 4/1/11. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-700, filed 1/10/05, effective 2/10/05.]

EPA effective: 5/29/15 (80 FR 23721, 4/29/15)

WAC 173-400-710 Definitions. (1) For purposes of WAC 173-400-720 through 173-400-750 the definitions in 40 C.F.R. 52.21(b) (in effect on the date in WAC 173-400-025) must be used. Exception: The definition of "secondary emissions" as defined in WAC 173-400-030 must be used.

(2) All usage of the term "source" in WAC 173-400-710 through 173-400-750 and in 40 C.F.R. 52.21 must be interpreted to mean "stationary source" as defined in 40 C.F.R. 52.21 (b)(5). A stationary source (or source) does not include emissions resulting directly from

an internal combustion engine for transportation purposes, from a non-road engine, or a nonroad vehicle as defined in section 216 of the Federal Clean Air Act.

[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-710, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-710, filed 11/28/12, effective 12/29/12. Statutory Authority: RCW 70.94.395 and 70.94.331. WSR 07-11-039 (Order 06-03), § 173-400-710, filed 5/8/07, effective 6/8/07. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-710, filed 1/10/05, effective 2/10/05.]

EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

WAC 173-400-720 Prevention of significant deterioration (PSD). (1) No major stationary source or major modification to which the requirements of this section apply is authorized to begin actual construction without having received a PSD permit.

(2) **Early planning encouraged.** In order to develop an appropriate application, the source should engage in an early planning process to assess the needs of the facility. An opportunity for a preapplication meeting with ecology is available to any potential applicant.

(3) **Enforcement.** Ecology or the permitting authority with jurisdiction over the source under chapter 173-401 WAC, the Operating permit regulation, shall:

(a) Receive all reports required in the PSD permit;

(b) Enforce the requirement to apply for a PSD permit when one is required; and

(c) Enforce the conditions in the PSD permit.

(4) **Applicable requirements.**

(a) A PSD permit must assure compliance with the following requirements:

~~(i) WAC 173-400-113 (1) through (4);~~

~~(ii) WAC 173-400-117 - Special protection requirements for federal Class I areas;~~

~~(iii) WAC 173-400-200;~~

~~(iv) WAC 173-400-205;~~

(v) Allowable emission limits established under WAC 173-400-081 must also meet the criteria of 40 C.F.R. 52.21 (k)(1) and 52.21 (p)(1) through (4) (in effect on the date in WAC 173-400-025); and

(vi) The following subparts of 40 C.F.R. 52.21 (in effect on the date in WAC 173-400-025) are adopted. Exceptions are listed in (b)(i), (ii), (iii), and (iv) of this subsection:

6HFWLRQ	7LWOH
40 C.F.R. 52.21 (a)(2)	Applicability Procedures.
40 C.F.R. 52.21 (b)	Definitions, except the definition of "secondary emissions."
40 C.F.R. 52.21 (c)	Ambient air increments.
40 C.F.R. 52.21 (d)	Ambient air ceilings.
40 C.F.R. 52.21 (h)	Stack heights.
40 C.F.R. 52.21 (i)	Review of major stationary sources and major modifications - Source applicability and exemptions.
40 C.F.R. 52.21 (j)	Control technology review.

6HFWLRQ	7LWOH
40 C.F.R. 52.21 (k)	Source impact analysis.
40 C.F.R. 52.21 (l)	Air quality models.
40 C.F.R. 52.21 (m)	Air quality analysis.
40 C.F.R. 52.21 (n)	Source information.
40 C.F.R. 52.21 (o)	Additional impact analysis.
40 C.F.R. 52.21 (p)(1) through (4)	Sources impacting federal Class I areas - Additional UHTXLUHPHQWV
40 C.F.R. 52.21 (r)	Source obligation.
40 C.F.R. 52.21 (v)	Innovative control technology.
40 C.F.R. 52.21 (w)	Permit rescission.
40 C.F.R. 52.21 (aa)	Actuals Plantwide Applicability Limitation.

(b) Exceptions to adopting 40 C.F.R. 52.21 by reference.

(i) Every use of the word "administrator" in 40 C.F.R. 52.21 means ecology except for the following:

(A) In 40 C.F.R. 52.21 (b)(17), the definition of federally enforceable, "administrator" means the EPA administrator.

(B) In 40 C.F.R. 52.21 (l)(2), air quality models, "administrator" means the EPA administrator.

(C) In 40 C.F.R. 52.21 (b)(43) the definition of prevention of significant deterioration program, "administrator" means the EPA administrator.

(D) In 40 C.F.R. 52.21 (b)(48)(ii)(c) related to regulations promulgated by the administrator, "administrator" means the EPA administrator.

(E) In 40 C.F.R. 52.21 (b)(50)(i) related to the definition of a regulated NSR pollutant, "administrator" means the EPA administrator.

(F) In 40 C.F.R. 52.21 (b)(37) related to the definition of repowering, "administrator" means the EPA administrator.

(G) In 40 C.F.R. 52.21 (b)(51) related to the definition of reviewing authority, "administrator" means the EPA administrator.

(ii) Each reference in 40 C.F.R. 52.21(i) to "paragraphs (j) through (r) of this section" is amended to state "paragraphs (j) through (p)(1), (2), (3) and (4) of this section, paragraph (r) of this section, WAC 173-400-720, and 173-400-730."

(iii) The following paragraphs replace the designated paragraphs of 40 C.F.R. 52.21:

(A) In 40 C.F.R. 52.21 (b)(1)(i)(a) and (b)(1)(iii)(h), the size threshold for municipal waste incinerators is changed to 50 tons of refuse per day.

(B) 40 C.F.R. 52.21 (b)(23)(i) After the entry for municipal solid waste landfills emissions, add Ozone Depleting Substances: 100 tpy.

~~(C) 40 C.F.R. 52.21(c) after the effective date of EPA's incorporation of this section into the Washington state implementation plan, the concentrations listed in WAC 173-400-116(2) are excluded when determining increment consumption.~~

(D) 40 C.F.R. 52.21 (r)(6)

"The provisions of this paragraph (r)(6) apply with respect to any regulated NSR pollutant from projects at an existing emissions unit at a major stationary source (other than projects at a source with a PAL) in circumstances where there is a reasonable possibility that a project that is not a part of a major modification may result in a significant emissions increase of such pollutant and the owner or operator elects to use the method specified in paragraphs 40 C.F.R. 52.21 (b)(41)(ii)(a) through (c) for calculating projected actual emissions.

(i) Before beginning actual construction of the project, the owner or operator shall document and maintain a record of the following information:

(a) A description of the project;

(b) Identification of the emissions unit(s) whose emissions of a regulated NSR pollutant could be affected by the project; and

(c) A description of the applicability test used to determine that the project is not a major modification for any regulated NSR pollutant, including the baseline actual emissions, the projected actual emissions, the amount of emissions excluded under paragraph 40 C.F.R. 52.21 (b)(41)(ii)(c) and an explanation for why such amount was excluded, and any netting calculations, if applicable.

(ii) The owner or operator shall submit a copy of the information set out in paragraph 40 C.F.R. 52.21 (r)(6)(i) to the permitting authority before beginning actual construction. This information may be submitted in conjunction with any NOC application required under the provisions of WAC 173-400-110. Nothing in this paragraph (r)(6)(ii) shall be construed to require the owner or operator of such a unit to obtain any PSD determination from the permitting authority before beginning actual construction.

(iii) The owner or operator shall monitor the emissions of any regulated NSR pollutant that could increase as a result of the project and that is emitted by any emissions unit identified in paragraph 40 C.F.R. 52.21 (r)(6)(i)(b); and calculate and maintain a record of the annual emissions, in tons per year on a calendar year basis, for a period of 5 years following resumption of regular operations after the change, or for a period of 10 years following resumption of regular operations after the change if the project increases the design capacity of or potential to emit that regulated NSR pollutant at such emissions unit.

(iv) The owner or operator shall submit a report to the permitting authority within 60 days after the end of each year during which records must be generated under paragraph 40 C.F.R. 52.21 (r)(6)(iii) setting out the unit's annual emissions during the calendar year that preceded submission of the report.

(v) The owner or operator shall submit a report to the permitting authority if the annual emissions, in tons per year, from the project identified in paragraph 40 C.F.R. 52.21 (r)(6)(i), exceed the baseline actual emissions (as documented and maintained pursuant to paragraph 40 C.F.R. 52.21 (r)(6)(i)(c)), by a significant amount (as defined in paragraph 40 C.F.R. 52.21 (b)(23)) for that regulated NSR pollutant, and if such emissions differ from the preconstruction projection as documented and maintained pursuant to paragraph 40 C.F.R. 52.21 (r)(6)(i)(c). Such report shall be submitted to the permitting authority within 60 days after the end of such year. The report shall contain the following:

(a) The name, address and telephone number of the major stationary source;

(b) The annual emissions as calculated pursuant to paragraph (r)(6)(iii) of this section; and

(c) Any other information that the owner or operator wishes to include in the report (e.g., an explanation as to why the emissions differ from the preconstruction projection).

(vi) A "reasonable possibility" under this subsection occurs when the owner or operator calculates the project to result in either:

(a) A projected actual emissions increase of at least fifty percent of the amount that is a "significant emissions increase," (without reference to the amount that is a significant net emissions increase), for the regulated NSR pollutant; or

(b) A projected actual emissions increase that, added to the amount of emissions excluded under the definition of projected actual emissions sums to at least fifty percent of the amount that is a "significant emissions increase," (without reference to the amount that is a significant net emissions increase), for the regulated NSR pollutant. For a project for which a reasonable possibility occurs only within the meaning of (r)(6)(vi)(b) of this subsection, and not also within the meaning of (r)(6)(vi)(a) of this subsection, then the provisions of (r)(6)(vi)(ii) through (v) of this subsection do not apply to the project."

(E) 40 C.F.R. 52.21 (r)(7) "The owner or operator of the source shall submit the information required to be documented and maintained pursuant to paragraphs 40 C.F.R. 52.21 (r)(6)(iv) and (v) annually within 60 days after the anniversary date of the original analysis. The original analysis and annual reviews shall also be available for review upon a request for inspection by the permitting authority or the general public pursuant to the requirements contained in 40 C.F.R. 70.4 (b)(3)(viii)."

(F) 40 C.F.R. 52.21 (aa)(2)(ix) "PAL permit means the PSD permit, an ecology issued order of approval issued under WAC 173-400-110, or regulatory order issued under WAC 173-400-091 issued by ecology that establishes a PAL for a major stationary source."

(G) 40 C.F.R. 52.21 (aa)(5) "Public participation requirements for PALs. PALs for existing major stationary sources shall be established, renewed, or expired through the public participation process in WAC 173-400-171. A request to increase a PAL shall be processed in accordance with the application processing and public participation process in WAC 173-400-730 and 173-400-740."

(H) 40 C.F.R. 52.21 (aa)(9)(i)(b) "Ecology, after consultation with the permitting authority, shall decide whether and how the PAL allowable emissions will be distributed and issue a revised order, order of approval or PSD permit incorporating allowable limits for each emissions unit, or each group of emissions units, as ecology determines is appropriate."

(I) 40 C.F.R. 52.21 (aa)(14) "Reporting and notification requirements. The owner or operator shall submit semiannual monitoring reports and prompt deviation reports to the permitting authority in accordance with the requirements in chapter 173-401 WAC. The reports shall meet the requirements in paragraphs 40 C.F.R. 52.21 (aa)(14)(i) through (iii)."

(J) 40 C.F.R. 52.21 (aa)(14)(ii) "Deviation report. The major stationary source owner or operator shall promptly submit reports of any deviations or exceedance of the PAL requirements, including periods where no monitoring is available. A report submitted pursuant to WAC 173-401-615 (3)(b) and within the time limits prescribed shall satisfy this reporting requirement. The reports shall contain the information found at WAC 173-401-615(3)."

(iv) 40 C.F.R. 52.21 (r)(2) is not adopted.

[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-720, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 05-03-033 (Order 03-07), § 173-400-720, filed 1/10/05, effective 2/10/05.]

EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

WAC 173-400-730 Prevention of significant deterioration application processing procedures. (1) **Application submittal.**

(a) The applicant shall submit an application that provides complete information necessary for ecology to determine compliance with all PSD program requirements.

(b) The applicant shall submit complete copies of its PSD application or an application to increase a PAL, distributed in the following manner:

(i) Three copies to ecology: Air Quality Program, P.O. Box 47600, Olympia, WA 98504-7600.

(ii) One copy to each of the following federal land managers:

(A) U.S. Department of the Interior - National Park Service; and

(B) U.S. Department of Agriculture - U.S. Forest Service.

(iii) One copy to the permitting authority with authority over the source under chapter 173-401 WAC.

(iv) One copy to EPA.

(c) Application submittal and processing for the initial request, renewal or expiration of a PAL under 40 C.F.R. 52.21(aa) shall be done as provided in 40 C.F.R. 52.21(aa)(3) through (5) (in effect on the date in WAC 173-400-025). Exception: Public participation must comply with WAC 173-400-740.

(2) **Application processing.**

(a) Completeness determination.

(i) Within thirty days after receiving a PSD permit application, ecology shall either notify the applicant in writing that the application is complete or notify the applicant in writing of all additional information necessary to complete the application. Ecology may request additional information clarifying aspects of the application after it has been determined to be complete.

(ii) The effective date of the application is the date on which ecology notifies the applicant that the application is complete pursuant to (a)(i) of this subsection.

(iii) If an applicant fails or refuses to correct deficiencies in the application, the permit may be denied and appropriate enforcement action taken.

(iv) The permitting authority shall send a copy of the completeness determination to the responsible federal land manager.

(b) Preparation and issuance of the preliminary determination.

(i) When the application has been determined to be complete, ecology shall begin developing the preliminary determination to approve or deny the application.

(ii) As expeditiously as possible after receipt of a complete application, ecology shall provide the applicant with a preliminary determination along with a technical support document and a public notice.

(c) Issuance of the final determination.

(i) Ecology shall make no final decision until the public comment period has ended and all comments received during the public comment period have been considered.

(ii) Within one year of the date of receipt of the complete application and as expeditiously as possible after the close of the public comment period, or hearing if one is held, ecology shall prepare and issue the final determination.

(d) Once the PSD program set forth in WAC 173-400-700 through 173-400-750 is incorporated into the Washington SIP, the effective date of a determination will be either the date of issuance of the final determination, or a later date if specified in the final determination.

Until the PSD program set forth in WAC 173-400-700 through 173-400-750 is incorporated into the Washington SIP, the effective date of a final determination is one of the following dates:

(i) If no comments on the preliminary determination were received, the date of issuance; or

(ii) If comments were received, thirty days after receipt of the final determination; or

(iii) A later date as specified within the PSD permit approval.

(3) **PSD technical support document.** Ecology shall develop a technical support document for each preliminary PSD determination. The preliminary technical support document will be updated prior to issuance of the final determination to reflect changes to the final determination based on comments received. The technical support document shall include the following information:

(a) A brief description of the major stationary source, major modification, or activity subject to review;

(b) The physical location, ownership, products and processes involved in the major stationary source or major modification subject to review;

(c) The type and quantity of pollutants proposed to be emitted into the air;

(d) A brief summary of the BACT options considered and the reasons why the selected BACT level of control was selected;

(e) A brief summary of the basis for the permit approval conditions;

(f) A statement on whether the emissions will or will not cause a state and national ambient air quality standard to be exceeded;

(g) The degree of increment consumption expected to result from the source or modification;

(h) An analysis of the impacts on air quality related values in federal Class I areas and other Class I areas affected by the project; and

(i) An analysis of the impacts of the proposed emissions on visibility in any federal Class I area following the requirements in WAC 173-400-117.

(4) **Appeals.** A PSD permit, any conditions contained in a PSD permit, or the denial of PSD permit may be appealed to the pollution control hearings board as provided in chapter 43.21B RCW. A PSD permit issued under the terms of a delegation agreement can be appealed to the EPA's environmental appeals board as provided in 40 C.F.R. 124.13 and 40 C.F.R. 124.19.

(5) **Construction time limitations.**

(a) Approval to construct or modify a major stationary source becomes invalid if construction is not commenced within eighteen months of the effective date of the approval, if construction is discontinued for a period of eighteen months or more, or if construction is not completed within a reasonable time. The time period between construction of the approved phases of a phased construction project cannot be extended. Each phase must commence construction within eighteen months of the projected and approved commencement date.

(b) Ecology may extend the eighteen-month effective period of a PSD permit upon a satisfactory showing that an extension is justified. A request to extend the effective time to begin or complete actual construction under a PSD permit may be submitted. The request may result from the cessation of on-site construction before completion or failure to begin actual construction of the project(s) covered by the PSD permit.

(i) Request requirements.

(A) A written request for the extension, submitted by the PSD permit holder, as soon as possible prior to the expiration of the current PSD permit.

(B) An evaluation of BACT and an updated ambient impact, including an increment analysis, for all pollutants subject to the approval conditions in the PSD permit.

(ii) Duration of extensions.

(A) No single extension of time shall be longer than eighteen months.

(B) The cumulative time prior to beginning actual construction under the original PSD permit and all approved time extensions shall not exceed fifty-four months.

(iii) Issuance of an extension.

(A) Ecology may approve and issue an extension of the current PSD permit.

(B) The extension of approval shall reflect any revised BACT limitations based on the evaluation of BACT presented in the request for extension and other information available to ecology.

(C) The issuance of an extension is subject to the public involvement requirements in WAC 173-400-740.

(iv) For the extension of a PSD permit, ecology must prepare a technical support document consistent with WAC 173-400-730(3) only to the extent that those criteria apply to a request to extend the construction time limitation.

[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-730, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-730, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-730, filed 3/1/11, effective 4/1/11. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-730, filed 1/10/05, effective 2/10/05.]

EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

WAC 173-400-740 PSD permitting public involvement requirements. (1) **Actions requiring notification of the public.** Ecology must provide public notice before approving or denying any of the following types of actions related to implementation of the PSD program contained in WAC 173-400-720:

(a) Any preliminary determination to approve or disapprove a PSD permit application; or

(b) An extension of the time to begin construction or suspend construction under a PSD permit; or

(c) A revision to a PSD permit, except an administrative amendment to an existing permit; or

(d) Use of a modified or substituted model in Appendix W of 40 C.F.R. Part 51 (in effect on the date in WAC 173-400-025) as part of review of air quality impacts.

(2) **Notification of the public.** As expeditiously as possible after the receipt of a complete PSD application, and as expeditiously as possible after receipt of a request for extension of the construction time limit under WAC 173-400-730(6) or after receipt of a nonadministrative revision to a PSD permit under WAC 173-400-750, ecology shall:

(a) Administrative record. Make available for public inspection in at least one location in the vicinity where the proposed source would be constructed, or for revisions to a PSD permit where the permittee exists, a copy of the information submitted by the applicant, and any applicable preliminary determinations, including analyses of the effects on air quality and air quality related values, considered in making the preliminary determination. Ecology may comply with this requirement by making these materials available on ecology's web site or at a physical location.

(i) Some materials comprising the administrative record (such as air quality modeling data) may be too large to post on a web site but may be made available as part of the record either in hard copy or on a data storage device.

(ii) Exemptions from this requirement include information protected from disclosure under any applicable law, including, but not limited to, RCW 70.94.205 and chapter 173-03 WAC.

(b) Notify the public.

(i) Public notice must be posted on ecology's web site for a minimum of thirty days. Day one of the public comment period begins on the next calendar day after ecology posts the public notice.

(ii) The following information must be posted for the duration of the public comment period:

(A) Public notice elements in subsection (3) of this section;

(B) PSD draft permit;

(C) PSD technical support document; and
(D) Information on how to access the administrative record.
(iii) If ecology grants a request to extend the public comment period, ecology must:
(A) Post the extension notice on the same web page where the original notice was posted;
(B) Specify the closing date of the extended comment period in the extension notice; and
(C) Distribute a copy of the extension notice by electronic means or via the United States postal service to whomever requested the extension and the organizations and individuals listed in (c) and (d) of this subsection.
(iv) If a hearing is held, the public comment period must extend through the hearing date and comply with the notice requirements in subsection (4)(c) of this section.
(v) If ecology determines a supplemental notice is appropriate, the applicant or other initiator of the action must pay the cost of providing this supplemental public notice. Supplemental notice may include, but is not limited to, publication in a newspaper of general circulation in the area of the proposed project.
(c) Distribute by electronic means or via the United States postal service a copy of the public notice to:
(i) Any Indian governing body whose lands may be affected by emissions from the project;
(ii) The chief executive of the city where the project is located;
(iii) The chief executive of the county where the project is located;
(iv) Individuals or organizations that requested notification of the specific project proposal;
(v) Other individuals who requested notification of PSD permits;
(vi) Any state within 100 km of the proposed project.
(d) Distribute by electronic means or via the United States postal service a copy of the public notice, PSD preliminary determination, and the technical support document to:
(i) The applicant;
(ii) The affected federal land manager;
(iii) EPA Region 10;
(iv) The permitting authority with authority over the source under chapter 173-401 WAC; and
(v) Individuals or organizations who request a copy.
(3) **Public notice content.** The public notice shall contain at least the following information:
(a) The name and address of the applicant;
(b) The location of the proposed project;
(c) A brief description of the project proposal;
(d) The preliminary determination to approve or disapprove the application;
(e) How much increment is expected to be consumed by this project;
(f) The name, address, and telephone number of the person to contact for further information;
(g) A brief explanation of how to comment on the project;
(h) An explanation on how to request a public hearing;
(i) The start date and end date of the public comment period consistent with subsection (2)(b)(i) of this section;

(j) A statement that a public hearing may be held if ecology determines within the public comment period that significant public interest exists;

(k) The length of the public comment period in the event of a public hearing; and

(l) For projects subject to special protection requirements for federal Class I areas, in WAC 173-400-117, and where ecology disagrees with the analysis done by the federal land manager, ecology shall explain its decision in the public notice or state that an explanation of the decision appears in the technical support document for the proposed approval or denial.

(4) **Public hearings.**

(a) The applicant, any interested governmental entity, any group, or any person may request a public hearing within the public comment period established consistent with subsection (2)(b)(i) of this section. A request must indicate the interest of the entity filing it and why a hearing is warranted. Whether a request for a hearing is filed or not, ecology may hold a public hearing if it determines significant public interest exists. Ecology will determine the location, date, and time of the public hearing.

(b) Notification of a public hearing will be accomplished per the requirements of WAC 173-400-740(2).

(c) The public must be notified at least thirty days prior to the date of the hearing (or first of a series of hearings).

(5) **Consideration of public comments.** Ecology shall make no final decision on any application or action of any type described in subsection (1) of this section until the public comment period has ended and any comments received during the public comment period have been considered. Ecology shall make all public comments available for public inspection at the same web site where the preconstruction information on the proposed major source or major modification was made available.

(6) **Issuance of a final determination.**

(a) The final approval or disapproval determination must be made within one year of receipt of a complete application and must include the following:

(i) A copy of the final PSD permit or the determination to deny the permit;

(ii) A summary of the comments received;

(iii) Ecology's response to those comments;

(iv) A description of what approval conditions changed from the preliminary determination; and

(v) A cover letter that includes an explanation of how the final determination may be appealed.

(b) Ecology shall post the final determination on the same web page where the draft permit and public notice was posted according to subsection (2)(b) of this section.

(c) Ecology shall distribute by electronic means or via the United States postal service a copy of the cover letter that accompanies the final determination to:

(i) Individuals or organizations that requested notification of the specific project proposal; and

(ii) Other individuals who requested notification of PSD permits.

(d) Ecology shall distribute a copy of the final determination to:

(i) The applicant;

(ii) U.S. Department of the Interior - National Park Service;

(iii) U.S. Department of Agriculture - Forest Service;

(iv) EPA Region 10;
(v) The permitting authority with authority over the source under chapter 173-401 WAC; and
(vi) Any person who commented on the preliminary determination.

[Statutory Authority: Chapter 70.94 RCW. WSR 18-17-111 (Order 15-07), § 173-400-740, filed 8/16/18, effective 9/16/18. Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-740, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-740, filed 11/28/12, effective 12/29/12. Statutory Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-740, filed 1/10/05, effective 2/10/05.]

EPA effective: 3/25/20 (85 FR 10301, 2/24/20)

WAC 173-400-750 Revisions to PSD permits. (1) The owner or operator may request, at any time, a change in conditions of a PSD permit and ecology may approve the request provided ecology finds that:
(a) The change in conditions will not cause the source to exceed an emissions standard established by regulation;
(b) No ambient air quality standard or PSD increment will be exceeded as a result of the change;
(c) The change will not adversely impact the ability of ecology or the authority to determine compliance with an emissions standard;
(d) The revised PSD permit will continue to require BACT for each new or modified emission unit approved by the original PSD permit; and
(e) The revised PSD permit continues to meet the requirements of WAC 173-400-800 through 173-400-860, and 173-400-113, as applicable.
(2) A request to revise a PSD permit must be acted upon using the timelines found in WAC 173-400-730. ~~The fee schedule found in chapter 173-455 WAC also applies.~~
(3) All revisions to PSD permits are subject to public involvement except for the following administrative revisions:
(a) Change of the owner or operator's business name and/or mailing address;
(b) Corrections to typographical errors;
(c) Revisions to compliance monitoring methods that provide for more frequent monitoring, replace a periodic monitoring requirement with a continuous monitoring, result in replacement of a manual emission testing method with an instrumental method, or other similar changes that based on ecology's technical evaluation of the proposal, do not reduce the ability of the permittee, the public, the permitting authority, EPA, or ecology to determine compliance with the emission limitations;
(d) Revisions to reporting requirements contained in a PSD permit to coordinate reporting with reporting requirements contained in the air operating permit issued to the source or that result in more frequent reporting by the permittee; or
(e) Any other revision, similar to those listed above, that based on ecology's technical evaluation of the proposal, does not reduce the stringency of the emission limitations in the PSD permit or the ability of ecology, the permitting authority, EPA, or the public to determine compliance with the approval conditions in the PSD permit.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-750, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-750, filed 3/1/11, effective 4/1/11. Statutory

Authority: RCW 70.94.152. WSR 05-03-033 (Order 03-07), § 173-400-750, filed 1/10/05, effective 2/10/05.]

EPA effective: 5/29/15 (80 FR 23721, 4/29/15)

WAC 173-400-800 Major stationary source and major modification in a nonattainment area. WAC 173-400-800 through 173-400-860 apply statewide except where a permitting authority has a permitting program for major stationary sources in a nonattainment area incorporated into the Washington state implementation plan as replacement for these sections.

These requirements apply to any new major stationary source or major modification of an existing major stationary source located in a designated nonattainment area that is major for the pollutant or pollutants for which the area is designated as not in attainment of one or more national ambient air quality standards.

[Statutory Authority: Chapter 70.94 RCW. WSR 11-06-060 (Order 09-01), § 173-400-800, filed 3/1/11, effective 4/1/11.]

EPA effective: 12/8/14 (79 FR 66291, 11/7/14)

WAC 173-400-810 Major stationary source and major modification definitions. The definitions in this section must be used in the major stationary source nonattainment area permitting requirements in WAC 173-400-800 through 173-400-860. If a term is defined differently in the federal program requirements for issuance, renewal and expiration of a Plant Wide Applicability Limitation (WAC 173-400-850), then that definition must be used for purposes of the Plant Wide Applicability Limitation program.

(1) Actual emissions means:

(a) The actual rate of emissions of a regulated NSR pollutant from an emissions unit, as determined in accordance with (b) through (d) of this subsection. This definition does not apply when calculating whether a significant emissions increase has occurred, or for establishing a PAL under WAC 173-400-850. Instead, "projected actual emissions" and "baseline actual emissions" as defined in subsections (2) and (23) of this section apply for those purposes.

(b) In general, actual emissions as of a particular date shall equal the average rate, in tons per year, at which the unit actually emitted the pollutant during a consecutive twenty-four-month period which precedes the particular date and which is representative of normal source operation. The permitting authority shall allow the use of a different time period upon a determination that it is more representative of normal source operation. Actual emissions shall be calculated using the unit's actual operating hours, production rates, and types of materials processed, stored, or combusted during the selected time period.

(c) The permitting authority may presume that source-specific allowable emissions for the unit are equivalent to the actual emissions of the unit.

(d) For any emissions unit that has not begun normal operations on the particular date, actual emissions shall equal the potential to emit of the unit on that date.

(2) Baseline actual emissions means the rate of emissions, in tons per year, of a regulated NSR pollutant, as determined in accordance with (a) through (d) of this subsection.

(a) For any existing electric utility steam generating unit, baseline actual emissions means the average rate, in tons per year, at which the unit actually emitted the pollutant during any consecutive twenty-four-month period selected by the owner or operator within the five-year period immediately preceding when the owner or operator begins actual construction of the project. The permitting authority shall allow the use of a different time period upon a determination that it is more representative of normal source operation.

(i) The average rate shall include emissions associated with startups, shutdowns, and malfunctions; and, for an emissions unit that is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or for an emissions unit that is located at a major stationary source that belongs to one of the listed source categories, the average rate shall include fugitive emissions (to the extent quantifiable).

(ii) The average rate shall be adjusted downward to exclude any noncompliant emissions that occurred while the source was operating above any emission limitation that was legally enforceable during the consecutive twenty-four-month period.

(iii) For a regulated NSR pollutant, when a project involves multiple emissions units, only one consecutive twenty-four-month period must be used to determine the baseline actual emissions for the emissions units being changed. A different consecutive twenty-four-month period can be used for each regulated NSR pollutant.

(iv) The average rate shall not be based on any consecutive twenty-four-month period for which there is inadequate information for determining annual emissions, in tons per year, and for adjusting this amount if required by (a)(ii) of this subsection.

(b) For an existing emissions unit (other than an electric utility steam generating unit), baseline actual emissions means the average rate, in tons per year, at which the emissions unit actually emitted the pollutant during any consecutive twenty-four-month period selected by the owner or operator within the ten-year period immediately preceding either the date the owner or operator begins actual construction of the project, or the date a complete permit application is received by the permitting authority for a permit required either under WAC 173-400-800 through 173-400-860 or under a plan approved by EPA, whichever is earlier, except that the ten-year period shall not include any period earlier than November 15, 1990.

(i) The average rate shall include emissions associated with startups, shutdowns, and malfunctions; and, for an emissions unit that is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or for an emissions unit that is located at a major stationary source that belongs to one of the listed source categories, the average rate shall include fugitive emissions (to the extent quantifiable).

(ii) The average rate shall be adjusted downward to exclude any noncompliant emissions that occurred while the source was operating above an emission limitation that was legally enforceable during the consecutive twenty-four-month period.

(iii) The average rate shall be adjusted downward to exclude any emissions that would have exceeded an emission limitation with which the major stationary source must currently comply, had such major stationary source been required to comply with such limitations during the consecutive twenty-four-month period. However, if an emission limitation is part of a maximum achievable control technology standard that EPA proposed or promulgated under 40 C.F.R. Part 63, the baseline actual emissions need only be adjusted if the state has taken credit for such emissions reductions in an attainment demonstration or maintenance plan as part of the demonstration of attainment or as reasonable further progress to attain the NAAQS.

(iv) For a regulated NSR pollutant, when a project involves multiple emissions units, only one consecutive twenty-four-month period must be used to determine the baseline actual emissions for the emissions units being changed. A different consecutive twenty-four-month period can be used for each regulated NSR pollutant.

(v) The average rate shall not be based on any consecutive twenty-four-month period for which there is inadequate information for determining annual emissions, in tons per year, and for adjusting this amount if required under (b)(ii) and (iii) of this subsection.

(c) For a new emissions unit, the baseline actual emissions for purposes of determining the emissions increase that will result from the initial construction and operation of such unit shall equal zero; and thereafter, for all other purposes, shall equal the unit's potential to emit. In the latter case, fugitive emissions, to the extent quantifiable, shall be included only if the emissions unit is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or if the emissions unit is located at a major stationary source that belongs to one of the listed source categories.

(d) For a PAL for a major stationary source, the baseline actual emissions shall be calculated for existing electric utility steam generating units in accordance with the procedures contained in (a) of this subsection, for other existing emissions units in accordance with the procedures contained in (b) of this subsection, and for a new emissions unit in accordance with the procedures contained in (c) of this subsection, except that fugitive emissions (to the extent quantifiable) shall be included regardless of the source category.

(3) Building, structure, facility, or installation means all of the pollutant-emitting activities which belong to the same industrial grouping, are located on one or more contiguous or adjacent properties, and are under the control of the same person (or persons under common control) except the activities of any vessel. Pollutant-emitting activities shall be considered as part of the same industrial grouping if they belong to the same major group (i.e., which have the same two-digit code) as described in the *Standard Industrial Classification Manual*, 1972, as amended by the 1977 Supplement (U.S. Government Printing Office stock numbers 4101-0065 and 003-005-00176-0, respectively).

(4) Clean coal technology means any technology, including technologies applied at the precombustion, combustion, or post combustion stage, at a new or existing facility which will achieve significant reductions in air emissions of sulfur dioxide or oxides of nitrogen associated with the utilization of coal in the generation of electricity, or process steam which was not in widespread use as of November 15, 1990.

(5) Clean coal technology demonstration project means a project using funds appropriated under the heading "Department of Energy-Clean Coal Technology," up to a total amount of two and one-half billion dollars for commercial demonstration of clean coal technology, or similar projects funded through appropriations for the Environmental Protection Agency. The federal contribution for a qualifying project shall be at least twenty percent of the total cost of the demonstration project.

(6) Construction means any physical change or change in the method of operation (including fabrication, erection, installation, demo-

lition, or modification of an emissions unit) that would result in a change in emissions.

(7) Continuous emissions monitoring system (CEMS) means all of the equipment that may be required to meet the data acquisition and availability requirements of this section, to sample, condition (if applicable), analyze, and provide a record of emissions on a continuous basis.

(8) Continuous parameter monitoring system (CPMS) means all of the equipment necessary to meet the data acquisition and availability requirements of this section, to monitor process and control device operational parameters (for example, control device secondary voltages and electric currents) and other information (for example, gas flow rate, O_2 or CO_2 concentrations), and to record average operational parameter value(s) on a continuous basis.

(9) Continuous emissions rate monitoring system (CERMS) means the total equipment required for the determination and recording of the pollutant mass emissions rate (in terms of mass per unit of time).

(10) Electric utility steam generating unit means any steam electric generating unit that is constructed for the purpose of supplying more than one-third of its potential electric output capacity and more than 25 MW electrical output to any utility power distribution system for sale. Any steam supplied to a steam distribution system for the purpose of providing steam to a steam-electric generator that would produce electrical energy for sale is also considered in determining the electrical energy output capacity of the affected facility.

(11) Emissions unit means any part of a stationary source that emits or would have the potential to emit any regulated NSR pollutant and includes an electric steam generating unit. For purposes of this section, there are two types of emissions units:

(a) A new emissions unit is any emissions unit which is (or will be) newly constructed and which has existed for less than two years from the date such emissions unit first operated.

(b) An existing emissions unit is any emissions unit that is not a new emissions unit. A replacement unit, as defined in subsection (25) of this section is an existing emissions unit.

(12) Fugitive emissions means those emissions which could not reasonably pass through a stack, chimney, vent or other functionally equivalent opening. Fugitive emissions, to the extent quantifiable, are addressed as follows for the purposes of this section:

(a) In determining whether a stationary source or modification is major, fugitive emissions from an emissions unit are included only if the emissions unit is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or the emissions unit is located at a stationary source that belongs to one of those source categories. Fugitive emissions are not included for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source and that are not, by themselves, part of a listed source category.

(b) For purposes of determining the net emissions increase associated with a project, an increase or decrease in fugitive emissions is creditable only if it occurs at an emissions unit that is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or if the emission unit is located at a major stationary source that belongs to one of the listed source categories. Fugitive emission increases or decreases are not creditable for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, and that are not, by themselves, part of a listed source category.

(c) For purposes of determining the projected actual emissions of an emissions unit after a project, fugitive emissions are included only if the emissions unit is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or if the emission unit is located at a major stationary source that belongs to one of the listed source categories. Fugitive emissions are not included for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, and that are not, by themselves, part of a listed source category.

(d) For purposes of determining the baseline actual emissions of an emissions unit, fugitive emissions are included only if the emissions unit is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or if the emission unit is located at a major stationary source that belongs to one of the listed source categories, except that, for a PAL, fugitive emissions shall be included regardless of the source category. With the exception of PALs, fugitive emissions are not included for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, and that are not, by themselves, part of a listed source category.

(e) In calculating whether a project will cause a significant emissions increase, fugitive emissions are included only for those emissions units that are part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or for any emissions units that are located at a major stationary source that belongs to one of the listed source categories. Fugitive emissions are not included for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, and that are not, by themselves, part of a listed source category.

(f) For purposes of monitoring and reporting emissions from a project after normal operations have been resumed, fugitive emissions are included only for those emissions units that are part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or for any emissions units that are located at a major stationary source that belongs to one of the listed source categories. Fugitive emissions are not included for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, and that are not, by themselves, part of a listed source category.

(g) For all other purposes of this section, fugitive emissions are treated in the same manner as other, nonfugitive emissions. This includes, but is not limited to, the treatment of fugitive emissions for offsets (see WAC 173-400-840(7)) and for PALs (see WAC 173-400-850).

(13) Lowest achievable emission rate (LAER) means, for any source, the more stringent rate of emissions based on the following:

(a) The most stringent emissions limitation which is contained in the implementation plan of any state for such class or category of stationary source, unless the owner or operator of the proposed stationary source demonstrates that such limitations are not achievable; or

(b) The most stringent emissions limitation which is achieved in practice by such class or category of stationary sources. This limitation, when applied to a modification, means the lowest achievable emissions rate for the new or modified emissions units within a stationary source. In no event shall the application of the term permit a proposed new or modified stationary source to emit any pollutant in excess of the amount allowable under an applicable new source standard of performance.

(14)(a) Major stationary source means any stationary source of air pollutants that emits, or has the potential to emit, one hundred tons per year or more of any regulated NSR pollutant, except that lower emissions thresholds apply in areas subject to sections 181-185B, sections 186 and 187, or sections 188-190 of the Federal Clean Air Act. In those areas the following thresholds apply:

(i) Fifty tons per year of volatile organic compounds in any serious ozone nonattainment area;

(ii) Fifty tons per year of volatile organic compounds in an area within an ozone transport region, except for any severe or extreme ozone nonattainment area;

(iii) Twenty-five tons per year of volatile organic compounds in any severe ozone nonattainment area;

(iv) Ten tons per year of volatile organic compounds in any extreme ozone nonattainment area;

(v) Fifty tons per year of carbon monoxide in any serious nonattainment area for carbon monoxide, where stationary sources contribute significantly to carbon monoxide levels in the area (as determined under rules issued by EPA);

(vi) Seventy tons per year of PM-10 in any serious nonattainment area for PM-10.

(b) For the purposes of applying the requirements of WAC 173-400-830 to stationary sources of nitrogen oxides located in an ozone nonattainment area or in an ozone transport region, any stationary source which emits, or has the potential to emit, one hundred tons per year or more of nitrogen oxides emissions, except that the emission thresholds in (b)(i) through (vi) of this subsection shall apply in areas subject to sections 181-185B of the Federal Clean Air Act.

(i) One hundred tons per year or more of nitrogen oxides in any ozone nonattainment area classified as marginal or moderate.

(ii) One hundred tons per year or more of nitrogen oxides in any ozone nonattainment area classified as a transitional, submarginal, or incomplete or no data area, when such area is located in an ozone transport region.

(iii) One hundred tons per year or more of nitrogen oxides in any area designated under section 107(d) of the Federal Clean Air Act as attainment or unclassifiable for ozone that is located in an ozone transport region.

(iv) Fifty tons per year or more of nitrogen oxides in any serious nonattainment area for ozone.

(v) Twenty-five tons per year or more of nitrogen oxides in any severe nonattainment area for ozone.

(vi) Ten tons per year or more of nitrogen oxides in any extreme nonattainment area for ozone.

(c) Any physical change that would occur at a stationary source not qualifying under (a) and (b) of this subsection as a major stationary source, if the change would constitute a major stationary source by itself.

(d) A major stationary source that is major for volatile organic compounds shall be considered major for ozone.

(e) The fugitive emissions of a stationary source shall not be included in determining for any of the purposes of subsection (14) of this section whether it is a major stationary source, unless the source belongs to one of the following categories of stationary sources:

(i) Coal cleaning plants (with thermal dryers);

(ii) Kraft pulp mills;

(iii) Portland cement plants;

(iv) Primary zinc smelters;

(v) Iron and steel mills;

(vi) Primary aluminum ore reduction plants;

(vii) Primary copper smelters;

(viii) Municipal incinerators capable of charging more than fifty tons of refuse per day;

(ix) Hydrofluoric, sulfuric, or nitric acid plants;

(x) Petroleum refineries;

(xi) Lime plants;

(xii) Phosphate rock processing plants;

(xiii) Coke oven batteries;

(xiv) Sulfur recovery plants;

(xv) Carbon black plants (furnace process);

(xvi) Primary lead smelters;

(xvii) Fuel conversion plants;

(xviii) Sintering plants;

(xix) Secondary metal production plants;

(xx) Chemical process plants - The term chemical processing plant shall not include ethanol production facilities that produce ethanol by natural fermentation included in NAICS codes 325193 or 312140;

(xxi) Fossil-fuel boilers (or combination thereof) totaling more than two hundred fifty million British thermal units per hour heat input;

(xxii) Petroleum storage and transfer units with a total storage capacity exceeding three hundred thousand barrels;

(xxiii) Taconite ore processing plants;

(xxiv) Glass fiber processing plants;

(xxv) Charcoal production plants;

(xxvi) Fossil fuel-fired steam electric plants of more than two hundred fifty million British thermal units per hour heat input; and

(xxvii) Any other stationary source category which, as of August 7, 1980, is being regulated under section 111 or 112 of the Federal Clean Air Act.

(15)(a) Major modification means any physical change in or change in the method of operation of a major stationary source that would result in:

(i) A significant emissions increase of a regulated NSR pollutant; and

(ii) A significant net emissions increase of that pollutant from the major stationary source.

(b) Any significant emissions increase from any emissions units or net emissions increase at a major stationary source that is significant for volatile organic compounds shall be considered significant for ozone.

(c) A physical change or change in the method of operation shall not include:

(i) Routine maintenance, repair and replacement;

(ii) Use of an alternative fuel or raw material by reason of an order under sections 2 (a) and (b) of the Energy Supply and Environmental Coordination Act of 1974 (or any superseding legislation) or by reason of a natural gas curtailment plan pursuant to the Federal Power Act;

(iii) Use of an alternative fuel by reason of an order or rule section 125 of the Federal Clean Air Act;

(iv) Use of an alternative fuel at a steam generating unit to the extent that the fuel is generated from municipal solid waste;

(v) Use of an alternative fuel or raw material by a stationary source which:

(A) The source was capable of accommodating before December 21, 1976, unless such change would be prohibited under any federally enforceable permit condition which was established after December 12, 1976, pursuant to 40 C.F.R. 52.21 or under regulations approved pursuant to 40 C.F.R. Part 51, Subpart I or 40 C.F.R. 51.166; or

(B) The source is approved to use under any permit issued under regulations approved by EPA implementing 40 C.F.R. 51.165.

(vi) An increase in the hours of operation or in the production rate, unless such change is prohibited under any federally enforceable permit condition which was established after December 21, 1976, pursuant to 40 C.F.R. 52.21 or regulations approved pursuant to 40 C.F.R. Part 51, Subpart I or 40 C.F.R. 51.166;

(vii) Any change in ownership at a stationary source;

(viii) The installation, operation, cessation, or removal of a temporary clean coal technology demonstration project, provided that the project complies with:

(A) The state implementation plan for the state in which the project is located; and

(B) Other requirements necessary to attain and maintain the National Ambient Air Quality Standard during the project and after it is terminated.

(d) This definition shall not apply with respect to a particular regulated NSR pollutant when the major stationary source is complying with the requirements for a PAL for that pollutant. Instead, the definitions in 40 C.F.R. Part 51, Appendix S (in effect on the date in WAC 173-400-025) shall apply.

(e) For the purpose of applying the requirements of WAC 173-400-830 (1)(i) to modifications at major stationary sources of nitrogen oxides located in ozone nonattainment areas or in ozone transport regions, whether or not subject to sections 181-185B, Part D, Title I of the Federal Clean Air Act, any significant net emissions increase of nitrogen oxides is considered significant for ozone.

(f) Any physical change in, or change in the method of operation of, a major stationary source of volatile organic compounds that results in any increase in emissions of volatile organic compounds from any discrete operation, emissions unit, or other pollutant emitting activity at the source shall be considered a significant net emissions increase and a major modification for ozone, if the major stationary source is located in an extreme ozone nonattainment area that is subject to sections 181-185B, Part D, Title I of the Federal Clean Air Act.

(g) Fugitive emissions shall not be included in determining for any of the purposes of this section whether a physical change in or change in the method of operation of a major stationary source is a major modification, unless the source belongs to one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source.

(16) Necessary preconstruction approvals or permits means those permits or orders of approval required under federal air quality control laws and regulations or under air quality control laws and regulations which are part of the applicable state implementation plan.

(17)(a) Net emissions increase means with respect to any regulated NSR pollutant emitted by a major stationary source, the amount by which the sum of the following exceeds zero:

(i) The increase in emissions from a particular physical change or change in the method of operation at a stationary source as calculated pursuant to WAC 173-400-820 (2) and (3); and

(ii) Any other increases and decreases in actual emissions at the major stationary source that are contemporaneous with the particular change and are otherwise creditable. In determining the net emissions increase, baseline actual emissions for calculating increases and decreases shall be determined as provided in the definition of baseline actual emissions, except that subsection (2)(a)(iii) and (b)(iv) of this section, in the definition of baseline actual emissions, shall not apply.

(b) An increase or decrease in actual emissions is contemporaneous with the increase from the particular change only if it occurs before the date that the increase from the particular change occurs;

(c) An increase or decrease in actual emissions is creditable only if:

(i) It occurred no more than one year prior to the date of submittal of a complete notice of construction application for the particular change, or it has been documented by an emission reduction credit (ERC). Any emissions increases occurring between the date of issuance of the ERC and the date when a particular change becomes operational shall be counted against the ERC; and

(ii) The permitting authority has not relied on it in issuing a permit for the source under regulations approved pursuant to 40 C.F.R. 51.165, which permit is in effect when the increase in actual emissions from the particular change occurs; and

(iii) As it pertains to an increase or decrease in fugitive emissions (to the extent quantifiable), it occurs at an emissions unit that is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or it occurs at an emissions unit that is located at a major stationary source that belongs to one of the listed source categories. Fugitive emission increases or decreases are not creditable for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, and that are not, by themselves, part of a listed source category.

(d) An increase in actual emissions is creditable only to the extent that the new level of actual emissions exceeds the old level;

(e) A decrease in actual emissions is creditable only to the extent that:

(i) The old level of actual emission or the old level of allowable emissions whichever is lower, exceeds the new level of actual emissions;

(ii) It is enforceable as a practical matter at and after the time that actual construction on the particular change begins;

(iii) The permitting authority has not relied on it as part of an offsetting transaction under WAC 173-400-113(4) or 173-400-830 or in issuing any permit under regulations approved pursuant to 40 C.F.R. Part 51, Subpart I or the state has not relied on it in demonstrating attainment or reasonable further progress;

(iv) It has approximately the same qualitative significance for public health and welfare as that attributed to the increase from the particular change; and

(f) An increase that results from a physical change at a source occurs when the emissions unit on which construction occurred becomes operational and begins to emit a particular pollutant.

(g) Any replacement unit that requires shakedown becomes operational only after a reasonable shakedown period, not to exceed one hundred eighty days.

(h) Subsection (1)(b) of this section, in the definition of actual emissions, shall not apply for determining creditable increases and decreases or after a change.

(18) Nonattainment major new source review (NSR) program means the major source preconstruction permit program that has been approved by EPA and incorporated into the plan to implement the requirements of 40 C.F.R. 51.165, or a program that implements 40 C.F.R. Part 51, Appendix S, sections I through VI. Any permit issued under either program is a major NSR permit.

(19) Pollution prevention means any activity that through process changes, product reformulation or redesign, or substitution of less polluting raw materials, eliminates or reduces the release of air pollutants (including fugitive emissions) and other pollutants to the environment prior to recycling, treatment, or disposal; it does not mean recycling (other than certain "in-process recycling" practices), energy recovery, treatment, or disposal.

(20) Predictive emissions monitoring system (PEMS) means all of the equipment necessary to monitor process and control device operational parameters (for example, control device secondary voltages and electric currents) and other information (for example, gas flow rate, O_2 or CO_2 concentrations), and calculate and record the mass emissions rate (for example, lb/hr) on a continuous basis.

(21) Prevention of significant deterioration (PSD) permit means any permit that is issued under the major source preconstruction permit program that has been approved by EPA and incorporated into the plan to implement the requirements of 40 C.F.R. 51.166, or under the program in 40 C.F.R. 52.21.

(22) Project means a physical change in, or change in the method of operation of, an existing major stationary source.

(23)(a) Projected actual emissions means the maximum annual rate, in tons per year, at which an existing emissions unit is projected to emit a regulated NSR pollutant in any one of the five years (twelve-month period) following the date the unit resumes regular operation after the project, or in any one of the ten years following that date, if the project involves increasing the emissions unit's design capacity or its potential to emit of that regulated NSR pollutant and full utilization of the unit would result in a significant emissions increase or a significant net emissions increase at the major stationary source.

(b) In determining the projected actual emissions before beginning actual construction, the owner or operator of the major stationary source:

(i) Shall consider all relevant information including, but not limited to, historical operational data, the company's own representations, the company's expected business activity and the company's highest projections of business activity, the company's filings with the state or federal regulatory authorities, and compliance plans under the approved plan; and

(ii) Shall include emissions associated with startups, shutdowns, and malfunctions; and, for an emissions unit that is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source, or for an emissions unit that is located at a major stationary source that belongs to one of the listed source categories, shall include fugitive emissions (to the extent quantifiable); and

(iii) Shall exclude, in calculating any increase in emissions that results from the particular project, that portion of the unit's emissions following the project that an existing unit could have accommodated during the consecutive twenty-four-month period used to establish the baseline actual emissions and that are also unrelated to the particular project, including any increased utilization due to product demand growth; or

(iv) In lieu of using the method set out in (b)(i) through (iii) of this subsection, the owner or operator may elect to use the emissions unit's potential to emit, in tons per year. For this purpose, if the emissions unit is part of one of the source categories listed in subsection (14)(e) of this section, the definition of major stationary source or if the emissions unit is located at a major stationary source that belongs to one of the listed source categories, the unit's potential to emit shall include fugitive emissions (to the extent quantifiable).

(24)(a) Regulated NSR pollutant, means the following:

(i) Nitrogen oxides or any volatile organic compounds;

(ii) Any pollutant for which a National Ambient Air Quality Standard has been promulgated;

(iii) Any pollutant that is identified under this subsection as a constituent or precursor of a general pollutant listed in (a)(i) or (ii) of this subsection, provided that such constituent or precursor pollutant may only be regulated under NSR as part of regulation of the general pollutant. For purposes of NSR precursor pollutants are the following:

(A) Volatile organic compounds and nitrogen oxides are precursors to ozone in all ozone nonattainment areas.

(B) Sulfur dioxide is a precursor to PM-2.5 in all PM-2.5 nonattainment areas.

(C) Nitrogen oxides are precursors to PM-2.5 in all PM-2.5 nonattainment areas.

(b) PM-2.5 emissions and PM-10 emissions shall include gaseous emissions from a source or activity which condense to form particulate matter at ambient temperatures. On or after January 1, 2011, such condensable particulate matter shall be accounted for in applicability determinations and in establishing emissions limitations for PM-2.5 in nonattainment major NSR permits. Compliance with emissions limitations for PM-2.5 issued prior to this date shall not be based on condensable particulate matter unless required by the terms and conditions of the permit or the applicable implementation plan. Applicability determinations for PM-2.5 made prior to the effective date of WAC 173-400-800 through 173-400-850 made without accounting for condensable particulate matter shall not be considered in violation of WAC 173-400-800 through 173-400-850.

(25)(a) Replacement unit means an emissions unit for which all the criteria listed below are met:

(i) The emissions unit is a reconstructed unit within the meaning of 40 C.F.R. 60.15 (b)(1), or the emissions unit completely takes the place of an existing emissions unit.

(ii) The emissions unit is identical to or functionally equivalent to the replaced emissions unit.

(iii) The replacement does not alter the basic design parameters of the process unit. Basic design parameters are:

(A) Except as provided in (a)(iii)(C) of this subsection, for a process unit at a steam electric generating facility, the owner or operator may select as its basic design parameters either maximum hourly heat input and maximum hourly fuel consumption rate or maximum hourly electric output rate and maximum steam flow rate. When establishing fuel consumption specifications in terms of weight or volume, the minimum fuel quality based on British thermal units content must be used for determining the basic design parameter(s) for a coal-fired electric utility steam generating unit.

(B) Except as provided in (a)(iii)(C) of this subsection, the basic design parameter(s) for any process unit that is not at a steam electric generating facility are maximum rate of fuel or heat input, maximum rate of material input, or maximum rate of product output. Combustion process units will typically use maximum rate of fuel input. For sources having multiple end products and raw materials, the owner or operator should consider the primary product or primary raw material of the process unit when selecting a basic design parameter.

(C) If the owner or operator believes the basic design parameter(s) in (a)(iii)(A) and (B) of this subsection is not appropriate for a specific industry or type of process unit, the owner or operator may propose to the reviewing authority an alternative basic design parameter(s) for the source's process unit(s). If the reviewing authority approves of the use of an alternative basic design parameter(s), the reviewing authority will issue a new permit or modify an existing permit that is legally enforceable that records such basic design parameter(s) and requires the owner or operator to comply with such parameter(s).

(D) The owner or operator shall use credible information, such as results of historic maximum capability tests, design information from the manufacturer, or engineering calculations, in establishing the magnitude of the basic design parameter(s) specified in (a)(iii)(A) and (B) of this subsection.

(E) If design information is not available for a process unit, then the owner or operator shall determine the process unit's basic design parameter(s) using the maximum value achieved by the process unit in the five-year period immediately preceding the planned activity.

(F) Efficiency of a process unit is not a basic design parameter.

(iv) The replaced emissions unit is permanently removed from the major stationary source, otherwise permanently disabled, or permanently barred from operation by a permit that is enforceable as a practical matter. If the replaced emissions unit is brought back into operation, it shall constitute a new emissions unit.

(b) No creditable emission reductions shall be generated from shutting down the existing emissions unit that is replaced.

(26) Reviewing authority means "permitting authority" as defined in WAC 173-400-030.

(27) Significant means:

(a) In reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

3ROOXWDQW	Emission Rate
Carbon monoxide	100 tons per year (tpy)
Nitrogen oxides	40 tons per year
Sulfur dioxide	40 tons per year
2]RQH	40 tons per year of volatile RUganic compounds or nitrogen R[LGHV
/HDG	0.6 tons per year
PM-10	15 tons per year
PM-2.5	10 tons per year of direct PM-2.5 emissions; 40 tons per year of nitrogen oxide emissions; 40 tons per year of sulfur dioxide emissions

(b) Notwithstanding the significant emissions rate for ozone, significant means, in reference to an emissions increase or a net emissions increase, any increase in actual emissions of volatile organic compounds that would result from any physical change in, or change in the method of operation of, a major stationary source locating in a serious or severe ozone nonattainment area that is subject to sections 181-185B, of the Federal Clean Air Act, if such emissions increase of volatile organic compounds exceeds twenty-five tons per year.

(c) For the purposes of applying the requirements of WAC 173-400-830 (1)(i) to modifications at major stationary sources of nitrogen oxides located in an ozone nonattainment area or in an ozone transport region, the significant emission rates and other requirements for volatile organic compounds in (a), (b), and (e) of this subsection, of the definition of significant, shall apply to nitrogen oxides emissions.

(d) Notwithstanding the significant emissions rate for carbon monoxide under (a) of this subsection, the definition of significant, significant means, in reference to an emissions increase or a net emissions increase, any increase in actual emissions of carbon monoxide that would result from any physical change in, or change in the method of operation of, a major stationary source in a serious nonattainment area for carbon monoxide if such increase equals or exceeds fifty tons per year, provided EPA has determined that stationary sources contribute significantly to carbon monoxide levels in that area.

(e) Notwithstanding the significant emissions rates for ozone under (a) and (b) of this subsection, the definition of significant, any increase in actual emissions of volatile organic compounds from any emissions unit at a major stationary source of volatile organic compounds located in an extreme ozone nonattainment area that is subject to sections 181-185B of the Federal Clean Air Act shall be considered a significant net emissions increase.

(28) Significant emissions increase means, for a regulated NSR pollutant, an increase in emissions that is significant for that pollutant.

(29) Source and stationary source means any building, structure, facility, or installation which emits or may emit a regulated NSR pollutant.

(30) Temporary clean coal technology demonstration project means a clean coal technology demonstration project that is operated for a period of five years or less, and which complies with the state implementation plan for the state in which the project is located and other requirements necessary to attain and maintain the National Ambient Air Quality Standards during the project and after it is terminated.

(31) Best available control technology (BACT) means an emissions limitation (including a visible emissions standard) based on the maximum degree of reduction for each regulated NSR pollutant which would be emitted from any proposed major stationary source or major modification which the reviewing authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application of production processes or available methods, systems, and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of such pollutant. In no event shall application of best available control technology result in emissions of any pollutant which would exceed the emissions allowed by any applicable standard under 40 C.F.R. Part 60 or 61. If the reviewing authority determines that technological or economic limitations on the application of measurement methodology to a particular emissions unit would make the imposition of an emissions standard infeasible, a design, equipment, work practice, operational standard, or combination thereof, may be prescribed instead to satisfy the requirement for the application of BACT. Such standard shall, to the degree possible, set forth the emissions reduction achievable by implementation of such design, equipment, work practice or operation, and shall provide for compliance by means which achieve equivalent results.

[Statutory Authority: For chapter 173-423 WAC is RCW 70.120A.010; and for chapters 173-400 and 173-476 WAC is RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-810, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-810, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-810, filed 3/1/11, effective 4/1/11.]

EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

WAC 173-400-820 Determining if a new stationary source or modification to a stationary source is subject to these requirements. (1) Any new major stationary source located anywhere in a nonattainment area designated under section 107 (d)(1)(A)(i) of the Federal Clean Air Act, that is major for the pollutant for which the area is designated nonattainment is subject to the permitting requirements of WAC 173-400-830 through 173-400-850. Any major modification of an existing major stationary source that is major for the pollutant for which the area is designated nonattainment and is located anywhere in a nonattainment area designated under section 107 (d)(1)(A)(i) of the Federal Clean Air Act, and that has a significant net emissions increase of the pollutant for which the area is designated nonattainment is subject to the permitting requirements of WAC 173-400-830 through 173-400-850. A modification to an existing major stationary source must use the following procedures to determine if the modification would result in a significant net emissions increase of the nonattainment pollutant.

(2) Except as otherwise provided in subsection (4) of this section, and consistent with the definition of major modification, a project is a major modification for a regulated NSR pollutant if it causes two types of emissions increases - A significant emissions increase, and a significant net emissions increase. The project is not a major modification if it does not cause a significant emissions increase. If the project causes a significant emissions increase, then the project is a major modification only if it also results in a significant net emissions increase.

(3) The procedure for calculating (before beginning actual construction) whether a significant emissions increase (i.e., the first step of the process) will occur depends upon the type of emissions units being modified, according to (a) through (c) of this subsection. For these calculations, fugitive emissions (to the extent quantifiable) are included only if the emissions unit is part of one of the source categories listed in the definition of major stationary source contained in WAC 173-400-810 (14)(e) or if the emissions unit is located at a major stationary source that belongs to one of the listed source categories. Fugitive emissions are not included for those emissions units located at a facility whose primary activity is not represented by one of the source categories listed in the definition of major stationary source contained in WAC 173-400-810 (14)(e) and that are not, by themselves, part of a listed source category. The procedure for calculating (before beginning actual construction) whether a significant net emissions increase will occur at the major stationary source (i.e., the second step of the process) is contained in the definition of net emission increase. Regardless of any such preconstruction projections, a major modification results if the project causes a significant emissions increase and a significant net emissions increase.

(a) Actual-to-projected-actual applicability test for projects that only involve existing emissions units. A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the difference between the projected actual emissions and the baseline actual emissions, for each existing emissions unit, equals or exceeds the significant amount for that pollutant.

(b) Actual-to-potential test for projects that only involve construction of a new emissions unit(s). A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the difference between the potential to emit from each new emissions unit following completion of the project and the baseline actual emissions of these units before the project equals or exceeds the significant amount for that pollutant.

(c) Hybrid test for projects that involve multiple types of emissions units. A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the emissions increases for each emissions unit, using the method specified in (a) and (b) of this subsection as applicable with respect to each emissions unit, for each type of emissions unit equals or exceeds the significant amount for that pollutant.

(4) Any major stationary source which has a PAL for a regulated NSR pollutant shall comply with requirements in WAC 173-400-850.

(5) The following specific provisions apply with respect to any regulated NSR pollutant emitted from projects at existing emissions units at a major stationary source (other than projects at a source with a PAL) in circumstances where there is a reasonable possibility that a project that is not a part of a major modification may result in a significant emissions increase of such pollutant, and the owner or operator elects to use the method specified in the definition of projected actual emissions contained in WAC 173-400-810 (23)(b)(i) through (iii) for calculating projected actual emissions.

(a) Before beginning actual construction of the project, the owner or operator shall document, and maintain a record of the following information:

(i) A description of the project;

(ii) Identification of the emissions unit(s) whose emissions of a regulated NSR pollutant could be affected by the project; and

(iii) A description of the applicability test used to determine that the project is not a major modification for any regulated NSR pollutant, including the baseline actual emissions, the projected actual emissions, the amount of emissions excluded under the definition of projected actual emissions contained in WAC 173-400-810 (23)(b)(iii) and an explanation for why such amount was excluded, and any netting calculations, if applicable.

(b) Before beginning actual construction, the owner or operator shall provide a copy of the information set out in (a) of this subsection to the permitting authority. This information may be submitted in conjunction with any NOC application required under the provisions of WAC 173-400-110. Nothing in this subsection shall be construed to require the owner or operator of such a unit to obtain any determination from the permitting authority before beginning actual construction.

(c) The owner or operator shall monitor the emissions of any regulated NSR pollutant that could increase as a result of the project and that is emitted by any emissions units identified in (a)(ii) of this subsection; and calculate and maintain a record of the annual emissions, in tons per year on a calendar year basis, for a period of five years following resumption of regular operations after the change, or for a period of ten years following resumption of regular operations after the change if the project increases the design capacity or potential to emit of that regulated NSR pollutant at such emissions unit.

(d) The owner or operator shall submit a report to the permitting authority within sixty days after the end of each year during which records must be generated under (c) of this subsection setting out the unit's annual emissions, as monitored pursuant to (c) of this subsection, during the year that preceded submission of the report.

(e) The owner or operator shall submit a report to the permitting authority if the annual emissions, in tons per year, from the project identified in (a) of this subsection, exceed the baseline actual emissions (as documented and maintained pursuant to (a)(iii) of this subsection), by a significant amount (as defined in the definition of significant) for that regulated NSR pollutant, and if such emissions differ from the preconstruction projection as documented and maintained pursuant to (a)(iii) of this subsection. Such report shall be submitted to the permitting authority within sixty days after the end of such year. The report shall contain the following:

(i) The name, address and telephone number of the major stationary source;

(ii) The annual emissions as calculated pursuant to (d) of this subsection; and

(iii) Any other information that the owner or operator wishes to include in the report (e.g., an explanation as to why the emissions differ from the preconstruction projection).

(f) A "reasonable possibility" under this subsection occurs when the owner or operator calculates the project to result in either:

(i) A projected actual emissions increase of at least fifty percent of the amount that is a "significant emissions increase," (without reference to the amount that is a significant net emissions increase), for the regulated NSR pollutant; or

(ii) A projected actual emissions increase that, added to the amount of emissions excluded under the definition of projected actual emissions sums to at least fifty percent of the amount that is a "significant emissions increase," (without reference to the amount that is a significant net emissions increase), for the regulated NSR pollutant. For a project for which a reasonable possibility occurs only within the meaning of (f)(ii) of this subsection, and not also within the meaning of (f)(i) of this subsection, then (c) through (f) of this subsection does not apply to the project.

(6) For projects not required to submit the above information to the permitting authority as part of a notice of construction application, the owner or operator of the source shall make the information required to be documented and maintained pursuant to subsection (5) of this section available for review upon a request for inspection by the permitting authority or the general public pursuant to the requirements contained in chapter 173-401 WAC.

[Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-820, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-820, filed 3/1/11, effective 4/1/11.]

EPA effective: 12/8/14 (79 FR 66291, 11/7/14)

WAC 173-400-830 Permitting requirements. (1) The owner or operator of a proposed new major stationary source or a major modification of an existing major stationary source, as determined according to WAC 173-400-820, is authorized to construct and operate the proposed project provided the following requirements are met:

(a) The proposed new major stationary source or a major modification of an existing major stationary source will not cause any ambient air quality standard to be exceeded, will not violate the requirements for reasonable further progress established by the SIP and will comply with WAC 173-400-113 (3) and (4) for all air contaminants for which the area has not been designated nonattainment.

(b) The permitting authority has determined, based on review of an analysis performed by the owner or operator of a proposed new major stationary source or a major modification of an existing major stationary source of alternative sites, sizes, production processes, and environmental control techniques, that the benefits of the project significantly outweigh the environmental and social costs imposed as a result of its location, construction, or modification.

(c) The proposed new major stationary source or a major modification of an existing major stationary source will comply with all applicable New Source Performance Standards, National Emission Standards for Hazardous Air Pollutants, National Emission Standards for Hazardous Air Pollutants for Source Categories, and emission standards adopted by ecology and the permitting authority.

(d) The proposed new major stationary source or a major modification of an existing major stationary source will employ BACT for all air contaminants and designated precursors to those air contaminants, except that it will achieve LAER for the air contaminants and designated precursors to those air contaminants for which the area has been designated nonattainment and for which the proposed new major stationary source is major or for which the existing source is major and the proposed modification is a major modification.

(e) Allowable emissions from the proposed new major stationary source or major modification of an existing major stationary source of that air contaminant and designated precursors to those air contaminants are offset by reductions in actual emissions from existing sources in the nonattainment area. All offsetting emission reductions must satisfy the requirements in WAC 173-400-840.

(f) The owner or operator of the proposed new major stationary source or major modification of an existing major stationary source has demonstrated that all major stationary sources owned or operated by such person (or by any entity controlling, controlled by, or under common control with such person) in Washington are subject to emission limitations and are in compliance, or on a schedule for compliance, with all applicable emission limitations and standards under the Federal Clean Air Act, including all rules in the SIP.

(g) If the proposed new source is also a major stationary source within the meaning of WAC 173-400-720, or the proposed modification is also a major modification within the meaning of WAC 173-400-720, it meets the requirements of the PSD program under 40 C.F.R. 52.21 delegated to ecology by EPA Region 10, while such delegated program remains in effect. The proposed new major stationary source or major modification will comply with the PSD program in WAC 173-400-700 through 173-400-750 for all air contaminants for which the area has not been designated nonattainment when that PSD program has been approved into the Washington SIP.

(h) The proposed new major stationary source or the proposed major modification meets the special protection requirements for federal Class I areas in WAC 173-400-117.

(i) All requirements of this section applicable to major stationary sources and major modifications of volatile organic compounds shall apply to nitrogen oxides emissions from major stationary sources and major modifications of nitrogen oxides in an ozone transport region or in any ozone nonattainment area, except in an ozone nonattainment area or in portions of an ozone transport region where EPA has granted a NO_X waiver applying the standards set forth under section 182(f) of the Federal Clean Air Act and the waiver continues to apply.

(j) The requirements of this section applicable to major stationary sources and major modifications of PM-10 and PM-2.5 shall also apply to major stationary sources and major modifications of PM-10 and PM-2.5 precursors, except where EPA determines that such sources do not contribute significantly to PM-10 levels that exceed the PM-10 ambient standards in the area.

(2) Approval to construct shall not relieve any owner or operator of the responsibility to comply fully with applicable provisions of the state implementation plan and any other requirements under local, state or federal law.

(3) At such time that a particular source or modification becomes a major stationary source or major modification solely by virtue of a relaxation in any enforceable limitation which was established after August 7, 1980, on the capacity of the source or modification otherwise to emit a pollutant, such as a restriction on hours of operation, then the requirements of regulations approved pursuant to 40 C.F.R. 51.165, or the requirements of 40 C.F.R. Part 51, Appendix S, as applicable, shall apply to the source or modification as though construction had not yet commenced on the source or modification. 40 C.F.R. Part 51, Appendix S shall not apply to a new or modified source for which enforceable limitations are established after WAC 173-400-800 through 173-400-850 have been approved into Washington's SIP.

[Statutory Authority: RCW 70.94.152, 70.94.331, 70.94.860. WSR 16-12-099 (Order 16-01), § 173-400-830, filed 5/31/16, effective 7/1/16. Statutory Authority: Chapter 70.94 RCW. WSR 12-24-027 (Order 11-10), § 173-400-830, filed 11/28/12, effective 12/29/12; WSR 11-06-060 (Order 09-01), § 173-400-830, filed 3/1/11, effective 4/1/11.]

EPA effective: 11/7/16 (81 FR 69385, 10/6/16)

WAC 173-400-840 Emission offset requirements. (1) The ratio of total actual emissions reductions to the emissions increase shall be 1.1:1 unless an alternative ratio is provided for the applicable nonattainment area in subsection (2) through (4) of this section.

(2) In meeting the emissions offset requirements of WAC 173-400-830 for ozone nonattainment areas that are subject to sections 181-185B of the Federal Clean Air Act, the ratio of total actual emissions reductions of VOC to the emissions increase of VOC shall be as follows:

(a) In any marginal nonattainment area for ozone - 1.1:1;

(b) In any moderate nonattainment area for ozone - 1.15:1;

(c) In any serious nonattainment area for ozone - 1.2:1;

(d) In any severe nonattainment area for ozone - 1.3:1; and

(e) In any extreme nonattainment area for ozone - 1.5:1.

(3) Notwithstanding the requirements of subsection (2) of this section for meeting the requirements of WAC 173-400-830, the ratio of total actual emissions reductions of VOC to the emissions increase of VOC shall be 1.15:1 for all areas within an ozone transport region that is subject to sections 181-185B of the Federal Clean Air Act, except for serious, severe, and extreme ozone nonattainment areas that are subject to sections 181-185B of the Federal Clean Air Act.

(4) In meeting the emissions offset requirements of this section for ozone nonattainment areas that are subject to sections 171-179b of the Federal Clean Air Act (but are not subject to sections 181-185B of the Federal Clean Air Act, including eight-hour ozone nonattainment areas subject to 40 C.F.R. 51.902(b)), the ratio of total actual emissions reductions of VOC to the emissions increase of VOC shall be 1.1:1.

(5) Emission offsets used to meet the requirements of WAC 173-400-830 (1)(e), must be for the same regulated NSR pollutant.

(6) If the offsets are provided by another source, the reductions in emissions from that source must be federally enforceable by the time the order of approval for the new or modified source is effective. An emission reduction credit issued under WAC 173-400-131 may be

used to satisfy some or all of the offset requirements of this subsection.

(7) Emission offsets are required for the incremental increase in allowable emissions occurring during startup and shutdown operations at the new or modified emission units subject to nonattainment area major new source review. The incremental increase is the difference between the allowable emissions during normal operation and the allowable emissions for startup and shutdown contained in the nonattainment new source review approval.

(8) Emission offsets including those described in an emission reduction credit issued under WAC 173-400-131, must meet the following criteria:

(a) The baseline for determining credit for emissions reductions is the emissions limit under the applicable state implementation plan in effect at the time the notice of construction application is determined to be complete, except that the offset baseline shall be the actual emissions of the source from which offset credit is obtained where:

(i) The demonstration of reasonable further progress and attainment of ambient air quality standards is based upon the actual emissions of sources located within the designated nonattainment area; or

(ii) The applicable state implementation plan does not contain an emissions limitation for that source or source category.

(b) Other limitations on emission offsets.

(i) Where the emissions limit under the applicable state implementation plan allows greater emissions than the potential to emit of the source, emissions offset credit will be allowed only for control below the potential to emit;

(ii) For an existing fuel combustion source, credit shall be based on the allowable emissions under the applicable state implementation plan for the type of fuel being burned at the time the notice of construction application is determined to be complete. If the existing source commits to switch to a cleaner fuel at some future date, an emissions offset credit based on the allowable (or actual) emissions reduction resulting from the fuels change is not acceptable, unless the permit or other enforceable order is conditioned to require the use of a specified alternative control measure which would achieve the same degree of emissions reduction should the source switch back to the higher emitting (dirtier) fuel at some later date. The permitting authority must ensure that adequate long-term supplies of the new fuel are available before granting emissions offset credit for fuel switches;

(iii) Emission reductions.

(A) Emissions reductions achieved by shutting down an existing emission unit or curtailing production or operating hours may be generally credited for offsets if:

(I) Such reductions are surplus, permanent, quantifiable, and federally enforceable; and

(II) The shutdown or curtailment occurred after the last day of the base year for the SIP planning process. For purposes of this subsection, the permitting authority may choose to consider a prior shutdown or curtailment to have occurred after the last day of the base year if the projected emissions inventory used to develop the attainment demonstration explicitly includes the preshutdown or precurtailment emissions from the previously shutdown or curtailed emission units. However, in no event may credit be given for shutdowns that occurred before August 7, 1977.

(B) Emissions reductions achieved by shutting down an existing emissions unit or curtailing production or operating hours and that do not meet the requirements in subsection (8)(b)(iii)(A) of this section may be generally credited only if:

(I) The shutdown or curtailment occurred on or after the date the construction permit application is filed; or

(II) The applicant can establish that the proposed new emissions unit is a replacement for the shutdown or curtailed emissions unit, and the emissions reductions achieved by the shutdown or curtailment met the requirements of (7)(b)(iii)(A)(I) of this section.

(iv) All emission reductions claimed as offset credit shall be federally enforceable;

(v) Emission reductions used for offsets may only be from any location within the designated nonattainment area. Except the permitting authority may allow use of emission reductions from another area that is nonattainment for the same pollutant, provided the following conditions are met:

(A) The other area is designated as an equal or higher nonattainment status than the nonattainment area where the source proposing to use the reduction is located; and

(B) Emissions from the other nonattainment area contribute to violations of the standard in the nonattainment area where the source proposing to use the reduction is located.

(vi) Credit for an emissions reduction can be claimed to the extent that the reduction has not been relied on in issuing any permit under 40 C.F.R. 52.21 or regulations approved pursuant to 40 C.F.R. Part 51, subpart I or the state has not relied on it in demonstration of attainment or reasonable further progress.

(vii) The total tonnage of increased emissions, in tons per year, resulting from a major modification that must be offset in accordance with Section 173 of the Federal Clean Air Act shall be determined by summing the difference between the allowable emissions after the modification and the actual emissions before the modification for each emissions unit.

(9) No emissions credit may be allowed for replacing one hydrocarbon compound with another of lesser reactivity, except for those compounds listed in Table 1 of EPA's "Recommended Policy on Control of Volatile Organic Compounds" (42 FR 35314, July 8, 1977). This document is also available from Office of Air Quality Planning and Standards, (MD-15) Research Triangle Park, NC 27711.

WAC 173-400-850 Actual emissions plantwide applicability limitation (PAL). The Actuals Plantwide Applicability Limitations (PAL) program in Section IV.K of Appendix S (Emission Offset Interpretive Ruling) to 40 C.F.R. Part 51, (in effect on the date in WAC 173-400-025) is adopted with the following exceptions:

(1) The term "reviewing authority" means "permitting authority" as defined in WAC 173-400-030.

(2) "PAL permit" means the major or minor new source review permit issued that establishes the PAL and those PAL terms as they are incorporated into an air operating permit issued pursuant to chapter 173-401 WAC.

(3) The reference to 40 C.F.R. 70.6 (a)(3)(iii)(B) in subsection IV.K.14 means WAC 173-401-615 (3)(b).

(4) No PAL permit can be issued under this provision until EPA adopts this section into the state implementation plan.

WAC 173-400-860 Public involvement procedures. The public involvement procedures in WAC 173-400-171 shall be followed, including joint public notifications (integrated review) with any proposed notice of construction approval for the project. Any permit issued pursuant to WAC 173-400-830 or 173-400-850 must comply with WAC 173-400-171.

[Statutory Authority: Chapter 70.94 RCW. WSR 11-06-060 (Order 09-01), § 173-400-860, filed 3/1/11, effective 4/1/11.]

EPA effective: 12/8/14 (79 FR 66291, 11/7/14)

~~**WAC 173-400-930 Emergency engines.** (1) **Applicability.**~~

~~(a) This section applies statewide except where a permitting authority has not adopted this section in rule.~~'

~~(b) This section applies to diesel-fueled compression ignition emergency engines with a cumulative BHP rating greater than 500 BHP and equal to or less than 2000 BHP.~~

~~(c) This section is not applicable to emergency engines proposed to be installed as part of a new major stationary source, as defined in WAC 173-400-710 and 173-400-810, or major modification, as defined in WAC 173-400-710 and 173-400-810.~~

~~(d) In lieu of filing a notice of construction application under WAC 173-400-110, the owner or operator may comply with the requirements of this section for emergency engines.~~

~~(e) Compliance with this section satisfies the requirement for new source review of emergency engines under RCW 70.94.152 and chapter 173-460 WAC.~~

~~(f) An applicant may choose to submit a notice of construction application in accordance with WAC 173-400-110 for a site specific review of criteria and toxic air pollutants in lieu of using this section's provisions.~~

~~(g) If an applicant cannot meet the requirements of this section, then they must file a notice of construction application.~~

~~(2) **Operating requirements for emergency engines.** Emergency engines using this section must:~~'

~~(a) Meet EPA emission standards applicable to all new nonroad compression-ignition engines in 40 C.F.R. 89.112 Table 1 and 40 C.F.R. 1039.102 Tables 6 and 7 (in effect on the date in WAC 173-400-025), as applicable for the year that the emergency engine is put in operation.~~

~~(b) Be fueled by ultra low sulfur diesel or ultra low sulfur biodiesel, with a sulfur content of 15 ppm or 0.0015% sulfur by weight or less.~~

~~(c) Operate a maximum of fifty hours per year for maintenance and testing or other nonemergency use.~~

~~(3) **Definitions.**~~

~~(a) **Emergency engine** means a new diesel-fueled stationary compression ignition engine. The engine must meet all the criteria specified below. The engine must be:~~

~~(i) Installed for the primary purpose of providing electrical power or mechanical work during an emergency use and is not the source of primary power at the facility; and~~

~~(ii) Operated to provide electrical power or mechanical work during an emergency use.~~

~~(b) **Emergency use** means providing electrical power or mechanical work during any of the following events or conditions:~~

~~(i) The failure or loss of all or part of normal power service to the facility beyond the control of the facility; or~~

~~(ii) The failure or loss of all or part of a facility's internal power distribution system.~~

~~Examples of emergency operation include the pumping of water or sewage and the powering of lights.~~

~~(c) **Maintenance and testing** means operating an emergency engine to:~~

~~(i) Evaluate the ability of the engine or its supported equipment to perform during an emergency; or~~

~~(ii) Train personnel on emergency activities; or~~

~~(iii) Test an engine that has experienced a breakdown, or failure, or undergone a preventative overhaul during maintenance; or~~

~~(iv) Exercise the engine if such operation is recommended by the engine or generator manufacturer.~~

- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: CO

 **Model Calculates  1 Short Term Average(s) of:   1-HR

 **This Run Includes:      3 Source(s);       4 Source Group(s); and   11358
Receptor(s)

                with:      3 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.
```

```
 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      6.3 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_CO_1HR.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_CO_1HR.SUM

- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: CO

 **Model Calculates  1 Short Term Average(s) of:   8-HR

 **This Run Includes:      3 Source(s);       4 Source Group(s); and   11358
Receptor(s)

                with:      3 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.
```

```
 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      6.3 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_CO_8HR.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_CO_8HR.SUM

 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
         with a Minimum NO2/NOx Ratio of  0.500
         and a Maximum NO2/NOx Ratio of  0.900
      * Model Uses RURAL Dispersion Only.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: NO2

 **Note that special processing requirements apply for the 1-hour NO2 NAAQS - check
available guidance.
   Model will process user-specified ranks of daily maximum 1-hour values averaged
across the number of years modeled.
   For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values can be
simulated using the MULTYEAR keyword.
   Multi-year PERIOD and 1-hour values should only be done in a single model run
using the MULTYEAR option with a
   single multi-year meteorological data file using STARTEND keyword.

 **Model Calculates  1 Short Term Average(s) of:   1-HR

 **This Run Includes:      3 Source(s);       4 Source Group(s); and   11358
Receptor(s)
```

```
                 with:      3 POINT(s), including
                            0 POINTCAP(s) and      0 POINTHOR(s)
                  and:      0 VOLUME source(s)
                  and:      0 AREA type source(s)
                  and:      0 LINE source(s)
                  and:      0 RLINE/RLINEXT source(s)
                  and:      0 OPENPIT source(s)
                  and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                  and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)
          Model Outputs External File(s) of Maximum Daily 1-hr Values by Day
(MAXDAILY Keyword)
          Model Outputs External File(s) of Maximum Daily 1-hr Values by Year
(MXDYBYYR Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                              ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =     11.0 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_NO2_1HR.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_NO2_1HR.SUM

                                            ***     MODEL SETUP OPTIONS SUMMARY
 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
         with a Minimum NO2/NOx Ratio of  0.500
         and a Maximum NO2/NOx Ratio of  0.900
      * Model Uses RURAL Dispersion Only.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: NO2

 **NOTE: Special processing requirements applicable for the 1-hour NO2 NAAQS have
been disabled!!!
         User has specified non-standard averaging periods:

         High ranked 1-hour values are NOT averaged across the number of years
modeled, and
         complete years of data are NOT required.

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:      3 Source(s);       4 Source Group(s); and   11358
Receptor(s)

                with:      3 POINT(s), including
```

```
                      0 POINTCAP(s) and      0 POINTHOR(s)
            and:      0 VOLUME source(s)
            and:      0 AREA type source(s)
            and:      0 LINE source(s)
            and:      0 RLINE/RLINEXT source(s)
            and:      0 OPENPIT source(s)
            and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
            and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      5.7 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_NO2_ANNUAL.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_NO2_ANNUAL.SUM

                                            ***     MODEL SETUP OPTIONS SUMMARY
 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * Option for Capped & Horiz Stacks Selected With:
          0 Capped Stack(s); and         3 Horizontal Stack(s)
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM-2.5

 **Note that special processing requirements apply for the 24-hour PM2.5 NAAQS -
check available guidance.
   Model will process user-specified ranks of high 24-hour values averaged across
the number of years modeled, and
   the multi-year average of individual ANNUAL values, averaged across the number of
years modeled.

 **Model Calculates  1 Short Term Average(s) of:  24-HR

 **This Run Includes:    652 Source(s);      30 Source Group(s); and   11358
Receptor(s)

                with:     14 POINT(s), including
                           0 POINTCAP(s) and      3 POINTHOR(s)
                 and:    635 VOLUME source(s)
```

```
                 and:       3 AREA type source(s)
                 and:       0 LINE source(s)
                 and:       0 RLINE/RLINEXT source(s)
                 and:       0 OPENPIT source(s)
                 and:       0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:       0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =     56.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_PM2P5_24HR.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_PM2P5_24HR.SUM

                                            ***     MODEL SETUP OPTIONS SUMMARY
 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * Option for Capped & Horiz Stacks Selected With:
          0 Capped Stack(s); and         3 Horizontal Stack(s)
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM-2.5

 **Note that special processing requirements apply for the 24-hour PM2.5 NAAQS -
check available guidance.
   Model will process user-specified ranks of high 24-hour values averaged across
the number of years modeled, and
   the multi-year average of individual ANNUAL values, averaged across the number of
years modeled.

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:    652 Source(s);      30 Source Group(s); and   11358
Receptor(s)

                with:     14 POINT(s), including
                           0 POINTCAP(s) and      3 POINTHOR(s)
                 and:    635 VOLUME source(s)
```

```
                 and:      3 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                               ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =     20.1 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_PM2P5_ANNUAL.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_PM2P5_ANNUAL.SUM

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * Option for Capped & Horiz Stacks Selected With:
          0 Capped Stack(s); and         3 Horizontal Stack(s)
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM-10

 **Model Calculates  1 Short Term Average(s) of:  24-HR

 **This Run Includes:    652 Source(s);      30 Source Group(s); and   11358
Receptor(s)

                with:     14 POINT(s), including
                           0 POINTCAP(s) and      3 POINTHOR(s)
                 and:    635 VOLUME source(s)
                 and:      3 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)
```

```
 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                               ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =     43.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_PM10_24HR.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_PM10_24HR.SUM

 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: TAP

 **Model Calculates  2 Short Term Average(s) of:   1-HR  24-HR
     and Calculates ANNUAL Averages

 **This Run Includes:      3 Source(s);      4 Source Group(s); and   11358
Receptor(s)

                with:      3 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)
```

```
 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  22112

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     5.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =     13.3 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   HOQUIAMPROJECT_TAPS.ERR

 **File for Summary of Results:   HOQUIAMPROJECT_TAPS.SUM

NOC Application Forms and SEPA Documentation

OLYMPIC REGION CLEAN AIR AGENCY

2940 Limited Lane NW - Olympia, Washington 98502 - 360-539-7610 – Fax 360-491-6308

FORM 1- NOTICE OF CONSTRUCTION

TO CONSTRUCT - INSTALL - ESTABLISH OR MODIFY AN AIR CONTAMINANT SOURCE

Form 1 Instructions:

1. Please complete all the fields below. **This NOC application is considered incomplete until signed.**
2. If the application contains any confidential business information, please complete a Request of Confidentiality of Records (www.orcaa.org).
3. Duty to Correction Application: An applicant has the duty to supplement or correct an application. Any applicant who fails to submit any relevant facts or who has submitted incorrect information in a permit application must, upon becoming aware of such failure or incorrect submittal, promptly submit supplementary factors or corrected information.

Business Name: Pacific Northwest Renewable Energy	**For ORCAA use only**
Mailing Address: P.O. Box 391, Sth Egrement, MA 01258	File No: 432 County No: 27 Source No: 926 Application No: 23 NOC 1606
Physical Address of Project or New Source: 411 Moon Island Road, Hoquiam, WA 98550	Date Received: Received JUL 20 2023 ORCAA
Billing Address: P.O. Box 391, Sth Egrement, MA 01258	

Project or Equipment to be installed/established:

Wood pellet manufacturing facility

Anticipated startup date: 02 / 01 / 2025 Is facility currently registered with ORCAA? Yes ☐ No ☑

This project must meet the requirements of the State Environmental Policy Act (SEPA) before ORCAA can issue final approval. Indicate the SEPA compliance option:

- ☐ SEPA was satisfied by ______________ (government agency) on __/__/__ (date) - Include a copy of the SEPA determination
- ☑ SEPA threshold determination by City of Hoquiam (government agency) is pending - Include a copy of the environmental checklist
- ☐ ORCAA is the only government agency requiring a permit - Include ORCAA Environmental Checklist
- ☐ This project is exempt from SEPA per ______________ (WAC citation).

Name of Owner of Business: Farnese Partners, LTD		Agency Use Only
Title: Owner		
Email: pheasman@pnwrenewable.com	Phone:	
Authorized Representative for Application (if different than owner): Mark Boivin		
Title: CEO		
Email: mboivin@pnwrenewable.com	Phone: (413) 244-7360	
I hereby certify that the information contained in this application is, to the best of my knowledge, complete and correct.		
Signature of Owner or Authorized Representative: (sign in Blue Ink)		
MD Boivin	Date: 7/20/23	

IMPORTANT: Do not send via email or other electronic means. ORCAA must receive Original, hardcopy, signed application and payment prior to processing application.

OLYMPIC REGION CLEAN AIR AGENCY

WASHINGTON STATE DEPARTMENT OF ECOLOGY

FORM 7

PSD APPLICABILITY FORM

This form is an aid to help determine if a proposed project will be required to undergo PSD review. Please submit this form with the cover sheet of the Notice of Construction application to the Local Air Authority. For locations in eastern Washington where the Department of Ecology is the delegated local air authority, submit this form to the appropriate Ecology Regional Office.

It is the responsibility of the applicant to ensure that all preconstruction permits are obtained before commencement of construction.

COMPANY INFORMATION

Company or owner name: Pacific Northwest Renewable Energy - Port of Grays Harbor

Mailing address: P.O. Box 391
Sth Egrement, MA 01258

Facility address: 411 Moon Island Road
Hoquiam, WA 98550

Contact: Brandon Henderson

Telephone: (254) 813-3260

Facility industrial classification and SIC: 2499

PROCESS INFORMATION AND EMISSIONS CALCULATIONS

This section is intended to furnish a best estimate of annual emissions and sufficient information for agency technical staff to verify the applicant's conclusions in answering the questions in the next section. Please provide:

(1) A description of the process with a flow diagram indicating points of emissions to the air.

(2) Design and operating parameters for the process (i.e., hours of operation per year, maximum and normal production rates, fuel and raw material requirements).

(3) Estimates of the potential emissions for all air pollutants from each emissions point and a description of the method or basis used to make the emission estimates (in enough detail so that one can follow the logic and the calculation steps). Potential emissions are based on the maximum rate from each emission point taking into account air pollution control equipment.

For either a new or modified source, calculate its potential to emit each regulated pollutant based on operation at maximum capacity (such as 8760 hours/year) with emissions control equipment operating.

For a modified source, subtract the actual emissions of the existing source from the potential to emit of the modified source to calculate the emissions increase(decrease). Actual emissions are the average of the last 24 months of operation, if that period is representative of normal operations.

Regulated Pollutant Under PSD	Potential To Emit Tons/Year	Actual Emissions Tons/Year	Emissions Increase (Decrease)	Significant PSD Rate Tons/Year
Carbon Monoxide	185			100
Nitrogen oxides	230			40
Sulfur dioxide	18			40
Particulate matter PM_{10}	88 / 71			25 15
Ozone (VOCs)	67			40
Lead (elemental)	1.76E-03			0.6
Fluorides	--			3
Sulfuric acid mist	--			7
Total reduced sulfur (including H_2S)	--			10
Reduced sulfur compounds (including H_2S)	--			10
Municipal waste combustor organics Dioxins and furans Metals	--			 3.5×10^{-6} 15
Municipal waste combustor acid gasses	--			40

QUESTION 1

Does the proposed source or, in the case of a modification to a source, the existing source fall within one of the following 28 source categories?

1. Fossil fuel-fired steam electric plants of more than 250 million Btu/hr heat input
2. Coal cleaning plants with thermal dryers
3. Kraft pulp mills
4. Portland cement plants
5. Primary zinc smelters
6. Iron and steel mill plants
7. Primary aluminum ore reduction plants
8. Primary copper smelters
9. Municipal incinerators capable of charging more than 250 tons of refuse per day
10. Hydrofluoric acid plants
11. Sulfuric acid plants
12. Nitric acid plants
13. Petroleum refineries
14. Lime plants
15. Phosphate rock processing plants
16. Coke oven batteries
17. Sulfur recovery plants
18. Carbon black plants (furnace process)
19. Primary lead smelters
20. Fuel conversion plants
21. Sintering plants
22. Secondary metal production plants
23. Chemical process plants
24. Fossil fuel boilers (or combinations) totaling more than 250 million Btu/hr heat input
25. Petroleum storage and transfer units with a total storage capacity exceeding 300,000 barrels
26. Taconite ore processing plants
27. Glass fiber processing plants
28. Charcoal production plants

YES____ (Please circle number.) GO TO QUESTION 2.
NO x_____ GO TO QUESTION 3.

QUESTION 2
Will emissions of any one regulated pollutant (including fugitive emissions) from the proposed or existing source exceed 100 tons per year?
YES____ GO TO QUESTION 6.
NO_____ PSD IS NOT REQUIRED. DO NOT ANSWER ANY MORE QUESTIONS. SUBMIT THIS FORM WITH THE NOTICE OF CONSTRUCTION APPLICATION.

QUESTION 3
Does the proposed source or, in the case of a modification to a source, the existing source fall within one of the following source categories?
1. Municipal Incinerators (□ 50 tons/day)
2. Asphalt concrete plants
3. Storage vessels for petroleum liquids, □40,000 gallons, construction after 06/11/73 and prior to 05/19/78.
4. Storage vessels for petroleum liquids, □40,000 gallons, construction after 05/18/78
5. Sewage treatment plants with sludge incinerators
6. Phosphate fertilizer industry: Plants manufacturing wet-process phosphoric acid, superphosphoric acid, diammonium phosphate, triple superphosphate, and granular triple superphosphate storage facilities.
7. Glass melting furnace □4,555 kilograms glass/day, (except all electric melters)
8. Grain elevators
9. Stationary gas turbines □ 10.7 gigajoules/hour heat input
10. Lead acid battery manufacturing plants
11. Automobile and light-duty truck assembly plant surface coating operations

YES____ (Please Circle Number) GO TO QUESTION 4
NO x_____ GO TO QUESTION 5

QUESTION 4
Will the emissions of any one regulated pollutant (including fugitive emissions) from the proposed or existing source exceed 250 tons/year?

YES____ GO TO QUESTION 6
NO_____ PSD IS NOT REQUIRED. DO NOT ANSWER ANY MORE QUESTIONS. SUBMIT THIS FORM WITH THE NOTICE OF CONSTRUCTION APPLICATION.

QUESTION 5
Will emissions of any one pollutant (not including fugitive emissions) from the proposed or existing source exceed 250 tons per year?
YES____ GO TO QUESTION 6.
NO x____ PSD IS NOT REQUIRED. DO NOT ANSWER ANY MORE QUESTIONS. SUBMIT THIS FORM WITH THE NOTICE OF CONSTRUCTION APPLICATION.

QUESTION 6
Is the project located within 10 kilometers (6.2 miles) of the boundary of a Class I area? Class I areas in Washington State are Mount Rainier National Park, North Cascade National Park, Olympic National Park, Alpine Lakes Wilderness Area, Glacier Peak Wilderness Area, Goat Rocks Wilderness Area, Mount Adams Wilderness Area, Pasayten Wilderness Area, and the Spokane Indian Reservation.

YES____ PSD REVIEW IS REQUIRED IF THE IMPACT OF ANY REGULATED POLLUTANT IS EQUAL TO OR GREATER THAN 1 $\mu g/m^3$, (24-hour average).
NO_____ CONTINUE

QUESTION 7
Is the proposed project a
1. ____ new source? GO TO QUESTION 8.
2. ____ modification, expansion, or addition to an existing source? GO TO QUESTION 9.

QUESTION 8
For which regulated pollutants does the potential to emit of the new source exceed the PSD significant rate?
____
____

PSD REVIEW IS REQUIRED FOR THESE POLLUTANTS. YOU MUST MEET WITH THE DEPARTMENT OF ECOLOGY TO DISCUSS THE PSD APPLICATION PROCEDURE.

QUESTION 9
For which regulated pollutants do the emissions increase from the modified source exceed the PSD significant rate?
____
____

PSD REVIEW IS REQUIRED FOR THESE POLLUTANTS. YOU MUST MEET WITH THE DEPARTMENT OF ECOLOGY TO DISCUSS THE PSD APPLICATION PROCEDURE.

X new unit installation
____ modification

Manufacturer: TBD

Model & Serial #s: TBD

Technical Specifications (attach additional pages if needed)

Oxidizer Type:

____ catalytic oxidizer
X regenerative thermal oxidizer
____ recuperative thermal oxidizer
____ thermal (direct fired) oxidizer

Air Flow:

blower acfm 124031
blower hp ____
combustion retention time (sec.) ____
pressure drop (in. H_2O) 25

Burner:

type of fuel Natural Gas
maximum fuel usage 8 MMBtu/hr
gas inlet temperature (°F) 176
set point temperature (°F) 1500

For catalytic oxidizers:
1. What is the catalyst material?
2. What is the expected catalyst lifetime?
3. Describe the catalyst cleaning and replacement procedures and frequency.

For regenerative thermal oxidizers:
1. What is the media type? Ceramic
2. How many chambers are there and what are the chamber dimensions? 4 chambers. 11 feet wide by 23 feet long by 8 feet tall

For recuperative thermal oxidizers:
1. Describe the type of heat exchanger?
2. What are the dimensions of the combustion chamber?

For direct fired thermal oxidizers:
1. What are the dimensions of the combustion chamber?

Describe monitoring of oxidizer, including temperature, airflow, fuel consumption, and pressure drop. Include a description of the data analyzer and how records will be kept: TBD

Emissions

VOC control efficiency (%) > 95%
Maximum VOC emissions (ppm or lbs/hr) 6.575 lb/hr
Maximum NOx emissions (ppm or lbs/hr) 52 lb/hr
Maximum CO emissions (ppm or lbs/hr) 42 lb/hr

Exhaust Parameters

Stack height (feet) 90
Stack internal diameter (feet) 87 inches
Exhaust airflow (scfm) 103229
Exhaust temperature (°F) 131

Other Information

The following information is needed to complete the application:
1. Brochure or technical fact sheet from manufacturer or consultant. See Appendix D
2. Scaled technical drawings of the oxidizer, including location of thermocouple and other monitoring equipment. TBD
3. Plan of facility showing locations of oxidizer, stack, and nearby buildings (including maximum heights). See Appendix B
4. Describe any concentrators or particulate control devices associated with the oxidizer. 2 cyclone precleaners, wet electrostatic precipitator

2. Scaled technical drawings of the baghouse including top, side and interior views.
3. Manufacturer brochure or technical fact sheet for baghouse.

Note: See back side of form for ORCAA approved equipment and operations.

REQUIREMENTS FOR NEW BAGHOUSES
ORCAA 1/4/96

1. **BACT for Particulate Control:** ORCAA may require demonstration of compliance based on measured stack grain loading in accordance to the procedures outlined in 40CFR Part 60 and in accordance with ORCAA's approved particulate source test procedures.

1.1 Low Temperature Process Streams - Grain Elevators, Barley Processing, Forest Products Dust, Large Cabinet Shops:

Particulate Limit: 0.01 gr/dscf
Opacity Limit: 5% for entire process stream.

These limits are appropriate for low temperature dust control when NOMEX bags are feasible.

1.2 High Temperature Process Streams - Ceramics, Metal Dust:

Particulate Limit: 0.01 gr/dscf
Opacity Limit: 5% for entire process stream.

1.3 Combustion Sources - Boilers, Asphalt Plants:

Particulate Limit: 0.02 gr/dscf (back half included)

Opacity Limit: 5% for entire process stream.

2. **Stack**: Emissions shall exit through a vertical stack at least 2 meters above the highest point of the baghouse. Permanent sampling ports and platforms shall be installed on the stack prior to commencement of operation. The sampling ports shall meet the requirements of 40, CFR Part 60, Appendix A, Method 1.

3. **Opacity Monitor (wood fired boilers):** Owners and operators of baghouses installed on wood fired boilers shall install, calibrate, maintain, and operate a continuous emissions monitoring system (CEMS) for continuously monitoring the boiler stack gas opacity prior to exiting to the atmosphere.

3.1 The opacity CEMS shall be certified and installed in accordance 40CFR Part 60, Performance Specification 1 (appendix B).
3.2 The opacity CEMS shall be equipped with a strip chart recorder or data acquisition system (DAS) capable of computing and recording stack gas opacity in three consecutive minute averages. The data acquisition system or strip chart recorder shall record and display opacity values to 0.5% opacity.
3.3 Prior to installation of the CEMS, the owner or operator shall provide ORCAA a written manufacturers certificate of conformance with Performance Specification 1.
3.4 An opacity CEMS quality assurance plan conforming with 40 CFR Part 60 Appendix F and the EPA publication "Recommended Quality Assurance Procedures for Opacity Continuous Emissions Monitoring Systems" (EPA 340/1-86-010) shall be developed and submitted to ORCAA for approval no later than 180 days after commencement of operation.
3.5 The opacity CEMS shall be operational and tested for compliance with 40 CFR Part 60, Appendix B Performance Specification 1 no later than 90 days after initial startup.

4. **Other:** Other requirements include; 1) monitoring of pressure drop across baghouse, 2) bag monitoring and maintenance schedule, 3) full set of replacement bags on-site, 4) emission inventory reporting, and 5) excess emissions reporting.

4. Describe any concentrators or particulate control devices associated with the oxidizer. cyclones and combined cyclone/fabric filters

SEPA ENVIRONMENTAL CHECKLIST

A. Background

1. Name of proposed project, if applicable:

Port of Grays Harbor Plant Project

2. Name of applicant:

Pacific Northwest Renewable Energy (PNWRE)

3. Address and phone number of applicant and contact person:

Applicant:
Mark Boivin, CEO
PO Box 391 South Egremont, MA 01258
413.244.7360
mboivin@pnwrenewable.com

Contact:
Sharese Graham
1201 Third Ave, Suite 550, Seattle, WA 98101
206.739.5454
sharese.graham@scjalliance.com

4. Date checklist prepared:

June 14, 2023

5. Agency requesting checklist:

City of Hoquiam

6. Proposed timing or schedule (including phasing, if applicable):

Construction is anticipated to begin in January 2024.

7. Do you have any plans for future additions, expansion, or further activity related to or connected with this proposal? If yes, explain.

There are no plans for additional construction after commencement of normal operations identified in the project description.

8. List any environmental information you know about that has been prepared, or will be prepared, directly related to this proposal.

- Air Quality Analysis
- Contaminated Media Management Plan
- Federal Aviation Administration (FAA) Obstruction Review
- Phase I Environmental Site Assessment
- Wetlands and Streams Delineation (prepared for a previous proposal at the same site)
- Cultural Resources Assessment (prepared for a previous proposal at the same site)

9. Do you know whether applications are pending for governmental approvals of other proposals directly affecting the property covered by your proposal? If yes, explain.

There are no known pending applications for other projects or proposals directly affecting the property for this proposed project.

10. List any government approvals or permits that will be needed for your proposal, if known.

State Approvals/Permits

- ORCAA – Air Quality Permit
- Department of Ecology – National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Permit and Industrial Stormwater Permit
- FAA – Clearance Letter

Local Approvals/Permits

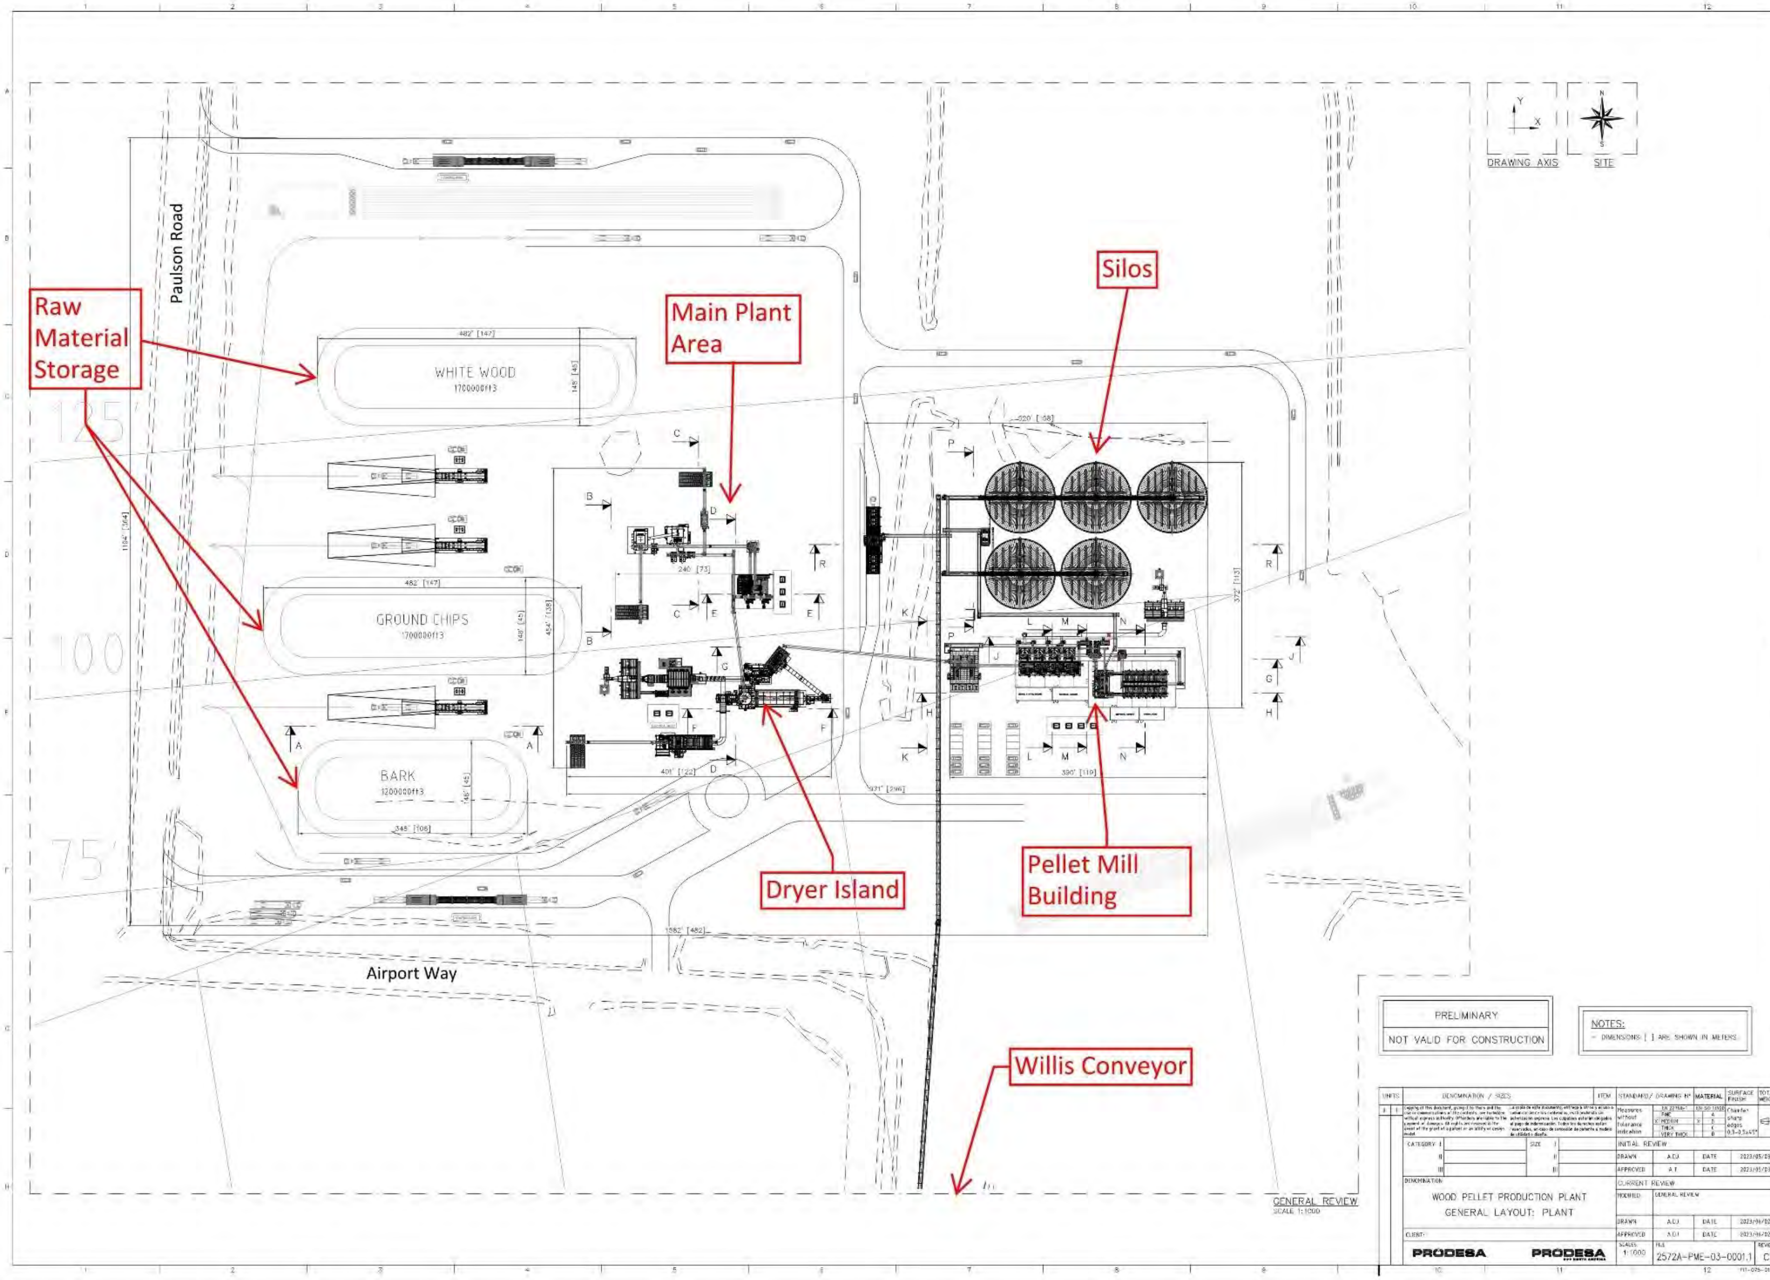
- City of Hoquiam – Zoning Conditional Use Permit, Critical Areas Review, Floodplain Permit, Construction Permits, Binding Site Plan
- Port of Grays Harbor – Approval of Operation Agreement and Lease Agreement

11. Give a brief, complete description of your proposal, including the proposed uses and the size of the project and site. There are several questions later in this checklist that ask you to describe certain aspects of your proposal. You do not need to repeat those answers on this page. (Lead agencies may modify this form to include additional specific information on project description.)

PNWRE is proposing to construct and operate a biomass facility (pellet plant) in Hoquiam, Grays Harbor County. Wood pellets will be manufactured at the project site and exported, via vessel, to international markets, including Asia and Europe. The adjacent chip mill site is expected to be one of the sources of raw material, thus reducing truck trips to and from the site.

The processing of wood chips at the proposed facility includes the use of three truck tippers, a chips cleaning line, two wet hammermills controlled by cyclones, one hog fuel furnace and dryer controlled by a wet electrostatic precipitator (WESP) and a regenerative thermal oxidizer (RTO), four dry hammermills each controlled by a cyclone, 12 pellet production and cooling lines controlled by two cyclones, and a regenerative catalytic oxidizer (RCO) controlling the combined dry hammermills and pellet cooling lines, five wood pellet storage silos, and a ship loadout area. The wet raw materials for pellet production and hog fuel for the furnace will be delivered to the facility via truck. The facility could process up to 440,800 tons per year (TPY) of dried wood pellets. The Project Site Plan is shown in Figure 1.

Figure 1 Project Site Plan



The steel silos (which are similar to grain silos) and conveyor will connect to the existing conveyor that leads from the Willis Enterprises chip plant to Terminal 3. The conveyor was recently renovated by Willis Enterprises. The storage silos will have a total capacity of up to 50,000 metric tons and shall aggregate pellets until enough volume is accumulated for bulk shipments of 20,000-45,000 metric tons per ship.

12. Location of the proposal. Give sufficient information for a person to understand the precise location of your proposed project, including a street address, if any, and section, township, and range, if known. If a proposal would occur over a range of areas, provide the range or boundaries of the site(s). Provide a legal description, site plan, vicinity map, and topographic map, if reasonably available. While you should submit any plans required by the agency, you are not required to duplicate maps or detailed plans submitted with any permit applications related to this checklist.

The project address is 411 Moon Island Road, TLN 056401000400, at the corner of Paulson Road and Airport Way near an existing wood chip plant (Willis Enterprises), and the Port of Grays Harbor Terminal 3 in the City of Hoquiam (Figure 2).

Figure 2 Project Location Map

B. Environmental Elements

1. Earth

a. General description of the site:

Circle or highlight one: Flat, rolling, hilly, steep slopes, mountainous, other:

The project site is generally bare, undeveloped ground.

The lowlands were formed by historic tidelands and riverine floodplains from the mainstem Hoquiam River and its major lower tributaries.

b. What is the steepest slope on the site (approximate percent slope)?

The steepest slope is less than 2%.

c. What general types of soils are found on the site (for example, clay, sand, gravel, peat, muck)? If you know the classification of agricultural soils, specify them, and note any agricultural land of long-term commercial significance and whether the proposal results in removing any of these soils.

The Natural Resource Conservation Service indicates the following soils in or near the project site:

- Fluvaquents, tidal, 24.0%
- Udorthents, level, 76.0%

The Project site was initially filled over 50 years ago. The initial fill included placement of sandy material dredged from Grays Harbor, while subsequent fill included angular rock used.

d. Are there surface indications or history of unstable soils in the immediate vicinity? If so, describe.

According to the City of Hoquiam, the project site is mapped as having High Liquefaction susceptibility. The capacity of soft soils to amplify earthquakes has been mapped by the Department of Natural Resources.

e. Describe the purpose, type, total area, and approximate quantities and total affected area of any filling, excavation, and grading proposed. Indicate source of fill.

Grading will be needed to prepare the building site, and other site components. Approximately 110,279 cubic yards of material will be excavated at the Project Site, from within an area approximately 46.5 acres in size, associated with construction of the facilities. A total of approximately 41.2 acres of the site will be graded to prepare the site.

Table 1 describes the grading quantities for the project site.

Table 1 Project Grading Quantities

Site Area	Depth of Excavation (feet)	Area of Excavation/Clearing (square feet)	Total Quantity (cubic feet)
Silos	8.2	49406	405,129
Pelleting line building		21797	178,735
Wet milling line building		5167	42,369
Truck dumper 1		1550	12,710
Truck dumper 2		1550	12,710
Truck dumper 3		1550	12,710
Rampa truck dumper 1	4.9	6329	31,012
Rampa truck dumper 2		6329	31,012
Rampa truck dumper 3		6329	31,012
Truck scale 1		1,507	7,384
Truck scale 2		1,507	7,384
Moving floor 1		1,130	5,537
Moving floor 2		1,130	5,537
Moving floor 3		1,130	5,537
Chips cleaning system		3,617	17,723
Drying island		51,150	250,635
Pelleting silos + RCO		5,328	26,107
North pound	2.0	35,715	71,430
South pound		27,728	55,456
Clearing for circulation, parking, etc.	1.0	1,795,689	1,795,689
		TOTAL CUBIC FEET	**3,005,818**
		(Cubic yards)	111,327

f. Could erosion occur because of clearing, construction, or use? If so, generally describe.

There is a minimal, temporary risk that short-term soil erosion will occur during construction as a result of grading and earthwork activities at the project site. There are no significant cumulative impacts to earth resources resulting from the project.

g. About what percent of the site will be covered with impervious surfaces after project construction (for example, asphalt or buildings)?

Around 16% of the site will be covered with impervious surfaces after completion of construction.

h. Proposed measures to reduce or control erosion, or other impacts to the earth, if any.

The use of construction Best Management Practices (BMPs) will reduce the minimal risks and will include the adherence to a Temporary Erosion and Sediment Control (TESC) plan. PNWRE will obtain a National Pollution Discharge Elimination System (NPDES) Construction Stormwater Permit and a City of Hoquiam grading permit prior to construction and grading activities at the project site.

2. Air

a. What types of emissions to the air would result from the proposal during construction, operation, and maintenance when the project is completed? If any, generally describe and give approximate quantities if known.

Air quality impacts at the project site resulting from construction are not expected to be significant. Construction activities could result in temporary, localized increases in particulate concentrations due to emissions from typical construction-related sources. Emissions from diesel equipment could temporarily reduce ambient air quality, but the project will use equipment that complies with applicable current regulations to minimize risk. Implementation of reasonable precautions during construction and compliance with regulations regarding engines, off-site odors, and off-site dust are expected to prevent significant air quality impacts. Additionally, compliance with the Olympic Regional Clean Air Agency (ORCAA) permit will be required.

Operational air impacts from the project will result from equipment and vehicle emissions. Particulate matter and visible emissions will be emitted during facility, vehicle, and vessel operations.

Stationary sources of diesel particulate matter (DPM) would be emitted at rates greater than regulatory de minimis levels by the emergency generator and diesel engines that power the emergency fire water pumps, but these sources would only operate during an emergency, and would fall within acceptable cancer risk and ORCAA thresholds.

Mobile DPM source emissions would result from diesel-powered trucks and marine bulk vessels traveling to and from the Project Site to deliver fiber feedstock and receive pellets respectively. Feedstock will be trucked to the site each day. It is assumed that construction workers will contribute to a temporary increase in traffic in the area.

Although the final number of truck movements will depend on the capacity of trailers, compaction rates of fiber feedstock (mill and harvest residuals) and pellets, it is estimated that at full operations, approximately 128 trucks per day, operating 7 days per week, will serve the site.

Trucks delivering fiber feedstock to the terminal, and vessels carrying the product from the Project Site, will be operated by third parties. Total GHG emissions from the Project would represent minor contributions to local, regional, and global GHGs and would not be a significant source of emissions when compared to standard benchmarks.

The project will induce emissions of air contaminants in the region, thereby requiring an approved Notice of Construction (NOC) application from the Olympic Region Clean Air Agency (ORCAA). The facility is not expected to generate criteria pollutant emissions in quantities that would trigger the need for a Prevention of Significant Deterioration (PSD) permit but is anticipated to trigger the need for a Title V Air Operating Permit. The facility would be an area source of hazardous air pollutants (HAP) as potential emissions of each individual HAP are less than the applicable major source threshold of 10 TPY. Total HAP is less than the combined HAP major source threshold of 25 TPY.

b. Are there any off-site sources of emissions or odor that may affect your proposal? If so, generally describe.

There are no known off-site emissions or odors that may affect the proposed project.

c. Proposed measures to reduce or control emissions or other impacts to the air, if any.

Implementation of reasonable precautions during construction and compliance with regulations regarding engines, off-site odors, and off-site dust are expected to prevent significant air impacts. Additionally, the contractor will comply with the ORCAA permit.

3. Water

a. Surface Water:

1. **Is there any surface water body on or in the immediate vicinity of the site (including year-round and seasonal streams, saltwater, lakes, ponds, wetlands)? If yes, describe the type and provide names. If appropriate, state what stream or river it flows into.**

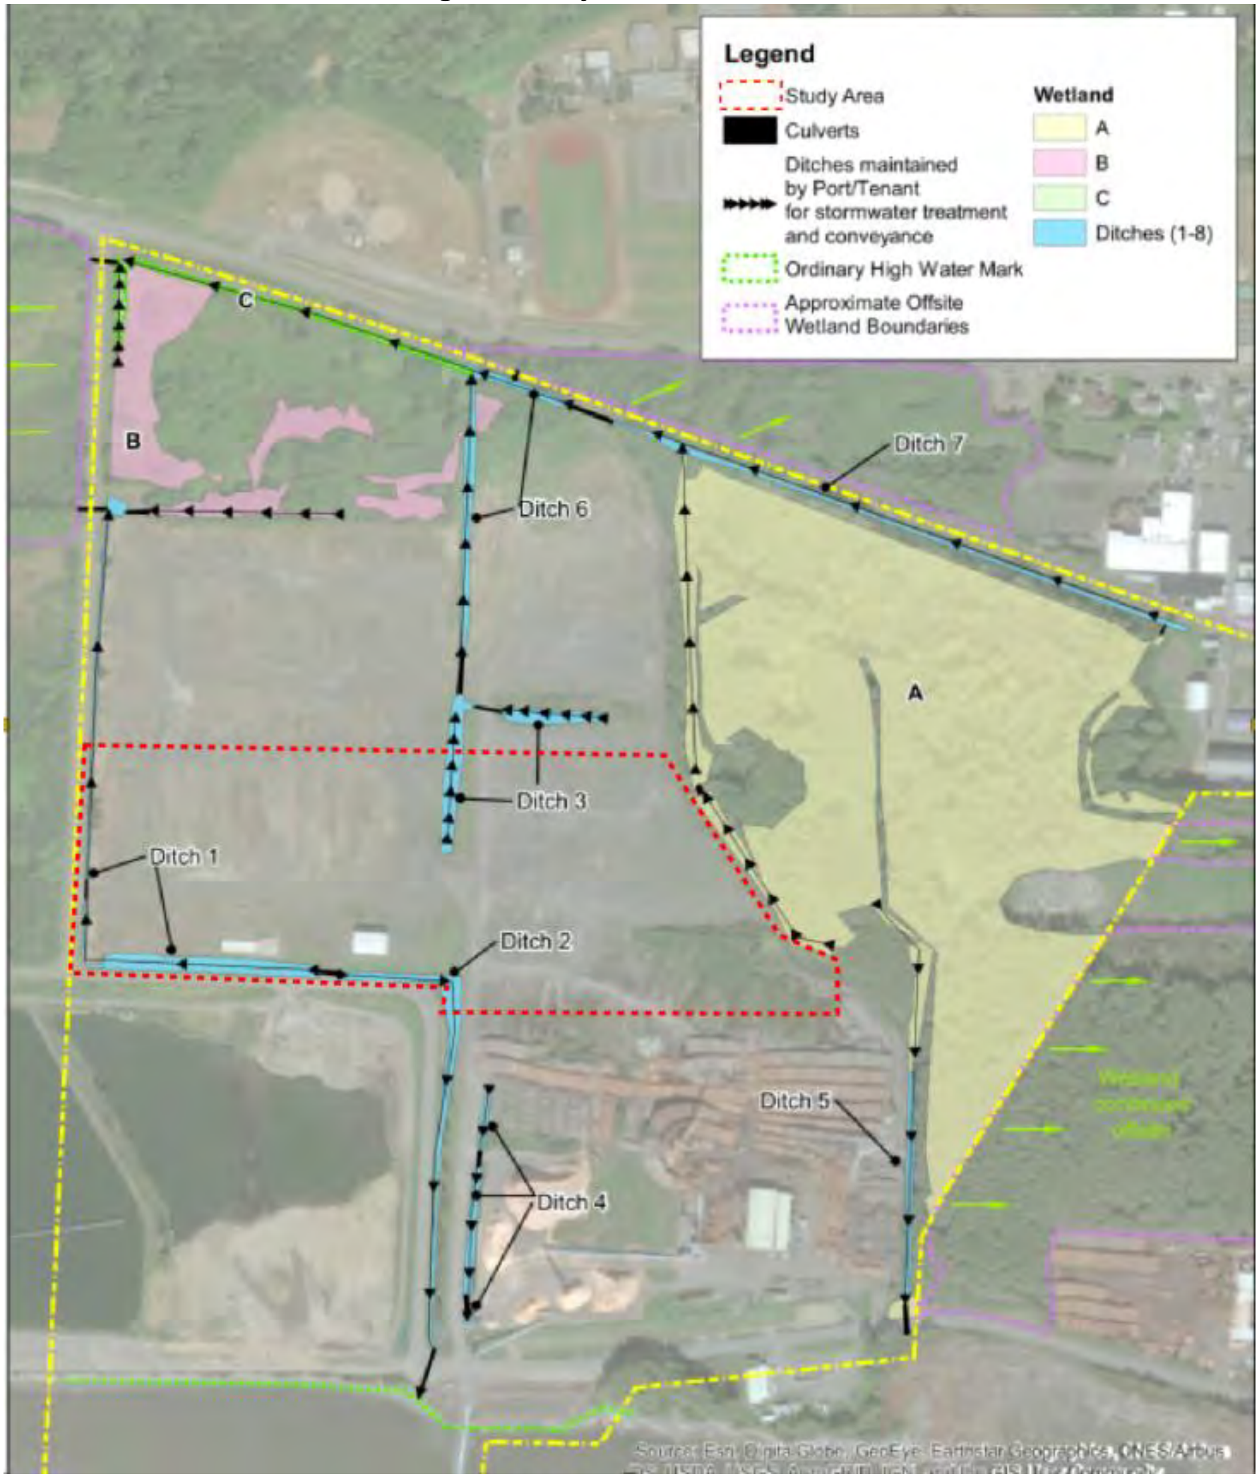
The following is a summary of the Wetland and Waterbody Delineation and Assessment Report (WSP, 2019), which was conducted for a previously proposed potash export facility (proposed by BHP but not constructed) that was included on the subject parcel.

Wetland A (offsite) is directly to the west of the Project Area. Wetland B and C are north of the Project site. Based on the City's SMP (HMC 11.05) which establishes buffers for all regulated wetlands, there is a 150-foot buffer associated with Wetland A. Ditches are exempt from regulation as wetland under the SMP, and as such, they do not have a regulatory buffer.

According to the *Wetland and Waterbody Delineation and Assessment Report* (BergerABAM, December 2017), there are wetlands offsite to the north and west and three ditches (Ditches 1, 2 and 3) within the Project Area. The water features are shown on Figure 3.

Ditch #1 is a shallow ditch that runs parallel to the north side of a portion of Airport Way. And then continues north along the east side of Paulson Road. The ditch collects stormwater and runoff from the western half of the site and conveys it north to an outfall at the north end of the ditch which conveys water to the Refuge to the west. This ditch was constructed as part of the NPDES general permit (WAR000130), to convey treated stormwater to an outfall to the west toward the Refuge and Grays Harbor. Vegetation identified in Ditch 1 includes reed canary grass, soft rush, colonial bent grass, velvet grass, white clover, horsetail, and cattail, among other species. Soils within this ditch exhibited primary indicators of hydrology at the time of the field investigations, as well as indicators of hydric soil conditions.

Figure 3 Project Water Features



Ditch #2 is a shallow ditch that flows east along Airport way, and then south along the eastern side of Paulson Road. Ditches #1 and #2 are hydrologically isolated from one another by a rock-filled driveway/access. This ditch was constructed as part of NPDES general permit (WAY000132), to convey treated stormwater to an outfall south of the study area along Grays Harbor shoreline. Vegetation, hydrology, and soil conditions are similar to those in Ditch #1.

Ditch #3 consists of two wide, shallow ponds/swales located near the center of the study area. These two ponds are hydrologically connected by a culvert, though the culvert is currently in disrepair. These ponds were created as part of NPDES general permit (WAR000131), for the purpose of detaining and treating stormwater and then conveying it northward toward similar drainage features excavated into Wetlands B and C, and ultimately on to waters of Grays Harbor through the outlet in the northwest corner of Wetland C. Vegetation, hydrology, and soil conditions in the ponds that comprise Ditch #3 are similar to those species present in Ditch #1 and Ditch #2. At the time of the site investigation, the eastern pond appears to have had a recent modification in hydrologic regime, as most of the vegetation, including several willows, has died.

The project has been designed to avoid all direct impacts to the water features described.

2. Will the project require any work over, in, or adjacent to (within 200 feet) the described waters? If yes, please describe and attach available plans.

The project will not require any work over, nor within 200 feet, of state shorelines.

3. Estimate the amount of fill and dredge material that would be placed in or removed from surface water or wetlands and indicate the area of the site that would be affected. Indicate the source of fill material.

There will be no fill or dredge material that would be placed in or removed from the surface water or wetlands.

4. Will the proposal require surface water withdrawals or diversions? Give a general description, purpose, and approximate quantities if known.

The project will not require any surface water withdrawal or diversion.

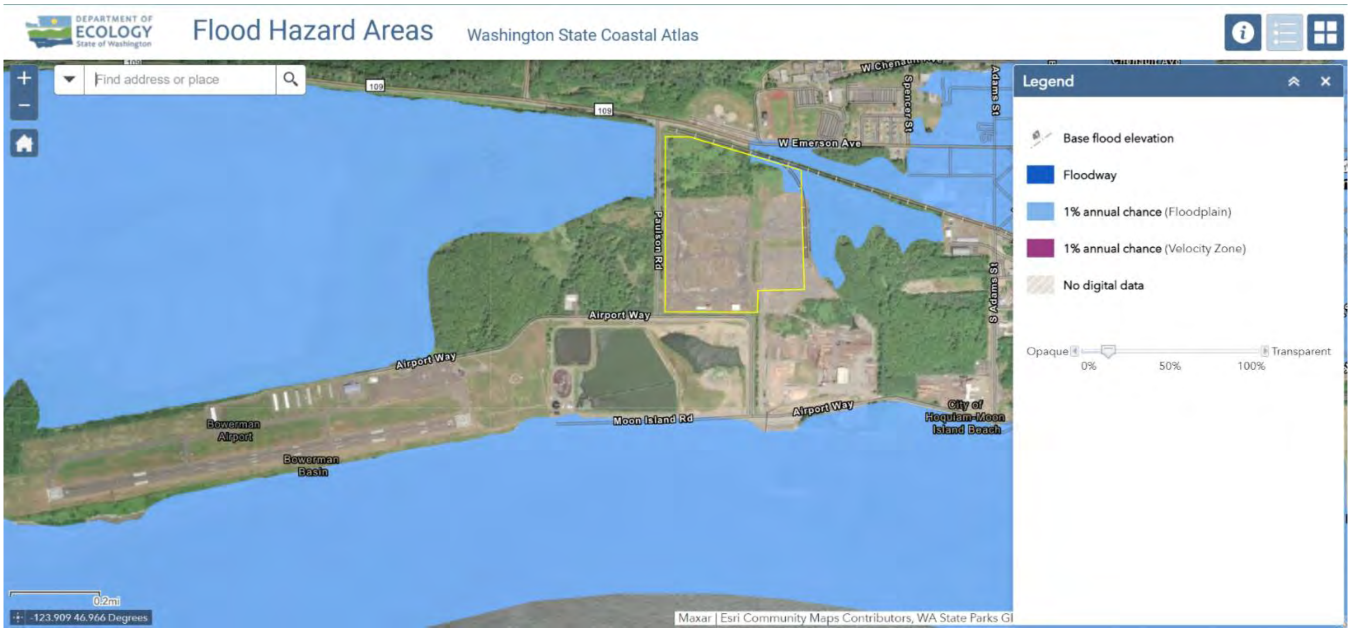
5. Does the proposal lie within a 100-year floodplain? If so, note the location on the site plan.

A small portion of the northeast corner of the parcel is within the 1% annual chance floodplain, but that section is outside of the project footprint (Figure 4)

6. Does the proposal involve any discharge of waste materials to surface waters? If so, describe the type of waste and anticipated volume of discharge.

The project does not involve any discharge of waste materials to surface waters.

Figure 4 Flood Hazard Areas



b. Ground Water:

1. **Will groundwater be withdrawn from a well for drinking water or other purposes? If so, give a general description of the well, proposed uses and approximate quantities withdrawn from the well. Will water be discharged to groundwater? Give a general description, purpose, and approximate quantities if known.**

No groundwater will be withdrawn from a well for drinking water or other purposes. The City of Hoquiam's municipal drinking water will be used on the project site.

2. **Describe waste material that will be discharged into the ground from septic tanks or other sources, if any (domestic sewage; industrial, containing the following chemicals…; agricultural; etc.). Describe the general size of the system, the number of such systems, the number of houses to be served (if applicable), or the number of animals or humans the system(s) are expected to serve.**

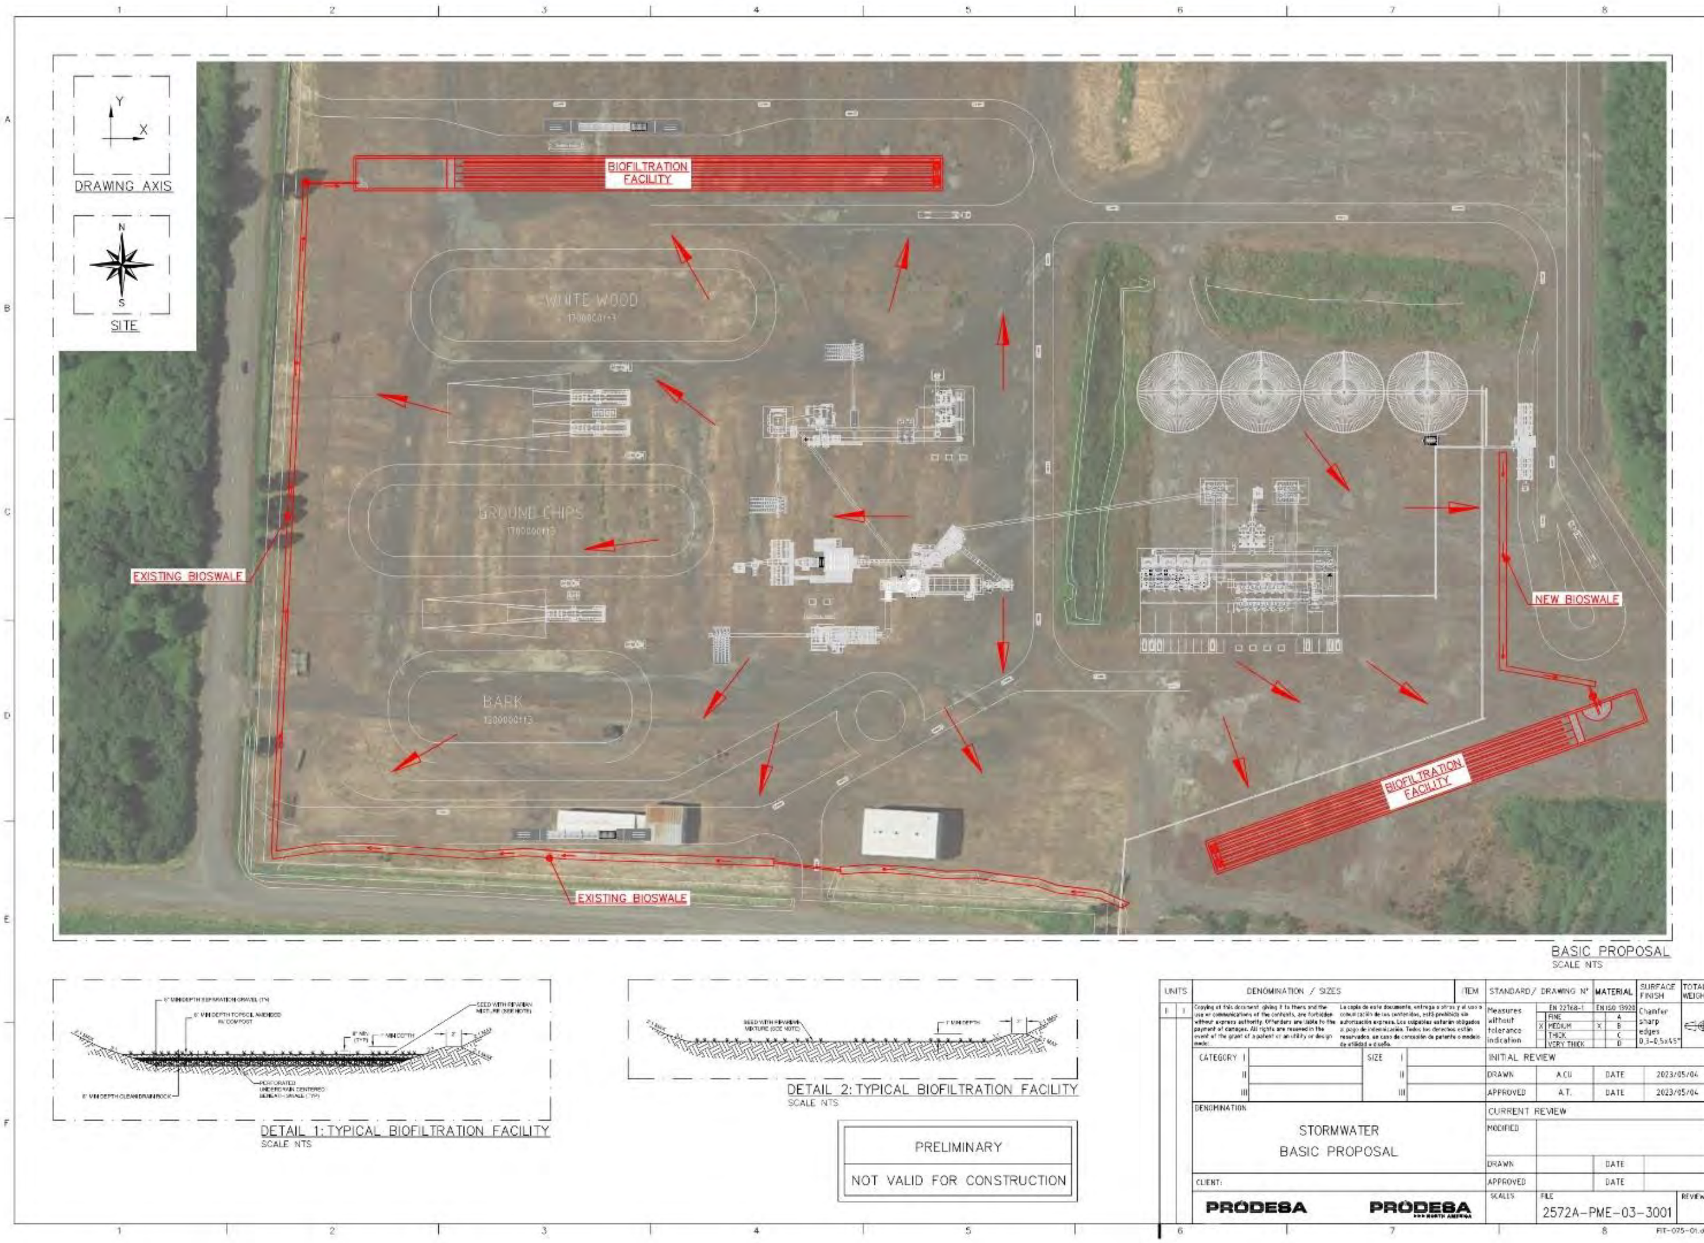
No waste material will be discharged into the groundwater from septic tanks or other sources.

c. Water Runoff (including stormwater):

1. **Describe the source of runoff (including storm water) and method of collection and disposal, if any (include quantities, if known). Where will this water flow? Will this water flow into other waters? If so, describe.**

A stormwater basic proposal is provided below, which depicts the locations of two biofiltration facilities, one existing bioswale, and one new bioswale (Figure 5).

Figure 5 Stormwater Plan



Stormwater runoff during construction will be managed through implementation of BMPs consistent with construction stormwater permit requirements and plans, and may include the following:

- Construction activities will be conducted in compliance with Ecology's construction stormwater NPDES permit requirements, the Surface Water Quality Standards for Washington (WAC 173-201A), or other conditions as specified in the Water Quality Certificate (WQC).
- Project construction will be completed subject to a water quality certification and in compliance with Washington State Water Quality Standards (WAC 173-201A), including limits on turbidity.
- Petroleum products, fresh cement, lime, concrete, chemicals, or other toxic or deleterious materials will not be allowed to enter into surface waters or onto land where there is a potential for reentry into surface waters.
- Fuel hoses, oil drums, oil or fuel transfer valves, fittings, etc., will be checked regularly for leaks, and materials will be maintained and stored properly to prevent spills.
- The contractor will prepare a Spill Prevention Control and Countermeasure (SPCC) plan and use it during all in-water demolition and construction operations. A copy of the plan will be maintained at the work site.
- The SPCC plan will outline BMPs, responsive actions in the event of a spill or release, and notification and reporting procedures. The plan will also outline management elements, such as personnel responsibilities, Project Site security, site inspections, and training.
- The SPCC plan will outline the measures to prevent the release or spread of hazardous materials found on site and encountered during construction but not identified in contract documents, including any hazardous materials that are stored, used, or generated on the construction site during construction activities. These items include, but are not limited to, gasoline, diesel fuel, oils, and chemicals.
- Applicable spill response equipment and material will be designated in the SPCC plan.

2. Could waste materials enter ground or surface waters? If so, generally describe.

Stormwater at the site has a low potential to be impacted; cleanup of any spills of dry material in the facility would be accomplished with vacuum equipment and the material would be returned to product storage, loaded into the vessel, or disposed off-site.

3. Does the proposal alter or otherwise affect drainage patterns in the vicinity of the site? If so, describe.

The project will not alter or otherwise affect drainage patterns in the vicinity of the project site.

4. Proposed measures to reduce or control surface, ground, and runoff water, and drainage pattern impacts, if any.

The project will include the following mitigation measures to reduce impacts associated with stormwater runoff below the level of significance:

- The proposed stormwater detention and treatment facilities have been designed at two locations (shown on stormwater basic proposal above) to preserve existing drainage patterns to the largest extent possible.

- The project will comply with City of Hoquiam stormwater regulations (HMC 11.05).
- The project will include new stormwater detention and treatment ponds to provide flow control and water quality treatment of stormwater, if necessary, before discharge through existing outfalls on the site.
- Catch basins will be blocked in the event of a pellet spill, and potentially impacted runoff will be contained and discharged to the wastewater system or to an approved disposal facility.
- Stormwater management will be conducted and managed in accordance with state and local regulatory requirements.

The project will comply with the following measures to protect water resources during project operations:

- Secondary containment will be provided at the onsite fueling station to contain any accidental releases.
- The facility will control risks during operations by following the industrial Stormwater Pollution Prevention Plan (SWPPP) and SPCC plan to prevent liquid products from leaving the containment areas. Spill kits will be placed in strategic and easily accessible locations for use if small spills occur; containment, control, and cleanup procedures will be immediately implemented, including notifying Ecology and other resource agencies as required by law.
- Stormwater treatment facilities would infiltrate stormwater runoff from new and existing impervious surfaces to the extent possible, or the stormwater runoff will be collected, treated, and discharged to the bay via existing outfalls. Stormwater treatment would comply with the most current version of Ecology's Stormwater Management Manual for Western Washington.
- The wood biomass pellets will be transferred to the product storage building and vessels via covered conveyors in order to protect pellets from rain exposure and avoid fiber feedstock or pellets blowing or spilling from the conveyors. Spill pans and side skirts will contain spills or fugitive dust from the return belt.
- All equipment will be routinely checked for leaks and other problems that could result in the discharge of petroleum-based products or other materials into the waters of Grays Harbor.
- Pellet spills on land will be cleaned up by sweeping, vacuum truck, or other means, and returned to product storage or disposal.

4. Plants

a. Check the types of vegetation found on the site:

☒ **deciduous tree: alder, maple, aspen, other**
☐ **evergreen tree: fir, cedar, pine, other**
☒ **shrubs**
☒ **grass**
☐ **pasture**
☐ **crop or grain**
☐ **orchards, vineyards, or other permanent crops.**
☐ **wet soil plants: cattail, buttercup, bullrush, skunk cabbage, other**
☐ **water plants: water lily, eelgrass, milfoil, other**
☒ **other types of vegetation**

b. What kind and amount of vegetation will be removed or altered?

The impacts to onsite vegetation at the project site have been minimized and avoided to the extent practicable by locating buildings and roads in previously disturbed areas where possible; however, the majority of the site has been previously disturbed and will be cleared for construction of the new facility. The project will require the removal and/or alteration of all vegetation that is within the footprint.

c. List threatened and endangered species known to be on or near the site.

The US Fish and Wildlife Service (USFWS) Information for Planning and Consulting (IPaC) tool does not indicate the presence of any threatened or endangered plant species known to be on or near the project site.

d. Proposed landscaping, use of native plants, or other measures to preserve or enhance vegetation on the site, if any.

Prior to the issuance of building permits, PNWRE will develop a landscape design for the project to control erosion and to satisfy the City of Hoquiam Landscaping and Screening ordinance (HMC 10.05.065).

e. List all noxious weeds and invasive species known to be on or near the site.

Reed canary grass and Himalayan blackberry were both identified in the project vicinity.

5. Animals https://ecology.wa.gov/Regulations-Permits/SEPA/Environmental-review/SEPA-guidance/SEPA-checklist-guidance/SEPA-Checklist-Section-B-Environmental-elements/Environmental-elements-5-Animals

a. List any birds and other animals that have been observed on or near the site or are known to be on or near the site.

Examples include:

- **Birds:** hawk, heron, eagle, songbirds, other: osprey
- **Mammals:** deer, bear, elk, beaver, other:
- **Fish:** bass, salmon, trout, herring, shellfish, other:

b. List any threatened and endangered species known to be on or near the site.

Information regarding listed species was obtained from the U.S. Fish and Wildlife Service (USFWS) Information Planning and Consultation (IPaC), the WDFW database Priority Habitats and Species (PHS) on the Web and SalmonScape, and NOAA Fisheries Northwest Region website. Table 2 identifies the species listed under the ESA that have the potential to occur within or near the Project Site.

Table 2 ESA-listed Species in the Project Area

Species Name	ESA Listing Status	Critical Habitat
Birds		
Marbled Murrelet (*Brachyramphus marmaroatus*)	Threatened	None
Western Snowy Plover (*Charadrius nivosus nivosus*)	Threatened	None
Yellow-billed Cuckoo (*Coccyzus americanus*)	Threatened	None
Fishes		
Bull Trout (*Salvelinus confluentus*)	Threatened	None
Insects		
Monarch Butterfly (*Danaus plexippus*)	Candidate	None

c. Is the site part of a migration route? If so, explain.

The City of Hoquiam is located in the Pacific Flyway, which extends from Mexico northward into Canada and the state of Alaska. Non-ESA listed migratory birds that are likely to be found in the area include but are not limited to: eagles, osprey, swifts, gulls, grebes, grosbeaks, flycatchers, hummingbirds, and dowitchers.

d. Proposed measures to preserve or enhance wildlife, if any.

According to the Biological Evaluation (WSP, May 2019) and Critical Areas Assessment (WSP, July 2019), birds, fish, and mammals may experience minimal, temporary impacts during construction, increased vessel traffic, noise, and construction lighting, but these impacts do not rise to a level of significance.

Even though the impacts to animals are not considered significant, PNWRE has incorporated mitigation measures into its Project to minimize water quality and noise impacts, which will also reduce construction impacts to terrestrial animals.

Construction activities with the potential to affect nesting migratory birds, such as tree and vegetation removal, would be conducted consistent with the provisions of the Migratory Bird Treaty Act (MBTA), which requires that nests of migratory birds be removed only at times when nests are inactive. Tree and vegetation removal would be conducted outside the active nesting season to the extent practicable. If any tree or vegetation removal is required within the time when nests could potentially be active (generally January to August), pre-disturbance nest surveys would be conducted to document whether any trees or vegetation to be removed contain active nests.

An osprey nest that is located on a power pole on the western boundary of the site may be affected by the project, so it will be relocated when the nest is inactive as part of the project, in accordance with USFWS best practices. Finally, to minimize the likelihood that vehicles will strike wildlife during construction, PNWRE will require that construction contractors operating vehicles receive training for awareness and avoidance of wildlife in the area.

Because the Project is located in a developed, industrial area, no significant, adverse environmental impacts to birds, fish, and mammals are anticipated from the Project's operation. The Project may slightly increase the impacts from truck traffic, noise, and lighting, but these impacts do not rise to a level of significance.

e. List any invasive animal species known to be on or near the site.

There are no known invasive animal species known to be on or near the site.

6. Energy and Natural Resources

1. What kinds of energy (electric, natural gas, oil, wood stove, solar) will be used to meet the completed project's energy needs? Describe whether it will be used for heating, manufacturing, etc.

Construction of the project will require the use of electric, natural gas, and petroleum fuels.

The project will use electric and natural gas energy to meet the completed project's needs. The electricity will be provided by Grays Harbor Public Utilities District and will power conveyors, rotating equipment, the WESP/RTO/RCO/Drying system, the ship loader, other equipment, and support facilities (e.g., heating, lighting, etc.) needed to operate the site. The site will also include emergency diesel powered generators and fire pumps. These will be used only when power is not available to the site in an emergency or during a fire and during routine testing. The generators will only supply power to safely shut down the facility and not to operate all systems.

The biomass drying system will use natural gas to start-up the grate furnace, operate the RTO, and operate the RCO. PNWRE estimated the energy consumption for the proposed biomass export facility for use in the air quality and GHG analysis. The total energy consumption is estimated to be 18.5MW.

2. Would your project affect the potential use of solar energy by adjacent properties? If so, generally describe.

The project includes the construction of five, 105-foot diameter by 102-foot-high silos, which will be the largest structures on the site. The silos would not interfere with the use of solar energy by adjacent properties, nor would any other part of the project.

3. What kinds of energy conservation features are included in the plans of this proposal? List other proposed measures to reduce or control energy impacts, if any.

Energy conservation measures that will be part of the facility design will include the following.

- Compliance with the Washington State Energy code.
- Selecting energy-efficient equipment, including electrical motors designed for energy efficiency.
- Using LED lighting at the site

7. Environmental Health

a. Are there any environmental health hazards, including exposure to toxic chemicals, risk of fire and explosion, spill, or hazardous waste, that could occur because of this proposal? If so, describe.

A Phase I Environmental Site Assessment (Phase I) was performed by Stantec Consulting Services, Inc. and is summarized in this section (Stantec, May 11, 2023).

The property was tidal mudflats until the early 1970s when dredged material was used to raise the surface grade and rock was imported for surfacing material. Aerial photographs indicate the Subject Property was used for lumber storage for most of the 1980s and 1990s. Lumber storage was phased out in the late 1990s and there has been no apparent use since that time.

The site has two prefabricated metal buildings located along Airport Way. The buildings appear to have been constructed in the late 1970s or early 1980s and were used for office space, storage space, and vehicle maintenance. The buildings have not been used in approximately 25 years and are currently in poor condition. There is a small wood-frame building associated with truck scales on the north side of the westernmost building.

During the construction of the plant, silos and new conveyor system, the contractor will adhere to the City of Hoquiam's noise, dust, vibration, and hazardous waste standards.

The environmental health hazards within the plant are noise, vibration, dust, and potential for fire. The specialized equipment and techniques will be implemented to limit dust emission, degradation in storage, self-heating and potential ignition. The plant, storage, and conveyor systems will be constructed to meet all the relevant safety guidelines. See Noise section, below, for relevant standards.

The Project will adhere to the City of Hoquiam Air Quality Standards (10.05.120, Chapter 70.94, 173-400 through 173-401, and 173-460 WAC).

The Project will adhere to the City of Hoquiam's Vibration and Concussion standards, which state that no use on a parcel shall generate vibration or concussion that other parcels can detect without the aid of instruments except during periods of construction (Ord. 04-07 §19, 2004; Ord. 00-09 §4, 2000).

The Project will adhere to the City of Hoquiam's Use and Storage of Hazardous Substances. The use and/or storage of hazardous substances, as defined in RCW 70.105.010(14) shall be permitted only in the C-1, C-2, and I district. All hazardous substances shall be stored and/or transported in approved containers that prevent any leakage to the air, earth, and/or surface or ground water.

The Project is not anticipated to have impacts from spills, noise, or vibration associated with construction or the completed project.

1. **Describe any known or possible contamination of the site from present or past uses.**

The Project site appears on the Recovered Government Archive State Hazardous Waste Site (RGA HWS) List. The listing is dated 1995 and this corresponds to the Project area's use as a log and lumber storage yard for the adjoining Rayonier mill. The Rayonier mill is listed as having had previous soil and groundwater impacts from petroleum products, lead, PCBs, and dioxins and furans. The facility was also included on the CSCSL list. Ecology's Site Cleanup Details database indicates that the initial investigation of the Rayonier facility was conducted in July 1992 and Ecology issued an Early Notice Letter in September 1992. The database information indicates that confirmed impacts to soil from petroleum, lead, PCBs, dioxins, and groundwater impacts from petroleum and lead were remediated and the facility received a No Further Action (NFA) determination in January 2002. The reports reference sampling and remedial excavation of soil in the "east ditch" along Airport Way and remedial excavation of lead-impacted soil from the maintenance area. The NFA Letter references several investigations and reports beginning in September 1992 reviewed towards the NFA determination.

2. **Describe existing hazardous chemicals/conditions that might affect project development and design. This includes underground hazardous liquid and gas transmission pipelines located within the project area and in the vicinity.**

Phase I identified the presence of arsenic in groundwater and dioxins/furans in soil above their applicable allowable levels. No other contaminants were identified. All soil excavated during construction will be handled and disposed of in accordance with the Contaminated Media Management Plan prepared for the project. Soil excavated as part of Project development will be isolated and stored on an impervious layer prior to disposal offsite at an approved facility.

3. **Describe any toxic or hazardous chemicals that might be stored, used, or produced during the project's development or construction, or at any time during the operating life of the project.**

Construction equipment will use petroleum-based fuels and petroleum- or vegetable- based lubricants. The contractor will prepare and implement an SPCC plan to avoid, minimize, and, if necessary, respond to fuel and lubricant releases during construction. Toxic or hazardous chemicals will be stored within containment. Basic safety measures for storage of any chemicals are detailed on the individual safety data sheets, and PNWRE will follow those prevention, response, and storage directions.

Because fiber feedstock is not a hazardous substance, the risks to human health and the environment from a fiber feedstock spill are low. Generally, any fiber feedstock spill is likely to be of a small quantity (from a trace amount to pounds) and would be readily cleaned up due to Project design (impervious surfaces at points where spill could occur). The risk of a marine spill is low based on the Project's location relative to the marine environment. The risk of a truck spill is highest on the Project Site, but truck speeds and impervious site conditions would minimize the risk of spill and allow for cleanup to occur should a spill occur.

4. **Describe special emergency services that might be required.**

Fire suppression equipment (sprinklers) will be installed and used throughout the process. Buildings will comply with local and Washington State requirements for fire suppression systems. The storage silos will be designed with nitrogen injections systems. No special emergency services are anticipated at this time.

5. **Proposed measures to reduce or control environmental health hazards, if any.**

No additional measures to reduce or control environmental health hazards beyond those previously mentioned are required.

b. Noise

1. **What types of noise exist in the area which may affect your project (for example: traffic, equipment, operation, other)?**

Noise in the project area is generated by adjacent uses and includes heavy equipment, rotating equipment operation, conveyance equipment, marine shipping traffic, vehicle traffic, and air traffic from a nearby airport. There is no noise in the area that is anticipated to affect the project.

2. **What types and levels of noise would be created by or associated with the project on a short-term or a long-term basis (for example: traffic, construction, operation, other)? Indicate what hours noise would come from the site)?**

Noise would be generated during construction from the use of equipment such as:

- Bulldozers
- Front-End Loaders
- Cranes
- Excavators
- Road Graders
- Dump Trucks
- Semi-Trucks
- Pile Driving Equipment
- Concrete trucks
- Skid Steer

After construction, operation of the facility would be a new source of noise. The primary source of noise would be operation of the hammermill equipment. The estimated noise levels for planned equipment are shown in Table 3 below. The facility will include noise suppression within the plant to minimize the effects offsite.

Table 3 Equipment Noise Levels

Equipment	Noise Level	Placement
Wet Hammer mill	100 dBA	Outdoor

Wet Hammer mill fan	88 dBA	Outdoor
Dry Hammer mill	96 dBA	Indoor
Dry Hammer mill fan	85 dBA	Outdoor
Pellet mill	93 dBA	Indoor
Cooler fan	97 dBA	Indoor

The land used immediately adjacent to the site is mostly industrial in nature and would not be affected by the noise from the pellet plant. There is a forested area between the facility and the schools and residences to the northeast of the railroad tracks that will provide a noise buffer.

3. Proposed measures to reduce or control noise impacts, if any.

Construction of the project would adhere to City of Hoquiam code (HMC 3A.30.010) for the generation of construction noise only between the hours of 7:00 am through 8:00 pm. Noise minimization methods will include prohibiting pure-tone backup alarms, restrictive diesel-powered equipment locations, using continuous loading methods, and installing temporary noise barriers.

Equipment at the completed plant will be mounted to isolation pads to reduce vibration and sound impacts.

8. Land and Shoreline Use

a. What is the current use of the site and adjacent properties? Will the proposal affect current land uses on nearby or adjacent properties? If so, describe.

The Project is located in an existing industrial area zoned and designated for industrial use by the Hoquiam Municipal Code (HMC) and Comprehensive Plan and designated as High Intensity by the Shoreline Master Program. The Project will have no significant, adverse environmental impacts to land and shoreline use because it will comply with the policies and regulations of the Hoquiam Municipal Code and Shoreline Master Program. The Project is outside of the Shoreline Buffer. The Project will not affect current land uses nearby or adjacent properties.

b. Has the project site been used as working farmlands or working forest lands? If so, describe. How much agricultural or forest land of long-term commercial significance will be converted to other uses because of the proposal, if any? If resource lands have not been designated, how many acres in farmland or forest land tax status will be converted to nonfarm or nonforest use?

The project site has not been used as working farmlands or working forest lands.

1. Will the proposal affect or be affected by surrounding working farm or forest land normal business operations, such as oversize equipment access, the application of pesticides, tilling, and harvesting? If so, how?

The Project will not affect or be affected by surrounding working farm or forest land normal business operations.

c. Describe any structures on the site.

The site has two prefabricated metal buildings located along Airport Way. The buildings appear to have been constructed in the late 1970s or early 1980s and were used for office space, storage space, and vehicle maintenance. The buildings have not been used in approximately 25 years and are currently in poor condition. There is a small wood-frame building associated with truck scales on the north side of the westernmost building.

d. Will any structures be demolished? If so, what?

All structures on the site will be demolished.

e. What is the current zoning classification of the site?

The site is zoned as Industrial.

f. What is the current comprehensive plan designation of the site?

The site has a comprehensive plan designation of Industrial.

g. If applicable, what is the current shoreline master program designation of the site?

The project site is not within the shoreline zone.

h. Has any part of the site been classified as a critical area by the city or county? If so, specify.

According to the City of Hoquiam's Comprehensive land Use Plan (February 2009), HMC 11.05.830 states "The city does not contain any critical aquifer recharge areas." Therefore, CARAs will not be impacted by the project.

The Project area is classified as a Tsunami hazard zone. The Project site also is mapped as having High Liquefaction susceptibility. The capacity of soft soils to amplify earthquakes has been mapped by DNR.

The Project site is mapped class D to E, as susceptibility to earthquake damage.

i. Approximately how many people would reside or work in the completed project?

No people would reside at the Project Site. The completed facility will employ approximately 52 employees.

j. Approximately how many people would the completed project displace?

The project will not displace anyone.

k. Proposed measures to avoid or reduce displacement impacts, if any.

No measures are required.

l. Proposed measures to ensure the proposal is compatible with existing and projected land uses and plans, if any.

The Project is consistent with existing land uses and the current Hoquiam Comprehensive Plan and zoning requirements.

m. Proposed measures to reduce or control impacts to agricultural and forest lands of long-term commercial significance, if any.

The project will not affect any agricultural or forest lands.

9. Housing

a. Approximately how many units would be provided, if any? Indicate whether high, middle, or low-income housing.

No housing is included as part of the Project.

b. Approximately how many units, if any, would be eliminated? Indicate whether high, middle, or low-income housing.

No housing would be eliminated as part of the Project.

c. Proposed measures to reduce or control housing impacts, if any.

No measures are required.

10. Aesthetics

a. What is the tallest height of any proposed structure(s), not including antennas; what is the principal exterior building material(s) proposed?

The tallest structures included in the Project are four, 102-foot-high storage silos, which will be constructed of metal. The exhaust stack will be approximately 80 feet high.

b. What views in the immediate vicinity would be altered or obstructed?

The Project would be visible from the east, north and south views and would alter some views in the area, however these existing views are of an industrial site. No views would be obstructed or materially blocked by the Project. The Project will have no impact on adjacent residential views of the shoreline.

c. Proposed measures to reduce or control aesthetic impacts, if any.

No measures are required to reduce or control aesthetic impacts.

11. Light and Glare

a. What type of light or glare will the proposal produce? What time of day would it mainly occur?

Lighting used during night-time construction or times of low light, if needed, will be used only in active work areas and for safety. Construction night-time lighting, if nighttime construction is needed, will be directional and will minimize glare and light spillage to the extent practicable.

Light spillage onto adjacent properties or to water during nighttime construction will be minimized to the extent practicable using shaded fixtures and directional lighting aimed only in areas for worker comfort and safety.

The Project will adhere to the City of Hoquiam Light and Glare Standards. Any land use creating intensive glare or light shall obscure the view of this glare or light from any point along the property line through the use of fences, walls, or hedge. Outside lighting will point away from the Wildlife Refuge.

b. Could light or glare from the finished project be a safety hazard or interfere with views?

Lights will be generally aimed downward and back towards the site if close to property line, thus reducing spillage. The Project will incorporate lighting design and associated directional lighting to minimize glare and light spillage to the extent practicable while still providing the necessary lighting levels for workers' safety and for Federal Aviation Administration (FAA) lighting requirements due to the proximity to Bowerman Airport.

c. What existing off-site sources of light or glare may affect your proposal?

Off-site lighting is typical of urban areas and consists of street and building lights. The adjacent Bowerman Airport includes high-intensity runway lights that are activated on approach. This existing lighting will not affect the project as it does not include activities that are sensitive to light. Lighting of adjacent industrial sites and the high school property to the north also have no effect on the proposal.

d. Proposed measures to reduce or control light and glare impacts, if any.

The project will incorporate lighting design and associated directional lighting to minimize glare and light spillage to the extent practicable. FAA-approved lighting will be mounted on buildings and structures for aviation safety. No other measures are required.

12. Recreation

a. What designated and informal recreational opportunities are in the immediate vicinity?

The John Gable Community Park and Hoquiam Skate Park are located north of the Project Site, north of Emerson Avenue. The facilities include concrete structures for skating, playground equipment, baseball fields, and parking.

The Grays Harbor National Wildlife Refuge is located west of the Project site and is part of the Grays Harbor Estuary. The refuge, established in 1990, encompasses almost 1,500 acres of intertidal flats, open water, salt marsh, and forested habitats and contains walking trails.

b. Would the proposed project displace any existing recreational uses? If so, describe.

Construction of the Project could result in indirect impacts from noise to recreational uses on lands adjacent to or near the site, but these impacts will be temporary and are not expected to rise to the level of significance.

The Project Site is an existing industrial facility that does not have any recreational uses. Existing recreational uses would be indirectly affected, but not displaced, by Project construction. Operation of the proposed facility is not anticipated to significantly displace or restrict access to any recreational uses as the proposed facility will be an industrial site used similarly to the existing wood chip facility and current shipping uses at Terminal 3.

c. Proposed measures to reduce or control impacts on recreation, including recreation opportunities to be provided by the project or applicant, if any.

Recreational facilities in the area have some exposure to noise and diesel emissions from truck traffic, and other diesel vehicles from existing industrial uses in the area. The Project is not anticipated to significantly add to the existing noise and emissions; thus, no measures are required.

13. Historic and Cultural Preservation

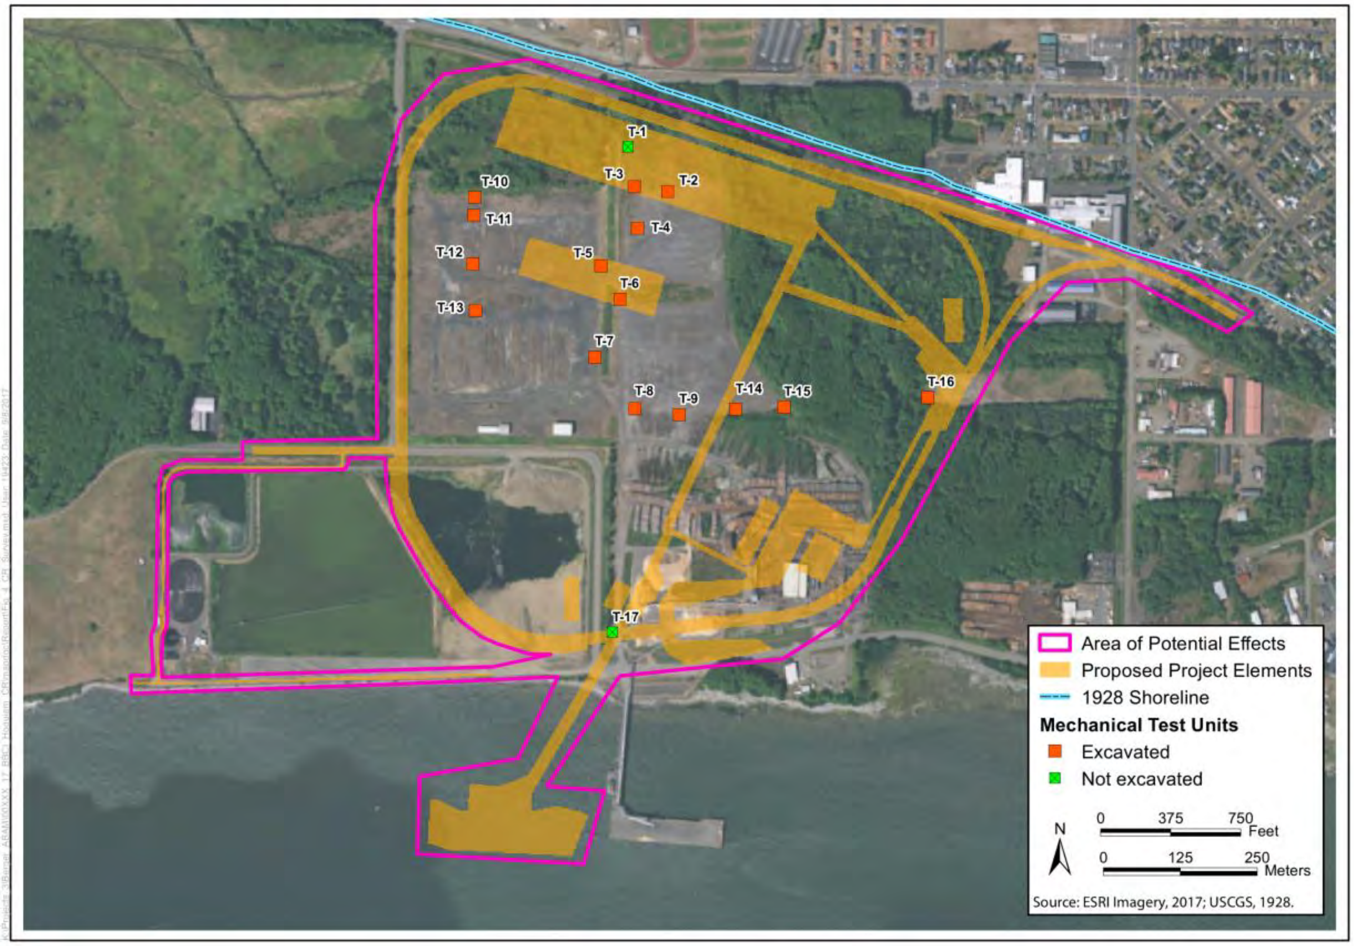
a. Are there any buildings, structures, or sites, located on or near the site that are over 45 years old listed in or eligible for listing in national, state, or local preservation registers? If so, specifically describe.

There are no buildings, structures, or sites located on or near the site that are over 45 years listed in or eligible for listing in the national, state, or local preservation registers.

b. Are there any landmarks, features, or other evidence of Indian or historic use or occupation? This may include human burials or old cemeteries. Are there any material evidence, artifacts, or areas of cultural importance on or near the site? Please list any professional studies conducted at the site to identify such resources.

No archaeological deposits were identified during subsurface investigations for the previous BHP proposal (*Cultural Resources Tech Report*, ICF 2019). Across much of the Area of Potential Effects (APE), the pre-development ground surface appears to be between 17 and 18 feet below the ground surface, with the exception of four locations where the pre-development ground surface was at a greater depth than the maximum reach of the excavator that was being used (21 feet).

Figure 6 Area of Potential Effects and Cultural Survey Sites (BHP Proposal)



c. Describe the methods used to assess the potential impacts to cultural and historic resources on or near the project site. Examples include consultation with tribes and the department of archeology and historic preservation, archaeological surveys, historic maps, GIS data, etc.

The APE is defined as a geographic area or areas within which the proposed project may directly or indirectly cause a change of character or use of historic properties.

According to the Cultural Resources Report (*Cultural Resources Tech Report*, ICF 2019), the City of Hoquiam maintains a local register of historic places which includes individually registered city landmarks, historic districts, or conservation districts (Hoquiam Municipal Code, Chapter 10.06). The upland portions of the Project Site are not currently accessed by tribal members and use of the uplands would not affect access to the Quinault's treaty resource areas. The Quinault Indian Nation have indicated that members fish in Grays Harbor near the Project Site and areas required for the positioning of vessels for product loading and shipment.

d. Proposed measures to avoid, minimize, or compensate for loss, changes to, and disturbance to resources. Please include plans for the above and any permits that may be required.

There are no measures proposed to avoid, minimize, or compensate for loss, changes to, and disturbance to resources, as there were none identified within the APE. The Project would have minor effects on fishing by Quinault Indian Nation members during construction and operation of the PNWRE Project. PNWRE is currently coordinating with the Quinault Indian Nation to inform them of the Project and receive input on the proposal.

14. Transportation

a. Identify public streets and highways serving the site or affected geographic area and describe proposed access to the existing street system. Show on site plans, if any.

The street network in the Project vicinity is shown on the site plan and vicinity maps (Figures 1 and 2) in Section A, above. Roadways in the vicinity include Highway 101, State Route 109/West Emerson Avenue, Paulson Road, and Airport Way.

b. Is the site or affected geographic area currently served by public transit? If so, generally describe. If not, what is the approximate distance to the nearest transit stop?

The site is not directly served by public transit. The closest Grays Harbor Transit bus stop is located at Emerson Avenue and Adams Street, approximately one mile from the Project site.

c. Will the proposal require any new or improvements to existing roads, streets, pedestrian, bicycle, or state transportation facilities, not including driveways? If so, generally describe (indicate whether public or private).

Private roads connecting the site to the existing roadway network and for interior circulation will be constructed of aggregate for facility traffic and employees only.

d. Will the project or proposal use (or occur in the immediate vicinity of) water, rail, or air transportation? If so, generally describe.

The operation of the Project will use shipping vessels from Terminal #3, which is in existing use by Willis Enterprises. The Project would increase vessel traffic by approximately one ship every 5 to 6 weeks, or 10 per year.

There is a rail spur located to the north, between the Project site and Emerson Avenue. The Project will not use rail and is not anticipated to affect existing rail traffic.

The Project Site is located approximately 0.25 miles to the east of Bowerman Airport. The Project was designed to minimize indirect impacts to Bowerman Airport. The layout of the storage building and other structures at the site are dictated primarily by the FAA's regulations governing the safe, efficient use and preservation of the navigable airspace in 40 C.F.R. Part 77. Consultation with the FAA is ongoing to ensure the proposed facility does not represent an obstruction to air navigation. The Project will comply with FAA provisions for lighting to ensure no impacts to Bowerman Airport.

e. How many vehicular trips per day would be generated by the completed project or proposal? If known, indicate when peak volumes would occur and what percentage of the volume would be trucks (such as commercial and non-passenger vehicles). What data or transportation models were used to make these estimates?

The completed Project will include approximately 128 traffic trips per day (truck and employee traffic).

f. Will the proposal interfere with, affect, or be affected by the movement of agricultural and forest products on roads or streets in the area? If so, generally describe.

The Project would not interfere with, affect, or be affected by the movement of agricultural and forest products on road or streets in the area.

g. Proposed measures to reduce or control transportation impacts, if any.

Truck traffic from the completed Project will be routed to avoid local surface streets and rail crossings within plant design requirements. No other measures are required.

15. Public Services

a. Would the project result in an increased need for public services (for example: fire protection, police protection, public transit, health care, schools, others)? If so, generally describe.

PNWRE plans to provide its own site security and utilize fire protection and emergency systems that meet or exceed applicable building standards. It is not anticipated that the Project will result in an increased need for public services.

b. Proposed measures to reduce or control direct impacts on public services, if any.

No measures are required.

16. Utilities

a. Circle utilities currently available at the site:
<u>electricity</u>, <u>natural gas</u>, <u>water</u>, refuse service, telephone, sanitary sewer, septic system, other:

b. Describe the utilities that are proposed for the project, the utility providing the service, and the general construction activities on the site or in the immediate vicinity which might be needed.

The facilities will use potable water (City), sanitary sewer (City), electricity (Grays Harbor PUD), natural gas (Cascade Natural Gas) and communication services (private). All services will tie into existing nearby utility lines.

C. Signature

The above answers are true and complete to the best of my knowledge. I understand that the lead agency is relying on them to make its decision.

OFFICE OF
AIR QUALITY PLANNING
AND STANDARDS

MEMORANDUM

SUBJECT: Release of AERMOD & AERMET Version 23132 and MMIF Version 4.1

FROM: Clint Tillerson, Model Development Team Lead
Air Quality Modeling Group
Air Quality Assessment Division, Office of Air Quality Planning and Standards

TO: EPA Regional Modeling Contacts

The United States Environmental Protection Agency (EPA), Office of Air Quality Planning and Standards (OAQPS) is releasing new versions (23132) of the AERMOD dispersion model and the AERMET preprocessor AERMOD, replacing AERMOD version 22112 and AERMET version 22112 as the regulatory versions of AERMOD and AERMET. Released concurrently with AERMOD and AERMET is MMIF 4.1 which replaces MMIF 4.0.

This memorandum provides information on these updated programs, including the nature of the updates and the status of the releases regarding regulatory applications. If there are any questions about this new release of the AERMOD Modeling System or issues found with the updated model components, please send an email to Tillerson.Clint@epa.gov.

Background

In 2005, the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) was promulgated as the EPA's preferred near-field dispersion model for regulatory applications, replacing the Industrial Source Complex (ISC) model. AERMET is the regulatory meteorological preprocessor for AERMOD and can process National Weather Service (NWS) surface data, NWS upper air data, site-specific data, (i.e., data collected at a nearby representative meteorological station), and pre-processed prognostic meteorological data.

AERMET processes the input meteorological data to calculate boundary layer parameters for input to the AERMOD model.

This release is concurrent with a Notice of Proposed Rulemaking (NPRM) to revise Appendix W to CFR 40 Part 51, *Guideline on Air Quality Models* (*Guideline*). The revision to the *Guideline* proposes updates to the regulatory formulation of AERMOD and AERMET and implementation. The proposed updates are included in this release as BETA options and cannot be used for regulatory applications of the modeling system without approval as an alternative model by the appropriate EPA Regional Office and subsequent concurrence by the EPA Model Clearinghouse (MCH). The EPA anticipates the proposed *Guideline* to be finalized in the Spring of 2024.

For more information regarding the regulatory application of the AERMOD Modeling System, please consult the *Guideline*.

AERMOD

AERMOD 23132 replaces the regulatory version 22112. In summary, updates in AERMOD 23132 include numerous small bug fixes related to the BUOYLINE, AREACIRC, RLINE, RLINEXT and SWPOINT source types; updates to error and warning messages; enhancements to the BUOYLINE and URBANOPT debug files; formulation updates and enhancements to the RLINE and RLINEXT source types, addition of new ALPHA options; and the BETA flag requirement to accept meteorological data processed with the COARE algorithm implemented in AERMET 23132. Note that the ALPHA and BETA options in AERMOD 23132 cannot be used in regulatory applications of the AERMOD Modeling System without EPA Region Office approval as an alternative model and concurrence from EPA's MCH. Refer to the AERMOD Model Change Bulletin #17 for a complete list of changes in AERMOD 23132. Some of the more substantial updates and new options of interest include the following:

Proposed Regulatory Updates

- Reformulation of RLINE source type to bring the RLINE source type into better agreement with other AERMOD source types. There were three main aspects of the reformulation: (1) Wind Speed calculation, (2) Harmonization with AERMOD sources, and (3) Dispersion Coefficients (RLINE - BETA option proposed as formulation update).
- Formulation updates to the Generic Reaction Set Method (GRSM) Tier 3 screening option for NO_2 conversion (GRSM - BETA option proposed as formulation update).

- Requirement of the BETA flag in the AERMOD control file if 'COARE' is found in the SFC meteorological input file header. The presence of 'COARE' in the SFC file header indicates the meteorological data were processed with the COARE algorithm in AERMET ('COARE' SFC Header Flag - BETA option).

New ALPHA Options

- A treatment for highly buoyant plumes when they penetrate the top of the mixed layer (HBP).
- Area meander for area source types (AREAMNDR).
- Characterization for aircraft sources as area and/or volume source types that accounts for plume rise from aircraft (ARCFTOPT).

Bug Fixes and Enhancements

- Capability to account for elevated terrain with RLINE and RLINEXT source types. **NOTE: When modeling project level conformity and hot-spot analyses, refer to the Office of Transportation and Air Quality (OTAQ) for current guidance for modeling roadway sources**.
- New debug file for urban debug option that reports temperature and vertical potential temperature profiles.
- Ability to use a mixture of 2-digit and 4-digit years across data input files (e.g., SFC meteorology, PFL meteorology, hourly emissions, and hourly background).
- Correction to conversion of 2-digit year to 4-digit year for check on SRFDATA keyword in control file. Year is assumed to be in the 1900s if the year is >=50 and in the 2000s if < 50.
- Correction to conflicts with source group IDs during event processing with BUOYLINE source type.
- Correction for NaN in the urban debug file.
- Correction for false warning message "Julian Day Out of Range" that was issued when using DAYRANGE keyword.
- Requirement of ALPHA flag when RLINEXT source type is specified.
- Correction when AREACIRC sources are listed in an INCLUDED file. Sources were overwritten when multiple reads of AREACIRC sources caused memory conflicts between array sizing and source ID assignments.

- Correction to ARMRATIO minimum and maximum values to match the ranges provided in the AERMOD User's Guide, based on whether the DFAULT keyword is specified.
- Warning message added when the SCREEN option is used with RLINE, RLINEXT, BUOYLINE, SWPOINT, AREA, or LINE source types.
- Correction for inconsistent results between BUOYLINE, RLINE, and RLINEXT source types when modeling for FLAT terrain and depending on how FLAT terrain was specified.

AERMET and MMIF

AERMET 23132 replaces the regulatory version 22112. Version 22112 represented a complete overhaul of the AERMET source code structure, though no updates to the formulation of AERMET were introduced. Version 23132 corrects various bugs reported since the code overhaul. In addition, several enhancements were included related to quality assurance (QA) checks on the number of site-specific sub-hourly observations and data reported in the QA output file. Perhaps the most substantial update to AERMET is the addition of the Coupled Ocean Atmosphere Response Experiment (COARE) air-sea flux procedure for processing meteorological data representative of a marine boundary layer needed for modeling offshore sources. The implementation of COARE in AERMET is being proposed as a regulatory update to AERMET in the proposed *Guideline* updates and replaces the stand-alone AERCOARE meteorological processor which has recently been approved as an alternative model for several offshore source permit applications. Note that the use of meteorological data processed with the COARE option in AERMET is a BETA option in AERMOD and requires EPA Regional Office approval and EPA MCH concurrence until this updated formulation of AERMET has been finalized in the *Guideline*. Refer to the AERMET Model Change Bulletin #13 for a complete list of changes in AERMET 23132. Some of the more substantial updates and new options of interest include the following:

Proposed Regulatory Update

- Addition of COARE air-sea flux procedure (BETA flag required in AERMOD).

Bug Fixes and Enhancements

- Additional QA on the number of observations/hour in sub-hourly site-specific data.

- Added NWS elevation to SURFACE EXTRACT and QAOUT file when derived from ISHD data.
- Additional QA checks to ONSITE/PROG heights when OSHEIGHTS is not specified.
- Updated AERMET to allow multi-level data to be out of ascending order.
- Check added on OUTPUT and PROFILE file for format overflows and NaN.
- Modified PBL_PROC and WRITE_SRSS to only get target sounding hours and UPPERAIR sunrise/sunset times when UPPERAIR data being used in Stage 2.
- Correction in subroutine MECH_HT to use unsmoothed mixing height when u* is missing for the hour.
- Initialized variables to correct issues with Linux compilation.
- Correction to allow primary surface characteristics keywords to be used with AERSURF2 file in subroutine AERSURF.
- Correction for sounding target hours when beginning of window is in previous day of sounding in subroutines PBL_PROC and CHECK_OBS.
- Correction in UPPERAIR location when using ONSITE/PROG mixing heights and no UPPERAIR data.
- Correction to SURFACE winds to only set to calm if not missing.
- Correction to sum ONSITE sub-hourly precipitation variables instead of averaging.

The addition of COARE in AERMET subsequently required updates to the Mesoscale Model Interface Program (MMIF) to extract additional meteorological parameters from prognostic model output for input to AERMET and modify the AERMET control files generated by MMIF. MMIF 4.1 replaces MMIF 4.0.

MEMORANDUM

SUBJECT: Applicability of Prevention of Significant Deterioration (PSD) and New Source Performance Standards (NSPS) to the Cleveland Electric, Incorporated, Plant in Willoughby, Ohio

FROM: Edward J. Lillis, Chief
Permits Programs Branch, AQMD (MD-15)

TO: George T. Czerniak, Chief
Air Enforcement Branch, Region V

This memorandum responds to your request for a written applicability determination for a Cleveland Electric, Incorporated, facility in Willoughby, Ohio. As discussed below, my staff has determined that this Cleveland Electric facility is subject to a 100 tons per year (tpy), major source applicability threshold for the PSD requirements at 40 CFR 51.21. If this facility has commenced construction with a minor source construction permit from Ohio, but without undergoing new source review (NSR), as required by 40 CFR 52.21, the source may be in violation of Federal PSD requirements. At this time, the Cleveland Electric Plant does not appear to be subject to the current emissions guideline for municipal waste combustors or NSPS of 40 CFR Part 60, subparts Ca and Ea, respectively. This response has been coordinated with the Compliance Monitoring Branch of the Stationary Source Compliance Division (SSCD), to whom your applicability request was addressed, and with the Standards Development Branch of the Emission Standards Division (ESD) on the applicability of NSPS and emissions guidelines.

In reviewing the information forwarded to our office, we have determined that, for PSD applicability purposes, the Cleveland Electric facility is both a municipal waste incinerator and a fuel conversion plant, as listed at 40 CFR 52.21(b)(1)(c)(iii), and would be major if the source "...emits, or has the potential to emit, 100 tpy of any pollutant subject to regulation under the (Clean Air) Act". The facility appears to meet the criteria for both categories by disposing of municipal waste using combustion and by producing a low heat value fuel gas. While there are no definitions in the PSD regulations for "municipal waste incinerator," "fuel conversion plant," and other categories listed as subject to the 100 tpy, major source threshold, the Environmental Protection Agency (EPA) has relied on case-by-case determinations in assessing source applicability. These assessments are based on precedents established by NSPS and other regulatory definitions, as well as technical analysis of the character and functions of both the proposed source and the listed source categories. We have used these guidelines in determining that the Cleveland Electric plant is considered listed under two source categories for which the lower PSD applicability threshold applies.

The NSPS regulations define "municipal waste combustor" at 40 CFR 60.51a to mean "... any device that combusts solid, liquid, or gasified (municipal solid waste) including, but not limited to, field-erected incinerators (with or without heat recovery), modular incinerators (starved air or excess air), furnaces (whether suspension-fired, grate-fired, mass-fired, or fluidized bed-fired) and gasification/combustion units." The emissions guideline of subpart Ca also incorporates this definition by reference (40 CFR 60.31a). On page 10 of Cleveland Electric's December 20, 1991 permit application submittal, the source is described as consisting of seven units, charging 50 tons per day (tpd) per unit, "...converting municipal solid waste into...fuel gas." For NSPS purposes, the Cleveland Electric source is a municipal waste combustor and would be subject to the NSPS standards of 40 CFR Part 60, subpart Ea, if each unit were not below the 250 tpd of refuse combustion capacity per unit applicability threshold of subpart Ea [40 CFR 60.50a(a)].

A municipal waste incinerator "combusts" solid waste and thus is functionally synonymous with municipal waste combustor. Accordingly, EPA has adopted the NSPS definition of municipal waste combustor for determining if a source is subject to the 100 tpy applicability threshold for PSD in section 16(1) of the-3- CAA. Section 169(1), as amended by Section 305(b) of the CAA Amendments of 1990 [P.L. 101-549, sec. 305(b)], lists "municipal incinerators capable of charging more than 50 tons of refuse per day" as being subject to the 100 ton emissions threshold. Under EPA's sourcewide plant definition [40 CFR 52.21(b)(5 and 6)], the 50 tpd charging rate applies to the sum of all units at the Cleveland Electric facility (which will be capable of charging a total of 350 tons of refuse per day). Therefore , the Cleveland Electric facility will be a major source for PSD purposes if the source emits, or has the potential to emit, 100 tpy of any pollutant regulated under the CAA [except HAP's listed under §112(b) of the CAA].

The production of low heat value fuel gas at the Cleveland Electric facility also classifies the source as a fuel conversion plant. Fuel conversion plants obviously include those plants which accomplish a change in state (e.g., solid to liquid to gas) for a fuel. This definition includes conversion of the following fuels: fossil (e.g., coal or oil shale); biomass (e.g., wood or peat); and anthropogenic (e.g., municipal waste derived fuel and inorganic fuel). The majority of such sources are likely to accomplish these changes through either gasification, liquefaction, or solidification. The category of fuel conversion plants may include, but is not limited to, some types of sources within standard industrial classifications 1311, 2819, 2969, 2421, and 2999. Generally, however, applicability for this source category is determined by whether a facility changes the state (e.g., solid to gas) or form (e.g., process sawdust into a pellet) of a fuel. Therefore, the Cleveland Electric facility fits into the fuel conversion plant category as well. In both cases, as a municipal waste incinerator and as a fuel conversion plant, the source is major and subject to PSD requirements if the source has the potential to emit 100 tpy of a regulated pollutant other than a HAP.

If you have any questions concerning our PSD applicability determination, please contact Bill Lamason of my staff at (919) 541-5374. Questions concerning NSPS should be directed to Walt Stevenson, ESD, at (919) 541-5264. On compliance issues, you may contact Clara Poffenberger, SSCD, at (703) 308-8709.

MEMORANDUM:

TO: Sean Taylor
THROUGH: Ross Winne, Richard Taylor
FROM: Jeff Babb
SUBJECT: SOURCE TEST REPORT REVIEW

The following test has been reviewed and was conducted in an acceptable fashion for the purpose intended.

COMPANY NAME	Hazlehurst Wood Pellets, LLC
COMPANY LOCATION	Hazlehurst, GA
SOURCE TESTED	Pellet Cooler Baghouse S1B Exhaust
POLLUTANT DETERMINED	Volatile Organic Compounds
REPORT REVIEWED BY	Jeff Babb
TEST WITNESSED BY	Jeff Babb
DATE(S) OF TEST	August 28, 2014
DATE RECEIVED BY APB	October 27, 2014
MAXIMUM EXPECTED OPERATING CAPACITY	20 ODT/HR
OPERATING CAPACITY	21 ODT/HR
ALLOWABLE EMISSION RATE	249 Tons/Year
APPLICABLE REGULATION	Air Quality Permit No. 2499-161-0023-E-01-0, Condition 2.1
CONTROL EQUIPMENT AND MONITORING DATA	N/A

TEST RUN #	1	2	3	AVERAGE
POLLUTANT CONCENTRATION (PPM Carbon)	145.9	142.8	153.9	147.5
EMISSION RATE (LB/HR Carbon)	6.62	6.07	6.55	6.41

PERCENT ALLOWABLE (%)	19.2
OTHER INFORMATION	ISMP calculated M25A emission rate = 7.8 LB/HR as Propane Ref. No. 201401158 results for M25A VOC Propane = 3.0 LB/HR Ref. No. 201401159 results for Formaldehyde = 0.01 LB/HR Ref. No. 201401160 results for Methanol = 0.01 LB/HR Ref. No. 201401161 results for Acetaldehyde = 0.02 LB/HR Ref. No. 201401159 results for M25A VOC S1B = 7.8 LB/HR Ref. No. 201401165 results for Formaldehyde = 0.01 LB/HR Ref. No. 201401166 results for Methanol = 0.09 LB/HR Ref. No. 201401167 results for Acetaldehyde = 0.06 LB/HR At a production rate of 21.0 ODT/HR the OTR26 (NCASI WPP1) Total VOC emission rate = 10.9 LB/HR On an ODT basis is 0.52 LB VOC/ODT. Therefore the OTM 26 (WPP1) potential total annual VOC emission rate is 47.7 LB/Year or 19.2% of the allowable VOC emission rate of 249 TON/Year.

PART A

Emission Point (one only): **S2B Pellet Cooler Baghouse Exhaust**

Pollutant (one only): **Total VOC** Date test performed: **12-16-15**

Applicable Rule(s), Regulation(s) or Permit Conditions: **Permit 2499-161-0023-V-02-0**
Condition 2.1.1 (249 tpy) PSD avoidance

Maximum expected operating capacity: **20 ODT/hr, output, 12% moisture**

Operating capacity during test: **20 ODT/hr, output, 12% moisture**

Computed allowable emission rate(s) or limitation(s): **None**

Reported emissions to atmosphere: **12.4 lb/hr (as propane)**

The test report should include a compilation of all CEMS data, control devise parameters and process operating data related to the test. **No CEMS present. Control device parameters and process operating data are provided in Appendix D of test report.**

PART B

For any facility operating under a Part 70 Permit, Condition 8.8.3 of that permit requires the following certification should be signed by a responsible official and included with the report:

I certify that based on my information and belief formed after reasonable inquiry, the statements and information in this report are true, accurate, and complete.

October 28, 2003

Mr. Michael Cathey
Managing Director
El Paso Energy Bridge Gulf of Mexico, L.L.C.
1001 Louisiana Street
Houston TX 77002

Diana Dutton, Esquire
Akin, Gump, Strauss, Hauer & Feld, L.L.P.
1700 Pacific Avenue, Suite 4100
Dallas TX 75201-4675

Dear Mr. Cathey and Ms. Dutton:

This letter responds to communications from El Paso Energy Bridge Gulf of Mexico, L.L.C. (El Paso), regarding preliminary views the Environmental Protection Agency (EPA) Region 6 expressed in a letter dated March 28, 2003, to the United States Coast Guard, and in several subsequent meetings and telephone calls. El Paso's objections to these views are set forth in an "Analysis of Deepwater Port Permitting Requirements" it provided EPA Region 6 at a meeting on May 9, 2003; in Mr. Cathey's June 16, 2003, letter to Commander Mark Prescott; and in Ms. Dutton's letters of July 18, 2003, and August 18, 2003, to EPA attorneys Patrick Rankin and Michael Boydston. EPA's understanding of the facts in this matter is based on representations in that correspondence, in El Paso's Application to the United States Coast Guard for a Deepwater Port (December 2002) (license application), in National Pollutant Discharge Elimination System (NPDES), Prevention of Significant Deterioration (PSD) and Title V permit applications El Paso filed under protest on September 4, 2003, and in El Paso's statements at a meeting with the Regional Administrator for EPA Region 6 on September 12, 2003.

BACKGROUND

Given the Nation's expanding demand for natural gas, a number of entities are in the process of developing plans and permit applications for deepwater ports through which that commodity may be imported from overseas gasification plants. Typically, such deepwater ports would be located on the outer continental shelf of the United States and use existing natural gas pipelines associated with offshore natural gas production to transport the imported gas ashore. Because the vessels transporting the gas carry it in a liquified state and the pipelines carry it in a gaseous state, the primary industrial process that would occur at offshore natural gas ports is conversion of natural gas from liquified to gaseous state for transport ashore. A major capital expense associated with the ports is generally the construction of offshore fixed facilities on which the re-gasification process will occur. El Paso's proposal, however, is somewhat different.

El Paso proposes to construct and operate a natural gas deepwater port approximately 120 miles off the coast of Louisiana. The proposed port would feature a "submerged turret system" (STS)[1] connected to a short (1.93 miles) pipeline leading to a metering platform. Two other short (3.93 and 1.38 miles) pipelines would convey the natural gas from the metering platform to existing natural gas pipelines operated by other entities for transport ashore. This fixed infrastructure would not include facilities for LNG storage or re-gasification and, under normal circumstances, would not be manned. As explained below, El Paso contends these relatively modest fixed facilities would constitute its entire deepwater port for purposes of federal regulation under the Deepwater Port Act (DPA), Clean Air Act (CAA), and Clean Water Act (CAA).

Only specially designed and equipped liquefied natural gas (LNG) vessels, two of which are now under construction, would be able to deliver natural gas to the fixed infrastructure of the proposed port. Those vessels are identified in El Paso's license application as El Paso Energy Bridge Vessels (EPEBVs). Like most LNG carriers, the EPEBVs would be propelled by steam turbines. The boilers generating the steam would normally be fired with natural gas "boil off" from the cargo on their voyage to the buoy, but by diesel oil while discharging cargo and on the return voyage. Unlike any LNG carrier previously constructed, however, the EPEBVs would be specially outfitted so they could be attached to the STS and re-gasify their LNG cargo before offloading it.

The operator of an EPEBV calling on the port would retrieve the STS, winch it into an opening in the bottom of the vessel's hull, and attach it to the vessel with hydraulically operated locking jacks. It would then ring up "finished with engines" and set a "moored condition" bridge watch. Thereafter, an El Paso representative, a.k.a., "person in charge" (PIC), and "other entities involved in cargo transfer process" would board the vessel. License Application, Appendix M, p. 3. The PIC would inspect the re-gasification system, determine the quantity and quality of the cargo, calibrate metering equipment, assure coordination with the pipeline operators so that maximum operating pressures would not be exceeded, and "issue permission to the vessel operator" to commence the re-gasification and transfer process. *Id,* p. 4.

Onboard re-gasification would be accomplished by warming the LNG until it turned into a gas, a process employing an "open loop" system, "closed loop" system, or a combination of the two. In the open loop mode, warm seawater would be drawn into the EPEBV, then passed through a shell and loop vaporizer, converting the LNG to a gaseous state by heating it, and then

---

[1] The proposed STS would be a special purpose buoy equipped with a flexible riser and pipeline manifold and would be affixed to the seabed by chains and anchors. When not in use, it would be submerged, but marked by a smaller lighted buoy on the surface.

would be discharged back to the sea at a reduced temperature. In the closed loop mode, steam from the EPEBV's boilers would be used to heat water circulated through the shell and loop vaporizer in a closed system from which there would be no warming water discharge. El Paso would normally use the open loop system at its proposed Gulf of Mexico facility, but could rely on the closed loop system if necessary. After re-gasification, the natural gas would be conveyed through the buoy, riser, and manifold to the 1.93 mile pipeline leading to the metering platform.

In its letter of March 28, 2003, EPA explained its views on how the CWA would apply to the discharges from the open loop re-gasification system as well as discharges from the metering platform. It also explained its views on how the CAA would apply to emissions associated with both the re-gasification processes and emissions from the metering platform. El Paso objects to regulation of any discharges or emissions originating on the EPEBVs and to the process for authorizing discharges and emissions from the metering platform.

SOURCE OF EPA AUTHORITY TO REGULATE ACTIVITIES ASSOCIATED WITH DEEPWATER PORTS

EPA regards a provision of the DPA, 33 U.S.C. § 1501, *et seq,* as the primary source of its authority to apply the CAA and CWA to activities associated with deepwater ports. In relevant part, 33 U.S.C. § 1518(a)(1) extends the Constitution and laws of the United States "to deepwater ports . . . and to activities connected, associated, or potentially interfering with the use or operation of any such port, in the same manner as if such port were an area of exclusive Federal jurisdiction located within a State." In addition, 33 U.S.C. § 1518(b) "federalizes" consistent laws of the adjacent state and directs that they be applied by federal officials. These statutory provisions are similar to Section 4 of the Outer Continental Shelf Lands Act (OCSLA), 43 U.S.C. § 1333(a)(1), and serve the same general purpose, i.e., defining the body of law that applies to activities within the purview of the respective acts. *See generally, e.g., Rodrique v. Aetna Casualty & Surety Co.*, 395 U.S. 352 (1969); *Wentz v. Kerr-McGee Corp*., 784 F.2d 699 (5th Cir. 1986); *Village of False Pass v. Clark*, 733 F.2d 605 (9th Cir. 1984). OCSLA § 4 has been long viewed by EPA as the source of its authority to regulate discharges from oil and gas operations on the outer continental shelf. *See* "Outer Continental Shelf Applicability of FWPCA," Opinion of the General Counsel (August 3, 1973), *published at* 2 Gen. Couns. Ops. (Water Pollution) 181, 182 (Environmental Law Publishing Service, 1979).

El Paso contends, however, that the DPA establishes a "one window" licensing process that shifts responsibility for issuing authorizations required by the CWA and CAA from EPA to the Secretary of Transportation. According to El Paso, EPA's role in that unified licensing process is limited to developing conditions implementing those statutes for inclusion in the deepwater port license issued by the Secretary. El Paso further argues that this unified licensing procedure has substantive consequences. According to El Paso, the Secretary's authority to regulate *via* this unified license is circumscribed by the exclusion of "vessels" in the DPA's definition of "deepwater port" and EPA could thus neither recommend nor require the Secretary's imposition of license conditions on vessels, regardless of whether the CWA and CAA authorize EPA to impose such conditions in independent permits. Under that view, only discharges and emissions from the metering platform would be subject to federal regulation.

EPA is informed, however, that the Secretary of Transportation interprets the DPA as requiring a unified application for all necessary federal permits and close coordination between responsible federal agencies, but not as requiring issuance of a single permit. "Federal Agencies with permit responsibilities such as the EPA and MMS will retain all distinct permit issuance authority." USCG Memorandum, "Environmental Planning Aspects of the Deepwater Port Act" (1 April 2003).[2] Because the Secretary has primary responsibility for administration of the DPA, EPA defers to that interpretation and does not address the merits of El Paso's argument. Nor does EPA address the merits of El Paso's argument on the scope of the DPA's vessel exclusion.[3]

INTERNATIONAL LAW

El Paso argues that EPA must interpret the grant of authority under 33 U.S.C. § 1518 in view of constraints imposed by international law, primarily the 1982 United Nations Convention on the Law of the Sea (UNCLOS), which generally prohibits nations from exercising sovereignty over vessels on the high seas.[4] EPA's interpretation is fully consistent with international law, however, as reflected in UNCLOS.

The United States has not acceded to UNCLOS, but it has been U.S. policy since 1983 to act in a manner consistent with the Convention's provisions regarding traditional uses of the ocean. Nothing in UNCLOS III and no general principle of international law, however, limits a nation's sovereignty over its own ports and internal waters, including the authority to impose conditions for entry. *See, e.g., Nevada v. Hall*, 440 U.S. 410 (1979); *United States v. Royal Caribbean Cruises, Ltd.*, 11 F. Supp. 2d 1358 (S.D. Fla. 1998). Assuming that the relevant UNCLOS provisions reflect customary international law and that EPA must interpret §1518 consistently with those provisions, the potential EPA requirements at issue are fully consistent with UNCLOS. Article 60 of UNCLOS explicitly recognizes that coastal States, in their exclusive economic zones (EEZs), "have the exclusive right to construct and to authorize and regulate the construction, operation, and use of . . . installations and structures for the purposes

---

[2] Under transition provisions of the Homeland Security Act, the United States Coast Guard remains responsible for processing El Paso's license application, despite its transfer to the recently created Department of Homeland Security. In this context, Coast Guard interpretations of the DPA are attributable to the Secretary of Transportation, who retains ultimate authority for issuance or denial of El Paso's deepwater port license.

[3] The DPA defines "vessel" as "every description of watercraft or other artificial contrivance used as a means of transportation on or through the water." 15 U.S.C. §1506(19).

[4] In addition, El Paso notes the DPA licensing prerequisite that "the deepwater port . . . not unreasonably interfere with international navigation or other reasonable uses of the high seas, as defined by treaty, convention, or customary international law." 33 U.S.C. § 1503(c)(4).

provided for in article 56 [pertaining to the EEZ] and other economic purposes." Deepwater ports fall within this provision.

Moreover, EPA's regulation of discharges and emissions associated with onboard re-gasification performed by ships that are physically attached to El Paso's submerged turret system in no way interferes with the freedom of navigation. There is thus no need for EPA to interpret its authority under the DPA restrictively in order to maintain consistency with international law.

To the extent you contend the re-gasification operations occur on the "high seas" rather than at ports over which the United States is sovereign, your argument appears directed at the authority of Congress to extend U.S. sovereignty to the area in which you propose to locate a deepwater port. EPA notes that Congress was aware of constraints imposed by international law when it enacted the DPA in 1974. It decided that, under the 1958 United Nations Convention on the High Seas, Article 2, "a nation might properly execute jurisdiction on the High Seas in order to license and regulate such [deepwater port] facilities." Senate Report 93-1217, 1974 U.S. Code Congressional and Administrative News 7529, 7536. Of course, UNCLOS further clarifies the authority of a coastal state to establish a deepwater port in its EEZ.

In support of its international law argument, El Paso also relies on Annex VI to the International Convention for the Prevention of Pollution from Ships (MARPOL). However, El Paso's arguments related to Annex VI are without merit. First, as El Paso acknowledges, Annex VI is not in force and has not yet been ratified by the United States. Second, El Paso claims that regulating emissions of vessels, as proposed by EPA here, "would undermine the international uniformity sought in MARPOL Annex VI," and alleges that EPA has reaffirmed its "deference to emerging international standards" in a recent rulemaking setting standards for Category 3 marine diesel engines. June 16 Cathey letter at 5 (citing 68 Fed. Reg. 9746, at 9759 (Feb. 28, 2003)). But, although EPA endeavors, where possible, to work within international standards, EPA did not "reaffirm[] its deference to emerging international standards" in that rulemaking. The text in question explains EPA's decision to not exercise its discretion to apply the standards contained in that rulemaking to marine diesel engines installed on foreign flag vessels. One of the reasons for that decision was "to facilitate the development of more stringent consensus international requirements" that have the potential of maximizing emission reductions from all vessels that visit U.S. ports. At the same time, EPA clearly noted that it would reconsider this issue in a future rulemaking. In addition, Annex VI does not address air emissions from re-gasification activities. Nor does MARPOL preclude Parties from imposing more stringent conditions on ships entering their ports. Again, EPA does not intend to impose any requirement on vessels exercising their navigational rights on the high seas, but is instead addressing activities conducted at the port. As earlier stated, this regulatory approach is consistent with Article 60 of UNCLOS, which gives "exclusive jurisdiction over . . . artificial islands, installations and structures" in the EEZ to coastal states.

CWA REGULATION OF VESSEL DISCHARGES

CWA § 502(12)(B), 33 U.S.C. § 1362(12), excludes addition of a pollutant from "a vessel or other floating craft" to the ocean or contiguous zone from its definition of "discharge of a pollutant." Based on that statutory exclusion, El Paso argues the CWA provides EPA no authority to regulate discharges from the EPEBVs. Under the 33 U.S.C. § 1518(a)(1), however, discharges from the EPEBVs must be regulated "as if" they occurred "in an area of exclusive Federal jurisdiction located within a State," i.e., in the territorial seas or inland waters. 33 U.S.C. § 1518(a)(1). The statutory exclusion for vessel discharges to the contiguous zone and ocean would not thus apply.

EPA has, however, promulgated a regulatory exclusion for vessel discharges that applies to the territorial seas and inland waters as well as to the contiguous zone and ocean. 40 C.F.R. §122.3 provides in pertinent part:

> The following discharges do not require NPDES permits:
>
> (a) any discharge of sewage from vessels, effluent from properly functioning marine engines, laundry, shower, and galley sink wastes, or any other discharge incidental to the normal operation of a vessel. This exclusion does not apply to rubbish, trash, garbage, or other such materials discharged overboard; nor to other discharges when the vessel is operating in a capacity other than as a means of transportation such as when used as an energy or mining facility, a storage facility or a seafood processing facility, or when secured to the bed of the ocean, contiguous zone or waters of the United States for the purpose of mineral or oil exploration or development . . . .

The first sentence of this regulation describes the fundamental ambit of the exclusion and the second sentence serves two purposes. The second sentence first clarifies that refuse discharged overboard is not excluded from NPDES permit requirements as "discharges incidental to the normal operation of a vessel." Second, it serves as a "recapture clause" for incidental discharges that might otherwise be subject to the exclusion of the first sentence "when the vessel is operating in a capacity other than as a means of transportation." This recapture provision is based on long-standing interpretations that Congress intended to exclude only "vessels or other floating craft" engaged in transportation from CWA permit requirements and that discharges from vessels operating other than as a means of transportation should be regulated under CWA § 402.

El Paso contends the re-gasification process that it would perform aboard EPEBVs is part of those vessels' transportation function, arguing that "[t]he Port [sic], while producing some wastewater pursuant to re-gasification operations, is only conducting those operations in furtherance of its sole purpose – the transportation of natural gas." August 18, 2003, Dutton Letter, pp. 8-9. On this basis El Paso distinguishes the EPEBVs from the seafood processing and drill ships the regulation's recapture provision references as examples, because the primary use of such vessels is not transportation, i.e., they only move to reach the locations in which they will operate in a non-transportation capacity.

There is no need to reach the question of how the recapture provision of the regulation might apply because the warming water discharges from the LNG re-gasification process that EPA would regulate under the port's NPDES permit are not "incidental to the normal operation of a vessel." LNG re-gasification is an industrial process that does not occur as part of the normal operation of a vessel. It is instead an industrial process normally performed at fixed facilities, e.g., onshore terminals, not on vessels delivering the LNG. Moreover, the proposed Port Pelican and Port Cabrillo, subjects of the only other deepwater port applications now pending, would use gravity-based fixed structures on which the LNG would be re-gasified after its delivery. At those facilities, discharges associated with re-gasification would be regulated in the facilities' NPDES permits.

Re-gasification would not even be "incidental to the normal operation" of the EPEBVs themselves. Re-gasification would not occur while the LNG is loaded aboard those vessels nor during their transit of ocean waters. Onboard re-gasification would also not occur should an EPEBV ever offload its cargo at any LNG terminal other than El Paso's. Indeed, the vessel's crew, although it would be fully qualified to transport LNG *via* steam powered vessels to any LNG terminal in the world, would only be allowed to operate the re-gasification system under the direct supervision of El Paso's PIC. Despite its physical location aboard the EPEBVs, the re-gasification process that would occur at this port would be part of El Paso's industrial operation, not part of the vessels' transportation operation. The warming water discharges from this port process should thus be regulated under an NPDES permit in the same fashion as warming water discharges from the same process at competing LNG terminals.

CAA REGULATION OF VESSEL EMISSIONS

El Paso has acknowledged that sources on the port metering platform will produce air emissions of an estimated 9.48 tons per year of NOx, 0.07 tons per year of SO_2, and 0.73 tons per year of PM_{10}. These emissions should be included in the applicability determinations for CAA preconstruction and operating permits. In addition, the much greater vessel emissions associated with the re-gasification process and the transfer of gas to the port should be included. Information submitted by El Paso indicates that these emissions may be as much as 1090 tons per year of NOx.[5] A detailed explanation of our position and a response to your various comments follows.

Fuel Conversion Facility

[5]This figure is derived from El Paso's air permit application, which apparently includes "hotelling" emissions along with re-gasification emissions, and should therefore be viewed as an upper boundary rather than a precise estimate of emissions associated with re-gasification and transfer of gas to the port.

First, in response to your concerns regarding the potential treatment of the port as a "fuel conversion facility," I am attaching a memorandum from EPA's Office of Air Quality Planning and Standards addressing this question. *See* Attachment A, Memorandum from Racqueline Shelton to Guy Donaldson (July 31, 2003). Based on this memorandum and on our current understanding of the nature of the LNG vaporization process at the port, we do not intend to treat the port as a "fuel conversion plant" for new source review (NSR) purposes.

Indirect Source Review

El Paso further asserts that EPA's view that it has permitting jurisdiction over the port "appears to be based on vessels being attracted by the Port, thus making the Port an indirect source of emissions," and that asserting jurisdiction on that basis constitutes a prohibited federally-federally imposed "indirect source review" program under Section 110(a)(5) of the CAA. June 16, 2003, Cathey letter, p. 8. This argument relies on a faulty premise. EPA is not considering the port's potential to attract mobile sources, but is instead examining the activities directly associated with the port and conducted as a part of its operations. This approach is consistent with the CAA:

> it is assuredly not the case that the ban on indirect source review was intended to go so far as to prohibit the attribution to a stationary source of all emissions which happen to emanate from or even merely physically contact a mobile source. Indeed, the statute itself provides that "direct emissions sources or facilities at, within, or associated with, any indirect source shall not be deemed indirect sources for the purpose of this [ban on indirect source review]."

Natural Resources Defense Council, Inc. v. EPA, 725 F.2d 761, 771 (D.C. Cir. 1984) (*NRDC)* (quoting 42 U.S.C. § 7410(a) (5) (C)). All emissions being considered are direct emissions, and are from stationary sources as defined under Section 302(z) of the Act, as further discussed below.[6]

"Stationary Sources" Under the CAA

El Paso maintains that EPA air permitting programs generally cover only stationary sources, and that the CAA defines all vessel emissions as mobile emissions sources. We agree with the first conclusion, but not the second.

Our determination that vessel emissions generated in handling LNG at the port should be included in the applicability determination stems from our reading of the plain language of the CAA. Specifically, its definition of "stationary source" gives EPA the authority to consider emissions from external combustion engine vessels in preconstruction and operating permits. This

---

[6]We also note that the CAA's requirement is that EPA not mandate inclusion of an indirect source review program in a State Implementation Plan (SIP) or include it in a Federal Implementation Plan (FIP). CAA Section 110(a)(5)(A), 42 U.S.C. § 7410. EPA's review of the port for permitting purposes is not equivalent to action on a SIP or FIP.

general definition, which is applicable to both preconstruction permits and operating permits, appears at Section 302(z):

> Stationary Source. The term "stationary source" means generally any source of an air pollutant except those emissions resulting directly from an internal combustion engine for transportation purposes or from a nonroad engine or nonroad vehicle as defined in section 216.

42 U.S.C. § 7602(z). In turn, the Section 216 definitions of "nonroad engine" and "nonroad vehicle" are limited to internal combustion engines. 42 U.S.C. § 7550(10), (11). Thus, a vessel powered by external combustion engines would be a "stationary source" for permitting purposes, because only internal-combustion-driven vehicles are excluded from the Section 302(z) definition of stationary source.[7]

El Paso disagrees with this approach, saying that EPA's "rigid" reading of the plain language of the statute would lead to the "illogical result" of treating internal and external combustion engines differently. "A more sensible reading of the CAA," El Paso contends, "is to exempt from permitting the emissions from all nonroad engines and also engines used for propulsion." July 18 Dutton Letter, p. 1. Such an exemption, however, is not present in the CAA. Whether Congress could have used a different approach when it wrote the CAA is not relevant to EPA's decision here, given the plain words of the statute. It is not EPA that has decided to treat external and internal combustion engines differently for purposes of determining what is a stationary source under the CAA. It is instead the express language enacted by Congress.[8]

However, we believe that these statutory definitions do not require EPA to include "to and fro" emissions from marine vessels powered by external combustion engines, or the vessels' "hotelling" emissions not directly associated with the activities of the port as part of the emissions attributable to the port facility. We draw this distinction because under the DPA other U.S. laws apply "to deepwater ports . . . and to activities connected, associated, or potentially interfering with the use or operation of any such port." 33 U.S.C. § 1518(a)(1). The "to and fro" emissions and "hotelling" emissions from the vessels are associated with the normal seagoing activities of the

---

[7]As you have informed us, the vessels used in this operation are powered by external combustion engines, not reciprocating internal combustion engines or gas turbines, which generally combust internally. Also, these engines are distinguished from any auxiliary engines on the vessel that may be internal combustion engines.

[8]Whether the Act as a whole would authorize similar treatment of internal-combustion-propelled vessels is not relevant. In this letter we take no position on the applicability of NSR or Title V to emissions from vessels propelled by internal combustion engines. We simply find that the plain language of the Clean Air Act directs that, when making NSR and Title V applicability determinations, EPA is to consider the re-gasification-related emissions from vessels calling at the port.

vessels and not with the industrial activities associated with the port. We thus intend to consider only the emissions from activities in support of the port's function – i.e., those related to processing and transferring gas at the port, regardless of whether they occur on the metering platform or on marine vessels propelled by external combustion engines, as stationary emissions of the port for CAA Title I and Title V purposes. The nature of controls, if any, EPA will propose to impose on those emissions will be reflected in a draft preconstruction/Title V permit.

EPA PSD Regulations and the *NRDC* Decision

El Paso argues that EPA regulations bar consideration of vessel emissions in CAA permitting applicability determinations. July 18 Dutton Letter, p. 3 (citing 40 C.F.R. §§ 51.166(b)(6); 52.21(b)(6)). The cited EPA regulations indeed exclude "the activities of any vessel" from the scope of a regulated stationary source in PSD permitting. EPA promulgated that exemption in 1982, in a rule withdrawing previous regulations that had provided for consideration of vessel emissions on a "control and proximity" basis. See 47 Fed. Reg. 27554 (July 25, 1982). The 1982 rulemaking amended various regulations, including the two cited by El Paso,[9] by adding the phrase "except the activities of any vessel." In the *NRDC* decision, however, the D.C. Circuit Court of Appeals unambiguously vacated the provisions on which El Paso relies:

> [W]e vacate that portion of EPA's revocation [i.e., its 1982 rule withdrawing the previous rules] which "excepts the activities of any vessel" from the emissions attributable to marine terminals, *see, e.g.,* 40 C.F.R. § 51.24(b)(6) (1983), 47 Fed. Reg. 27,560 (1982).

NRDC, 725 F.2d at 775. El Paso correctly notes that the Court also remanded the matter to EPA for further action consistent with its opinion. Nonetheless, the *vacatur* leaves no legally effective regulation that would exempt "the activities of any vessel" from consideration for port permitting purposes. *See Action on Smoking and Health v. Civil Aeronautics Board*, 713 F.2d 795, 797 ("To 'vacate' . . . means 'to annul; to cancel or rescind; to declare, to make, or to render, void; to defeat; to deprive of force; to make of no authority or validity; to set aside.'") El Paso therefore cannot rely on the language added to the regulations by the 1982 rulemaking.

El Paso also asserts that even under EPA's 1980 "control and proximity" regulations, which were withdrawn by the 1982 rule partly vacated in *NRDC*, EPA could still not consider any vessel emissions in permitting the port. Without assessing the merits of El Paso's interpretation of those regulations, we note that the *NRDC* court did not re-promulgate them. Accordingly, the statute rather than these regulations governs our decision here. Our conclusion is reinforced by the fact that the definition of stationary source was added in 1990, after both the rules and the D.C. Circuit opinion had been written. Therefore, nothing in the statute supports the conclusion that re-gasification of LNG occurring at a fixed location using power generated by an external

---

[9] 40 C.F.R. § 51.24, which is referenced in the 1983 rulemaking partially vacated in *NRDC*, has since been renumbered as 40 C.F.R. § 166. *See* 51 Fed. Reg. 40656 (Nov. 7, 1986).

combustion engine must be regulated as a mobile source, even when the re-gasification process occurs on a vessel used to transport the LNG and re-gasification equipment to that fixed location.

CONCLUSION

As explained above, EPA Region 6 concludes that:

(1) All discharges from the metering platform and discharges of warming water from the re-gasification process performed aboard EPEBVs are subject to regulation under CWA §402.

(2) Emissions related to the re-gasification and transfer of gas at the port will be included in the CAA operating and preconstruction permit applicability determinations without regard to whether those emissions originate on the metering platforms or EPEBVs. The PSD/Title V permit applications El Paso submitted on September 4, 2003, provide a "worst case" estimate of El Paso's potential to emit. Regional technical staff will be contacting El Paso representatives to discuss potential terms of the draft preconstruction and operating permit.

EPA recognizes and appreciates that El Paso has different views on these matters. Nothing in this letter, however, precludes El Paso from acting on its own interpretation of applicable laws and regulations. The views explained in this letter, if and when applied in a permit, would be subject to administrative review by EPA's Environmental Appeals Board. This letter, therefore, does not constitute "final agency action" for purposes of obtaining judicial review. Final agency action occurs upon completion of the permit appeal processes.

Thank you for your patience in this matter. The views of both El Paso and EPA on these difficult issues of first impression have changed substantially since you originally raised them in May, and substantial time was necessary to provide El Paso full opportunity to express its views and to coordinate this response with various affected programs in EPA and other federal agencies. I assure you that EPA Region 6 will give fair and timely consideration to El Paso's permit applications.

Sincerely yours,

Charles J. Sheehan
Regional Counsel

Re: Amite BioEnergy, LLC

Dear Mr. Aultman:

I am writing this as legal counsel for Amite BioEnergy, LLC ("Amite"). Pursuant to Miss. Code Ann. § 49-17-43(7)(g), Amite is voluntarily disclosing information that indicates its facility (Air Pollution Control Permit To Construct Air Emissions Equipment, Permit No. 0080-00031) located in Gloster, Mississippi, may not be in full compliance with 11 Miss. Admin. Code Part 2 Chapter 2, Permit Regulations for the Construction and/or Operation of Air Emissions Equipment, and Chapter 5, Regulations for the Prevention of Significant Deterioration of Air Quality.

The basis for this notice is information identified during work at a sister facility which indicated different emission rates than expected. The actual conditions at the Gloster facility have not yet been determined but ongoing testing will be available in the near term. This will include Volatile Organic Compound EPA Method 25a and Fourier Transform Infrared Spectroscopy EPA Method 320 testing. Upon completion of the testing, Amite will supplement this notice and schedule a meeting with Mississippi Department of Environmental Quality ("MDEQ") staff to review the findings and determine an appropriate path forward. In the meantime, if you need additional information or have questions about this notice please call my office at the number listed above. We appreciate your assistance going forward as Amite addresses this matter and look forward to working with the MDEQ on a satisfactory resolution.

Very truly yours,

Keith W. Turner

RE: Submittal of Stack Test Report
Amite BioEnergy LLC; Gloster, MS
AI #57796

Dear. Mr. Tynes,

On behalf of Amite BioEnergy LLC (Amite), a company owned by Drax Biomass Inc., Trinity Consultants, Inc. (Trinity) submits the attached stack test report for testing performed at Amite on November 26-30, 2018. The testing was performed by Sanders Engineering & Analytical Services, Inc.

Also included as an attachment is a summary of tables of the tested emissions from each source. The Primary Hammermills, the Secondary Hammermills, the Pellet Coolers, the Loadout Silo, and the Regenerative Thermal Oxidizer (RTO) were all tested for VOCs. Additionally, the RTO was also tested for formaldehyde.

Below is a summary of the emissions from each source.

Amite BioEnergy – Emissions from Stack Test

Equipment	Average Volatile Organic Compound Emissions [1] (tons/yr)	Average Formaldehyde Emissions (tons/yr) [1]
Primary Hammermill 1A (AA-004)	11.21	N/A
Primary Hammermill 1B (AA-004)	18.73	N/A
Primary Hammermill 2A (AA-004)	36.51	N/A
Primary Hammermill 2B (AA-004)	23.17	N/A
Primary Hammermill 3A (AA-004)	16.33	N/A
Primary Hammermill 3B (AA-004)	11.95	N/A
Secondary Hammermill 1 (AA-007)	31.0	N/A
Secondary Hammermill 2 (AA-007)	29.5	N/A
Secondary Hammermill 3 (AA-007)	30.9	N/A
Cooler 1AB	91.0	N/A
Cooler 1CD	77.9	N/A
Cooler 2AB	82.9	N/A
Cooler 2CD	88.2	N/A
Cooler 3AB	84.7	N/A
Cooler 3CD	74.0	N/A
Loadout Silo	7.74	N/A
RTO	79.87	2.44
Total	**795.58**	**2.44**

(1) Emissions are the average of three 1-hour runs.

If you have any questions about the attached report, please call either me at (504) 828-5845, ext 1001, or ______________.

Sincerely,

TRINITY CONSULTANTS

Sharon Killian

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

DATE: January 20, 1976

SUBJECT*:* Clarification of Sources Subject to Prevention of Significant Deterioration (PSD) Review

FROM: D. Kent Berry, Director
Policy Analysis Staff

TO*:* Asa B. Foster, Jr., Director
Air and Hazardous Materials Division
Region IV

This is in response-to your November 26, 1975, memo to Dr. Steigerwald requesting clarification of the emission points in phosphate rock processing plants and fuel conversion plants that should be subject to PSD review. I understand from discussions with your staff that you are mainly interested in a clarification of the general processes and -operations covered by the PSD review rather than the specific emission points that would normally be associated with each process or facility. As a general policy, all emission points of SO 2 and particulate matter at a facility covered by the PSD review should be considered in determining the air quality impact of the facility. A BACT determination should generally be made for all emission points also, although you have the flexibility not to specify a BACT emission limit for certain emission points if little would be gained.

Fuel conversion plants are defined for purposes of PSD as those plants which accomplish a change in state for a given fossil fuel. The large majority of these plants are likely to accomplish these changes through coal gasification, coal liquefaction, or oil shale processing. The recently promulgated NSPS governing new coal preparation plants regulate most particulate emissions from pre-gasification or liquefaction operations and thereby define BACT for them. NSPS for both SO 2 and PM already exist for the boilers which are necessary in most fuel conversion operations to generate process steam. An SSEIS for coal gasification plants is being drafted with the intent to include the gasification process itself for sulfur and HC emissions in cases where pipeline quality gas would be produced.

We have examined several of the first-generation fuel-conversion processes and can provide, if you need it, more detailed information on specific emission points and typical emission rates as well as the location of a number of proposed plants. Mike Trutna in Jean Schueneman's division should be the contact for additional information in this area, including assistance on BACT determinations (see Jean's memo to you of December 2, 1975).

With respect to phosphate rock processing, the same philosophy stated above should apply: all processes emitting SO_2 and/or particulate matter located on the same premises with phosphate rock preparation operations are subject to PSD review. A list of the processes commonly associated with phosphate rock preparation is presented in Table 1 and shown in Figure 1. If, however, any of the chemical or fertilizer production processes are not associated with the phosphate rock processing operation, we feel there is no basis for their inclusion under the PSD regulation as presently worded. In addition, the particulate impact of these processes meeting NSPS is relatively minor.

In our opinion, the measures required to meet the NSPS fluoride standards for the fertilizer production operations also represent BACT for particulate matter and therefore a separate BACT determination for particulate matter is not necessary. However, some estimate of the particulate emissions is needed to complete the air quality impact analysis and an estimate of these emissions is presented in Table 1. Further assistance in quantifying the particulate emissions can be provided on a case-by-case basis.

In addition to the process sources, fugitive dust emissions from haul roads, tailings piles etc. may need to be examined with respect to BACT (probably by specifying operating and maintenance practices) and also for their air quality impact (although where the plant covers a large land area, the concentration may have dropped off substantially by the time the plume reaches the plant boundary).

I hope this adequately answers your questions. If you need further assistance or want to discuss our response in more detail, please contact Mike Trutna (8-629-5365) or myself (8-629-5543). Enclosures

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

DATE: Nov 26, 1975

SUBJECT: Definition of Sources Subject to Prevention of Significant Deterioration (PSD) New Source Review

FROM: Asa B. Foster, Jr., Director
Air & Hazardous Materials Division

TO: Dr. Bernard J. Steigerwald
Deputy Assistance Administrator
Air Quality Planning & Standards

<ins>Summary</ins>

Two of the source categories contained in the Prevention of Significant Deterioration (PSD) regulations are Phosphate Rock Processing Plants and Fuel Conversion Plants. In implementing these regulations there is some confusion as to the emission points actual covered in the definition. Any further definition and/or clarification is desirable.

<ins>Action</ins>

Please provide-me with a clarification of the emission points that EPA intends to be included in the definitions of Phosphate Rock Processing and Fuel Conversion Plants.

<ins>Background</ins>
40 CFR 52.21(d).

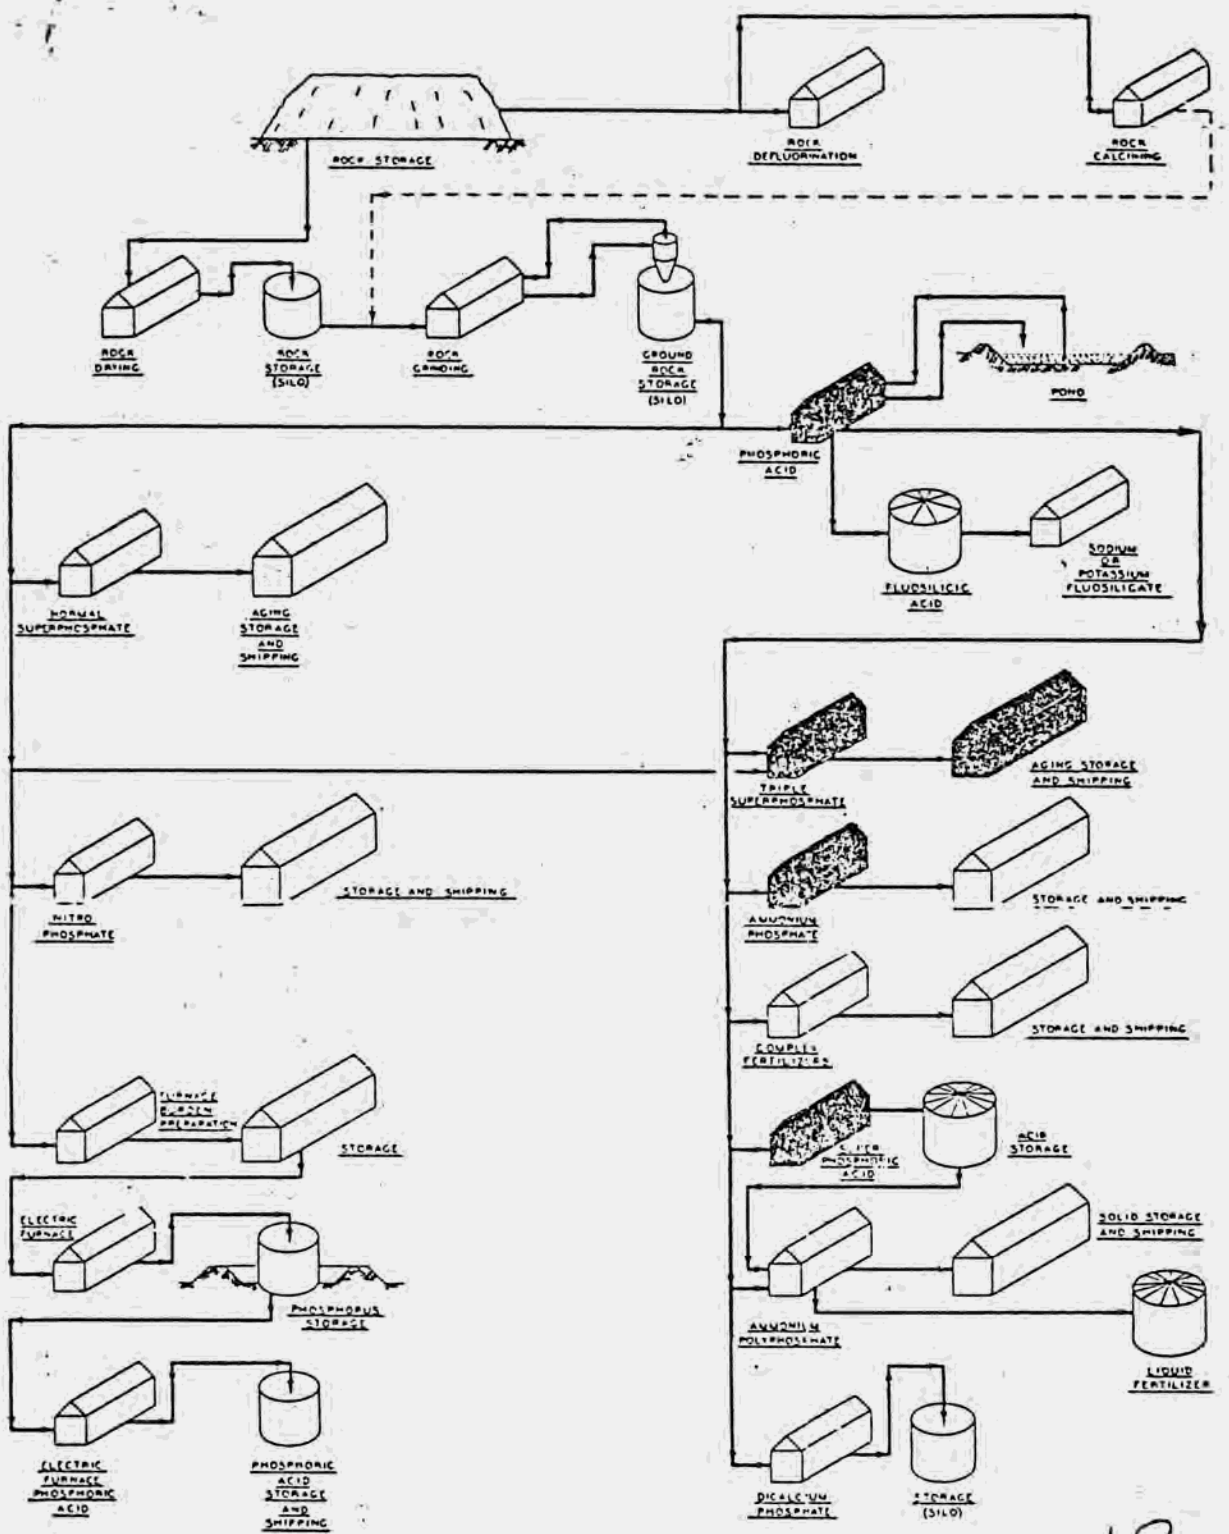

FIGURE 1
PHOSPHATE ROCK PROCESSING INDUSTRY

2 of 3

Table 1 - Processes Commonly Associated with Phosphate Rock Preparation

Emission Source	Emission Factors: Potential[1]	Emission Factors: BACT[2]	BACT[2]	Typical Size of New Facility	Emissions from Typical Facility	Comments
I. Phosphate Rock Preparation						
Mining	Negl.	NA	NA			Mining wet rock (10 - 15% moisture)
Beneficiation	Negl.	NA	NA			Concentration processes occur in a wet slurry
Drying	3.3-14#/ton	.086#/ton	Scrubber(99%)	250tons/hr	21.5#/hr	
Calcining	7.9#/ton	.159#/ton	Scrubber(98%)	50tons/hr	8.0#/hr	
Nodulizing						None expected
Grinding	1.8 to 4.4#/ton	.031#/ton	Baghouse(99%)	50tons/hr	4.3#/hr	
Thermal Defluorination	7.5#/ton	.075#/ton	Scrubber(99%)	NA	--	
Material Handling and Storage	1.3 to 2#/ton	.017#/ton	Scrubber(99%)	50tons/hr	0.9#/hr	
II. Phosphate Fertilizer Industry						
Phosphoric Acid Mfg						
Wet Process	Negl.	NA	NA	500tons/day		Covered under NSPS/fluorides, low part impact
Thermal Process	134#/ton	.134#/ton	Scrubber(99%)			None expected
Superphosphoric Acid Plant						
Vacuum Evaporation (evaporators, cooling tanks, hot wells) Submerged combustion	1.3#/ton	.013#/ton	Venturi Scrubber w/packed tower	200tons/day	0.1#/hr	
Diammonium Phosphate Plants (reactor, granulator, dryer, cooler, screens, mills)	82#/ton	1.64#/ton	Scrubber(98%) w/packed tower	500tons/day	34.2#/hr	
Run-of-Pile Triple Superphosphate (mixer, curing belt, conveyors, storage)	2.5#/ton	0.05#/ton	Scrubber(98%) w/packed tower	600tons/day	1.25#/hr	
Granular Triple Superphosphate (reactor, granulator, dryer, cooler, screens, mills, storage)	1.51#/ton	0.03#/ton	Scrubber(98%) w/packed tower	500tons/day	0.6#/hr	
III. Other Products						
Elemental phosphorous	None expected					
Animal feed	No data					

1. Estimates only, especially in II.

2. Intended to be indications only.

NORTH CAROLINA
Environmental Quality

January 14, 2019

Mr. Royal Smith
EVP of Operations
Enviva Pellets Hamlet, LLC
7200 Wisconsin Avenue
Bethesda, Maryland 20814

Dear Mr. Smith:

SUBJECT: Air Quality Permit No. 10365R03
Facility ID: 7700096
Enviva Pellets Hamlet, LLC
Hamlet, North Carolina
Richmond County
PSD Status: Minor
Fee Class: Title V

In accordance with your Air Permit Application received on May 14, 2018 we are forwarding herewith Air Quality Permit No. 10365R03 to Enviva Pellets Hamlet, LLC, 1125 North NC Highway 177, Hamlet, North Carolina, authorizing the construction and operation, of the emission source(s) and associated air pollution control device(s) specified herein. Additionally, any emissions activities determined from your Air Quality Permit Application as being insignificant per 15A North Carolina Administrative Code 2Q .0503(8) have been listed for informational purposes as an "ATTACHMENT."

As the designated responsible official it is your responsibility to review, understand, and abide by all of the terms and conditions of the attached permit. It is also your responsibility to ensure that any person who operates any emission source and associated air pollution control device subject to any term or condition of the attached permit reviews, understands, and abides by the condition(s) of the attached permit that are applicable to that particular emission source.

If any parts, requirements, or limitations contained in this Air Quality Permit are unacceptable to you, you have the right to request a formal adjudicatory hearing within 30 days following receipt of this permit, identifying the specific issues to be contested. This hearing request must be in the form of a written petition, conforming to NCGS (North Carolina General Statutes) 150B-23, and filed with both the Office of Administrative Hearings, 6714 Mail Service Center, Raleigh, North Carolina 27699-6714 and the Division of Air Quality, Permitting Section, 1641 Mail Service Center, Raleigh, North Carolina 27699-1641. The form for requesting a formal adjudicatory hearing may be obtained upon request from the Office of Administrative Hearings. Please note that this permit will be stayed in its entirety upon receipt of the request for a hearing. Unless a request for a hearing is made pursuant to NCGS 150B-23, this Air Quality Permit shall be final and binding 30 days after issuance.

You may request modification of your Air Quality Permit through informal means pursuant to NCGS 150B-22. This request must be submitted in writing to the Director and must identify the specific provisions or issues for which the modification is sought. Please note that this Air Quality Permit will become final and binding regardless of a request for informal modification unless a request for a hearing is also made under NCGS 150B-23.

The construction of new air pollution emission source(s) and associated air pollution control device(s), or modifications to the emission source(s) and air pollution control device(s) described in this permit must be covered under an Air Quality Permit issued by the Division of Air Quality prior to construction unless the Permittee has fulfilled the requirements of GS 143-215-108A(b) and received written approval from the Director of the Division of Air Quality to commence construction. Failure to receive an Air Quality Permit or written approval prior to commencing construction is a violation of GS 143-215.108A and may subject the Permittee to civil or criminal penalties as described in GS 143-215.114A and 143-215.114B.

Richmond County has triggered increment tracking under PSD for NOx, PM-10, and PM-2.5. This modification will result in an increase of 3.61 pounds per hour of NOx, a decrease of 7.12 pounds per hour of PM-10, and a decrease of 4.26 pounds per hour of PM-2.5.

This Air Quality Permit shall be effective from January 14, 2019 until February 28, 2021, is nontransferable to future owners and operators, and shall be subject to the conditions and limitations as specified therein. Should you have any questions concerning this matter, please contact Kevin Godwin at (919) 707-8480 or kevin.godwin@ncdenr.gov.

Sincerely yours,

Mark Cuilla

for William D. Willets, P.E., Chief, Permitting Section
Division of Air Quality, NCDEQ

ATTACHMENT

Insignificant Activities per 15A NCAC 02Q .0503(8)

Emission Source ID No.	Emission Source Description
IES-CHIP-1	Log chipping (138 tons per hour)
IES-BARKHOG	Bark hog (25 tons per hour)
IES-GWH	Green wood handling operations
IES-GN	Emergency generator (671 brake horsepower)
IES-FWP	Fire water pump (131 brake horsepower)
IES-DRYSHAVE	Dried shaving material handling (25 tons per hour)
IES-TK-1	Diesel fuel storage tank (1,000 gallons capacity)
IES-TK-2	Diesel fuel storage tank (185 gallons capacity)
IES-TK-3	Diesel fuel storage tank (5,000 gallons capacity)
IES-GWSP-1 through IES-GWSP-4	Green wood storage piles
IES-BFSP-1 and IES-BFP-2	Bark fuel storage piles
IES-BFB	Bark fuel bin
IES-DEBARK-1	De-barker (275 tons per hour)

1. Because an activity is insignificant does not mean that the activity is exempted from an applicable requirement or that the Permittee is exempted from demonstrating compliance with any applicable requirement.
2. When applicable, emissions from stationary source activities identified above shall be included in determining compliance with the permit requirements for toxic air pollutants under 15A NCAC 02D .1100 "Control of Toxic Air Pollutants" or 02Q .0711 "Emission Rates Requiring a Permit."
3. For additional information regarding the applicability of MACT or GACT see the DAQ page titled "Specific Permit Conditions Regulatory Guide." The link to this site is as follows: http://deq.nc.gov/about/divisions/air-quality/air-quality-permits/specific-permit-conditions-regulatory-guide.

Summary of Changes to Permit

The following changes were made to the existing Air Permit:

Page No.	Section	Description of Changes
N/A	Attachment – List of Insignificant Activities	<u>Included the following sources:</u> Log Chipping (ID No. IES-CHIP-1), Bark Hog (ID No. IES-BARKHOG), Emergency Generator (ID No. IES-GN), Fire water pump (ID No. IES-FWP), Dried shaving material handling (ID No. IES-DRYSHAVE), Bark fuel storage piles (ID No. IES-BFSP-1 and 2), Bark fuel bin (ID No. IES-BFB). <u>Updated storage tank capacities as follows:</u> Diesel fuel storage tank (ID No. IES-TK-1, 1,000 gallons capacity), Diesel fuel storage tank (ID No. IES-TK-2, 185 gallons capacity), Diesel fuel storage tanks (ID No. IES-TK-3, 5,000 gallons capacity).

Page No.	Section	Description of Changes
3	Table of Permitted Emission Sources	Removed the PSD designation throughout the table. Included the following sources and control devices: Hammermill collection conveyor (ID No. ES-HMC) controlled by bagfilter (ID No. CD-HMC-BH), Pellet cooler high-pressure fines relay (ID No. ES-PCHP) controlled by bagfilter (ID No. CD-PCHP-BH), Pellet cooler low-pressure fines relay (ID No. ES-PCLP) controlled by bagfilter (ID No. CD-PCLP-BH), Pellet dust collection transfer bin (ID No. PDCTB) controlled by bagfilter (ID No. CD-PDCTB-BH), Additive handling and storage (ID No. ES-ADD) controlled by bagfilter (ID No. CD-ADD-BH). Removed cyclones as control devices. Removed Hammermill Area (ID No. ES-HMA) emission point. Changed the Pellet Loadout Bins from eight (8) to two (2) bins (ID Nos. ES-PB-1 and 2) Included new regenerative thermal oxidizer (ID No. CD-RTO-1) installed on Green wood hammermills (ID No. GMH-1 through 3) and Rotary dryer (ID No. ES-DRYER). Included new wet scrubber (ID No. CD-WSB) and regenerative catalytic oxidizer (ID No. CD-RCO) installed on Pellet coolers (ID Nos. ES-CLR-1 through 6) Moved the following sources to the insignificant activity list: Log Chipping (ID No. IES-CHIP-1), Bark Hog (ID No. IES-BARKHOG), Emergency Generator (ID No. IES-GM), and Fire water pump (ID No. IES-FWP).
4	2.1 A.	Updated emission source description to reflect the proposed emission source configuration.
5	2.1 A.1	Updated the 15A NCAC 02D .0515 condition to reflect the proposed control device configuration.
8	2.2 A.2.	Removed the existing PSD condition and replaced with a PSD avoidance condition.

AIR QUALITY PERMIT

Permit No.	Replaces Permit No.(s)	Effective Date	Expiration Date
10365R03	10365R02	January 14, 2019	February 28, 2021

Until such time as this permit expires or is modified or revoked, the below named Permittee is permitted to construct and operate the emission source(s) and associated air pollution control device(s) specified herein, in accordance with the terms, conditions, and limitations within this permit. This permit is issued under the provisions of Article 21B of Chapter 143, General Statutes of North Carolina as amended, and Title 15A North Carolina Administrative Codes (15A NCAC), Subchapters 2D and 2Q, and other applicable Laws.

Pursuant to Title 15A NCAC, Subchapter 2Q, the Permittee shall not construct, operate, or modify any emission source(s) or air pollution control device(s) without having first submitted a complete Air Quality Permit Application to the permitting authority and received an Air Quality Permit, except as provided in this permit.

Permittee:	**Enviva Pellets Hamlet, LLC**
Facility ID:	**7700096**
Facility Site Location:	**1125 North NC Highway 177**
City, County, State, Zip:	**Hamlet, Richmond County, North Carolina, 28345**
Mailing Address:	**7200 Wisconsin Avenue**
City, State, Zip:	**Bethesda, Maryland 20814**
Application Number:	**7700096.18A**
Complete Application Date:	**June 6, 2017**
Primary SIC Code:	**2499**
Division of Air Quality,	**Fayetteville Regional Office**
Regional Office Address:	**Systel Building**

Table Of Contents

SECTION 1: PERMITTED EMISSION SOURCE (S) AND ASSOCIATED AIR POLLUTION CONTROL DEVICE (S) AND APPURTENANCES

SECTION 2: SPECIFIC LIMITATIONS AND CONDITIONS

2.1- Emission Source(s) Specific Limitations and Conditions
(Including specific requirements, testing, monitoring, recordkeeping, and reporting requirements)

2.2- Multiple Emission Source(s) Specific Limitations and Conditions
(Including specific requirements, testing, monitoring, recordkeeping, and reporting requirements)

SECTION 3: GENERAL PERMIT CONDITIONS

SECTION 1- PERMITTED EMISSION SOURCE(S) AND ASSOCIATED AIR POLLUTION CONTROL DEVICE(S) AND APPURTENANCES

The following table contains a summary of all permitted emission sources and associated air pollution control devices and appurtenances:

Emission Source ID No.	Emission Source Description	Control Device ID No.	Control Device Description
ES-GHM-1, ES-GHM-2, and ES-GHM-3	Green wood hammermills	CD-WESP CD-RTO-1	One wet electrostatic precipitator (square feet of collector plate area to be determined) in series with One natural gas-fired regenerative thermal oxidizer (32 million Btu per hour heat input)
ES-DRYER **02D .1112 Case-by-case MACT**	Green wood direct-fired rotary dryer system (250.4 million Btu per hour heat input)	CD-WESP CD-RTO-1	One wet electrostatic precipitator (square feet of collector plate area to be determined) in series with One natural gas-fired regenerative thermal oxidizer (32 million Btu per hour heat input)
ES-DWH	Dried wood handling	CD-DWH-BH-1 and CD-DWH-BH-2	Two bagfilters (square feet filter surface to be determined) operating in parallel
ES-HM-1 through ES-HM-8 **02D .1112 Case-by-case MACT**	Eight (8) hammermills	CD-HM-BH-1 through CD-HM-BH-8	Eight (8) bagfilters (square feet filter surface area to be determined)
ES-HMC	Hammermill collection conveyor	CD-HMC-BH	One bagfilter (square feet filter surface area to be determined)
ES-PMFS	Pellet mill feed silo	CD-PMFS-BH	One bagfilter (square feet of filter surface area to be determined)
ES-CLR-1 through ES-CLR-6 **02D .1112 Case-by-case MACT**	Six (6) pellet coolers	CD-WSB CD-RCO	One wet scrubber (minimum liquid injection rate to be determined) One natural gas-fired regenerative catalytic oxidizer (32 million Btu per hour heat input)
ES-PCHP	One pellet cooler high-pressure fines relay system	CD-PCHP-BH	One bagfilter (square feet of filter surface area to be determined)
ES-PCLP	One pellet cooler low-pressure fines relay system	CD-PCLP-BH	One bagfilter (square feet of filter surface area to be determined)
ES-PDCTB	One pellet dust collection transfer bin	CD-PDCTB-BH	One bagfilter (square feet of filter surface area to be determined)
ES-FPH, ES-PB1, ES-PB2, ES-PL-1 through ES-PL-3	Finished product handling and two (2) pellet loadout bins and three (3) pellet mill loadouts	CD-FPH-BH	One bagfilter (square feet of filter surface area to be determined)

Emission Source ID No.	Emission Source Description	Control Device ID No.	Control Device Description
ES-ADD	Additive handling and storage	CD-ADD-BH	One bagfilter (square feet of filter surface area to be determined)

SECTION 2 - SPECIFIC LIMITATIONS AND CONDITIONS

2.1- Emission Source(s) and Control Devices(s) Specific Limitations and Conditions

The emission source(s) and associated air pollution control device(s) and appurtenances listed below are subject to the following specific terms, conditions, and limitations, including the testing, monitoring, recordkeeping, and reporting requirements as specified herein:

A. Green wood hammermills (ID Nos. ES-GHM-1, 2, and 3), Rotary dryer system (ID No. ES-DRYER), Dried wood handling (ID No. ES-DWH), Hammermills (ID Nos. ES-HM-1 through ES-HM-8), Hammermill collection conveyor (ID No. ES-HMC), Pellet mill feed silo (ID No. ES-PMFS), Pellet coolers (ID Nos. ES-CLR-1 through ES-CLR-6), Pellet cooler high-pressure fines relay system (ID No. ES-PCHP), Pellet cooler low-pressure fines relay system (ID No. ES-PCLP), Pellet dust collection system transfer bin (ID No. ES-PDCTB), Finished product handling and load-out bins (ID Nos. ES-FPH, ES-PB-1 and ES-PB-2), and Additive handling and storage (ID No. ES-ADD)

The following table provides a summary of limits and standards for the emission source(s) described above:

Regulated Pollutant	Limits/Standards	Applicable Regulation
Particulate matter	$E = 4.10 \times P^{0.67}$ for $P < 30$ tph $E = 55 \times P^{0.11} - 40$ for $P \geq 30$ tph where, E = allowable emission rate (lb/hr) P = process weight rate (tph)	15A NCAC 02D .0515
Sulfur dioxide	2.3 pounds per million Btu	15A NCAC 02D .0516
Visible emissions	20 percent opacity when averaged over a 6-minute period	15A NCAC 02D .0521
Hazardous Air Pollutants (HAP)	See Section 2.1 A.4.	15A NCAC 02D .1112 [§ 112(g) Case-by-case MACT]

Regulated Pollutant	Limits/Standards	Applicable Regulation
Volatile organic compounds (VOC), Nitrogen Oxides (NOx), and Carbon Monoxide (CO)	Less than 250 tons per consecutive 12-month period, See Section 2.2 A.2.	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530

1. **15A NCAC 02D .0515: PARTICULATES FROM MISCELLANEOUS INDUSTRIAL PROCESSES**
   a. Emissions of particulate matter from these sources shall not exceed an allowable emission rate as calculated by the following equation: [15A NCAC 02D .0515(a)]

      $E = 4.10 \times P^{0.67}$ for $P < 30$ tph
      $E = 55 \times P^{0.11} - 40$ for $P \geq 30$ tph

      Where E = allowable emission rate in pounds per hour
      P = process weight in tons per hour

      Liquid and gaseous fuels and combustion air are not considered as part of the process weight.

   Testing [15A NCAC 02Q .0308(a)]

   b. Under the provisions of NCGS 143-215.108, the Permittee shall test the outlet of the regenerative thermal oxidizer (ID No. CD-RTO-1) and the regenerative catalytic oxidizer (ID No. CD-RCO) for total suspended particulate (TSP) in accordance with a testing protocol approved by the DAQ. Testing shall be completed and the results submitted within 180 days of commencement of operation unless an alternate date is approved by the DAQ.

   Monitoring/Recordkeeping [15A NCAC 02Q .0308(a)]

   c. The Permittee shall maintain production records such that the process rates "P" in tons per hour, as specified by the formulas contained above (or the formulas contained in 15A NCAC 02D .0515), can be derived, and shall make these records available to a DAQ authorized representative upon request.

   d. Particulate matter emissions from the green wood hammermills (ID No. ES-GHM-1, 2, and 3) and rotary dryer (ID No. ES-DRYER) shall be controlled by one wet electrostatic precipitator (ID No. CD-WESP) in series with on regenerative thermal oxidizer (ID No. CD-RTO-1). Particulate matter emissions from dried wood handling (ID No. ES-DWH) shall be controlled by two bagfilters (ID Nos. CD-DWH-BH-1 and 2) operating in parallel. Particulate matter emissions from hammermills (ID No. ES-HM-1 through 8) shall be controlled by bagfilters (ID No. CD-HM-BH-1 through 8). Particulate matter emissions from the hammermill collection conveyor (ID No. ES-HMC) shall be controlled by a bagfilter (ID No. CD-HMC-BH). Particulate matter emissions from the pellet mill feed silo (ID No. ES-PMFS) shall be controlled by a bagfilter (ID No. CD-PMFS-BH). Particulate matter emissions from pellet coolers (ID Nos. ES-CLR-1 through 6) shall be controlled by a wet scrubber (ID No. CD-WSB) in series with a regenerative catalytic oxidizer (ID No. CD-RCO). Particulate matter emissions from the pellet cooler high-pressure fines relay system (ID No. ES-PCHP) shall be controlled by a bagfilter (ID No. CD-PCHP-BH). Particulate matter emissions from the pellet cooler low-pressure fines relay system (ID No. ES-PCLP) shall be controlled by a bagfilter (ID No. CD-PCLP). Particulate matter from the pellet dust collection transfer bin (ID No. ES-

PDCTB) shall be controlled by a bagfilter (ID No. CD-PDCTB-BH). Particulate matter emissions from the finished product handling (ID No. ES-FPH) and pellet loadout bins (ID No. ES-PB1 and 2) shall be controlled by a bagfilter (ID No. CD-FPH-BH). Particulate matter emissions from the additive handling and storage (ID No. ES-ADD) shall be controlled by a bagfilter (ID No. CD-ADD-BH).

For bagfilters:
To ensure compliance, the Permittee shall perform inspections and maintenance as recommended by the manufacturer. In addition to the manufacturer's inspection and maintenance recommendations, or if there are no manufacturer's inspection and maintenance recommendations, as a minimum, the inspection and maintenance requirement shall include the following:

i. a monthly visual inspection of the system ductwork and material collection unit for leaks, and
ii. an annual (for each 12-month period following the initial inspection) internal inspection of the bagfilters' structural integrity.

For WESP:
To ensure compliance, the Permittee shall perform inspections and maintenance as recommended by the manufacturer. In addition to the manufacturer's inspection and maintenance recommendations, or if there are no manufacturer's inspection and maintenance recommendations, as a minimum, the inspection and maintenance requirement shall include the following:

The Permittee shall establish the minimum primary voltage and minimum current within the first 30 days following the commencement of operation of the dryer. To assure compliance and effective operation of the wet electrostatic precipitator, the Permittee shall monitor and record the primary voltage and minimum current through the precipitator for each day of the calendar year period that the dryer system is operated. The Permittee shall be allowed three (3) days of absent observations per semi-annual period.

For RTO and RCO:
To ensure compliance, the Permittee shall perform inspections and maintenance as recommended by the manufacturer.

e. The results of inspection and maintenance shall be maintained in a log (written or electronic format) on-site and made available to an authorized representative upon request. The log shall record the following:
   i. the date and time of each recorded action;
   ii. the results of each inspection;
   iii. the results of any maintenance performed; and
   iv. any variance from manufacturer's recommendations, if any, and corrections made.

Reporting

f. The Permittee shall submit the results of any maintenance performed on the WESP, bagfilters, and bin vent filters within 30 days of a written request by the DAQ.

2. 15A NCAC 02D .0516: SULFUR DIOXIDE EMISSIONS FROM COMBUSTION SOURCES

a. Emissions of sulfur dioxide from these sources shall not exceed 2.3 pounds per million Btu heat input. Sulfur dioxide formed by the combustion of sulfur in fuels, wastes, ores, and other substances shall be included when determining compliance with this standard. [15A NCAC 2D .0516]

Testing [15A NCAC 02Q .0308(a)]

b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17. found in Section 3.

<u>**Monitoring/Recordkeeping/Reporting**</u> [15A NCAC 02Q .0308(a)]

c. No monitoring/recordkeeping/reporting is required for sulfur dioxide emissions from firing biomass in the dryer system or natural gas in the thermal oxidizers.

3. 15A NCAC 02D .0521: CONTROL OF VISIBLE EMISSIONS

a. Visible emissions from these sources shall not be more than 20 percent opacity when averaged over a six-minute period. However, six-minute averaging periods may exceed 20 percent not more than once in any hour and not more than four times in any 24-hour period. In no event shall the six-minute average exceed 87 percent opacity. [15A NCAC 02D .0521 (d)]

<u>**Testing**</u> [15A NCAC 02Q .0308(a)]

b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17. found in Section 3.

<u>**Monitoring**</u> [15A NCAC 02Q .0308(a)]

c. To ensure compliance, once a month the Permittee shall observe the emission points of these sources for any visible emissions above normal. The monthly observation must be made for each month of the calendar year period to ensure compliance with this requirement. The Permittee shall establish "normal" for the source in the first 30 days following the effective date of the permit. If visible emissions from this source are observed to be above normal, the Permittee shall either:
   i. take appropriate action to correct the above-normal emissions as soon as practicable and within the monitoring period and record the action taken as provided in the recordkeeping requirements below, or
   ii. demonstrate that the percent opacity from the emission points of the emission source in accordance with 15A NCAC 2D .2610 (Method 9) for 12 minutes is below the limit given in Section 2.1 A.3. a. above.

<u>**Recordkeeping**</u> [15A NCAC 02Q .0308(a)]

d. The results of the monitoring shall be maintained in a log (written or electronic format) on-site and made available to an authorized representative upon request. The log shall record the following:
   i. the date and time of each recorded action;
   ii. the results of each observation and/or test noting those sources with emissions that were observed to be in noncompliance along with any corrective actions taken to reduce visible emissions; and
   iii. the results of any corrective actions performed.

<u>**Reporting**</u> [15A NCAC 02Q .0308(a)]

e. No reporting is required.

4. 15A NCAC 02D .1112 National Emissions Standards for Hazardous Air Pollutants, 112(g) Case-by-Case Maximum Achievable Control Technology

<u>**Testing**</u> [15A NCAC 02Q .0308(a)]

a. <u>Initial Performance Tests</u> – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall establish emission factors for HAPs by conducting an initial performance test on the wood-fired direct heat drying system (ID No. ES-DRYER), the green wood hammermills (ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3), the dry hammermills (ID Nos. ES-HM-1 to ES-HM-8), the dry wood handling operations (ID Nos. ES-DWH), and the pellet presses and coolers (ID Nos. ES-CLR-1 through ES-CLR-6). Initial testing shall be conducted in accordance with the following:
   i. The pollutants and emission sources to be tested during the initial performance test are listed in the following table:

Emission Source	Pollutant
Dryer system/greenwood hammermills controlled via a RTO	Acetaldehyde Acrolein Formaldehyde Methanol Phenol Propionaldehyde
Pellet coolers pellet presses controlled via a RCO	
One dry hammermill	
Dry wood handling operations	

ii. Initial testing shall be conducted in accordance with Section 2.2 A.2. c. ii. through x. below.

b. Periodic Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall establish emission factors for HAPs by conducting an initial performance test on the wood-fired direct heat drying system (ID No. ES-DRYER), the green wood hammermills (ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3), the dry hammermills (ID Nos. ES-HM-1 to ES-HM-8), the dry wood handling operations (ID Nos. ES-DWH), and the pellet presses and coolers (ID Nos. ES-CLR-1 through ES-CLR-6). Periodic testing shall be conducted in accordance with the following:

i. The pollutants and emission sources to be tested during the periodic performance tests are listed in the following table:

Emission Sources	Pollutant
Dryer system/greenwood hammermills controlled via a RTO	Acetaldehyde Acrolein Formaldehyde Methanol Phenol Propionaldehyde
Pellet coolers pellet presses controlled via a RCO	
One dry hammermill	
Dry wood handling operations	

ii. Periodic testing shall be conducted in accordance with Section 2.2 A.2. d. ii. through ix. below.

c. **Monitoring/Recordkeeping/Reporting** [15A NCAC 02Q .0308(a)]
Monitoring, recordkeeping, and reporting shall be performed in accordance with 2.2 A.2.

2.2- Multiple Emission Source(s) Specific Limitations and Conditions

A. Facility-wide Emission Sources

The following table provides a summary of limits and standards for the emission source(s) describe above:

Regulated Pollutant	Limits/Standards	Applicable Regulation
Fugitive dust	Minimize fugitive dust beyond property boundary	15A NCAC 02D .0540
VOC NOx CO	Less than 250 tons per 12-month period, Less than 250 tons per 12-month period, Less than 250 tons per 12-month period	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530

1. **Fugitive Dust Control Requirement** [15A NCAC 02D .0540] - STATE ENFORCEABLE ONLY
As required by 15A NCAC 2D .0540 "Particulates from Fugitive Dust Emission Sources," the Permittee shall not cause or allow fugitive dust emissions to cause or contribute to substantive complaints or excess visible emissions beyond the property boundary. If substantive complaints or excessive fugitive dust emissions from the facility are observed beyond the property boundaries for six minutes in any one hour (using Reference Method 22 in 40 CFR, Appendix A), the owner or operator may be required to submit a fugitive dust plan as described in 02D .0540(f).
"Fugitive dust emissions" means particulate matter from process operations that does not pass through a process stack or vent and that is generated within plant property boundaries from activities such as: unloading and loading areas, process areas stockpiles, stock pile working, plant parking lots, and plant roads (including access roads and haul roads).

2. **15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530: PREVENTION OF SIGNIFICANT DETERIORATION**
   a. In order to avoid applicability of 15A NCAC 2D .0530(g), the above emission sources shall discharge into the atmosphere less than 250 tons of volatile organic compounds (VOC), nitrogen oxides (NOx), and carbon monoxide (CO) per consecutive 12-month period. [15A NCAC 2D .0530]

   b. To ensure that the limits established above are not exceeded,
      i. the greenwood hammermills and pellet dryer will be controlled by a regenerative thermal oxidizer (ID No. CD-RTO-1),
      ii. the pellet mills and pellet coolers will be controlled by a regenerative catalytic oxidizer (ID No. CD-RCO), and
      iii. the facility will not process more than 625,011 oven dried tons per year (ODT/year) with a maximum of 85% softwood, on a rolling 12-month average basis.

   Testing [15A NCAC 02Q .0308(a)]

   c. Initial Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with PSD avoidance limits in Section 2.2 A.2.a. above by conducting an initial performance test on the wood-fired direct heat drying system (ID No. ES-DRYER), the green wood hammermills (ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3), the dry hammermills (ID Nos. ES-HM-1 to ES-HM-8), the dry wood handling operations (ID Nos. ES-DWH), and the pellet presses and coolers (ID Nos. ES-CLR-1 through ES-CLR-6). Initial testing shall be conducted in accordance with the following:
      i. The pollutants and emission sources to be tested during the initial performance test are listed in the following table:

Emission Sources	Pollutant
Dryer system/greenwood hammermills controlled via a RTO	VOC
	PM/PM10/PM2.5
	NOx
	CO
Pellet coolers pellet presses controlled via a RCO	VOC
	PM/PM10/PM2.5
One dry hammermill	VOC
	PM/PM10/PM2.5
Dry wood handling operations	VOC
	PM/PM10/PM2.5

      ii. The Permittee shall utilize EPA reference methods contained in 40 CFR 60, Appendix A, 40 CFR Part 63, and OTM 26 AND in accordance with a testing protocol (using testing protocol submittal form) approved by the DAQ.
      iii. The Permittee shall submit a protocol to the DAQ at least 45 days prior to compliance testing.

iv. The Permittee shall be responsible for ensuring, within practicable limits, that the equipment or processes being tested are operated at or near the maximum normal production rate or at a lesser rate if specified by the Director or his delegate.
v. To the extent possible, testing shall be conducted at the maximum normal operating softwood percentage.
vi. The Permittee shall establish the firebox temperature of the regenerative thermal oxidizer (ID No. CD-RTO-1) during testing. The firebox temperature shall be based upon the average temperature over the span of the test runs. Documentation for the firebox temperature shall be submitted to the DAQ as part of the test report for the regenerative thermal oxidizer.
vii. The Permittee shall establish the temperature at the inlet of the catalytic oxidizer (ID No. CD-RCO) during testing when operating in both modes. The inlet temperature shall be based upon the average temperature over the span of the test runs. Documentation for the inlet temperature shall be submitted to the DAQ as part of the test report for the catalytic oxidizer.
viii. Testing is required on only one of the dry hammermills. The Permittee shall ensure that the dry hammermill selected for testing is representative of operations of all the dry hammermills.
ix. Testing shall be completed within 180 days of commencement of operation.
x. The Permittee shall submit a written report of the test results to the Regional Supervisor, DAQ, within 60 days of completion of the test.

d. Periodic Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with the PSD avoidance in Section 2.2 A.2.a. above by conducting periodic performance tests on the wood-fired direct heat drying system (ID No. ES-DRYER), the green wood hammermills (ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3), the dry hammermills (ID Nos. ES-HM-1 to ES-HM-8), the dry wood handling operations (ID Nos. ES-DWH), and the pellet presses and coolers (ID Nos. ES-CLR-1 through ES-CLR-6). Periodic testing shall be conducted in accordance with the following:

i. The pollutants and emission sources to be tested during the periodic performance tests are listed in the following table:

Emission Source	Pollutant
Dryer system/greenwood hammermills controlled via a RTO	VOC
	PM/PM10/PM2.5
	NOx
	CO
Pellet coolers pellet presses controlled via a RCO	VOC
	PM/PM10/PM2.5
One dry hammermill	VOC
	PM/PM10/PM2.5
Dry wood handling operations	VOC
	PM/PM10/PM2.5

ii. Testing shall be conducted in accordance with Section 2.2 A.2. c. ii. through v. above.
iii. Testing is required on only one of the dry hammermills. The Permittee shall ensure that the dry hammermill selected for testing is representative of operations of all the dry hammermills. A different hammermill shall be tested for each periodic performance tests, until all the hammermills have been tested.
iv. The Permittee shall conduct performance tests when the following conditions are met:
(A) As the softwood content increases by more than 10 percentage points over what was established during the initial test up to 85%, or
(B) As the production rate increases by more than 10 percentage points over what was established during the initial test up to 625,011 ODT/year.

(C) At a minimum testing shall be conducted annually. Annual performance tests shall be completed no later than 13 months after the previous performance test.

v. The Permittee shall conduct the periodic performance test and submit a written report of the test results to the Regional Supervisor, DAQ, within 90 days from the date the monthly softwood content or overall production rate increased as described in Section 2.2 A.2.d.iv (A) and (B) above. The Permittee shall submit a written report of results for the periodic performance test as described in Section 2.2.A.2.d.iv (C) to the Regional Supervisor, DAQ, within 60 days of completion of the test.

vi. When performance testing has occurred at 85 percent softwood AND 90 percent of the maximum permitted throughput, subsequent periodic performance testing shall occur on an annual basis and shall be completed no later than 13 months after the previous performance test. The Permittee shall submit a written report of the periodic performance test results to the Regional Supervisor, DAQ, within 60 days of completion of the test.

vii. The Permittee may re-establish any parametric operating value during periodic testing. Compliance with previously approved parametric operating values is not required during periodic required testing or other tests undertaken to re-establish parametric operating values by the Permittee.

viii. When establishing new parametric monitoring values via source testing, the Permittee shall include an application for an Administrative Amendment to the permit with the submittal of the test results.

ix. The Permittee shall comply with applicable emission standards at all times, including during periods of testing.

Monitoring and Recordkeeping [15A NCAC 02Q .0308(a)]

Regenerative Thermal Oxidizer and Regenerative Catalytic Oxidizer

e. The Permittee shall install, calibrate, operate, maintain, and inspect a continuous temperature monitoring, and recording system, in accordance with manufacturer's recommendations, for the regenerative thermal oxidizer and regenerative catalytic oxidizer (ID Nos. CD-RTO-1 and CD-RCO) to monitor the temperature in the combustion chamber (the second half of the oxidizer away from the flame zone) to ensure the average combustion temperature does not drop below the temperature range established during the performance test.

f. The Permittee shall develop and maintain a written malfunction plan for the temperature monitoring and recording system that describes, in detail, the operating procedures for periods of malfunction and a protocol to address malfunctions so that corrective actions can immediately be investigated. The malfunction plan shall identify malfunctions, as described by the manufacturer, and ensure the operators are prepared to correct such malfunctions as soon as practical. The Permittee shall keep any necessary parts for routine repairs of the temperature monitoring and recording system readily available.

g. The Permittee shall perform periodic inspection and maintenance for the oxidizers as recommended by the manufacturer. At a minimum, the Permittee shall perform an annual internal inspection of the primary heat exchanger and associated inlet/outlet valves of the control device to ensure structural integrity.

h. The process rate and hardwood/softwood mix shall be recorded in a monthly log kept on site.

The results of the calculations and the total amount of VOC, NOx, and CO emissions shall be recorded monthly in a logbook (written or electronic format) and made available to an authorized representative upon request.

i. For the dryer system, GHG (CO_2e) emissions shall be calculated on a monthly basis and compliance demonstrated using the applicable Part 98 emission factors. Compliance shall be documented on a 12-month rolling basis.

Reporting [15A NCAC 02Q .0308(a)]

j. The Permittee shall submit a semi-annual summary report, acceptable to the Regional Air Quality Supervisor, of monitoring and recordkeeping activities postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December, and July 30 of each calendar year for the preceding six-month period between January and June. The report shall contain the following:

   i. The monthly VOC, NOx, and CO emissions for the previous 17 months. The emissions must be calculated for each of the 12-month periods over the previous 17 months.
   ii. A report indicating and explaining all instances of the average minimum regenerative thermal oxidizer and regenerative catalytic oxidizer combustion chamber temperature falling below the temperature range established during the performance test or noting that no such instances have occurred.

k. All instances of deviations from the requirements of this permit must be clearly identified.

3. **15A NCAC 02Q .0207: ANNUAL EMISSIONS REPORTING**
The Permittee shall report by **June 30** of each year the actual emissions of each air pollutant listed in 15A NCAC 02Q .0207(a) from each emission source within the facility during the previous calendar year. The report shall be in or on such form as may be established by the Director. The accuracy of the report shall be certified by the responsible official of the facility.

4. **15A NCAC 02Q. 0304: APPLICATIONS**
The Permittee, at least 90 days prior to the expiration date of this permit, shall request permit renewal by letter in accordance with 15A NCAC 02Q .0304(d) and (f). Pursuant to 15A NCAC 02Q .0203(i), no permit application fee is required for renewal of an existing air permit. The renewal request should be submitted to the Regional Supervisor, DAQ.

5. **15A NCAC 02Q .0504: OPTION FOR OBTAINING CONSTRUCTION AND OPERATION PERMIT**
The Permittee shall file a Title V Air Quality Permit Application pursuant to 15A NCAC 02Q .0504. to modify the construction and operation permit on or before **12 months after commencing operation of any of the sources listed in this permit**.

SECTION 3 - GENERAL CONDITIONS

1. In accordance with G.S. 143-215.108(c)(1), TWO COPIES OF ALL DOCUMENTS, REPORTS, TEST DATA, MONITORING DATA, NOTIFICATIONS, REQUESTS FOR RENEWAL, AND ANY OTHER INFORMATION REQUIRED BY THIS PERMIT shall be submitted to:

   Heather Carter
   Regional Air Quality Supervisor
   North Carolina Division of Air Quality
   Fayetteville Regional Office
   Systel Building
   225 Green Street, Suite 714
   Fayetteville, NC 28301-5043
   (910) 433-3300

   For identification purposes, each submittal should include the facility name as listed on the permit, the facility identification number, and the permit number.

2. RECORDS RETENTION REQUIREMENT - In accordance with 15A NCAC 2D .0605, any records required by the conditions of this permit shall be kept on site and made available to DAQ personnel for inspection upon request. These records shall be maintained in a form suitable and readily available for expeditious inspection and review. These records must be kept on site for a minimum of 2 years, unless another time period is otherwise specified.

3. ANNUAL FEE PAYMENT - Pursuant to 15A NCAC 2Q .0203(a), the Permittee shall pay the annual permit fee within 30 days of being billed by the DAQ. Failure to pay the fee in a timely manner will cause the DAQ to initiate action to revoke the permit.

4. EQUIPMENT RELOCATION - In accordance with 15A NCAC 2Q .0301, a new air permit shall be obtained by the Permittee prior to establishing, building, erecting, using, or operating the emission sources or air cleaning equipment at a site or location not specified in this permit.

5. REPORTING REQUIREMENT - In accordance with 15A NCAC 2Q .0309, any of the following that would result in previously unpermitted, new, or increased emissions must be reported to the Regional Supervisor, DAQ:

   a. changes in the information submitted in the application regarding facility emissions;

   b. changes that modify equipment or processes of existing permitted facilities; or

   c. changes in the quantity or quality of materials processed.

   If appropriate, modifications to the permit may then be made by the DAQ to reflect any necessary changes in the permit conditions. In no case are any new or increased emissions allowed that will cause a violation of the emission limitations specified herein.

6. In accordance with 15A NCAC 2Q .0309, this permit is subject to revocation or modification by the DAQ upon a determination that information contained in the application or presented in the support thereof is incorrect, conditions under which this permit was granted have changed, or violations of conditions contained in this permit have occurred. In accordance with G.S. 143-215.108(c)(1), the facility shall be properly operated and maintained at all times in a manner that will effect an overall reduction in air pollution. Unless otherwise specified by this permit, no emission source may be operated without the concurrent operation of its associated air cleaning device(s) and appurtenances.

7. In accordance with G.S. 143-215.108(c)(1), this permit is nontransferable by the Permittee. Future owners and operators must obtain a new air permit from the DAQ.

8. In accordance with G.S. 143-215.108(c)(1), the issuance of this permit in no way absolves the Permittee of liability for any potential civil penalties which may be assessed for violations of State law which have occurred prior to the effective date of this permit.

9. In accordance with G.S. 143-215.108(c)(1), this permit does not relieve the Permittee of the responsibility of complying with all applicable requirements of any Federal, State, or Local water quality or land quality control authority.

10. In accordance with 15A NCAC 2D .0605, reports on the operation and maintenance of the facility shall be submitted by the Permittee to the Regional Supervisor, DAQ at such intervals and in such form and detail as may be required by the DAQ. Information required in such reports may include, but is not limited to, process weight rates, firing rates, hours of operation, and preventive maintenance schedules.

11. A violation of any term or condition of this permit shall subject the Permittee to enforcement pursuant to G.S. 143-215.114A, 143-215.114B, and 143-215.114C, including assessment of civil and/or criminal penalties.

12. Pursuant to North Carolina General Statute 143-215.3(a)(2), no person shall refuse entry or access to any authorized representative of the DAQ who requests entry or access for purposes of inspection, and who presents appropriate credentials, nor shall any person obstruct, hamper, or interfere with any such representative while in the process of carrying out his official duties. Refusal of entry or access may constitute grounds for permit revocation and assessment of civil penalties.

13. In accordance with G.S. 143-215.108(c)(1), this permit does not relieve the Permittee of the responsibility of complying with any applicable Federal, State, or Local requirements governing the handling, disposal, or incineration of hazardous, solid, or medical wastes, including the Resource Conservation and Recovery Act (RCRA) administered by the Division of Waste Management.

14. PERMIT RETENTION REQUIREMENT - In accordance with 15A NCAC 2Q .0110, the Permittee shall retain a current copy of the air permit at the site. The Permittee must make available to personnel of the DAQ, upon request, the current copy of the air permit for the site.

15. CLEAN AIR ACT SECTION 112(r) REQUIREMENTS - Pursuant to 15A NCAC 2D .2100 "Risk Management Program," if the Permittee is required to develop and register a risk management plan pursuant to Section 112(r) of the Federal Clean Air Act, then the Permittee is required to register this plan with the USEPA in accordance with 40 CFR Part 68.

16. PREVENTION OF ACCIDENTAL RELEASES - GENERAL DUTY - Pursuant to Title I Part A Section 112(r)(1) of the Clean Air Act "Hazardous Air Pollutants - Prevention of Accidental Releases - Purpose and General Duty," although a risk management plan may not be required, if the Permittee produces, processes, handles, or stores any amount of a listed hazardous substance, the Permittee has a general duty to take such steps as are necessary to prevent the accidental release of such substance and to minimize the consequences of any release. **This condition is federally-enforceable only.**

17. GENERAL EMISSIONS TESTING AND REPORTING REQUIREMENTS - If emissions testing is required by this permit, or the DAQ, or if the Permittee submits emissions testing to the DAQ in support of a permit application or to demonstrate compliance, the Permittee shall perform such testing in accordance with 15A NCAC 2D .2600 and follow all DAQ procedures including protocol approval, regional notification, report submittal, and test results approval.

Permit issued this the 14th day of January, 2019.

NORTH CAROLINA ENVIRONMENTAL MANAGEMENT COMMISSION

for William D. Willets, P.E., Chief, Permitting Section
Division of Air Quality, NCDEQ
By Authority of the Environmental Management Commission

Air Permit No. 10365R03

July 31, 2003

MEMORANDUM

SUBJECT: Request for Guidance on the Definition of Fuel Conversion Plants for Purposes of Prevention of Significant Deterioration (PSD)

FROM: Racqueline Shelton
Group Leader
Integrated Implementation Group C-339-03

TO: Guy Donaldson
Acting Chief
Air Permits Section (6PD-R)

Your June 17, 2003, memorandum requests assistance in making an official determination regarding the definition of the PSD source category "fuel conversion plants" found in 40 CFR Subpart 52.21. Stationary sources considered "fuel conversion plants" have a 100 tpy major source threshold for PSD applicability purposes. Specifically, you ask if the classification of "fuel conversion plants" applies to off-shore gas delivery systems that will vaporize liquefied natural gas (LNG) for delivery to a downstream infrastructure. The issue regards two project proposals you are reviewing, including the Chevron Texaco, Port Pelican Terminal that is proposed as SIC Code 4491, a marine cargo handling facility where LNG is transferred from ships to pipelines. We have reviewed your request, your suggested interpretation, the legislative history on the issue, and prior EPA guidance, including EPA's memorandum dated May 26, 1992, entitled "Applicability of Prevention of Significant Deterioration (PSD) and New Source Performance Standards (NSPS) to the Cleveland Electric, Incorporated, Plant in Willoughby, Ohio" from Edward J. Lillis, Chief Air Programs Branch to George T. Czerniak, Chief Air Enforcement Branch, Region V. Based on this information and as discussed below, we conclude that the process of vaporization of LNG to natural gas at these sources does not qualify these sources as "fuel conversion plants" under the Federal PSD rules at 40 CFR 52.21(b)(1)(i)(*a*) and (iii)(*q*).

It is our understanding that the vaporization of LNG, which is a change of state from a liquid to a gas, occurs at temperatures above -260 degrees F. As a result, LNG vaporizes naturally at ambient temperatures and that indirect contact with seawater, which is warmer than LNG, is used to speed up the vaporization. We understand that vaporization of LNG occurs without the need for chemical or process change that generally occurs at other sources that EPA considers as “fuel conversion plants”(e.g., coal gasification, oil shale processing , conversion of municipal waste to fuel gas, processing of sawdust into pellets) under the PSD rules.

The vaporization of LNG to natural gas differs from the fuel conversion processes discussed in EPA’s memorandum regarding Cleveland Electric since the vaporization would occur naturally at ambient conditions without additional processing. Our view is that the PSD rules are not intended to include the vaporization of LNG to natural gas in the source category of “fuel conversion plants”

If you have any questions please contact me or Mike Sewell of this group at (919) 541-0873.

SUBJECT: Air Quality Permit No. 10386R04
Facility ID: 8200152
Enviva Pellets Sampson, LLC
Faison, North Carolina
Sampson County
Fee Class: Title V
PSD Status: Major

Dear Mr. Schaar:

In accordance with your complete Prevention of Significant Deterioration (PSD) permit application received April 3, 2018, and State Renewal application received August 2, 2019, we are forwarding herewith Air Quality Permit No. 10386R04 to Enviva Pellets Sampson, LLC, 5 Connector Road, US 117, Faison, North Carolina, authorizing the construction and operation, of the emission source(s) and associated air pollution control device(s) specified herein. Additionally, any emissions activities determined from your Air Quality Permit Application as being insignificant per 15A North Carolina Administrative Code 02Q .0503(8) have been listed for informational purposes as an "ATTACHMENT."

As the designated responsible official, it is your responsibility to review, understand, and abide by all of the terms and conditions of the attached permit. It is also your responsibility to ensure that any person who operates any emission source and associated air pollution control device subject to any term or condition of the attached permit reviews, understands, and abides by the condition(s) of the attached permit that are applicable to that particular emission source.

If any parts, requirements, or limitations contained in this Air Quality Permit are unacceptable to you, you have the right to request a formal adjudicatory hearing within 30 days following receipt of this permit, identifying the specific issues to be contested. This hearing request must be in the form of a written petition, conforming to NCGS (North Carolina General Statutes) 150B-23, and filed with both the Office of Administrative Hearings, 6714 Mail Service Center, Raleigh, North Carolina 27699-6714 and the Division of Air Quality, Permitting Section, 1641 Mail Service Center, Raleigh, North Carolina 27699-1641. The form for requesting a formal adjudicatory hearing may be obtained upon request from the Office of Administrative Hearings. Please note that this permit will be stayed in its entirety upon receipt of the request for a hearing. Unless a request for a hearing is made pursuant to NCGS 150B-23, this Air Quality Permit shall be final and binding 30 days after issuance.

You may request modification of your Air Quality Permit through informal means pursuant to NCGS 150B-22. This request must be submitted in writing to the Director and must identify the specific provisions or issues for which the modification is sought. Please note that this Air Quality Permit will become final and binding regardless of a request for informal modification unless a request for a hearing is also made under NCGS 150B-23.

The construction of new air pollution emission source(s) and associated air pollution control device(s), or modifications to the emission source(s) and air pollution control device(s) described in this permit must be covered under an Air Quality Permit issued by the Division of Air Quality prior to construction unless the Permittee has fulfilled the requirements of NCGS 143-215.108A(b) and received written approval from the Director of the Division of Air Quality to commence construction. Failure to receive an Air Quality Permit or written approval prior to commencing construction is a violation of NCGS 143-215.108A and may subject the Permittee to civil or criminal penalties as described in NCGS 143-215.114A and 143-215.114B.

Sampson County has triggered increment tracking under PSD for PM10, PM2.5, and NOx. This modification will result in a decrease of 0.023 pounds per hour of PM10, a decrease of 4.6 pounds per hour of PM2.5, and a decrease of 0.091 pounds per hour of NOx.

This Air Quality Permit shall be effective from October 2, 2019 until September 30, 2027, is nontransferable to future owners and operators, and shall be subject to the conditions and limitations as specified therein. Should you have any questions concerning this matter, please contact Betty Gatano, P.E., at (919) 707-8736 or Betty.Gatano@ncdenr.gov.

Sincerely yours,

for Booker T. Pullen

ATTACHMENT

Insignificant Activities per 15A NCAC 02Q .0503(8)

Emission Source ID No.	Emission Source Description
IES-GWH **PSD**	Green wood handling and sizing operations
IES-BARKHOG **PSD**	Bark Hog
IES-TK-1 **PSD**	Diesel fuel storage tank (up to 2,500 gallons capacity)
IES-TK-2 **PSD**	Diesel fuel storage tank (up to 1,000 gallons capacity)
IES-TK-3 **PSD**	Diesel fuel storage tank (up to 2,500 gallons capacity)
IES-GWSP-1 through IES-GWSP-4 **PSD**	Four (4) green wood storage piles
IES-BFSP-1 and IES-BFSP-2 **PSD**	Two (2) bark fuel storage piles
IES-DEBARK-1 **PSD**	Debarker
IES-CHIP-1 **PSD**	Log chipping
IES-DRYSHAVE **PSD**	Dry shaving material handling
IES-BFB **PSD**	Bark fuel bin
IES-PAVEDROADS **PSD**	Paved roads
IES-EG **NSPS Subpart IIII** **MACT Subpart ZZZZ**	689 HP diesel-fired emergency generator
IES-FWP **NSPS Subpart IIII** **MACT Subpart ZZZZ**	131 HP diesel-fired fire water pump

1. Because an activity is insignificant does not mean that the activity is exempted from an applicable requirement or that the owner or operator of the source is exempted from demonstrating compliance with any applicable requirement.
2. When applicable, emissions from stationary source activities identified above shall be included in determining compliance with the permit requirements for toxic air pollutants under 15A NCAC 02D .1100 "Control of Toxic Air Pollutants" or 02Q .0711 "Emission Rates Requiring a Permit".
3. For additional information regarding the applicability of MACT or GACT see the DAQ page titled "Specific Permit Conditions Regulatory Guide." The link to this site is as follows: http://deq.nc.gov/about/divisions/air-quality/air-quality-permits/specific-permit-conditions-regulatory-guide.

Summary of Changes to Permit

The following changes were made to Enviva Pellets Sampson, LLC, Sampson, NC., Air Permit No. 10386R03.

Pages	Section	Description of Changes
Cover and throughout	--	Updated all dates and permit revision numbers.
Insignificant Activities list	--	• Added log chipping (ID No. IES-CHIP-1). • Added the bark hog (ID No. IES-BARKHOG). • Removed the dry wood handling and sizing operations (ID No. IES-DWHS). • Added two greenwood storage piles (ID No. IES-GWSP-3 and -4). • Added two bark fuel storage piles (ID No. IES-BFSP-1 and -2). • Added dry shaving materials handling (ID No. IES-DRYSHAVE). • Removed greenwood fuel bin (ID No. IES-GWFB). • Added bark fuel bin (ID No. IES-BFB). • Added paved roads (ID No. IES-PAVEDROADS) • Reformatted listing for the emergency generator (ID No. IES-EG) and the fire water pump (ID No. IES-FWP). • Added the "PSD" label to all applicable equipment.
3	Section 1 – Equipment Table	• Changed reference to bagfilters and bin vent filters to baghouses and renamed control devices accordingly. • Removed log chipping (ID No. ES-CHIP-1) and moved emission source to the insignificant activities list. • Removed the bark hog (ID No. ES-BARKHOG) and moved emission source to the insignificant activities list. • Removed baghouses (ID Nos. CD-GHM-BH-1 through -3) as control devices for the green wood hammermills (ID Nos. ES-GHM-1 through -3). The WESP (ID No. CD-WESP) and the regenerative thermal oxidizer (RTO) (ID No. RTO) will be used as PM, VOC, and HAP control for the green wood hammermills. • Removed the cyclones (ID Nos. CD-DC1 through DC4) as control devices for the dryer (ID No. ES-DRYER). These cyclones are used for product recovery rather than as control devices. The WESP (ID No. CD-WESP) and the RTO (ID No. RTO) will be used as PM, VOC, and HAP control for the dryer. • Added RTO (ID No. CD-RTO) as control on the dryer (ID No. ES-DRYER). • Added a furnace bypass (ID No. ES-FBYPASS) and a dryer bypass (ID No. ES-DBYPASS). • Added dried wood handling operations (ID No. ES-DWH) controlled by two baghouses (ID No. CD-DWH-BH-1 and -2). • Removed the cyclones (ID Nos. CD-HM-CYC-1 through -8) on the dry hammermills (ID No. ES-HM-1 through -8). These cyclones are used for product recovery rather than as control devices. The baghouses (ID Nos. CD-HM-BH1 through 8) are used as PM control for the dry hammermills.

Pages	Section	Description of Changes
3	Section 1 – Equipment Table (continued)	• Added hammermill conveying system (ID No. ES-HMC) controlled by a baghouse (ID No. CD-HMC-BH). • Added additive handling and storage (ID No. ES-ADD) controlled by a baghouse (ID No. CD-ADD-BH). • Changed the name of the pellet fine bins (ID No. ES-PFB) to the pellet cooler HP fines relay system (ID No. ES-PCHP) controlled by baghouse (ID No. CD-PCHP-BH), to reflect the nomenclature at the facility. • Added references to presses to the pellet coolers (ID Nos. ES-CLR-1 through -6). • Changed the name of the pellet cooler recirculation (ID No. ES-PCR) to the pellet cooler LP fines relay system (ID No. ES-PCLP) controlled by a baghouse (ID No. CD-PCLP-BH), to reflect the nomenclature at the facility.
5	2.1 A Equipment List	Updated and reformatted equipment list.
6	2.1 A.1.b	Removed requirements to test WESP (ID No. WESP) because this requirement has been met. Replaced with shell testing language.
--	2.1 A.1.c (old)	Removed requirement for the facility to maintain process rates. This requirement is typically for emission sources with no controls. All the permitted emission sources of PM are controlled.
6	2.1 A.1.c (new)	Added testing requirements to demonstrate compliance with 15A NCAC 02D .0515 for the dryer (ID No. ES-DRYER), green wood hammermills (ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3), dry hammermills (ID No. ES-HM-1 through -8), and pellet presses and pellet coolers (ID Nos. ES-CLR-1 through ES-CLR-6).
6 – 7	2.1 A.1.d	Specified that each PM emission source shall be controlled by baghouse or cyclone.
7	2.1 A.1.f through i	Clarified the inspection, maintenance, and operating requirements of the WESP (ID No. CD-WESP) and RTO (ID No. CD-RTO) for PM control from the dryer (ID No. ES-DRYER) and green wood hammermills (ID No. ES-GHM-1 through -3).
7	2.1 A.1.k	Added semiannual reporting requirement.
8	2.1 A.3.c	Added requirement to re-establish normal VE after exhaust from the green wood hammermills has been rerouted to the WESP (ID No. CD-WESP) and the RTO (ID No. CD-RTO).
9	2.1 A.3.e	Added semiannual reporting requirement.
9 -10	2.1 A.4	Modified the permitting language for the 112(g), Case-by-Case, MACT.
11 – 16	2.2 A.1	• Updated BACT emission limits and controls for the Softwood Expansion Project (SWEP). • Removed footnote and permit language stating that the BACT emission limits do not apply during startup, shutdown, or malfunction (SSM). The emission limits do apply during SSM and DAQ has added work practice standards and operating limits to the permit to ensure compliance. • Updated requirements to reflect revised emission limits and BACT.
16	2.2 A.2	Added condition for reporting of excess emissions under 15A NCAC 02D .0535.
17	2.2 A.3	Added condition for 15A NCAC 02D .0540, Particulates from Fugitive Dust Emission Sources.
17	2.2 A.4	Added condition for 15A NCAC 02D .1806, Control and Prohibition of Odorous Emissions.
17	2.2 A.5	Added condition for 15A NCAC 02Q .0207, Annual Emissions Reporting, requiring Permittee to submit emissions inventory annually.

Pages	Section	Description of Changes
17	2.2 A.6	Added condition for 15A NCAC 02Q .0304, Applications, requiring Permittee to submit permit renewal at least 90 days from permit expiration date.
18	2.2 A.7	Added condition for 15A NCAC 02Q .0504, Option for Obtaining Construction and Operation Permit, requiring Permittee to submit amended Title V permit application within 12 months of operating any of the new sources or control devices.

State of North Carolina
Department of Environmental Quality
Division of Air Quality

AIR QUALITY PERMIT

Permit No.	Replaces Permit No.(s)	Effective Date	Expiration Date
10386R04	10386R03	October 2, 2019	September 30, 2027

Until such time as this permit expires or is modified or revoked, the below named Permittee is permitted to construct and operate the emission source(s) and associated air pollution control device(s) specified herein, in accordance with the terms, conditions, and limitations within this permit. This permit is issued under the provisions of Article 21B of Chapter 143, General Statutes of North Carolina as amended, and Title 15A North Carolina Administrative Codes (15A NCAC), Subchapters 02D and 02Q, and other applicable Laws.

Pursuant to Title 15A NCAC, Subchapter 02Q, the Permittee shall not construct, operate, or modify any emission source(s) or air pollution control device(s) without having first submitted a complete Air Quality Permit Application to the permitting authority and received an Air Quality Permit, except as provided in this permit.

Permittee:	**Enviva Pellets Sampson, LLC**
Facility ID:	**8200152**
Facility Site Location: **City, County, State, Zip:**	**5 Connector Road, US 117** **Faison, Sampson County, North Carolina, 28341**
Mailing Address: **City, State, Zip:**	**5 Connector Road, US 117** **Faison, North Carolina, 28341**
Application Number: **Complete Application Date:**	**8200152.18A and 8200152.19A** **April 3, 2018 and August 2, 2019**
Primary SIC Code:	**2499**
Division of Air Quality, **Regional Office Address:**	**Fayetteville Regional Office** **Systel Building** **225 Green Street, Suite 714** **Fayetteville, North Carolina, 28301**

Table of Contents

SECTION 1: PERMITTED EMISSION SOURCE (S) AND ASSOCIATED AIR POLLUTION CONTROL DEVICE (S) AND APPURTENANCES

SECTION 2: SPECIFIC LIMITATIONS AND CONDITIONS

2.1- Emission Source(s) Specific Limitations and Conditions (Including specific requirements, testing, monitoring, recordkeeping, and reporting requirements)

2.2- Multiple Emission Source(s) Specific Limitations and Conditions (Including specific requirements, testing, monitoring, recordkeeping, and reporting requirements)

SECTION 3: GENERAL PERMIT CONDITIONS

SECTION 1- PERMITTED EMISSION SOURCE (S) AND ASSOCIATED AIR POLLUTION CONTROL DEVICE (S) AND APPURTENANCES

The following table contains a summary of all permitted emission sources and associated air pollution control devices and appurtenances:

Emission Source ID No.	Emission Source Description	Control Device ID No.	Control Device Description
ES-GHM-1, ES-GHM-2, ES-GHM-3 **PSD** **Case-by-Case MACT**	Three (3) green wood hammermills	CD-WESP CD-RTO	One wet electrostatic precipitator (29,904 square feet of collector plate area) in series with one natural gas/propane-fired regenerative thermal oxidizer (maximum firing rate of 32 million Btu per hour)
ES-DRYER **PSD** **Case-by-Case MACT**	Wood-fired direct heat drying system (250.4 million Btu per hour heat input)	CD-WESP CD-RTO	One wet electrostatic precipitator (29,904 square feet of collector plate area) in series with one natural gas/propane-fired regenerative thermal oxidizer (maximum firing rate of 32 million Btu per hour)
ES-FBYPASS **PSD**	Furnace bypass	N/A	N/A
ES-DBPYASS **PSD**	Dryer bypass	N/A	N/A
ES-DWH **PSD** **Case-by-Case MACT**	Dried wood handling operations	CD-DWH-BH-1 and CD-DWH-BH-2	Two (2) baghouses (377 square feet of filter area, each)
ES-HM-1 through ES-HM-8 **PSD** **Case-by-Case MACT**	Eight (8) dry hammermills	CD-HM-BH1 through CD-HM-BH8	Eight (8) baghouses (2,168 square feet of filter area each)
ES-HMC **PSD**	Hammermill conveying system	CD-HMC-BH	One baghouse (377 square feet of filter area)
ES-PMFS **PSD**	Pellet mill feed silo	CD-PMFS-BH	One baghouse (377 square feet of filter area)
ES-ADD **PSD**	Additive Handling and Storage	CD-ADD-BH	One baghouse (942 square feet of filter area)
ES-HMA and ES-PCHP **PSD** **Case-by-Case MACT**	Hammermill area and pellet cooler HP fines relay system	CD-PCHP-BH	One baghouse (1,520 square feet of filter area)

Emission Source ID No.	Emission Source Description	Control Device ID No.	Control Device Description
ES-CLR-1 through ES-CLR-6 **PSD** **Case-by-case MACT**	Six (6) pellet coolers and twelve (12) pellet presses (two (2) pellet presses are associated with each pellet cooler)	CD-CLR-1 through CD-CLR-6	Six (6) simple cyclones (54 inches in diameter) installed one each on the coolers
ES-PCLP **PSD**	Pellet cooler LP fines relay system	CD-PCLP-BH	One baghouse (942 square feet of filter area)
ES-PSTB **PSD**	Pellet sampling transfer bin	CD-PSTB-BH	One baghouse (377 square feet of filter area)
ES-FPH, ES-PB-1 through ES-PB-4, ES-PL-1 and ES-PL-2 **PSD**	Finished product handling, four (4) pellet load-out bins, and two (2) pellet mill loadouts	CD-FPH-BH	One baghouse (4,842 square feet of filter area)

SECTION 2 - SPECIFIC LIMITATIONS AND CONDITIONS

2.1- Emission Source(s) and Control Devices(s) Specific Limitations and Conditions

The emission source(s) and associated air pollution control device(s) and appurtenances listed below are subject to the following specific terms, conditions, and limitations, including the testing, monitoring, recordkeeping, and reporting requirements as specified herein:

A. **Three (3) green wood hammermills (ID Nos. ES-GHM-1, ES-GHM-2 and ES-GHM-3) controlled by a wet electrostatic precipitator (ID No. CD-WESP) and a regenerative thermal oxidizer (ID No. CD-RTO)**

Wood-fired direct heat drying system (ID No. ES-DRYER) controlled by a wet electrostatic precipitator (ID No. CD-WESP) and a regenerative thermal oxidizer (ID No. CD-RTO)

Furnace bypass (ID No. ES-FBYPASS) and dryer bypass (ID No. ES-DBYPASS)

Dry wood handling operations (ID No. ES-DWH) controlled by baghouses (ID Nos. CD-DWH-BH-1 and 2)

Eight (8) hammermills (ID Nos. ES-HM-1 through ES-HM-8) controlled by baghouses (ID Nos. CD-HM-BH1 through CD-HM-BH8)

Hammermill conveying system (ID No. ES-HMC) controlled by baghouse (ID No. CD-HMC-BH)

Hammermill area (ID No. ES-HMA) and pellet cooler HP fines relay system (ID No. ES-PCHP) controlled by a baghouse (ID No. CD-PCHP-BH)

Pellet mill feed silo (ID No. ES-PMFS) controlled by a baghouse (ID No. CD-PMFS-BH)

Pellet presses and pellet coolers (ID Nos. ES-CLR-1 through ES-CLR-6) controlled by cyclones (ID Nos. CD-CLR-1 through CD-CLR-6)

Pellet cooler LP fines relay system (ID No. ES-PCLP) controlled by a baghouse (ID No. CD-PCLP-BH)

Pellet sampling transfer bin (ID No. ES-PSTB) controlled by a baghouse (ID No. CD-PSTB-BH)

Finished product handling (ID No. ES-FPH), pellet load-out bins (ID Nos. ES-PB-1 through ES-PB-4), and pellet mill load-out (ID No. ES-PL-1 and ES-PL-2) controlled by a baghouse (ID No. CD-FPH-BH)

The following table provides a summary of limits and standards for the emission source(s) described above:

Regulated Pollutant	Limits/Standards	Applicable Regulation
Particulate matter	$E = 4.10 \times P^{0.67}$ for $P < 30$ tph $E = 55 \times P^{0.11} - 40$ for $P \geq 30$ tph where, E = allowable emission rate (lb/hr) P = process weight rate (tph)	15A NCAC 02D .0515
Sulfur dioxide	*ID No. ES-DRYER only:* 2.3 pounds per million Btu	15A NCAC 02D .0516
Visible emissions	20 percent opacity	15A NCAC 02D .0521
Hazardous Air Pollutants	See Section 2.1 A.4.	15A NCAC 02D .1112 [112(g) Case-by-Case MACT]
PM/PM10/PM2.5 Nitrogen oxides Volatile organic carbon Carbon monoxide Greenhouse gases	See Section 2.2 A.1.	15A NCAC 02D .0530

1. **15A NCAC 02D .0515: PARTICULATES FROM MISCELLANEOUS INDUSTRIAL PROCESSES**
   a. Emissions of particulate matter from these sources shall not exceed an allowable emission rate as calculated by the following equation:

   $E = 4.10 \times P^{0.67}$ for $P < 30$ tph
   $E = 55 \times P^{0.11} - 40$ for $P \geq 30$ tph

   Where E = allowable emission rate in pounds per hour
   P = process weight in tons per hour

   Liquid and gaseous fuels and combustion air are not considered as part of the process weight.

   Testing [15A NCAC 02Q .0308(a)]
   b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17.
   c. Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with emission limits in Section 2.1 A.1.a for the wood-fired direct heat drying system **(ID No. ES-DRYER),** green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)**, dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8),** and pellet presses and pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Testing shall be conducted as specified in Section 2.2 A.1.d.

   Monitoring [15A NCAC 02Q .0308(a)]

   For baghouses and/or cyclones:
   d. Particulate matter emissions shall be controlled as follows:
      i. Particulate matter emissions from the dry wood handling operations **(ID No. ES-DWH)** shall be controlled by baghouses **(ID Nos. CD-DWH-BH-1 and CD-DWH-2);**
      iii. Particulate matter emissions from eight (8) hammermills **(ID Nos. ES-HM-1 through ES-HM-8)** shall be controlled by baghouses **(ID Nos. CD-HM-BH1 through CD-HM-BH8);**
      iv. Particulate matter emissions from the hammermill conveying system **(ID No. ES-HMC)** shall be controlled by baghouse **(ID No. CD-HMC-BH);**

v. Particulate matter emissions from the hammermill area **(ID No. ES-HMA)** and pellet cooler HP fines relay system **(ID No. ES-PCHP)** shall be controlled by baghouse **(ID No. CD-PCHP-BH)**;
vi. Particulate matter emissions from the pellet mill feed silo **(ID No. ES-PMFS)** shall be controlled by baghouse **(ID No. CD-PMFS-BH)**;
vii. Particulate matter emissions from the pellet presses and pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)** shall be controlled by cyclones **(ID Nos. CD-CLR-1 through CD-CLR-6)**;
viii. Particulate matter emissions from pellet cooler LP fines relay system **(ID No. ES-PCLP)** shall be controlled by baghouse **(ID No. CD-PCLP-BH)**;
ix. Particulate matter emissions from the pellet sampling transfer bin **(ID No. ES-PSTB)** shall be controlled by baghouse **(ID No. CD-PSTB-BH)**; and
x. Particulate matter emissions from finished product handling **(ID No. ES-FPH)**, pellet load-out bins **(ID Nos. ES-PB-1 through ES-PB-4)**, and pellet mill load-out **(ID No. ES-PL-1 and ES-PL-2)** shall be controlled by baghouse **(ID No. CD-FPH-BH)**.

e. To ensure compliance, the Permittee shall perform inspections and maintenance as recommended by the manufacturer. In addition to the manufacturer's inspection and maintenance recommendations, or if there are no manufacturer's inspection and maintenance recommendations, as a minimum, the inspection and maintenance requirement shall include the following:
i. a monthly visual inspection of the system ductwork and material collection units for leaks; and
ii. an annual (for each 12-month period following the initial inspection) internal inspection of the baghouses' structural integrity.

For wet electrostatic precipitator and regenerative thermal oxidizer:

f. Particulate matter emissions shall be controlled as follows:
i. Particulate matter emissions from the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2 and ES-GHM-3)** shall be controlled by a wet electrostatic precipitator **(ID No. CD-WESP)** in series with a regenerative thermal oxidizer **(ID No. CD-RTO)**.
ii. Particulate matter emissions from the wood-fired direct heat drying system **(ID No. ES-DRYER)** shall be controlled by a wet electrostatic precipitator **(ID No. CD-WESP)** in series with a regenerative thermal oxidizer **(ID No. CD-RTO)**.

g. To ensure compliance and effective operation of the wet electrostatic precipitator **(ID No. CD-WESP)**, the Permittee shall:
i. operate the wet electrostatic precipitator with at least the minimum number of grids operating during compliance testing specified in Section 2.1 A.1.c above;
ii. maintain the minimum secondary voltage and minimum current at the level established during compliance testing specified in Section 2.1 A.1.c above.
iii. monitor and record the secondary voltage and current for each grid of the precipitator daily. The daily observation must be made for each day of the calendar year period. The Permittee shall be allowed three (3) days of absent observations per semiannual period.
iv. The Permittee may re-establish any parametric operating value during periodic testing. Compliance with previously approved parametric operating values is not required during periodic required testing or other tests undertaken to re-establish parametric operating values by the Permittee. If the new parametric operating values re-established during periodic testing are more stringent, the Permittee shall submit a request to revise the value(s) in the permit at the same time the test report required pursuant to General Condition 17 is submitted. The permit revision will be processed pursuant to 15A NCAC 02Q .0514. If, during performance testing, the new parametric operating values are less stringent, the Permittee may request to revise the value(s) in the permit pursuant to 15A NCAC 02Q .0515.

h. To ensure compliance, the Permittee shall perform inspections and maintenance on the wet electrostatic precipitator **(ID No. CD-WESP)** and the regenerative thermal oxidizer **(ID No. CD-RTO)**, as recommended by the manufacturer. In addition to the manufacturer's inspection and maintenance recommendations, or if there are no manufacturer's inspection and maintenance recommendations, as a minimum, the inspection and maintenance requirement shall include the following:

i. a monthly visual inspection of the system ductwork and material collection units for leaks;
ii. an annual (for each 12-month period following the initial inspection) internal inspection of the heat transfer medium and associated inlet/outlet valves on the regenerative thermal oxidizer **(ID No. CD-RTO)**; and
iii. an annual (for each 12-month period following the initial inspection) internal inspection of the wet electrostatic precipitator **(ID No. CD-WESP)**. This inspection must include (but is not limited to) the following:
    (A) visual checks of critical components,
    (B) checks for any equipment that does not alarm when de-energized, to ensure it is operational,
    (C) checks for signs of plugging in the hopper and gas distribution equipment, and
    (D) replacement of broken equipment as required.

Recordkeeping [15A NCAC 02Q .0308(a)]

i. The results of inspection and maintenance shall be maintained in a logbook (written or electronic format) on-site and made available to an authorized representative upon request. The logbook shall record the following:
    i. the date and time of each recorded action;
    ii. the results of each inspection;
    iii. the results of any maintenance performed on the control devices; and
    iv. any variance from manufacturer's recommendations, if any, and corrections made.

Reporting [15A NCAC 02Q .0308(a), 15A NCAC 02D .0605(b)(3)]

j. The Permittee shall submit the results of any maintenance performed on the wet electrostatic precipitator, regenerative thermal oxidizer, cyclones, and/or baghouses within 30 days of a written request by the DAQ.
k. The Permittee shall submit a summary report of the monitoring and recordkeeping activities given in Sections 2.1 A.1.d through i above postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December and July 30 of each calendar year for the preceding six-month period between January and June. All instances of deviations from the requirements of this permit must be clearly identified.

2. **15A NCAC 02D .0516: SULFUR DIOXIDE EMISSIONS FROM COMBUSTION SOURCES**
    a. Emissions of sulfur dioxide from this source **(ID No. ES-DRYER)** shall not exceed 2.3 pounds per million Btu heat input. Sulfur dioxide formed by the combustion of sulfur in fuels, wastes, ores, and other substances shall be included when determining compliance with this standard

    Testing [15A NCAC 02Q .0308(a)]

    b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17.

    Monitoring/Recordkeeping/Reporting [15A NCAC 02Q .0308(a)]

    c. No monitoring/recordkeeping/reporting is required for sulfur dioxide emissions from firing biomass in the wood-fired direct heat drying system **(ID No. ES-DRYER)**.

3. **15A NCAC 02D .0521: CONTROL OF VISIBLE EMISSIONS**
    a. Visible emissions from these sources shall not be more than 20 percent opacity when averaged over a six-minute period. However, six-minute averaging periods may exceed 20 percent not more than once in any hour and not more than four times in any 24-hour period. In no event shall the six-minute average exceed 87 percent opacity.

    Testing [15A NCAC 02Q .0308(a)]

    b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17.

Monitoring [15A NCAC 02Q .0308(a)]

c. To ensure compliance, once a month the Permittee shall observe the emission points of the sources in Section 2.1 A for any visible emissions above normal. The monthly observation must be made for each month of the calendar year period to ensure compliance with this requirement. For the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2 and ES-GHM-3)** and wood-fired direct heat drying system **(ID No. ES-DRYER)**, the Permittee shall establish "normal" in the first 30 days following the commencement of operation after exhaust from the green wood hammermills has been rerouted to the WESP **(ID No. CD-WESP)** and the RTO **(ID No. CD-RTO)**. If visible emissions from the sources in Section 2.1 A are observed to be above normal, the Permittee shall either:
   i. take appropriate action to correct the above-normal emissions as soon as practicable and within the monitoring period and record the action taken as provided in the recordkeeping requirements below, or
   ii. demonstrate that the percent opacity from the emission points of the emission source in accordance with 15A NCAC 02D .2610 (Method 9) for 12 minutes is below the limit given in Section 2.1 A.3.a. above.

Recordkeeping [15A NCAC 02Q .0308(a)]

d. The results of the monitoring shall be maintained in a logbook (written or electronic format) on-site and made available to an authorized representative upon request. The logbook shall record the following:
   i. the date and time of each recorded action;
   ii. the results of each observation and/or test noting those sources with emissions that were observed to be in noncompliance along with any corrective actions taken to reduce visible emissions; and
   iii. the results of any corrective actions performed.

Reporting [15A NCAC 02Q .0308(a), 15A NCAC 02D .0605(b)(3)]

e. The Permittee shall submit a summary report of the monitoring and recordkeeping activities given in Sections 2.1 A.3.c and d above postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December and July 30 of each calendar year for the preceding six-month period between January and June. All instances of deviations from the requirements of this permit must be clearly identified.

4. 15A NCAC 02D .1112: 112(g) CASE BY CASE MAXIMUM ACHIEVABLE CONTROL TECHNOLOGY

a. The Permittee shall comply with all applicable provisions, including the notification, testing, reporting, recordkeeping, and monitoring requirements contained in Environmental Management Commission Standard 15A NCAC 02D .1112, "Case-By-Case Maximum Achievable Control Technology," and as promulgated in 40 CFR 63, including Subpart A "General Provisions." The Permittee shall comply with the following:
   i. For the wood pellet mill dryer **(ID No. ES-DRYER)**, the Permittee shall use a low HAP emitting dryer design not requiring add-on control.
   ii. Within six months of issuance of this permit (10386R04), the Permittee shall submit to DAQ an application requesting authorization for installation of a regenerative catalytic oxidizer or regenerative thermal oxidizer (RCO/RTO) to control HAP emissions from the pellet presses and pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Installation and startup of the control device shall be completed by no later than June 1, 2021, provided that, if a permit authorizing the same is not issued until after June 1, 2020, installation and startup of the control device shall be completed within twelve months of permit issuance. Initial compliance for the RCO/RTO shall be demonstrated in accordance with the future issued permit.
   iii. Within six months of issuance of this permit (10386R04), the Permittee shall submit to DAQ an application requesting authorization for either of the following:

(A) the installation of an RCO/RTO to control VOC and HAP emissions from the dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)**, or

(B) an engineering solution that will result in an equivalent or greater reduction in VOC and HAP emissions from the dry hammermills.

Installation and startup of the control device or engineering solution shall be completed by no later than June 1, 2021, provided that, if a permit authorizing the same is not issued until after June 1, 2020, installation and startup of the control device shall be completed within twelve months of permit issuance. Initial compliance for the RCO/RTO or engineering solution shall be demonstrated in accordance with the future issued permit.

Testing [15A NCAC 02Q .0308(a)]

b. Initial Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall establish emission factors for HAPs by conducting an initial performance test on the wood-fired direct heat drying system **(ID No. ES-DRYER)**, the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)**, the dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)**, the dry wood handling operations **(ID Nos. ES-DWH)**, and the pellet presses and coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Initial testing shall be conducted in accordance with the following:

i. The pollutants and emission sources to be tested during the initial performance test are listed in the following table:

Emission Source	Pollutant
Dryer system/green wood hammermills controlled via WESP and RTO	Acetaldehyde Acrolein Formaldehyde Methanol Phenol Propionaldehyde
One pellet cooler cyclone	
One dry hammermill baghouse	
Dry wood handling operations	

ii. Initial testing shall be conducted in accordance with Section 2.2 A.1.d.ii through vi. below.

c. Periodic Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall establish emission factors for HAPs by conducting periodic performance tests on the wood-fired direct heat drying system **(ID No. ES-DRYER)**, the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)**, the dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)**, and the pellet presses and coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Periodic testing shall be conducted in accordance with the following:

i. The pollutants and emission sources to be tested during the periodic performance tests are listed in the following table:

Emission Sources	Pollutant
Dryer system/green wood hammermills controlled via WESP and RTO	Acetaldehyde Acrolein Formaldehyde Methanol Phenol Propionaldehyde
One pellet cooler cyclone	
One dry hammermill baghouse	

ii. Periodic testing shall be conducted in accordance with Section 2.2 A.1.e.ii through xiv below.

Monitoring/Recordkeeping/Reporting [15A NCAC 02Q .0308(a)]

d. No monitoring recordkeeping, or reporting is required for any emission source subject to 112(g) Case-by-Case MACT.

2.2- Multiple Emission Source(s) Limitations and Conditions

A. Facility-wide Emission Sources

The following table provides a summary of limits and standards for the emission source(s) describe above:

Regulated Pollutant	Limits/Standards	Applicable Regulation
PM/PM10/PM2.5 Nitrogen oxides Volatile organic carbon Carbon monoxide Greenhouse gases	BACT Limits	15A NCAC 02D .0530
Fugitive dust	Minimize fugitive dust beyond property boundary	15A NCAC 02D .0540
Odor	State-enforceable only odor control	15A NCAC 02D .1806
N/A	Annual Emission Reporting due June 30	15A NCAC 02Q .0207
N/A	Permit renewal application due 90 days prior to permit expiration	15A NCAC 02Q .0304
N/A	Option for obtaining construction and operation permit	15A NCAC 02Q .0504

1. 15A NCAC 02D .0530: PREVENTION OF SIGNIFICANT DETERIORATION

a. The Permittee shall comply with all applicable provisions, including the notification, testing, reporting, recordkeeping, and monitoring requirements in accordance with 15A NCAC 02D .0530, "Prevention of Significant Deterioration of Air Quality" (PSD) as promulgated in 40 CFR 51.166.

b. For PSD purposes, the following "Best Available Control Technology" (BACT) emissions limits shall not be exceeded:

Emission Source	Pollutant	Control Technology or Work Practice	BACT Emission Limit	Averaging Period
Wood-fired Direct Heat Drying System **(ID No. ES-DRYER)**	NOx	Good Combustion Practices	0.20 lb/million Btu	3-hour
	CO	Process Design	0.21 lb/ million Btu	3-hour
	GHG	Good Operating Practices	230,000 tpy (CO_2e)	Annual
Wood-fired Direct Heat Drying System **(ID No. ES-DRYER)** Green Wood Hammermills **(ID Nos. ES-GHM-1 to ES-GHM-3)**	VOC**	RTO	0.15 lb/ODT	3-hour
	PM/PM10/2.5	WESP	0.105 lb/ODT (filterable only)	3-hour
Dry Hammermills **(ID Nos. ES-HM-1 to ES-HM-8)**	VOC**	Good Operating Procedures	0.60 lb/ODT	3-hour
	PM	Baghouse	0.004 gr/scf	3-hour
	PM10		0.004 gr/scf (filterable only)	3-hour
	PM2.5		0.000014 gr/scf (filterable only)	3-hour
Hammermill Conveying System **(ID No. ES-HMC)**	PM	Baghouse	0.004 gr/scf	3-hour
Dried Wood Handling **(ID No. ES-DWH)**	VOC**	Good Operating Procedures	0.12 lb/ODT	3-hour

Emission Source	Pollutant	Control Technology or Work Practice	BACT Emission Limit	Averaging Period
	PM	Baghouses	0.004 gr/scf	3-hour
Pellet Presses and Coolers **(ID No. ES-CLR-1 to ES-CLR-6)**	VOC**	Good Operating Procedures	1.74 lb/ODT	3-hour
	PM	Cyclones - Proper Design and Good Operating Procedures	0.04 gr/scf	3-hour
	PM10		0.0057 gr/scf (filterable only)	3-hour
	PM2.5		0.0007 gr/scf (filterable only)	3-hour
Pellet cooler LP Fines Relay System **(ID No. ES-PCLP)**	PM2.5/PM10/PM	Baghouse	0.004 gr/scf	3-hour
Pellet Sampling Transfer Bin **(ID No. ES-PSTB)**	PM2.5/PM10/PM	Baghouse	0.004 gr/scf	3-hour
Hammermill Area/Pellet cooler HP Fines Relay System **(ID Nos. ES-HMA and ES-PCHP)**	PM2.5/PM10/PM	Baghouse	0.004 gr/scf	3-hour
Pellet Mill Feed Silo **(ID No. ES-PMFS)**	PM2.5/PM10/PM	Baghouse	0.004 gr/scf	3-hour
Finished Product Handling/Pellet Loadout Bins/Pellet Mill Loadouts **(ID Nos. ES-FPH, ES-PB-1 to 4/ ES-PL-1 and 2)**	PM	Baghouse	0.004 gr/scf	3-hour
	PM10	Baghouse	0.004 gr/scf	3-hour
	PM2.5	Baghouse	0.000014 gr/scf	3-hour
Paved Roads **(ID No. IES-PAVEDROADS)**	PM/PM10/PM2.5	Combination of watering of paved roads, vehicle speed control, and good housekeeping	Not Applicable	
Green Wood Handling **(ID No. IES-GWH)**	PM/PM10/PM2.5	None	Not Applicable	
Green Wood Storage Piles **(ID Nos. IES-GWSP-1 to IES-GWPS-4)**	VOC			
	PM/PM10/PM2.5			
Bark Fuel Storage Piles **(ID Nos. IES-BFSP-1 and IES-BFSP-2)**	VOC			
	PM/PM10/PM2.5			
Bark Fuel Bin **(ID No. IES-BFB)**	PM/PM10/PM2.5			
Dry Shavings Material Handling **(ID No. IES-DRYSHAVE)**	PM			
Debarker **(ID No. IES-DEBARK-1)**	PM/PM10/PM2.5			
Log Chipping **(ID No. IES-CHIP-1)**	VOC			
Bark Hog **(ID No. IES-BARKHOG)**	VOC			
	PM			
Diesel storage tanks **(ID Nos. IES-TK1, IES-TK2, and IES-TK3)**	VOC	Good operation practices	Not Applicable	

* The VOC limit is expressed as alpha pinene basis per the procedures in EPA OTM 26.

<u>**Notifications**</u> [15A NCAC 02Q .0308(a)]

c. The completion of the Softwood Expansion Project (SWEP) is defined as the replacement of pellet presses that allow throughput of up to 657,000 ODT/year on an annual basis and the rerouting of the exhaust from the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)** to the wet electrostatic precipitator **(ID No. CD-WESP)** and the regenerative thermal oxidizer **(ID No. CD-RTO)**. The Permittee shall notify the DAQ of the actual completion date of the SWEP postmarked within 15 days after such date.

<u>**Testing**</u> [15A NCAC 02Q .0308(a)]

d. <u>Initial Performance Tests</u> – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with the BACT emission limits in Section 2.2 A.1.b above by conducting an initial performance test on the wood-fired direct heat drying system **(ID No. ES-DRYER)**, the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)**, the dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)**, the dry wood handling operations **(ID Nos. ES-DWH)**, and the pellet presses and coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Initial testing shall be conducted in accordance with the following:

i. The pollutants and emission sources to be tested during the initial performance test are listed in the following table:

Emission Sources	Pollutant
Dryer system/green wood hammermills controlled via WESP and RTO	VOC
	PM/PM10/PM2.5
	NOx
	CO
One pellet cooler cyclone	VOC
	PM/PM10/PM2.5
One dry hammermill baghouse	VOC
	PM/PM10/PM2.5
Dry wood handling operations	VOC

ii. The Permittee shall conduct initial compliance testing in accordance with a testing protocol approved by the DAQ.

iii. The Permittee shall submit a protocol to DAQ at least 45 days prior to initial compliance testing and shall submit a notification of initial compliance testing at least 15 days in advance of the testing.

iv. The RTO **(ID No. CD-RTO)** is comprised of two fireboxes, each containing two temperature probes. During the initial compliance test, the Permittee shall establish the minimum average firebox temperature for each of the two fireboxes comprising the regenerative thermal oxidizer **(ID No. CD-RTO)**, for a total of two average temperatures per regenerative thermal oxidizer. "Average firebox temperature" means the average temperature of the two temperature probes in each firebox. The minimum average firebox temperature for each firebox shall be based upon the average temperature of the two temperature probes over the span of the test runs. Documentation for the minimum average firebox temperature for each firebox shall be submitted to the DAQ as part of the initial compliance test report.

v. Initial compliance testing shall be completed as follows:

(A) The Permittee shall be responsible for ensuring, within practicable limits, that the equipment or processes being tested are operated at or near the maximum normal production rate but at a rate not to exceed 71.71 ODT per hour (not to exceed 537,625 ODT per year on an annual basis).

(B) Testing shall be conducted at the maximum normal operating softwood percentage, not to exceed 80% softwood.

(C) Testing shall be completed and results submitted to the DAQ within 90 days of permit issuance, unless an alternate date is approved in advance by DAQ.

vi. Additional initial compliance testing upon completion of the SWEP shall be completed as follows:

(A) The Permittee shall be responsible for ensuring, within practicable limits, that the equipment or processes being tested are operated at or near the maximum normal production rate but at a rate not to exceed 120 ODT per hour (not to exceed 657,000 ODT per year on an annual basis).
(B) Testing shall be conducted at the maximum normal operating softwood percentage, not to exceed 80% softwood.
(C) Testing shall be completed and results submitted to the DAQ within 120 days completion of the construction of the SWEP, unless an alternate date is approved in advance by DAQ,

e. Periodic Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with the BACT emission limits in Section 2.2 A.1.b above by conducting periodic performance tests on the wood-fired direct heat drying system **(ID No. ES-DRYER)**, the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)**, the dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)**, and the pellet presses and coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Periodic testing shall be conducted in accordance with the following:

i. The pollutants and emission sources to be tested during the periodic performance tests are listed in the following table:

Emission Sources	Pollutant
Dryer system/green wood hammermills controlled via WESP and RTO	VOC
	PM/PM10/PM2.5
	NOx
	CO
One pellet cooler cyclone	VOC
	PM/PM10/PM2.5
One dry hammermill baghouse	VOC
	PM/PM10/PM2.5

ii. The Permittee shall conduct periodic compliance testing in accordance with a testing protocol approved by the DAQ.
iii. The Permittee shall submit a protocol to DAQ at least 45 days prior to periodic compliance testing and shall submit a notification of periodic compliance testing at least 15 days in advance of the testing.
iv. The Permittee shall be responsible for ensuring, within practicable limits, that the equipment or processes being tested are operated at or near the maximum normal production rate.
v. To the extent possible, testing shall be conducted at the maximum normal operating softwood percentage.
vi. The Permittee shall conduct periodic performance tests when the following conditions are met:
(A) The monthly average softwood content exceeds the average softwood percentage documented during prior performance testing by more than 10 percentage points, or
(B) The monthly production rate exceeds the average production rate documented during prior performance testing by more than 10 percentage points, or
(C) At a minimum testing shall be conducted annually, unless a longer duration is otherwise approved pursuant to Section 2.2.A.1.e.x. Annual performance tests shall be completed no later than 13 months after the previous performance test.
vii. The Permittee shall notify the DAQ within 15 days when the conditions specified in Section 2.2 A.1.e.vi (A) or (B) are met.
viii. The Permittee shall conduct the periodic performance test and submit a written report of the test results to the DAQ within 90 days from the date the monthly softwood content or overall production rate increased as described in Section 2.2 A.1.e.vi (A) and (B) above, unless an alternate date is approved in advance by DAQ,
ix. When periodic performance testing has occurred at 90 percent softwood AND at 90 percent of the maximum permitted throughput, subsequent periodic performance testing shall occur on an annual

basis and shall be completed no later than 13 months after the previous performance test, unless a longer duration is otherwise approved pursuant to Section 2.2.A.1.e.x.

x. The Permittee may request that the performance tests be conducted less often for a given pollutant if the performance tests for at least 3 consecutive years show compliance with the emission limit. If the request is granted, the Permittee shall conduct a performance test no more than 36 months after the previous performance test for the given pollutant.

xi. If a performance test shows noncompliance with an emission limit for a given pollutant, the Permittee shall return to conducting annual performance tests (no later than 13 months after the previous performance test) for that pollutant.

xii. Except as specified in Section 2.2 A.1.e.viii above, the Permittee shall submit a written report of results for any periodic performance test to the DAQ, not later than 30 days after sample collection, in accordance with 15A NCAC 02D .2602(h).

xiii. The Permittee may re-establish any parametric operating value during periodic testing. Compliance with previously approved parametric operating values is not required during periodic required testing or other tests undertaken to re-establish parametric operating values by the Permittee. If the new parametric operating values re-established during periodic testing are more stringent, the Permittee shall submit a request to revise the value(s) in the permit at the same time the test report required pursuant to General Condition 17 is submitted. The permit revision will be processed pursuant to 15A NCAC 02Q .0514. If, during performance testing, the new parametric operating values are less stringent, the Permittee may request to revise the value(s) in the permit pursuant to 15A NCAC 02Q .0515.

xiv. The Permittee shall comply with applicable emission standards at all times, except as allowed by Section 2.2 A.1.b, including during periods of testing.

Monitoring/Recordkeeping [15ANCAC 02Q .0308(a)]

f. Within six months of issuance of this permit (10386R04), the Permittee shall submit to the DAQ a permit application that includes one of the following:
   i. A revised BACT analysis for VOC emissions from the dry hammermills **(ID Nos. ES-HM-1 to ES-HM-8)** and the pellet presses and pellet coolers **(ID No. ES-CLR-1 to ES-CLR-6)**, OR
   ii. A request for an avoidance condition for 15A NCAC 02D .0530, Prevention of Significant Deterioration, for VOC emissions.
g. Regardless of the actual completion date of the SWEP, the Permittee shall complete the rerouting of the exhaust from green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)** to the wet electrostatic precipitator **(ID No. CD-WESP)** and the regenerative thermal oxidizer **(ID No. CD-RTO)** within twelve (12) months of issuance of this permit (10368R04).
h. The Permittee shall not increase production beyond 537,625 oven-dried tons (ODT) of pellets per consecutive 12-month period (the permitted maximum production rate in Air Permit No. 10386R03) until exhaust from the green wood hammermills **(ID Nos. ES-GHM-1, ES-GHM-2, and ES-GHM-3)** has been rerouted to the wet electrostatic precipitator **(ID No. CD-WESP)** and the regenerative thermal oxidizer **(ID No. CD-RTO)**.
i. Upon completion of the SWEP, the Permittee shall not process more than 657,000 ODT of pellets per consecutive 12-month period. The process rate shall be recorded monthly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request.
j. Upon completion of the SWEP, the Permittee shall not process more than 558,450 ODT of pellets per consecutive 12-month period (85% of the permitted maximum production rate of 657,000 ODT per consecutive 12-month period) from the eight dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)**. The dry hammermill process rate shall be recorded monthly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request.
k. The furnace bypass **(ID No. ES-FBYPASS)** shall be limited to less than 50 hours per year for startups (for temperature control) and shutdowns. The furnace bypass shall be limited to a cold startup of 15% maximum heat input (or 37.6 million Btu per hour). The cold startup period of time begins when the wood-fired furnace is started up and lasts until the wood-fired furnace's refractory

is heated to a temperature sufficient to sustain combustion operations at a minimal level or 8 hours, whichever is less.

l. The furnace bypass **(ID No. ES-FBYPASS)** in idle mode, defined as maximum heat input of 5 million Btu per hour, shall be limited to less than 500 hours per year.
m. At all times, including periods of startup, shutdown, and malfunction, the Permittee shall, to the extent practicable, maintain and operate all emission sources including associated control devices in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.
n. The Permittee shall record the hardwood/softwood mix monthly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request.
o. The Permittee shall calculate the total emissions of NOx, filterable PM, CO, and VOC monthly and shall record the emissions monthly in a logbook (written or electronic format) kept on-site and made available to DAQ personnel upon request.
p. For the wood-fired direct heat drying system **(ID No. ES-DRYER)**, GHG (CO_2e) emissions shall be calculated monthly and compliance demonstrated using the applicable Part 98 emission factors. Compliance shall be documented on a 12-month rolling basis.
q. To ensure compliance and effective operation of the RTO **(ID No. CD-RTO)**, the Permittee shall maintain a 3-hour rolling average firebox temperature for each of the two fireboxes comprising the RTO at or above the minimum average temperatures established during the most recent performance testing. The Permittee shall maintain records of the 3-hour rolling average temperatures for each firebox. The Permittee shall also perform inspections and maintenance on the RTO as specified above in Section 2.1 A.1.h.
r. To ensure compliance and effective operation of the wet electrostatic precipitator **(ID No. CD-WESP)**, the Permittee shall perform inspections and maintenance as specified above in Section 2.1 A.1.h. The Permittee shall also maintain the minimum secondary voltage and minimum current of the wet electrostatic precipitator as specified above in Section 2.1 A.1.g.
s. To ensure compliance and effective operation of the baghouses and cyclones, the Permittee shall perform inspections and maintenance as specified above in Section 2.1 A.1.e.
t. Monitoring and recordkeeping are not required for the following emission sources:
    i. Paved roads;
    ii. VOC emissions from storage tanks; and
    iii. Emission sources with no BACT emission limits or work practice standards.

Reporting [15A NCAC 02Q .0308(a), 15A NCAC 02D .0605(b)(3)]

u. The Permittee shall submit the results of any maintenance performed on the wet electrostatic precipitator, regenerative thermal oxidizer, cyclones, and/or baghouses within 30 days of a written request by the DAQ.
v. The Permittee shall submit a summary report of the monitoring and recordkeeping activities given in Sections 2.2 A.1.f through u above postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December and July 30 of each calendar year for the preceding six-month period between January and June. All instances of deviations from the requirements of this permit must be clearly identified.

2. 15A NCAC 02D .0535 EXCESS EMISSIONS REPORTING AND MALFUNCTION

As required by 15A NCAC 2D .0535, the Permittee of a source of excess emissions that last for more than four hours and that results from a malfunction, a breakdown of process or control equipment or any other abnormal conditions, shall:

a. Notify the Director or his designee of any such occurrence by 9:00 a.m. Eastern time of the Division's next business day of becoming aware of the occurrence and describe:
   i. the name and location of the facility,
   ii. the nature and cause of the malfunction or breakdown,
   iii. the time when the malfunction or breakdown is first observed,
   iv. the expected duration, and
   v. an estimated rate of emissions.

b. Notify the Director or his designee immediately when the corrective measures have been accomplished.

This reporting requirement does not allow the operation of the facility in excess of Environmental Management Commission Regulations.

3. 15A NCAC 02D .0540: PARTICULATES FROM FUGITIVE DUST EMISSION SOURCES

As required by 15A NCAC 02D .0540 "Particulates from Fugitive Dust Emission Sources," the Permittee shall not cause or allow fugitive dust emissions to cause or contribute to substantive complaints or excess visible emissions beyond the property boundary. If substantive complaints or excessive fugitive dust emissions from the facility are observed beyond the property boundaries for six minutes in any one hour (using Reference Method 22 in 40 CFR, Appendix A), the owner or operator may be required to submit a fugitive dust plan as described in 02D .0540(e) and (f).

"Fugitive dust emissions" means particulate matter from process operations that does not pass through a process stack or vent and that is generated within plant property boundaries from activities such as: unloading and loading areas, process areas stockpiles, stock pile working, plant parking lots, and plant roads (including access roads and haul roads).

State-enforceable only

4. 15A NCAC 02D .1806: CONTROL AND PROHIBITION OF ODOROUS EMISSIONS

The Permittee shall not operate the facility without implementing management practices or installing and operating odor control equipment sufficient to prevent odorous emissions from the facility from causing or contributing to objectionable odors beyond the facility's boundary.

5. 15A NCAC 02Q .0207: ANNUAL EMISSIONS REPORTING

The Permittee shall report by **June 30** of each year the actual emissions of each air pollutant listed in 15A NCAC 02Q .0207(a) from each emission source within the facility during the previous calendar year. The report shall be in or on such form as may be established by the Director. The accuracy of the report shall be certified by the responsible official of the facility.

6. 15A NCAC 02Q. 0304: APPLICATIONS

The Permittee, at least 90 days prior to the expiration date of this permit, shall request permit renewal by letter in accordance with 15A NCAC 02Q .0304(d) and (f). Pursuant to 15A NCAC 02Q .0203(i), no permit application fee is required for renewal of an existing air permit. The renewal request should be submitted to the Regional Supervisor, DAQ.

7. 15A NCAC 02Q .0504: OPTION FOR OBTAINING CONSTRUCTION AND OPERATION PERMIT

a. The Permittee shall file a Title V Air Quality Permit Application pursuant to 15A NCAC 02Q .0504 to amend the existing Title V first time application (8200152.17B) on or before 12 months after commencing operation of any of the new sources or control devices listed in this permit.

Reporting [15A NCAC 02Q .0504]

b. The Permittee shall notify the Regional Office in writing of the date of beginning operation of any of the new sources or control devices listed in this permit, postmarked no later than 30 days after

SECTION 3 - GENERAL CONDITIONS

1. In accordance with G.S. 143-215.108(c)(1), TWO COPIES OF ALL DOCUMENTS, REPORTS, TEST DATA, MONITORING DATA, NOTIFICATIONS, REQUESTS FOR RENEWAL, AND ANY OTHER INFORMATION REQUIRED BY THIS PERMIT shall be submitted to:

   Heather Carter
   Regional Air Quality Supervisor
   North Carolina Division of Air Quality
   Fayetteville Regional Office
   Systel Building, 225 Green Street, Suite 714
   Fayetteville, NC 28301
   (910) 433-3300

   For identification purposes, each submittal should include the facility name as listed on the permit, the facility identification number, and the permit number.

2. RECORDS RETENTION REQUIREMENT - In accordance with 15A NCAC 02D .0605, any records required by the conditions of this permit shall be kept on site and made available to DAQ personnel for inspection upon request. These records shall be maintained in a form suitable and readily available for expeditious inspection and review. These records must be kept on site for a minimum of 2 years, unless another time period is otherwise specified.

3. ANNUAL FEE PAYMENT - Pursuant to 15A NCAC 02Q .0203(a), the Permittee shall pay the annual permit fee within 30 days of being billed by the DAQ. Failure to pay the fee in a timely manner will cause the DAQ to initiate action to revoke the permit.

4. EQUIPMENT RELOCATION - In accordance with 15A NCAC 02Q .0301, a new air permit shall be obtained by the Permittee prior to establishing, building, erecting, using, or operating the emission sources or air cleaning equipment at a site or location not specified in this permit.

5. REPORTING REQUIREMENT - In accordance with 15A NCAC 02Q .0309, any of the following that would result in previously unpermitted, new, or increased emissions must be reported to the Regional Supervisor, DAQ:

   a. changes in the information submitted in the application regarding facility emissions;

   b. changes that modify equipment or processes of existing permitted facilities; or

   c. changes in the quantity or quality of materials processed.

   If appropriate, modifications to the permit may then be made by the DAQ to reflect any necessary changes in the permit conditions. In no case are any new or increased emissions allowed that will cause a violation of the emission limitations specified herein.

6. In accordance with 15A NCAC 02Q .0309, this permit is subject to revocation or modification by the DAQ upon a determination that information contained in the application or presented in the support thereof is incorrect, conditions under which this permit was granted have changed, or violations of conditions contained in this permit have occurred. In accordance with G.S. 143-215.108(c)(1), the facility shall be properly operated and maintained at all times in a manner that will effect an overall reduction in air pollution. Unless otherwise specified by this permit, no emission source may be operated without the concurrent operation of its associated air cleaning device(s) and appurtenances.

7. In accordance with G.S. 143-215.108(c)(1), this permit is nontransferable by the Permittee. Future owners and operators must obtain a new air permit from the DAQ.

8. In accordance with G.S. 143-215.108(c)(1), this issuance of this permit in no way absolves the Permittee of liability for any potential civil penalties which may be assessed for violations of State law which have occurred prior to the effective date of this permit.

9. In accordance with G.S. 143-215.108(c)(1), this permit does not relieve the Permittee of the responsibility of complying with all applicable requirements of any Federal, State, or Local water quality or land quality control authority.

10. In accordance with 15A NCAC 02D .0605, reports on the operation and maintenance of the facility shall be submitted by the Permittee to the Regional Supervisor, DAQ at such intervals and in such form and detail as may be required by the DAQ. Information required in such reports may include, but is not limited to, process weight rates, firing rates, hours of operation, and preventive maintenance schedules.

11. A violation of any term or condition of this permit shall subject the Permittee to enforcement pursuant to G.S. 143-215.114A, 143-215.114B, and 143-215.114C, including assessment of civil and/or criminal penalties.

12. Pursuant to North Carolina General Statute 143-215.3(a)(2), no person shall refuse entry or access to any authorized representative of the DAQ who requests entry or access for purposes of inspection, and who presents appropriate credentials, nor shall any person obstruct, hamper, or interfere with any such representative while in the process of carrying out his official duties. Refusal of entry or access may constitute grounds for permit revocation and assessment of civil penalties.

13. In accordance with G.S. 143-215.108(c)(1), this permit does not relieve the Permittee of the responsibility of complying with any applicable Federal, State, or Local requirements governing the handling, disposal, or incineration of hazardous, solid, or medical wastes, including the Resource Conservation and Recovery Act (RCRA) administered by the Division of Waste Management.

14. PERMIT RETENTION REQUIREMENT - In accordance with 15A NCAC 02Q .0110, the Permittee shall retain a current copy of the air permit at the site. The Permittee must make available to personnel of the DAQ, upon request, the current copy of the air permit for the site.

15. CLEAN AIR ACT SECTION 112(r) REQUIREMENTS - Pursuant to 15A NCAC 02D .2100 "Risk Management Program," if the Permittee is required to develop and register a risk management plan pursuant to Section 112(r) of the Federal Clean Air Act, then the Permittee is required to register this plan with the USEPA in accordance with 40 CFR Part 68.

16. PREVENTION OF ACCIDENTAL RELEASES - GENERAL DUTY - Pursuant to Title I Part A Section 112(r)(1) of the Clean Air Act "Hazardous Air Pollutants - Prevention of Accidental Releases - Purpose and General Duty," although a risk management plan may not be required, if the Permittee produces, processes, handles, or stores any amount of a listed hazardous substance, the Permittee has a general duty to take such steps as are necessary to prevent the accidental release of such substance and to minimize the consequences of any release. **This condition is federally-enforceable only.**

17. GENERAL EMISSIONS TESTING AND REPORTING REQUIREMENTS - If emissions testing is required by this permit, or the DAQ, or if the Permittee submits emissions testing to the DAQ in support of a permit application or to demonstrate compliance, the Permittee shall perform such testing in accordance with 15A NCAC 02D .2600 and follow all DAQ procedures including protocol approval, regional notification, report submittal, and test results approval.

Permit issued this the 2nd day of October, 2019.

NORTH CAROLINA ENVIRONMENTAL MANAGEMENT COMMISSION

for

William D. Willets, P.E., Chief, Permitting Section
Division of Air Quality, NCDEQ
By Authority of the Environmental Management Commission

Air Permit No. 10386R04

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 4
ATLANTA FEDERAL CENTER
61 FORSYTH STREET
ATLANTA, GEORGIA 30303-8960

June 4, 2007

Ms. E.A. Veronica Barringer
Bureau of Air Quality
South Carolina Department of Health
and Environmental Services
2600 Bull Street
Columbia, South Carolina 29201

Dear Ms. Barringer:

By letter dated June 14, 2005, the Region 4 office of the U.S. Environmental Protection Agency (EPA) sent an opinion to the South Carolina Department of Health and Environmental Control (SCDHEC) on whether operations at two South Carolina emissions sources should be considered "fuel conversion plants" for prevention of significant deterioration (PSD) applicability purposes. The operations in question were wood waste (biomass) gasification operations at the Norbord South Carolina, Inc. (Norbord) oriented strandboard manufacturing facility and at the University of South Carolina (USC) campus in Columbia. In our letter we expressed the opinion that both biomass gasification operations should be considered fuel conversion plants. We also stated that our opinion did not mean the entire Norbord and USC facilities should be considered fuel conversion plants. Rather, our opinion was that just the operations (and emissions units) associated directly with biomass gasification constitute a fuel conversion plant for these facilities.

After our opinion letter was submitted, Norbord provided additional information to SCDHEC and asked for further review. SCDHEC in turn requested reconsideration by EPA. Upon further review of the statutory and regulatory history of the PSD rules and of past EPA statements on the activities constituting a fuel conversion plant, we now are of the opinion that the biomass gasification operation at the Norbord facility should not be considered a fuel conversion plant for PSD applicability purposes. The rationale for our revised opinion is provided below.

As stated in our original opinion letter, we are responding to SCDHEC's request based on how we believe such a request would be resolved under the federal PSD rules in Title 40 Code of Federal Regulations and under EPA policies. Our response does not represent final agency action. Instead, this letter provides guidance for SCDHEC to consider in its role as the PSD reviewing authority.

Background

The PSD rules applicable to Norbord are South Carolina's rules in Regulation 61-62.5, Standard No. 7. SCDHEC's PSD rules, just like federal PSD rules in 40 CFR 52.21, contain a list of source categories for which the major source emissions threshold is 100 tons per year (tpy) of any individual regulated new source review (NSR) pollutant. One of these source categories is "fuel conversion plants." Sources not listed have a major source emissions threshold of 250 tpy.

Norbord operates three rotary gasifier/burner oxidizer systems at its oriented strandboard facility. Each system includes a rotary kiln gasifier generating a synthetic gas from gasification of wood waste. The synthetic gas is burned in a secondary combustion chamber producing hot exhaust gases used to produce steam and (in one system) hot oil for manufacturing process needs. A feature essential to the opinion expressed below is that the gasification process at Norbord does not involve fossil fuels. All of the material feeding the gasification process is a biomass, non-fossil material.

Review of History on the Fuel Conversion Plant Source Category

As part of our reconsideration, we have reviewed the history of the PSD program as related to the establishment of the list of specific source categories now embodied in the definition of "major source." A summary of our review is as follows, starting with a summary of the statutory and regulatory history.

- Congress established the basic framework for a national air quality control program in the Clean Air Act as amended in 1970. These amendments, however, did not contain any explicit requirements on preventing significant deterioration of air quality.

- Responding to a lawsuit, the U.S. District Court for the District of Columbia issued an opinion (*Sierra Club v. Ruckelshaus*) on May 30, 1972, directing EPA to establish rules for preventing significant deterioration of air quality. On November 1, 1972, the U.S. Court of Appeals for the District of Columbia affirmed the opinion of the District Court. The District Court opinion was then stayed by the U.S. Supreme Court until June 11, 1973, when the Supreme Court (in an equally divided opinion) affirmed the judgment of the Court of Appeals, thereby upholding the District Court opinion.

- EPA proposed PSD rules on July 16, 1973 (38 FR 18986) and listed 16 source categories covered by the rules. This list did not include fuel conversion plants. Also, as of that time EPA had not introduced the 100 tpy/250 tpy two-tier approach to defining major sources.

- On August 27, 1974 (39 FR 31000), EPA re-proposed the PSD rules and included this statement in the preamble: "The list of sources subject to review has been expanded to include three additional source types - fuel conversion plants (such as coal gasification and oil shale plants) ...." The re-proposed rule itself did not contain a definition of the term fuel conversion plants. In addition, the two-tier approach was still not part of PSD regulations.

- On December 5, 1974 (39 FR 42510), EPA promulgated the first set of PSD rules. These rules contained "fuel conversion plants" as a listed source category but without a definition of the term. The two-tier approach was still absent.

- In August 1977, Congress adopted the Clean Air Act Amendments of 1977 with a statutory PSD section. The 1977 amendments included the PSD 100 tpy/250 tpy two-tier concept along with a list of the source categories having a 100-tpy PSD major source threshold. The listed categories included fuel conversion plants, but without any definition of the term.

- Pursuant to the Clean Air Act Amendments of 1977, EPA issued implementing PSD regulations in June 1978 and revised them in August 1980 in response to the holdings in *Alabama Power Company v. Costle*. The 1980 PSD rules contained the 100-tpy source category list with fuel conversion plants as one of the categories but again without definition. This list (still without definitions) remains in current federal PSD rules and in current SCDHEC PSD rules.

We next proceed to a summary of EPA statements on the meaning of the term fuel conversion as expressed in various documents.

- PSD source clarification memo; January 20, 1976 - This memo was from EPA headquarters in response to an EPA Region 4 request for clarification on sources subject to PSD review. The memo contains this statement: "Fuel conversion plants are defined for purposes of PSD as those plants which accomplish a change in state for a given fossil fuel. The large majority of these plants are likely to accomplish these changes through coal gasification, coal liquefaction, or oil shale processing."

- Cleveland Electric memo; May 26, 1992 - At the plant in question, Cleveland Electric proposed to produce fuel gas by means of gasifying municipal waste. EPA concluded that this process qualified as a fuel conversion plant and made the following statement: "Fuel conversion plants obviously include those plants which accomplish a change in state (e.g., solid to liquid to gas) for a fuel. This definition includes conversion of the following fuels: fossil (e.g., coal or oil shale); biomass (e.g., wood or peat); and anthropogenic (e.g., municipal waste derived fuel and inorganic fuel). The majority of such sources are likely to accomplish these changes through either gasification, liquefaction, or solidification. ... Generally, however, applicability for this source category is determined by whether a facility changes state (e.g., solid to gas) or form (e.g., process sawdust into a pellet) of a fuel."

- Pencor-Masada Oxynol order; May 2, 2001 - In this order (referred to as the Masada I order) issued by the EPA Administrator in response to a title V operating permit petition, the Administrator covered various topics related to a refuse recycling and ethanol production facility. One of these topics was whether a gasifier associated with refuse processing was a fuel conversion process. EPA's conclusion reads in part as follows: "Based on our review, EPA policy has historically defined this category [fuel conversion plants] as 'plants which accomplish a change in state for a given fossil fuel. The large majority of these plants are likely to accomplish these changes through coal gasification, coal liquefaction or oil shale processing.' In this case, where fossil fuels are not involved and where the processing involves hydrolysis, a chemical process, it is EPA's judgment that the Masada facility is not a fuel conversion plant." [The embedded quote is from the January 20, 1976 memo listed above.]

The 1976 memo and the 2001 order support the idea that the term fuel conversion plants is limited to facilities engaged in the processing of fossil fuels, whereas the 1992 memo does not.

Revised Opinion

By this letter we now revise our opinion for the Norbord gasifier operation based on the likely meaning of the term fuel conversion projects at the time it was first introduced (as indicated by the preamble statement in the August 1974 re-proposal of PSD rules and in the January 1976 memo), recognizing that there have been no statutory or regulatory changes since that time necessitating a different view of the term. Our revised opinion is that the Norbord gasifier operation is not a fuel conversion plant because it does not involve a fossil fuel. This opinion is consistent with the Masada I order issued by the EPA Administrator in May 2001. Concurrence with this opinion has been obtained from EPA's Office of Air and Radiation (including the Office of Air Quality Planning and Standards) and Office of General Counsel.

If you have any questions concerning the opinion expressed in this letter, please call Jim Little at 404-562-9118.

Sincerely,

James W. Little, for

Director

NORTH CAROLINA
Environmental Quality

October 30, 2019

Mr. Mark Jordan
Plant Manager
Enviva Pellets Northampton, LLC
7200 Wisconsin Avenue
Bethesda, Maryland 20814

Dear Mr. Jordan:

SUBJECT: Air Quality Permit No. 10203R06
Facility ID: 6600167
Enviva Pellets Northampton, LLC
Garysburg, North Carolina
Northampton County
Fee Class: Title V

In accordance with your Air Permit Applications received on October 1, 2018 and amended version received on April 1, 2019, we are forwarding herewith Air Quality Permit No. 10203R06 to Enviva Pellets Northampton, LLC, 309 Enviva Boulevard, Garysburg, North Carolina, authorizing the construction and operation, of the emission source(s) and associated air pollution control device(s) specified herein. Additionally, any emissions activities determined from your Air Quality Permit Application as being insignificant per 15A North Carolina Administrative Code 02Q .0102 have been listed for informational purposes as an "ATTACHMENT." Please note the requirements for the annual compliance certification are contained in General Condition P in Section 3. The current owner is responsible for submitting a compliance certification for the entire year regardless of who owned the facility during the year.

As the designated responsible official it is your responsibility to review, understand, and abide by all of the terms and conditions of the attached permit. It is also your responsibility to ensure that any person who operates any emission source and associated air pollution control device subject to any term or condition of the attached permit reviews, understands, and abides by the condition(s) of the attached permit that are applicable to that particular emission source.

If any parts, requirements, or limitations contained in this Air Quality Permit are unacceptable to you, you have the right to request a formal adjudicatory hearing within 30 days following receipt of this permit, identifying the specific issues to be contested. This hearing request must be in the form of a written petition, conforming to NCGS (North Carolina General Statutes) 150B-23, and filed with both the Office of Administrative Hearings, 6714 Mail Service Center, Raleigh, North Carolina 27699-6714 and the Division of Air Quality, Permitting Section, 1641 Mail Service Center, Raleigh, North Carolina 27699-1641. The form for requesting a formal adjudicatory hearing may be obtained upon request from the Office of Administrative Hearings. Please note that this permit will be stayed in its entirety upon receipt of the request for a hearing. Unless a request for a hearing is made pursuant to NCGS 150B-23, this Air Quality Permit shall be final and binding 30 days after issuance.

You may request modification of your Air Quality Permit through informal means pursuant to NCGS 150B-22. This request must be submitted in writing to the Director and must identify the specific provisions or issues for which the modification is sought. Please note that this Air Quality Permit will become final and binding regardless of a request for informal modification unless a request for a hearing is also made under NCGS 150B-23.

The construction of new air pollution emission source(s) and associated air pollution control device(s), or modifications to the emission source(s) and air pollution control device(s) described in this permit must be covered under an Air Quality Permit issued by the Division of Air Quality prior to construction unless the Permittee has fulfilled the requirements of NCGS 143-215.108A(b) and received written approval from the Director of the Division of Air Quality to commence construction. Failure to receive an Air Quality Permit or written approval prior to commencing construction is a violation of NCGS 143-215.108A and may subject the Permittee to civil or criminal penalties as described in NCGS 143-215.114A and 143-215.114B.

Northampton County has triggered increment tracking under PSD for NOx, SO_2, PM-10, and PM-2.5. This modification will result in an increase of 26.4 pounds per hour of NOx, an increase of 4.6 pounds per hour of SO_2, a decrease of 0.7 pounds per hour of PM-10, and a decrease of 2.3 pounds per hour of PM-2.5.

This Air Quality Permit shall be effective from October 30, 2019 until February 28, 2025, is nontransferable to future owners and operators, and shall be subject to the conditions and limitations as specified therein. Should you have any questions concerning this matter, please contact Richard Simpson at (919) 707-8476 or richard.simpson@ncdenr.gov.

Sincerely yours,

Mark J Cuilla

ATTACHMENT

Insignificant Activities per 15A NCAC 02Q .0102

Emission Source ID No.	Emission Source Description
IES-Debark	Debarker
IES-Bark	Bark Hog
IES-DDB-1 through IES-DDB-4	Four natural gas/propane-fired low NOx double duct burners (each rated at 1 MMBtu/hour)
IES DLH	Dry line hopper
IES-EPWC	Electric powered green wood chipper
IES-GWFB	Green wood fuel storage bin
IES-DRYSHAVE	Dry shaving handling and storage systems
IES-DRYSHAVE-1	Dry shaving handling and storage systems with one bagfilter CD-DSR-BF (2,577 square feet of filter area)
IES-PVAP	Propane vaporizer
IES-ADD	Additive handling and storage with one bagfilter CD-ADD-BF (TBDXXX square feet of filter area)
IES-GN-1 **NSPS IIII, GACT ZZZZ**	One emergency use generator (350 brake horsepower)
IES-GN-2 **NSPS IIII, GACT ZZZZ**	One emergency use generator (671 brake horsepower)
IES-FWP **NSPS IIII, GACT ZZZZ**	One fire water pump (300 brake horsepower)
IES-TK1 and IES-TK2	Two diesel storage tanks (2,500 gallon and 600 gallon capacity)
IES-TK3	Mobile diesel storage tank (5,000 gallon)
IES-TK4	Diesel storage tank (1,000 gallon)

1. Because an activity is insignificant does not mean that the activity is exempted from an applicable requirement or that the Permittee is exempted from demonstrating compliance with any applicable requirement.
2. When applicable, emissions from stationary source activities identified above shall be included in determining compliance with the permit requirements for toxic air pollutants under 15A NCAC 02D .1100 "Control of Toxic Air Pollutants" or 02Q .0711 "Emission Rates Requiring a Permit."
3. For additional information regarding the applicability of MACT or GACT see the DAQ page titled "Specific Permit Conditions Regulatory Guide." The link to this site is as follows: http://deq.nc.gov/about/divisions/air-quality/air-quality-permits/specific-permit-conditions-regulatory-guide.

Summary of Changes to Permit

The following changes were made to Enviva Pellets Northampton, LLC, Garysburg, NC., Air Permit No. 10203R05 (*Table of Changes as sent to public notice July 19, 2019*).

Page No.	Section	Description of Changes
Cover Letter	N/A	Updated cover letter with application number, permit numbers, dates, fee class, and Director name.
NA	Insignificant Activities	Added new sources debarker IES-Debark, bark hog IES-Bark, four natural gas/propane double duct burners IES-DDB-1 through IES-DDB-4, dry shaving handling and storage systems IES-DRYSHAVE, dry shaving handling and storage systems IES-DRYSHAVE-1 with one bagfilter CD-DSR-BF, propane vaporizer IES-PVAP, additive handling and storage IES-ADD with one bagfilter CD-ADD-BF, one emergency use generator IES-GN-2, mobile diesel storage tank IES-TK3, and diesel storage tank IES-TK4.
NA	Insignificant Activities	Reclassified dry line hopper to an insignificant source and changed ID No. to IES-DLH.
NA	Insignificant Activities	Reclassified dry wood handling IES-DWH and green wood handling and storage IES-GWHS as significant sources and changed ID Nos. to ES-DWH-1 and ES-GWHS.
NA	Insignificant Activities	Pellet press system IES-PP was deleted since it is incorporated with the pellet coolers.
NA	Insignificant Activities	Finished product handling IES-FPH was deleted since it is incorporated with handling ES-FPH.
NA	Insignificant Activities	Log chipper IES-CHIP-1 was deleted since it is incorporated with chipper IES-EPWC.
NA	Insignificant Activities	Two electric powered wood re-chippers, IES-RCHP-1 and IES-RCHP-2, were deleted since they are being replaced by five new green hammermills (ES-GHM-1 through ES-GHM-5).
NA	Insignificant Activities	Generator ID No. was changed from IES-GN to IES-GN-1. Diesel storage tanks ID Nos. were changed from IS-TK1 and IS-TK2 to IES-TK1 and IES-TK2. IES-TK2 capacity was updated from 500 gallons to 600 gallons.
3, 6	Section 1 and Section 2.1 A.	Add five (5) new closed-loop green hammermills (ES-GHM-1 through ES-GHM-5) and route the exhaust to the existing wet electrostatic precipitator (CD-WESP-1) and the new regenerative thermal oxidizer (CD-RTO-1). The Green hammermills exhaust will also have the ability to be routed and controlled by new CD-WESP-2 and new CD-RTO-2 when the CD-WESP-1 and CD-RTO-1 are shut down. Simple cyclone CD-DC is for product handling and deleted from the permit as a control device.
3, 6	Section 1 and Section 2.1 A.	Updated wood dryer ID No. from (ES-DRYER) to (ES-DRYER-1). The exhaust will route to existing wet electrostatic precipitator (CD-WESP-1) and the new regenerative thermal oxidizer (CD-RTO-1).
3, 6	Section 1 and Section 2.1 A.	Added dryer 1 bypass ES-DRYERBYP-1 and furnace 1 bypass (ES-FURNACEBYP-1).
3, 6	Section 1 and Section 2.1 A.	Added a new direct heat wood fired dryer (ES-DRYER-2) controlled by new wet electrostatic precipitator CD-WESP-2 in series with a new regenerative thermal oxidizer (CD-RTO-2).
3, 6	Section 1 and Section 2.1 A.	Added dryer 2 bypass (ES-DRYERBYP-2) and furnace 2 bypass (ES-FURNACEBYP-2).

Page No.	Section	Description of Changes
3, 6	Section 1 and Section 2.1 A.	Added a new dry wood handling (ES-DWH-2) controlled by a new bagfilter (CD-DWH-BF-2).
3, 6	Section 1 and Section 2.1 A.	Assigned source ID Nos. (ES-PS-1) and (ES-PS-2) to existing dry hammermill pre-screeners.
4, 6	Section 1 and Section 2.1 A.	The eight existing dry hammermills exhaust will also route through new wet scrubber (CD-WS-1) and regenerative catalytic oxidizer (CD-RCO-1) that can also operate as an RTO.
4, 6	Section 1 and Section 2.1 A.	Renamed existing nuisance system to dust control system (ES-DCS) and update the permit to reflect that the exhaust will route through new wet scrubber (CD-WS-1) and regenerative catalytic oxidizer (CD-RCO-1) that can operate as an RTO.
4, 6	Section 1 and Section 2.1 A.	Added a new dry shavings reception (ES-DSR) controlled by a new bagfilter (CD-DSR-BF).
4, 6	Section 1 and Section 2.1 A.	Added a new dry shavings silo (ES-DSS) controlled by a new bagfilter (CD-DSS-BF).
4, 6	Section 1 and Section 2.1 A.	Added two new dry shavings hammermills (ES-DSHM-1 and ES-DSHM-2) controlled by new wet scrubber (CD-WS-1) and regenerative catalytic oxidizer (CD-RCO-1) that can operate as an RTO.
5, 6	Section 1 and Section 2.1 A.	The six existing pellet coolers exhaust will also route through new wet scrubber (CD-WS-2) and regenerative catalytic oxidizer (CD-RCO-2) that can operate as an RTO.
5, 6	Section 1 and Section 2.1 A.	Rename the currently permitted Pellet Fines Bin (ES-PFB-1) and associated bin vent filter (CD-PFB-BV) to Pellet Cooler Fines Relay System (ES-PCHP) and baghouse (CD-PCHP-BV.)
NA	Section 1 and Section 2.1 A.	Since the sources will not be utilized, deleted bagging system conveyor and screens (ES-BSC-1, ES-BSS-1, and ES-BSS-2) and associated filters (CD-BS-BF-1 and CD-BS-BF-2).
NA	Section 1 and Section 2.1 A.	Since the sources will not be utilized, deleted bagging systems (ES-BSC-2, ES-BSC-3, ES-BSB-1, and ES-BSB-2).
6, 11	Section 2.1 A. and Section 2.1 4.	Added 15A NCAC 02D .0535 Excess emissions reporting and malfunctions rule to the table and section.
6	Section 2.1 A.	Added PM, NOx, and CO to the table for PSD avoidance.
8	Section 2.1 A.1.c.	To demonstrate compliance with 15A NCAC 02D .0515, added particulate testing.
8, 9	Section 2.1 A.1.d through i.	Added the new control devices for monitoring requirements.
9	Section 2.1 A.1.j.	Added the recordkeeping requirements.
10	Section 2.1 A.2.	Added the new wood dryer to the 15A NCAC 02D .0516 requirements.
11	Section 2.2 A.	Added the table for the regulated pollutants and applicable standards.
12	Section 2.2 A.1.	Added regulation 15A NCAC 02D .0540 Particulates from Fugitive Dust Emissions.
12	Section 2.2 A.2.	Included existing PSD avoidance conditions until the facility meets Construction Schedule per Section 2.3. Also updated conditions to include dryer, dry hammermill, and pellet cooler systems throughput limitations along with associated percent softwood limitations on a rolling 12-month average basis.

Page No.	Section	Description of Changes
13	Section 2.2 A.3.	Added regulation 15A NCAC 02Q .0317 Avoidance Condition for 15A NCAC 02D .0530: Prevention of Significant Deterioration facility-wide for PM, VOCs, and NOx. Conditions include throughput and softwood limits along with initial and periodic testing, monitoring, recordkeeping, and reporting for the proposed modification.
18	Section 2.2 A.4.	Added regulation 15A NCAC 02Q .0317 Avoidance Condition for 15A NCAC 02D .1111: Maximum Available Control Technology (MACT) Standards facility-wide for HAPs. Conditions include initial and periodic testing, monitoring, recordkeeping, and reporting.
18	Section 2.2 A.5.	Included existing 15A NCAC 02D .1100 Toxics Air Pollutant Emissions Limitation and Requirement until the facility meets Construction Schedule per Section 2.3.
19	Section 2.2 A.6.	Added eleven toxics pollutants and new associated equipment to 15A NCAC 02D .1100 Toxics Air Pollutant Emissions Limitation and Requirement.
20	Section 2.2 A.7.	Deleted the eleven toxics pollutants that were moved to Section 2.2 A.4.
22	Section 2.2 A.8.	Added regulation 15A NCAC 02Q .1806 Control and Prohibition of Odorous Emissions.
23	Section 2.2 A.9.	Added regulation 15A NCAC 02Q .0207 Annual Emissions Reporting.
23	Section 2.2 A.10.	Added regulation 15A NCAC 02Q .0304 Applications Annual Emissions Reporting.
23	Section 2.2 A.11.	Added regulation 15A NCAC 02Q .0504 Option for Obtaining Construction and Operation Permit.
23	Section 2.3.	Added Section 2.3 for a Construction Schedule.
25-27	Section 3	The General Conditions were updated to the latest version of DAQ shell.

Summary of Changes to Permit

The following changes were made to Enviva Pellets Northampton, LLC, Garysburg, NC., Air Permit No. 10203R05 (*Table of Changes in response to Hearing Officer's recommendations*).

Page No.	Section	Description of Changes
10	Section 2.1 A.1.l.	Added semiannual reporting requirements.
11	Section 2.1 A.3.e.	Added semiannual reporting requirements.
12	Section 2.2 A.2.b.i. and 2.2 A.2.b.ii.	Changed the word pellets to wood.
14	Section 2.2 A.3.c.vii.	Deleted dryer bypass malfunction hours and reserved the section
14	Section 2.2 A.3.c.viii.	Deleted furnace bypass malfunction hours. Added maximum heat input percentage for cold startup. Added description:"The cold startup period of time begins when a wood-fired furnace is started up and lasts until the wood-fired furnace's refractory is heated to a temperature sufficient to sustain combustion operations at a minimal level or 8 hours, whichever is less;".

Page No.	Section	Description of Changes
17	Section 2.2 A.3.o.	Deleted "for malfunctions".
17	Section 2.2 A.3.q.	Added an equation to calculate monthly NOx emissions.
18	Section 2.2 A.3.t.	Added reporting requirements: "The monthly ODT of pellets per year for the previous 17 months." and "The monthly hardwood/softwood mix for the previous 17 months."
22	Section 2.2 A.6.b.	Added current shell language for 15A NCAC 02D .1100 regulations including the date the facility submitted the modeling analysis and the date the modeling analysis was reviewed and approved by the AQAB.
23	Section 2.2 A.11.a.	Changed 15A NCAC 02Q .0504 condition to: "Pursuant to 15A NCAC 02Q .0504, the Permittee filed its first time Title V Air Quality Permit Application (6600167.14B) on April 22, 2014."
23	Section 2.2 A.11.b.	Changed 15A NCAC 02Q .0504 condition to: "The Permittee shall amend the first time Title V Air Quality Permit Application (6600167.14B) within 90 days of the issuance of Permit No. 10203R06." Deleted the reporting requirements.

State of North Carolina
Department of Environmental Quality
Division of Air Quality

AIR QUALITY PERMIT

Permit No.	Replaces Permit No.(s)	Effective Date	Expiration Date
10203R06	10203R05	October 30, 2019	February 28, 2025

Until such time as this permit expires or is modified or revoked, the below named Permittee is permitted to construct and operate the emission source(s) and associated air pollution control device(s) specified herein, in accordance with the terms, conditions, and limitations within this permit. This permit is issued under the provisions of Article 21B of Chapter 143, General Statutes of North Carolina as amended, and Title 15A North Carolina Administrative Codes (15A NCAC), Subchapters 02D and 02Q, and other applicable Laws.

Pursuant to Title 15A NCAC, Subchapter 02Q, the Permittee shall not construct, operate, or modify any emission source(s) or air pollution control device(s) without having first submitted a complete Air Quality Permit Application to the permitting authority and received an Air Quality Permit, except as provided in this permit.

Permittee:	**Enviva Pellets Northampton, LLC**
Facility ID:	**6600167**
Facility Site Location: **City, County, State, Zip:**	**309 Enviva Boulevard** **Garysburg, Northampton County, North Carolina, 27831**
Mailing Address: **City, State, Zip:**	**7200 Wisconsin Avenue** **Bethesda, Maryland 20814**
Application Number: **Complete Application Date:**	**6600167.18A** **October 1, 2018 and April 1, 2019**
Primary SIC Code:	**2499**
Division of Air Quality, **Regional Office Address:**	**Raleigh Regional Office** **3800 Barrett Drive** **Raleigh, North Carolina, 27609**

Table Of Contents

SECTION 1: PERMITTED EMISSION SOURCE (S) AND ASSOCIATED AIR POLLUTION CONTROL DEVICE (S) AND APPURTENANCES

SECTION 2: SPECIFIC LIMITATIONS AND CONDITIONS

- 2.1- Emission Source(s) Specific Limitations and Conditions
  (Including specific requirements, testing, monitoring, recordkeeping, and reporting requirements)
- 2.2- Multiple Emission Source(s) Specific Limitations and Conditions
  (Including specific requirements, testing, monitoring, recordkeeping, and reporting requirements)
- 2.3- Construction Schedule

SECTION 3: GENERAL PERMIT CONDITIONS

SECTION 1- PERMITTED EMISSION SOURCE(S) AND ASSOCIATED AIR POLLUTION CONTROL DEVICE(S) AND APPURTENANCES

The following table contains a summary of all permitted emission sources and associated air pollution control devices and appurtenances:

Emission Source ID No.	Emission Source Description	Control Device ID No.	Control Device Description
ES-GWHS	Green wood handling and storage	NA	NA
ES-GHM-1 through ES-GHM-5	Five green hammermills	CD-WESP-1 and CD-RTO-1 OR CD-WESP-2 and CD-RTO-2	One wet electrostatic precipitator (29,904 square feet of total collection plate area) One propane or natural gas-fired regenerative thermal oxidizer (32 million Btu per hour) OR One wet electrostatic precipitator (29,904 square feet of total collection plate area) One propane or natural gas-fired regenerative thermal oxidizer (32 million Btu per hour)
ES-DRYER-1	Direct heat, wood-fired dryer (175.3 million Btu per hour heat input, 71.71 ODT/hr)	CD-WESP-1 and CD-RTO-1	One wet electrostatic precipitator (29,904 square feet of total collection plate area) One propane or natural gas-fired regenerative thermal oxidizer (32 million Btu per hour)
ES-DRYERBYP-1	Dryer 1 bypass	NA	NA
ES-FURNACEBYP-1	Furnace 1 bypass	NA	NA
ES-DRYER-2	Direct heat, wood-fired dryer (180 million Btu per hour heat input, 82.1 ODT/hr)	CD-WESP-2 and CD-RTO-2	One wet electrostatic precipitator (29,904 square feet of total collection plate area) One propane or natural gas-fired regenerative thermal oxidizer (32 million Btu per hour)
ES-DRYERBYP-2	Dryer 2 bypass	NA	NA
ES-FURNACEBYP-2	Furnace 2 bypass	NA	NA
ES-DWH-1	Dried wood handling	CD-DWH-BF-1	Bagfilter (2,577 square feet of filter area)
ES-DWH-2	Dried wood handling	CD-DWH-BF-2	Bagfilter (2,577 square feet of filter area)
ES-PS-1 and ES-PS-2	Dry hammermills pre-screeners 1 and 2	NA	NA

Emission Source ID No.	Emission Source Description	Control Device ID No.	Control Device Description
ES-HM-1 through ES-HM-8	Eight dry hammermills	CD-HM-CYC-1 through 8, and CD-HM-BF-1 through CD-HM-3, and CD-WS-1, and CD-RCO-1	Eight simple cyclones (120 inches in diameter each) Three bagfilters (6,250 square feet of filter area each) One wet scrubber (1,485 gallons per minute) One propane or natural gas-fired regenerative catalytic oxidizer (19.6 million Btu per hour heat input) that can also operate as a regenerative thermal oxidizer
ES-DCS	Dust control system	CD-HM-BF-3, and CD-WS-1, and CD-RCO-1	One bagfilter (6,250 square feet of filter area) One wet scrubber (1,485 gallons per minute) One propane or natural gas-fired regenerative catalytic oxidizer (19.6 million Btu per hour heat input) that can operate as a regenerative thermal oxidizer
ES-DLC-1	Dry line feed conveyor	NA	NA
ES-DSR	Dry shavings reception	CD-DSR-BF	One bagfilter (2,577 square feet of filter area)
ES-DSS	Dry shavings silo	CD-DSS-BF	One bagfilter (88 square feet of filter area)
ES-DSHM-1 and ES-DSHM-2	Dry shavings hammermill 1 and 2	CD-WS-1, and CD-RCO-1	One wet scrubber (1,485 gallons per minute) One propane or natural gas-fired regenerative catalytic oxidizer (19.6 million Btu per hour heat input) that can operate as a regenerative thermal oxidizer
ES-PMFS	Pellet feed mill silo	CD-PMFS-BV	One bin vent filter (377 square feet of filter area)

Emission Source ID No.	Emission Source Description	Control Device ID No.	Control Device Description
ES-CLR-1 through ES-CLR-6	Pellet coolers	CD-CLR-1 through CD-CLR-6, and	Six high efficiency cyclones (54 inches in diameter each)
		CD-WS-2, and	One wet scrubber (990 gallons per minute)
		CD-RCO-2	One propane or natural gas-fired regenerative catalytic oxidizer (19.6 million Btu per hour heat input) that can operate as a regenerative thermal oxidizer
ES-PCHP	Pellet cooler fines relay system	CD-PCHP-BV	One bagfilter (780 square feet of filter area)
ES-FPH	Finished product handling	CD-FPH-BF	One bagfilter (4,842 square feet of filter area)
ES-PB-1 through ES-PB-12	Twelve (12) pellet load-out bins		
ES-PL-1 ES-PL-2	Pellet mill load-out 1 and 2		

SECTION 2 - SPECIFIC LIMITATIONS AND CONDITIONS

2.1- Emission Source(s) and Control Devices(s) Specific Limitations and Conditions

The emission source(s) and associated air pollution control device(s) and appurtenances listed below are subject to the following specific terms, conditions, and limitations, including the testing, monitoring, recordkeeping, and reporting requirements as specified herein:

A. Green wood handling and storage (ID No. ES-GWHS)

Five (5) green hammermills (ID Nos. ES-GHM-1 through ES-GHM-5) controlled by a wet electrostatic precipitator (ID No. CD-WESP-1) and a regenerative thermal oxidizer (ID No. CD-RTO-1) or controlled by a wet electrostatic precipitator (ID No. CD-WESP-2) and a regenerative thermal oxidizer (ID No. CD-RTO-2);

Wood-fired direct heat drying system (ID No. ES-DRYER-1) controlled by a wet electrostatic precipitator (ID No. CD-WESP-1) and a regenerative thermal oxidizer (ID No. CD-RTO-1);
Dryer 1 bypass (ID No. ES-DRYERBYP-1) and Furnace 1 bypass (ID No. ES-FURNACEBYP-1);

Wood-fired direct heat drying system (ID No. ES-DRYER-2) controlled by a wet electrostatic precipitator (ID No. CD-WESP-1) and a regenerative thermal oxidizer (ID No. CD-RTO-2);
Dryer 2 bypass (ID No. ES-DRYERBYP-2) and Furnace 2 bypass (ID No. ES-FURNACEBYP-2);

Dry wood handling (ID No. ES-DWH-1) with associated bagfilter (ID No. CD-DWH-BF-1);
Dry wood handling (ID No. ES-DWH-2) with associated bagfilter (ID No. CD-DWH-BF-2);

Two (2) dry hammermill pre-screeners (ID No. ES-PS-1 and ES-PS-2);
Eight (8) hammermills (ID Nos. ES-HM-1 through ES-HM-8) with associated cyclones (ID Nos. CD-HM-CYC-1 through CD-HM-CYC-8) in series with three bagfilters (ID Nos. CD-HM-BF-1 through CD-HM-BF3) in series with a wet scrubber (CD-WS-1) in series with a regenerative catalytic oxidizer (ID No. CD-RCO-1) that can also operate as a regenerative thermal oxidizer;
Dust control system (ID No. ES-DCS) with associated bagfilter(ID No. CD-HM-BF-3) in series with a wet scrubber (CD-WS-1) in series with a regenerative catalytic oxidizer (ID No. CD-RCO-1) that can also operate as a regenerative thermal oxidizer;

Dry line feed conveyor (ID No. ES-DLC-1);

Dry shavings reception (ID No. ES-DSR) with associated bagfilter (ID No. CD-DSR-BF);
Dry shavings silo (ID No. ES-DSS) with associated bagfilter (ID No. CD-DSS-BF);
Two dry shavings hammermills (ID Nos. ES-DSHM-1 and ES-DSHM-2) controlled by a wet scrubber (CD-WS-1) in series with a regenerative catalytic oxidizer (ID No. CD-RCO-1) that can also operate as a regenerative thermal oxidizer;

Pellet mill feed silo (ID No. ES-PMFS) with associated bin vent filter (ID No. CD-PMFS-BV);
Pellet coolers (ID Nos. ES-CLR-1 through ES-CLR-6) with associated cyclones (ID Nos. CD-CLR-1 through CD-CLR-6) in series with a wet scrubber (CD-WS-2) in series with a regenerative catalytic oxidizer (ID No. CD-RCO-2) that can also operate as a regenerative thermal oxidizer;
Pellet cooler fines relay system (ID No. ES-PCHP) with associated bagfilter (ID No. CD-PCHP-BF);

Finished product handling (ID No. ES-FPH), pellet load-out bins (ID Nos. ES-PB-1 through ES-PB-12), and pellet mill load-outs (ID Nos. ES-PL-1 and ES-PL-2) with associated bagfilter (ID No. CD-FPH-BF)

The following table provides a summary of limits and standards for the emission source(s) described above:

Regulated Pollutant	Limits/Standards	Applicable Regulation
Particulate matter	$E = 4.10 \times P^{0.67}$ for $P < 30$ tph $E = 55 \times P^{0.11} - 40$ for $P \geq 30$ tph where, E = allowable emission rate (lb/hr) P = process weight rate (tph)	15A NCAC 02D .0515
Sulfur dioxide	*ID Nos. ES-DRYER-1 and ES-DRYER-2 only:* 2.3 pounds per million Btu	15A NCAC 02D .0516
Visible emissions	20 percent opacity when averaged over a 6-minute period	15A NCAC 02D .0521
n/a	Excess emissions reporting and malfunctions	15A NCAC 02D .0535
Fugitive dust	State-enforceable only Minimize fugitive dust beyond property boundary See Section 2.2 A.1.	15A NCAC 02D .0540
Volatile organic compounds (VOC), and Carbon monoxide (CO)	Less than 456.4 tons of VOC and 250 tons of CO per consecutive 12-month period, See Section 2.2 A.2.	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530
PM/PM10/PM2.5 VOC NOx CO	Less than 250 tons per 12-month period, Less than 250 tons per 12-month period, Less than 250 tons per 12-month period Less than 250 tons per 12-month period See Section 2.2 A.3.	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530
Hazardous Air Pollutants (HAP)	See Section 2.2 A.4.	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .1111 MACT
Toxic air pollutants	State-enforceable only See Section 2.2 A.5. and 2.2 A.6.	15A NCAC 02D .1100
Toxic air pollutants	State-enforceable only See Section 2.2 A.7.	15A NCAC 02D .0711

1. 15A NCAC 02D .0515: PARTICULATES FROM MISCELLANEOUS INDUSTRIAL PROCESSES

a. Emissions of particulate matter from these sources shall not exceed an allowable emission rate as calculated by the following equation:

$E = 4.10 \times P^{0.67}$ for $P < 30$ tph
$E = 55 \times P^{0.11} - 40$ for $P \geq 30$ tph

Where E = allowable emission rate in pounds per hour
P = process weight in tons per hour

Liquid and gaseous fuels and combustion air are not considered as part of the process weight.

Testing [15A NCAC 02Q .0308(a)]

b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17.

c. Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with emission limit in Section 2.1 A.1.a for the wood-fired direct heat drying systems **(ID Nos. ES-DRYER-1 and ES-DRYER-2)**, green hammermills **(ID Nos. ES-GHM-1 through ES-GHM-5)**, the dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)** and pellet coolers **(ID Nos. ES-CLR-1 through CLR-6)**. Testing shall be conducted as specified in Section 2.2 A.2.

Monitoring [15A NCAC 02Q .0308(a)]

For baghouses and/or cyclones:

d. Particulate matter emissions shall be controlled as follows:
   i. Particulate matter emissions from the dry wood handling operations **(ID Nos. ES-DWH-1 and ES-DWH-2)** shall be controlled by baghouses **(ID Nos. CD-DWH-BF-1 and CD-DWH-BF-2);**
   ii. Particulate matter emission from eight (8) dry hammermills **(ID Nos. ES-HM-1 through ES-HM-8)** shall be controlled by cyclones **(ID Nos. CD-HM-CYC-1 through CD-HM-CYC-8)** in series with baghouses **(ID Nos. CD-HM-BH1 through CD-HM-BH3);**
   iii. Particulate matter emission from the dust control system **(ID No. ES-DCS)** shall be controlled by baghouse **(ID No. CD-HM-BF-3);**
   iv. Particulate matter emissions from the dry shavings reception **(ID No. ES-DSR)** shall be controlled by a baghouse **(ID No. CD-DSR-BF)**;
   v. Particulate matter emissions from the dry shavings silo **(ID No. ES-DSS)** shall be controlled by a baghouse **(ID No. CD-DSS-BF)**;
   vi. Particulate matter emissions from the pellet mill feed silo **(ID No. ES-PMFS)** shall be controlled by baghouse **(ID No. CD-PMFS-BV)**;
   vii. Particulate matter emissions from the pellet coolers **(ID Nos. ES-CLR-1 through CLR-6)** shall be controlled cyclones **(ID Nos. CD-CLR-1 through CD-CLR-6)**;
   viii. Particulate matter emissions from pellet cooler fines relay system **(ID No. ES-PCHP)** shall be controlled by baghouse **(ID No. CD-PCHP-BV)**;
   xi. Particulate matter emissions from finished product handling **(ID No. ES-FPH)**, pellet load-out bins **(ID Nos. ES-PB-1 through PB-12)**, and pellet mill load-out **(ID No. ES-PL-1 and PL-2)** shall be controlled by baghouse **(ID No. CD-FPH-BF)**.

e. To ensure compliance, the Permittee shall perform inspections and maintenance as recommended by the manufacturer. In addition to the manufacturer's inspection and maintenance recommendations, or if there are no manufacturer's inspection and maintenance recommendations, as a minimum, the inspection and maintenance requirement shall include the following:
   i. a monthly visual inspection of the system ductwork and material collection units for leaks; and
   ii. an annual (for each 12-month period following the initial inspection) internal inspection of the baghouses' structural integrity.

For wet electrostatic precipitator, wet scrubbers, and regenerative thermal or catalytic oxidizers:

f. Particulate matter emissions shall be controlled as follows:
   i. Particulate matter emissions from the green hammermills **(ID Nos. ES-GHM-1, through ES-GHM-5)** shall be controlled by a wet electrostatic precipitator **(ID No. CD-WESP-1)** in series with a regenerative thermal oxidizer **(ID No. CD-RTO-1)** or controlled by a wet electrostatic precipitator **(ID No. CD-WESP-2)** in series with a regenerative thermal oxidizer **(ID No. CD-RTO-2)**
   ii. Particulate matter emissions from the wood-fired direct heat drying system **(ID No. ES-DRYER-1)** shall be controlled by a wet electrostatic precipitator **(ID No. CD-WESP-1)** in series with a regenerative thermal oxidizer **(ID No. CD-RTO-1);**
   iii. Particulate matter emissions from the wood-fired direct heat drying system **(ID No. ES-DRYER-2)** shall be controlled by a wet electrostatic precipitator **(ID No. CD-WESP-2)** in series with a regenerative thermal oxidizer **(ID No. CD-RTO-2);**
   iv. Particulate matter emissions from the eight (8) dry hammermills **(ID Nos. ES-HM-1 through**

ES-HM-8) shall be controlled by a wet scrubber **(ID No. CD-WS-1)** in series with a regenerative catalytic/thermal oxidizer **(ID No. CD-RCO-1);**

v. Particulate matter emissions from pellet coolers **(ID Nos. ES-CLR-1 through CLR-6)** shall be controlled by a wet scrubber **(ID No. CD-WS-2)** in series with a regenerative catalytic/thermal oxidizer **(ID No. CD-RCO-2);**

g. To ensure compliance and effective operation of the wet electrostatic precipitators **(ID No. CD-WESP-1 and CD-WESP-2)**, the Permittee shall:
   i. operate the wet electrostatic precipitator with at least the minimum number of grids operating during compliance testing specified in Section 2.2 A.2;
   ii. maintain the minimum secondary voltage and minimum current at the level established during compliance testing specified in Section 2.2 A.2;
   iii. monitor and record the secondary voltage and current for each grid of the precipitator daily. The daily observation must be made for each day of the calendar year period. The Permittee shall be allowed three (3) days of absent observations per semiannual period.

h. To ensure compliance and effective operation of the wet scrubbers **(ID No. CD-WS-1 and CD-WS-2)**, the Permittee shall maintain the required minimum liquid recirculation rate at the level established during compliance testing as specified in Section 2.2 A.2. The Permittee shall monitor and record the required minimum liquid recirculation rate daily. The daily observation must be made for each day of the calendar year period. The Permittee shall be allowed three (3) days of absent observations per semiannual period.

i. To ensure compliance, the Permittee shall perform inspections and maintenance on the wet electrostatic precipitators **(ID Nos. CD-WESP-1 and CD-WESP-2)**, the wet scrubbers **(ID Nos. CD-WS-1 and CD-WS-2),** the regenerative thermal oxidizers **(ID Nos. CD-RTO-1 and CD-RTO-2)**, and the regenerative catalytic/thermal oxidizers **(ID Nos. CD-RCO-1 and CD RCO-2)** as recommended by the manufacturer. In addition to the manufacturer's inspection and maintenance recommendations, or if there are no manufacturer's inspection and maintenance recommendations, as a minimum, the inspection and maintenance requirement shall include the following:
   i. a monthly visual inspection of the system ductwork and material collection units for leaks;
   ii. an annual (for each 12-month period following the initial inspection) internal inspection of the heat transfer medium and associated inlet/outlet valves on the regenerative thermal and catalytic oxidizers **(ID No. CD-RTO-1, CD-RTO-2, CD-RCO-1 and CD RCO-2)**; and
   iii. an annual (for each 12-month period following the initial inspection) internal inspection of the wet electrostatic precipitators **(ID No. CD-WESP1 and CD-WESP-2).** This inspection must include (but is not limited to) the following:
      (A) visual checks of critical components,
      (B) checks for any equipment that does not alarm when de-energized, to ensure it is operational,
      (C) checks for signs of plugging in the hopper and gas distribution equipment, and
      (D) replacement of broken equipment as required.
   iv. an annual (for each 12-month period following the initial inspection) internal inspection of spray nozzles and the cleaning/calibration of all associated instrumentation on the wet scrubbers **(ID Nos. CD-WS-1 and CD-WS-2).**

Recordkeeping [15A NCAC 02Q .0308(a)]

j. The results of inspection and maintenance shall be maintained in a logbook (written or electronic format) on-site and made available to an authorized representative upon request. The logbook shall record the following:
   i. the date and time of each recorded action;
   ii. the results of each inspection;
   iii. the results of any maintenance performed on the control devices; and
   iv. any variance from manufacturer's recommendations, if any, and corrections made.

Reporting [15A NCAC 02Q .0308(a)]

k. The Permittee shall submit the results of any maintenance performed on any control device within 30 days of a written request by the DAQ.
l. The Permittee shall submit a summary report of the monitoring and recordkeeping activities given in Sections 2.1 A.1.d through j above postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December and July 30 of each calendar year for the preceding six-month period between January and June. All instances of deviations from the requirements of this permit must be clearly identified.

2. 15A NCAC 02D .0516: SULFUR DIOXIDE EMISSIONS FROM COMBUSTION SOURCES

a. Emissions of sulfur dioxide from these sources **(ID Nos. ES-DRYER-1 and ES-DRYER-2)** shall not exceed 2.3 pounds per million Btu heat input. Sulfur dioxide formed by the combustion of sulfur in fuels, wastes, ores, and other substances shall be included when determining compliance with this standard.

Testing [15A NCAC 02Q .0308(a)]

b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17.

Monitoring/Recordkeeping/Reporting [15A NCAC 02Q .0308(a)]

c. No monitoring/recordkeeping/reporting is required for sulfur dioxide emissions from the firing of biomass in the wood-fired direct heat drying systems **(ID Nos. ES-DRYER-1 and ES-DRYER-2)**.

3. 15A NCAC 02D .0521: CONTROL OF VISIBLE EMISSIONS

a. Visible emissions from these sources shall not be more than 20 percent opacity when averaged over a six-minute period. However, six-minute averaging periods may exceed 20 percent not more than once in any hour and not more than four times in any 24-hour period. In no event shall the six-minute average exceed 87 percent opacity.

Testing [15A NCAC 02Q .0308(a)]

b. If emissions testing is required, the testing shall be performed in accordance with General Condition 17.

Monitoring [15A NCAC 02Q .0308(a)]

c. To ensure compliance, once a week the Permittee shall observe the emission points of these sources for any visible emissions above normal. The weekly observation must be made for each week of the calendar year period to ensure compliance with this requirement. For all new emission sources or control devices listed in the above table, the Permittee shall establish "normal" in the first 30 days following the commencement of operation. If visible emissions from these sources are observed to be above normal, the Permittee shall either:
   i. take appropriate action to correct the above-normal emissions as soon as practicable and within the monitoring period and record the action taken as provided in the recordkeeping requirements below, or
   ii. demonstrate that the percent opacity from the emission points of the emission source in accordance with 15A NCAC 02D .2610 (Method 9) for 12 minutes is below the limit given in Section 2.1 A.3.a above.

Recordkeeping [15A NCAC 02Q .0308(a)]

d. The results of the monitoring shall be maintained in a logbook (written or electronic format) on-site and made available to an authorized representative upon request. The logbook shall record the following:
   i. the date and time of each recorded action;

ii. the results of each observation and/or test noting those sources with emissions that were observed to be in noncompliance along with any corrective actions taken to reduce visible emissions; and
iii. the results of any corrective actions performed.

Reporting [15A NCAC 02Q .0308(a), 15A NCAC 02D .0605(b)(3)]

e. The Permittee shall submit a summary report of the monitoring and recordkeeping activities given in Sections 2.1 A.3.c and d above postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December and July 30 of each calendar year for the preceding six-month period between January and June. All instances of deviations from the requirements of this permit must be clearly identified.

4. 15A NCAC 02D .0535: EXCESS EMISSIONS REPORTING AND MALFUNCTIONS

1. NOTIFICATION REQUIREMENT - As required by 15A NCAC 2D .0535, the Permittee of a source of excess emissions that last for more than four hours and that results from a malfunction, a breakdown of process or control equipment or any other abnormal conditions, shall:
   a. Notify the Director or his designee of any such occurrence by 9:00 a.m. Eastern time of the Division's next business day of becoming aware of the occurrence and describe:
      i. the name and location of the facility,
      ii. the nature and cause of the malfunction or breakdown,
      iii. the time when the malfunction or breakdown is first observed,
      iv. the expected duration, and
      v. an estimated rate of emissions.
   b. Notify the Director or his designee immediately when the corrective measures have been accomplished.

This reporting requirement does not allow the operation of the facility in excess of Environmental Management Commission Regulations.

2.2- Multiple Emission Source(s) Specific Limitations and Conditions

A. Facility-wide Emission Sources

The following table provides a summary of limits and standards for the emission source(s) describe above:

Regulated Pollutant	Limits/Standards	Applicable Regulation
Fugitive dust	State-enforceable only Minimize fugitive dust beyond property boundary	15A NCAC 02D .0540
VOC CO	Less than 456.4 tons per 12-month period Less than 250 tons per 12-month period	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530
PM/PM10/PM2.5 VOC NOx CO	Less than 250 tons per 12-month period, Less than 250 tons per 12-month period, Less than 250 tons per 12-month period Less than 250 tons per 12-month period	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530
Hazardous Air Pollutants (HAP)	Less than 25 tons for combined HAPs per 12-month period Less than 10 tons for single a HAP per 12-month period.	15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .1111 MACT
Toxic air pollutants	State-enforceable only Less than modeled emission rates	15A NCAC 02D .1100
Toxic air pollutants	State-enforceable only Less than toxic permitted emission rates	15A NCAC 02D .0711

Regulated Pollutant	Limits/Standards	Applicable Regulation
Odor	State-enforceable only odor control	15A NCAC 02D .1806
N/A	Annual Emission Reporting due June 30	15A NCAC 02Q .0207
N/A	Permit renewal application due 90 days prior to permit expiration	15A NCAC 02Q .0304
N/A	Option for obtaining construction and operation permit	15A NCAC 02Q .0504

State-enforceable only

1. 15A NCAC 02D .0540: PARTICULATES FROM FUGITIVE DUST EMISSION SOURCES

As required by 15A NCAC 02D .0540 "Particulates from Fugitive Dust Emission Sources," the Permittee shall not cause or allow fugitive dust emissions to cause or contribute to substantive complaints or excess visible emissions beyond the property boundary. If substantive complaints or excessive fugitive dust emissions from the facility are observed beyond the property boundaries for six minutes in any one hour (using Reference Method 22 in 40 CFR, Appendix A), the owner or operator may be required to submit a fugitive dust plan as described in 02D .0540(f).

"Fugitive dust emissions" means particulate matter from process operations that does not pass through a process stack or vent and that is generated within plant property boundaries from activities such as: unloading and loading areas, process areas stockpiles, stock pile working, plant parking lots, and plant roads (including access roads and haul roads).

2. 15A NCAC 02Q .0317: AVOIDANCE CONDITIONS for 15A NCAC 02D .0530: PREVENTION OF SIGNIFICANT DETERIORATION

a. The following conditions in this section are enforceable until all of the requirements from Section 2.3 A., "Actions to be Taken by the Permittee", have been met. Until such time as this condition (Section 2.2. A.2) is no longer applicable, the facility remains classified as PSD major.

b. In order to avoid applicability of 15A NCAC 2D .0530(g), facility-wide emission sources shall discharge into the atmosphere less than 456.4 tons of volatile organic compounds (VOC) and 250 tons of carbon monoxide (CO) per consecutive 12-month period. To ensure compliance with the above limitations, the Permittee shall:
   i. not process more than 537,625 oven-dried tons (ODT) of wood per year with an average maximum of 30% softwood from the wood-fired dryer system **(ID No. ES-DRYER-1)**; and
   ii. not process more than 531,441 ODT of wood per year with an average maximum of 30% softwood from the dry hammermill system **(ID No. ES-HM-1 through ES-HM-8)**; and
   iii. not process more than 625,225 ODT of pellets per year with an average maximum of 30% softwood from the pellet cooler system **(ID No. ES-CLR-1 through ES-CLR-6)**.

<u>**Monitoring and Recordkeeping [15A NCAC 02Q .0308(a)]**</u>

c. The Permittee shall demonstrate compliance with the facility-wide VOC and CO emission limitations by calculating the rolling 12-month annual facility-wide VOC and CO emissions on a monthly basis (by the 30th day following the end of each calendar month) as follows. The VOC and CO emissions shall be calculated in a manner consistent with the calculation methodologies in the air permit supporting this limitation. Emission factors used in the calculations for each source shall be appropriate for the annual average softwood content that has been processed in the previous 12-month period. All emission factors used shall be reviewed and approved by DAQ.

i. The process rates and percent softwood from the dryer, dry hammermill, and pellet cooler systems shall be recorded monthly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request.
ii. Calculations of CO emissions from the dryer system (ID No. ES-DRYER-1) shall be made at the end of each month. CO emissions shall be determined by multiplying the approved CO emission factor (0.023 lb/ODT) by the process rate.
iii. Calculations and the facility-wide VOC and dryer CO emissions shall be recorded monthly in a log (written or electronic format).

Reporting Requirements [15A NCAC 02Q .0308(a)]

d. The Permittee shall submit the results of any maintenance performed on the wet electrostatic precipitator, cyclones, and/or baghouses within 30 days of a written request by the DAQ.
e. The Permittee shall submit a semi-annual summary report, acceptable to the Regional Air Quality Supervisor, of monitoring and recordkeeping activities postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December, and July 30 of each calendar year for the preceding six-month period between January and June. The report shall contain the following:
   i. The monthly VOC and CO emissions for the previous 17 months. The emissions must be calculated for each of the 12-month periods over the previous 17 months.
   ii. The monthly ODT of pellets per year for the previous 17 months.
   iii. The monthly hardwood/softwood mix for the previous 17 months.
   iv. The 30 day rolling average product moisture content.

3. 15A NCAC 02Q .0317: AVOIDANCE CONDITIONS for 15A NCAC 02D .0530: PREVENTION OF SIGNIFICANT DETERIORATION

a. The following conditions in this section are enforceable after all of the requirements from Section 2.3 A., "Actions to be Taken by the Permittee", have been met. Following the applicability of this condition (Section 2.2 A.3), the facility will be classified as PSD minor.

b. In order to avoid applicability of 15A NCAC 2D .0530(g), facility-wide emission sources shall discharge into the atmosphere less than 250 tons of particulate matter, particulate matter 10 micrometers, particulate matter 2.5 micrometers, volatile organic compounds (VOC), nitrogen oxides (NOx), and carbon monoxide (CO) per consecutive 12-month period.

c. To ensure that the limits established above are not exceeded,
   i. the facility will not process more than 781,255 oven dried tons per year (ODT/year) with a maximum of 80% softwood, on a rolling 12-month average basis;
   ii. the green hammermills and wood dryers will be controlled by wet electrostatic precipitators **(ID No. CD-WESP-1 and CD-WESP-2)** in series with regenerative thermal oxidizers **(ID No. CD-RTO-1 and CD-RTO-2)**;
   iii. dry hammermills will not process more than 85% of the maximum facility throughput or a total of 664,067 oven dried tons per year (ODT/year) on a rolling 12-month average basis;
   iv. the dry hammermills will be controlled by three bagfilters **(ID Nos. CD-HM-BF-1 through CD-HM-BF3)** in series with a wet scrubber **(ID No. CD-WS-1)** in series with a regenerative catalytic oxidizer **(ID No. CD-RCO-1)** that can also operate as a regenerative thermal oxidizer;
   v. the dry shavings hammermills **(ID Nos. ES-DSHM-1 and ES-DSHM-2)** shall be controlled by a wet scrubber **(ID No. CD-WS-1)** in series with a regenerative catalytic oxidizer **(ID No. CD-RCO-1)** that can also operate as a regenerative thermal oxidizer;
   vi. the pellet coolers will be controlled by a wet scrubber **(ID No. CD-WS-2)** in series with a regenerative catalytic oxidizer **(ID No. CD-RCO-2)** that can also operate as a regenerative thermal oxidizer;
   vii. Reserved.

viii. the furnace bypasses **(ID Nos. ES-FURNACEBYP-1 and ES-FURNACEBYP-2)** shall be limited to less than 50 hours per year per furnace for start-ups (for temperature control) and shutdowns. The furnace bypasses shall not be utilized at the same time and be limited to a cold startup of 15% maximum heat input or 26.3 million Btu/hr for furnace 1 and 27.0 million Btu/hr for furnace 2. The cold startup period of time begins when a wood-fired furnace is started up and lasts until the wood-fired furnace's refractory is heated to a temperature sufficient to sustain combustion operations at a minimal level or 8 hours, whichever is less;

ix. the furnace bypasses **(ID Nos. ES-FURNACEBYP-1 and ES-FURNACEBYP-2)** in idle mode, defined as maximum heat input of 5 million Btu per hour each, shall be limited to less than 500 hours per year per furnace.

x. At all times, including periods of startup, shutdown, and malfunction, the Permittee shall, to the extent practicable, maintain and operate all emission sources including associated control devices in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

Notifications [15A NCAC 02Q .0308(a)]

d. The completion of the modification is defined as the installation of equipment that allow throughput of up to 781,255 ODT/year on an annual basis, and
   i. the rerouting of the exhaust from the wood-fired direct heat drying system **(ID No. ES-DRYER-1)** to the wet electrostatic precipitator **(ID No. CD-WESP-1)** and the regenerative thermal oxidizer **(ID No. CD-RTO-1)**.
   ii. the rerouting of the exhaust from the dry hammermills **(ID Nos. ES-HM-1 to ES-HM-8)** and bagfilters **(ID Nos. CD-HM-BH1 through CD-HM-BH3)** to wet scrubber **(ID No. CD-WS-1)** and the regenerative catalytic/thermal oxidizer **(ID No. CD-RCO-1)**.
   iii. the rerouting of the exhaust from the pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)** to wet scrubber **(ID No. CD-WS-2)** and the regenerative catalytic/thermal oxidizer **(ID No. CD-RCO-2)**.

   The Permittee shall notify the DAQ of the actual completion date of the modification postmarked within 15 days after such date.

Testing [15A NCAC 02Q .0308(a)]

e. Initial Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with PSD avoidance limits in Section 2.2 A.3.b. above by conducting an initial performance test on the green hammermills **(ID Nos. ES-GHM-1 through ES-GHM-5)**, the wood-fired direct heat drying systems **(ID No. ES-DRYER-1 and ES-DRYER-2)**, the dry hammermills **(ID Nos. ES-HM-1 to ES-HM-8)**, the dry shavings hammermills **(ID Nos. ES-DSHM-1 and ES-DSHM-2)**, and the pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Initial testing shall be conducted in accordance with the following:
   i. The pollutants and emission sources to be tested during the initial performance test are listed in the following table:

Emission Sources	Pollutant
Green hammermills and dryer system controlled via RTO	VOC
	PM/PM10/PM2.5
	NOx
	CO
Dry and dry shavings hammermills controlled via RCO	VOC
	PM/PM10/PM2.5
Pellet coolers controlled	VOC

Emission Sources	Pollutant
via RCO	PM/PM10/PM2.5

ii. The Permittee shall conduct initial compliance testing in accordance with a testing protocol approved by the DAQ.
iii. The Permittee shall submit a protocol to DAQ at least 45 days prior to initial compliance testing and shall submit a notification of initial compliance testing at least 15 days in advance of the testing.
iv. The regenerative thermal oxidizer/regenerative catalytic oxidizer **(ID Nos. CD-RTO-1, CD-RTO-2, CD-RCO-1 and CD-RCO-2)** are comprised of one or more fireboxes per oxidizer, each containing two temperature probes. During the initial compliance test, the Permittee shall establish the minimum average firebox temperature for each firebox(s) comprising each regenerative thermal oxidizer/regenerative catalytic oxidizer **(ID Nos. CD-RTO-1, CD-RTO-2, CD-RCO-1 and CD-RCO-2)**, for an average temperature for each firebox per regenerative thermal/catalytic oxidizer. "Average firebox temperature" means the average temperature of the two temperature probes in each firebox. The minimum average firebox temperature for each firebox shall be based upon the average temperature of the two temperature probes over the span of the test runs. Documentation for the minimum average firebox temperature for each firebox shall be submitted to the DAQ as part of the initial compliance test report.
v. Testing shall be completed within 180 days of commencement of operation of the new equipment.
vi. The Permittee shall submit a written report of the test results to the Regional Supervisor, DAQ, within 60 days of completion of the test.

f. <u>Periodic Performance Tests</u> – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall demonstrate compliance with the PSD avoidance in Section 2.2 A.3.b. above by conducting periodic performance tests on the green hammermills **(ID Nos. ES-GHM-1 through ES-GHM-5)**, the wood-fired direct heat drying systems **(ID No. ES-DRYER-1 and ES-DRYER-2),** the dry hammermills **(ID Nos. ES-HM-1 to ES-HM-8)**, the dry shavings hammermills **(ID Nos. ES-DSHM-1 and ES-DSHM-2)**, and the pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Periodic testing shall be conducted in accordance with the following:
i. The pollutants and emission sources to be tested during the periodic performance tests are listed in the following table:

Emission Source	Pollutant
Green hammermills and dryer system controlled via RTO	VOC
	PM/PM10/PM2.5
	NOx
	CO
Dry and dry shavings hammermills controlled via RCO	VOC
	PM/PM10/PM2.5
Pellet coolers controlled via RCO	VOC
	PM/PM10/PM2.5

ii. The Permittee shall conduct periodic compliance testing in accordance with a testing protocol approved by the DAQ.
iii. The Permittee shall submit a protocol to DAQ at least 45 days prior to periodic compliance testing and shall submit a notification of periodic compliance testing at least 15 days in advance of the testing.
iv. The Permittee shall be responsible for ensuring, within practicable limits, that the equipment or processes being tested are operated at or near the maximum normal production rate.
v. To the extent possible, testing shall be conducted at the maximum normal operating softwood

percentage.

vi. The Permittee shall conduct periodic performance tests when the following conditions are met:
   (A) The monthly average softwood content exceeds the average softwood percentage documented during prior performance testing by more than 10 percentage points, or
   (B) The monthly production rate exceeds the average production rate documented during prior performance testing by more than 10 percentage points, or
   (C) At a minimum testing shall be conducted annually. Annual performance tests shall be completed no later than 13 months after the previous performance test.

vii. The Permittee shall notify the DAQ within 15 days when the conditions specified in Section 2.2 A.3.f.vi (A) or (B) are met.

viii. The Permittee shall conduct the periodic performance test and submit a written report of the test results to the DAQ within 90 days from the date the monthly softwood content or overall production rate increased as described in Section 2.2 A.3.f.vi. (A) and (B) above, unless an alternate date is approved in advance by DAQ,

ix. When periodic performance testing has occurred at 80 percent softwood AND at 90 percent of the maximum permitted throughput, subsequent periodic performance testing shall occur on an annual basis and shall be completed no later than 13 months after the previous performance test.

x. The Permittee may request that the performance tests be conducted less often for a given pollutant if the performance tests for at least 3 consecutive years show compliance with the emission limit. If the request is granted, the Permittee shall conduct a performance test no more than 36 months after the previous performance test for the given pollutant.

xi. If a performance test shows noncompliance with an emission limit for a given pollutant, the Permittee shall return to conducting annual performance tests (no later than 13 months after the previous performance test) for that pollutant.

xii. Except as specified in Section 2.2 A.3.f.viii. above, the Permittee shall submit a written report of results for any periodic performance test to the DAQ, not later than 30 days after sample collection, in accordance with 15A NCAC 02D .2602(h).

xiii. The Permittee may re-establish any parametric operating value during periodic testing. Compliance with previously approved parametric operating values is not required during periodic required testing or other tests undertaken to re-establish parametric operating values by the Permittee.

xiv. The Permittee shall comply with applicable emission standards at all times, including during periods of testing.

Monitoring and Recordkeeping: [15A NCAC 02Q .0308(a)]

g. The Permittee shall install, calibrate, operate, maintain, and inspect a continuous temperature monitoring, and recording system, in accordance with manufacturer's recommendations for the regenerative thermal oxidizers and the regenerative catalytic oxidizers **(ID Nos. CD-RTO-1, CD-RTO-2, CD-RCO-1, and CD-RCO-2)**. To ensure compliance and effective operation of the oxidizers, the Permittee shall maintain a 3-hour rolling average firebox temperature for each firebox comprising the RTO or RCO at or above the minimum average temperatures established during the most recent performance testing. The Permittee shall maintain records of the 3-hour rolling average temperatures for each firebox. The Permittee shall also perform inspections and maintenance on the RTO as specified above in Section 2.1 A.1.i.

h. For the oxidizers, the Permittee shall develop and maintain a malfunction plan for the temperature monitoring and recording system that describes, in detail, the operating procedures for periods of malfunctions.

i. The Permittee shall perform periodic inspection and maintenance for the oxidizers as recommended by the manufacturer. At a minimum, the Permittee shall perform an annual internal inspection of the primary heat exchanger and associated inlet/outlet valves of the control device to ensure structural integrity.

j. To ensure compliance and effective operation of wet scrubbers **(ID No. CD-WS-1 and CD-WS-2)**, the Permittee shall perform inspections, maintenance, and maintain the required minimum recirculation rate specified above in Section 2.1 A.1.h.

k. To ensure compliance and effective operation of the wet electrostatic precipitators **(ID No. CD-WESP-1**

and CD-WESP-2), the Permittee shall perform inspections and maintenance as specified above in Section 2.1 A.1.i. The Permittee shall also maintain the minimum secondary voltage and minimum current of the wet electrostatic precipitator as specified above in Section 2.1 A.1.g.

l. To ensure compliance and effective operation of the bagfilters and cyclones, the Permittee shall perform inspections and maintenance as specified above in Section 2.1 A.1.e.

m. The Permittee shall not process more than 781,255 oven-dried tons (ODT) of pellets per year. The process rate shall be recorded monthly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request.

n. The Permittee shall record the hardwood/softwood mix monthly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request.

o. The Permittee shall install a time monitoring and recording system for the bypass hours on the dryers and furnaces during startup, shutdowns, and malfunctions. The bypass hours for each source shall be recorded weekly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request. The Permittee must develop and maintain a written malfunction plan for the time monitoring and recording system that describes, in detail, the operating procedures for periods of malfunctions.

p. To ensure compliance and effective operation of the furnace bypasses **(ID Nos. ES-FURNACEBYP-1 and ES-FURNACEBYP-2)** at idle mode, defined as maximum heat input of 5 million Btu per hour each, the Permittee shall record the hours and heat input for each source weekly in a logbook (written or electronic format) kept on-site and made available to an authorized representative upon request.

q. The Permittee shall calculate the total emissions of NOx, filterable PM, CO, and VOC monthly and shall record the emissions monthly in a logbook (written or electronic format) kept on-site and made available to DAQ personnel upon request. Monthly NOx emissions, in tons, shall be calculated by the following equations and emission factors:

$$E_{\mathrm{NOx(Total)}} = \sum E_{\mathrm{NOx(Dryer1)}} + \sum E_{\mathrm{NOx(Dryer2)}} + \sum E_{\mathrm{NOx(RTO1)}} + \sum E_{\mathrm{NOx(RTO2)}} + 3.94$$

$$E_{\mathrm{NOx(Dryer1\ or\ Dryer2)}} = \frac{(0.47\ x\ Q_D)}{2{,}000}$$

$$E_{\mathrm{NOx(RTO1\ or\ RTO2)}} = \left(\frac{(4.55 \times P_{\mathrm{RTO}}) + (3.15 \times NG_{\mathrm{RTO}})}{2{,}000}\right)$$

Where:

$E_{NOx(Total)}$	=	total tons of NOx emissions per month from the facility.
$E_{NOx(Dryer1\ or\ 2)}$	=	total tons of NOx emissions per month from each dryer.
$E_{NOx(RTO1)}$	=	number of tons of NOx emissions per month from RTO1 fuel combustion.
$E_{NOx(RTO2)}$	=	number of tons of NOx emissions per month from RTO2 fuel combustion.
Q_D	=	the oven dried tons of processed wood through the dryers per month.
0.47	=	dryer line NOx emission factor of 0.47 lb/ODT is derived from the October 2013 site specific stack test of 33.48 lb/hr at a maximum throughput.
$P_{RTO1\ or\ RTO2}$	=	propane hours per month when oxidizer deemed "in operation", is not bypassed, and oxidizer temperature is greater than or equal to the hourly block average temperature specified per stack test with an emission factor of 4.55 lb/hr (from DAQ combustion spreadsheet).
$NG_{RTO1\ or\ RTO2}$	=	natural gas hours per month when oxidizer deemed "in operation", is not bypassed, and oxidizer temperature is greater than or equal to the hourly block average temperature specified per stack test with an emission factor of 3.15 lb/hr (from DAQ combustion spreadsheet).
3.94	=	equates to the monthly PTE for the miscellaneous sources including; double duct burners, propane vaporizer, catalytic oxidizers, bypass stacks, emergency generators, and a fire water pump (per application 6600167.18A).

r. For the wood-fired direct heat drying systems **(ID Nos. ES-DRYER-1 and ES-DRYER-2)**, GHG (CO_2e) emissions shall be calculated on a monthly basis and compliance demonstrated using the applicable Part 98 emission factors. Compliance shall be documented on a 12-month rolling basis.

Reporting Requirements: [15A NCAC 02Q .0308(a)]

s. The Permittee shall submit the results of any maintenance performed on the wet electrostatic precipitator, regenerative thermal oxidizers, regenerative catalytic oxidizers, cyclones, and/or baghouses within 30 days of a written request by the DAQ.

t. The Permittee shall submit a semi-annual summary report, acceptable to the Regional Air Quality Supervisor, of monitoring and recordkeeping activities postmarked on or before January 30 of each calendar year for the preceding six-month period between July and December, and July 30 of each calendar year for the preceding six-month period between January and June. The report shall contain the following:
   i. The monthly PM, PM10, PM2.5, VOC, NOx, and CO emissions for the previous 17 months. The emissions must be calculated for each of the 12-month periods over the previous 17 months.
   ii. The monthly ODT of pellets per year for the previous 17 months.
   iii. The monthly hardwood/softwood mix for the previous 17 months.
   iv. A report indicating and explaining all instances of the average minimum regenerative thermal oxidizer and regenerative catalytic oxidizer combustion chamber temperature falling below the minimum temperature range established during the performance test or noting that no such instances have occurred.

u. All instances of deviations from the requirements of this permit must be clearly identified.

4. 15A NCAC 02Q .0317: AVOIDANCE CONDITIONS for 15A NCAC 02D .1111: Maximum Available Control Technology (MACT) Standards

a. The following conditions in this section are enforceable after all of the requirements from Section 2.3 A., "Actions to be Taken by the Permittee", have been met. Following the applicability of this condition (Section 2.2 A.3), the facility will be classified as HAP minor.

b. In order to remain classified a minor source for hazardous air pollutants (HAP) and avoid applicability of 15A NCAC 02D .1111, "Maximum Achievable Control Technology," facility-wide HAP emissions shall be less than the following limitations:
   a. 25 tons per consecutive 12-month period of total, combined HAP; and,
   b. 10 tons per consecutive 12-month period of any individual HAP.

Testing [15A NCAC 02Q .0308(a)]

c. Initial Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall establish emission factors for HAPs by conducting an initial performance test on the green hammermills **(ID Nos. ES-GHM-1 through ES-GHM-5)**, the wood-fired direct heat drying systems **(ID No. ES-DRYER-1 and ES-DRYER-2),** the dry hammermills **(ID Nos. ES-HM-1 to ES-HM-8)**, the dry shavings hammermills **(ID Nos. ES-DSHM-1 and ES-DSHM-2)**, and the pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6)**. Initial testing shall be conducted in accordance with the following:
   i. The pollutants and emission sources to be tested during the initial performance test are listed in the following table:

Emission Source	Pollutant
Green hammermills and dryer system controlled via RTO	Acetaldehyde Acrolein Formaldehyde Methanol Phenol Propionaldehyde
Dry and dry shavings hammermills controlled via RCO	
Pellet coolers controlled via RCO	

ii. Initial testing shall be conducted in accordance with Section 2.2 A.3.f.ii through vii above.

d. Periodic Performance Tests – Under the provisions of North Carolina General Statute 143-215.108, the Permittee shall establish emission factors for HAPs by conducting performance test on the green hammermills **(ID Nos. ES-GHM-1 through ES-GHM-5)**, the wood-fired direct heat drying systems **(ID No. ES-DRYER-1 and ES-DRYER-2),** the dry hammermills **(ID Nos. ES-HM-1 to ES-HM-8)**, the dry shavings hammermills **(ID Nos. ES-DSHM-1 and ES-DSHM-2)**, and the pellet coolers **(ID Nos. ES-CLR-1 through ES-CLR-6**. Periodic testing shall be conducted in accordance with the following:

i. The pollutants and emission sources to be tested during the periodic performance tests are listed in the following table:

Emission Sources	Pollutant
Green hammermills and dryer system controlled via RTO	Acetaldehyde Acrolein Formaldehyde Methanol Phenol Propionaldehyde
Dry and dry shavings hammermills controlled via RCO	
Pellet coolers controlled via RCO	

ii. Periodic testing shall be conducted in accordance with Section 2.2 A.3.f.ii through xiv above.

e. **Monitoring/Recordkeeping/Reporting** [15A NCAC 02Q .0308(a)]
Monitoring, recordkeeping, and reporting shall be performed in accordance with Section 2.2 A.3.g through u above.

State-enforceable only

5. **TOXIC AIR POLLUTANT EMISSIONS LIMITATION AND REQUIREMENT** - The following emission limitations and requirements in this section are enforceable until all of the requirements from Section 2.3 A., "Actions to be Taken by the Permittee", have been met. Pursuant to 15A NCAC 02D .1100 and in accordance with the approved application for an air toxic compliance demonstration, the following permit limit shall not be exceeded.

EMISSION SOURCE	TOXIC AIR POLLUTANTS	EMISSION LIMITS
Dryer system (ID No. ES-DRYER-1)	Acrolein Formaldehyde	2.93 lb/hr 6.65 lb/hr
Hammermill Filter #1	Acrolein Formaldehyde	0.177 lb/hr 0.299 lb/hr
Hammermill Filter #2	Acrolein Formaldehyde	0.177 lb/hr 0.299 lb/hr
Hammermill Filter #3	Acrolein Formaldehyde	0.118 lb/hr 0.199 lb/hr
Pellet Cooler #1 Aspiration Stack	Acrolein Formaldehyde	0.149 lb/hr 0.0945 lb/hr
Pellet Cooler #2 Aspiration Stack	Acrolein Formaldehyde	0.149 lb/hr 0.0945 lb/hr
Pellet Cooler #3 Aspiration Stack	Acrolein Formaldehyde	0.149 lb/hr 0.0945 lb/hr
Pellet Cooler #4 Aspiration Stack	Acrolein Formaldehyde	0.149 lb/hr 0.0945 lb/hr
Pellet Cooler #5 Aspiration Stack	Acrolein Formaldehyde	0.149 lb/hr 0.0945 lb/hr
Pellet Cooler #6 Aspiration Stack	Acrolein Formaldehyde	0.149 lb/hr 0.0945 lb/hr
Emergency generator (ID No. IES-GN)	Acrolein Formaldehyde	2.27E-04 lb/hr 2.89E-03 lb/hr
Fire water pump (ID No. IES-FWP)	Acrolein Formaldehyde	1.94E-04 lb/hr 2.48E-03 lb/hr

a. No reporting is required.

State-enforceable only

6. **TOXIC AIR POLLUTANT EMISSIONS LIMITATION AND REQUIREMENT** - The following conditions in this section are enforceable after all of the requirements from Section 2.3 A., "Actions to be Taken by the Permittee", have been met. Pursuant to 15A NCAC 02D .1100 and in accordance with the approved application for an air toxic compliance demonstration, the following permit limit shall not be exceeded.

TOXIC AIR POLLUTANTS (CAS NUMBER)	UNITS	RTO1	FBYP-1 and 2 EACH IDLE-MODE	FBYP1 Cold startup	RTO2	FBYP2 Cold startup	RCO1
Acetaldehyde (75-07-0)	lb/hour	3.3E-01	4.2E-03	2.2E-02	3.5E-01	2.2E-02	6.3E-02

a. No reporting is required.

b. The Permittee has submitted a toxic air pollutant dispersion modeling analysis dated May 23, 2019 for the facility's toxic air pollutant emissions as listed in the above table. The modeling analysis was reviewed and approved by the AQAB on June 3, 2019. Placement of the emission sources, configuration of the emission points, and operation of the sources shall be in accordance with the submitted dispersion modeling analysis and should reflect any changes from the original analysis submittal as outlined in the AQAB review memo.

State-enforceable only

7. **TOXIC AIR POLLUTANT EMISSION RATES REQUIRING A PERMIT** – Pursuant to 15A NCAC 02Q .0711, a permit to emit toxic air pollutants is required for any facility whose actual rate of emissions from all sources are greater than any one of the following rates:

Pollutant (CAS Number)	Carcinogens (lb/yr)	Chronic Toxicants (lb/day)	Acute Systemic Toxicants (lb/hr)	Acute Irritants (lb/hr)
1,3-Butadiene (106-99-0)	11			
Ammonia (7664-41-7)				0.68
Benzo(a)pyrene (50-32-8)	2.2			
Carbon tetrachloride (56-23-5)	460			
Chlorobenzene (108-90-7)		46		
Chloroform (67-66-3)	290			
Di(2-ethylhexyl)phthalate (117-81-7)		0.63		
Ethylene dichloride (107-06-2)	260			
Hexachlorodibenzo-p-dioxin (57653-85-7)	0.0051			
Methyl chloroform (71-55-6)		250		
Methyl ethyl ketone (78-93-3)		78		
Methyl isobutyl ketone (108-10-1)		52		7.6
Methylene chloride (75-09-2)	1600		0.39	
Pentachlorophenol (87-86-5)		0.063	0.0064	
Perchloroethylene (127-18-4)	13000			
Polychlorinated biphenyls (1336-36-3)	5.6			
Styrene (100-42-5)			2.7	
Tetrachlorodibenzo-p-dioxin (1746-01-6)	0.00020			
Trichloroethylene (79-01-6)	4000			
Toluene (108-88-3)		98		14.4
Trichlorofluoromethane (75-01-4)			140	
Vinyl chloride (75-01-4)	26			
Xylene (1330-20-7)		57		16.4

State-enforceable only

8. **15A NCAC 02D .1806: CONTROL AND PROHIBITION OF ODOROUS EMISSIONS**
The Permittee shall not operate the facility without implementing management practices or installing and operating odor control equipment sufficient to prevent odorous emissions from the facility from causing or contributing to objectionable odors beyond the facility's boundary.

9. **15A NCAC 02Q .0207: ANNUAL EMISSIONS REPORTING**
The Permittee shall report by **June 30** of each year the actual emissions of each air pollutant listed in 15A NCAC 02Q .0207(a) from each emission source within the facility during the previous calendar year. The report shall be in or on such form as may be established by the Director. The accuracy of the report shall be certified by the responsible official of the facility.

10. **15A NCAC 02Q. 0304: APPLICATIONS**
The Permittee, at least 90 days prior to the expiration date of this permit, shall request permit renewal by letter in accordance with 15A NCAC 02Q .0304(d) and (f). Pursuant to 15A NCAC 02Q .0203(i), no permit application fee is required for renewal of an existing air permit. The renewal request should be submitted to the Regional Supervisor, DAQ.

11. **15A NCAC 02Q .0504: OPTION FOR OBTAINING CONSTRUCTION AND OPERATION PERMIT**
   a. Pursuant to 15A NCAC 02Q .0504, the Permittee filed its first time Title V Air Quality Permit Application (6600167.14B) on April 22, 2014.
   b. The Permittee shall amend the first time Title V Air Quality Permit Application (6600167.14B) within **90 days of the issuance of Permit No. 10203R06.**

2.3 Construction Schedule

The new pollution control devices are subject to the construction schedule described below.

A. **Actions to be Taken by the Permittee** - The Permittee shall comply with the following construction schedule:

   1. Within 6 months from permit issuance (10203R06), the Permittee shall purchase the new pollution control devices **(I.D. Nos. CD-RTO-1, CD-WS-1, CD-WS-2, CD-RCO-1, CD-RCO-2, CD-DWH-BF-1, CD-DWH-2, CD-DSR-BF, CD-DSS-BF, and CD-ADD-BF excluding Dryer Line 2 controls in the event Line 2 equipment is not installed)**;
   2. Within 12 months from permit issuance (10203R06), the Permittee shall begin installation of the new control devices **(I.D. Nos. CD-RTO-1, CD-WS-1, CD-WS-2, CD-RCO-1, CD-RCO-2, CD-DWH-BF-1, CD-DWH-2, CD-DSR-BF, CD-DSS-BF, and CD-ADD-BF excluding Dryer Line 2 controls in the event Line 2 equipment is not installed)**; and
   3. Within 24 months from permit issuance (10203R06), the Permittee shall complete installation of new control devices **(I.D. Nos. CD-RTO-1, CD-WS-1, CD-WS-2, CD-RCO-1, CD-RCO-2, CD-DWH-BF-1, CD-DWH-2, CD-DSR-BF, CD-DSS-BF, and CD-ADD-BF excluding Dryer Line 2 controls in the event Line 2 equipment is not installed)**; and demonstrate final compliance with 15A NCAC 02D .0515, .0516, .0521, .0535, .0540, .0711, .1100, 15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .0530, and 15A NCAC 02Q .0317 for avoidance of 15A NCAC 02D .1111 MACT.

B. **Activity Reporting** - No later than 30 calendar days after any date identified for accomplishment of any activity listed above, the Permittee shall submit written notice of what action was taken to the DAQ. If the action dates above are not met, the notice shall include an explanation of why the action date was not met, remedial action(s) taken, and a statement identifying the extent to which subsequent dates or times for accomplishment of listed activities may be affected.

B. GENERAL CONDITIONS AND LIMITATIONS

1. In accordance with G.S. 143-215.108(c)(1), TWO COPIES OF ALL DOCUMENTS, REPORTS, TEST DATA, MONITORING DATA, NOTIFICATIONS, REQUESTS FOR RENEWAL, AND ANY OTHER INFORMATION REQUIRED BY THIS PERMIT shall be submitted to the:

   Regional Supervisor
   North Carolina Division of Air Quality
   Raleigh Regional Office
   3800 Barrett Drive
   Raleigh, NC 27609
   919-791-4200

   For identification purposes, each submittal should include the facility name as listed on the permit, the facility identification number, and the permit number.

2. RECORDS RETENTION REQUIREMENT - In accordance with 15A NCAC 02D .0605, any records required by the conditions of this permit shall be kept on site and made available to DAQ personnel for inspection upon request. These records shall be maintained in a form suitable and readily available for expeditious inspection and review. These records must be kept on site for a minimum of 2 years, unless another time period is otherwise specified.

3. ANNUAL FEE PAYMENT - Pursuant to 15A NCAC 02Q .0203(a), the Permittee shall pay the annual permit fee within 30 days of being billed by the DAQ. Failure to pay the fee in a timely manner will cause the DAQ to initiate action to revoke the permit.

4. EQUIPMENT RELOCATION - In accordance with 15A NCAC 02Q .0301, a new air permit shall be obtained by the Permittee prior to establishing, building, erecting, using, or operating the emission sources or air cleaning equipment at a site or location not specified in this permit.

5. REPORTING REQUIREMENT - In accordance with 15A NCAC 02Q .0309, any of the following that would result in previously unpermitted, new, or increased emissions must be reported to the Regional Supervisor, DAQ:

   a. changes in the information submitted in the application regarding facility emissions;

   b. changes that modify equipment or processes of existing permitted facilities; or

   c. changes in the quantity or quality of materials processed.

   If appropriate, modifications to the permit may then be made by the DAQ to reflect any necessary changes in the permit conditions. In no case are any new or increased emissions allowed that will cause a violation of the emission limitations specified herein.

6. In accordance with 15A NCAC 02Q .0309, this permit is subject to revocation or modification by the DAQ upon a determination that information contained in the application or presented in the support thereof is incorrect, conditions under which this permit was granted have changed, or violations of conditions contained in this permit have occurred. In accordance with G.S. 143-215.108(c)(1), the facility shall be properly operated and maintained at all times in a manner that will effectuate an overall reduction in air pollution. Unless otherwise specified by this permit, no emission source may be operated without the concurrent operation of its associated air cleaning device(s) and appurtenances.

7. In accordance with G.S. 143-215.108(c)(1), this permit is nontransferable by the Permittee. Future owners and operators must obtain a new air permit from the DAQ.

8. In accordance with G.S. 143-215.108(c)(1), this issuance of this permit in no way absolves the Permittee of liability for any potential civil penalties which may be assessed for violations of State law which have occurred prior to the effective date of this permit.

9. In accordance with G.S. 143-215.108(c)(1), this permit does not relieve the Permittee of the responsibility of complying with all applicable requirements of any Federal, State, or Local water quality or land quality control authority.

10. In accordance with 15A NCAC 02D .0605, reports on the operation and maintenance of the facility shall be submitted by the Permittee to the Regional Supervisor, DAQ at such intervals and in such form and detail as may be required by the DAQ. Information required in such reports may include, but is not limited to, process weight rates, firing rates, hours of operation, and preventive maintenance schedules.

11. A violation of any term or condition of this permit shall subject the Permittee to enforcement pursuant to G.S. 143-215.114A, 143-215.114B, and 143-215.114C, including assessment of civil and/or criminal penalties.

12. Pursuant to North Carolina General Statute 143-215.3(a)(2), no person shall refuse entry or access to any authorized representative of the DAQ who requests entry or access for purposes of inspection, and who presents appropriate credentials, nor shall any person obstruct, hamper, or interfere with any such representative while in the process of carrying out his official duties. Refusal of entry or access may constitute grounds for permit revocation and assessment of civil penalties.

13. In accordance with G.S. 143-215.108(c)(1), this permit does not relieve the Permittee of the responsibility of complying with any applicable Federal, State, or Local requirements governing the handling, disposal, or incineration of hazardous, solid, or medical wastes, including the Resource Conservation and Recovery Act (RCRA) administered by the Division of Waste Management.

14. PERMIT RETENTION REQUIREMENT - In accordance with 15A NCAC 02Q .0110, the Permittee shall retain a current copy of the air permit at the site. The Permittee must make available to personnel of the DAQ, upon request, the current copy of the air permit for the site.

15. CLEAN AIR ACT SECTION 112(r) REQUIREMENTS - Pursuant to 15A NCAC 02D .2100 "Risk Management Program," if the Permittee is required to develop and register a risk management plan pursuant to Section 112(r) of the Federal Clean Air Act, then the Permittee is required to register this plan with the USEPA in accordance with 40 CFR Part 68.

16. PREVENTION OF ACCIDENTAL RELEASES - GENERAL DUTY - Pursuant to Title I Part A Section 112(r)(1) of the Clean Air Act "Hazardous Air Pollutants - Prevention of Accidental Releases - Purpose and General Duty," although a risk management plan may not be required, if the Permittee produces, processes, handles, or stores any amount of a listed hazardous substance, the Permittee has a general duty to take such steps as are necessary to prevent the accidental release of such substance and to minimize the consequences of any release. **This condition is federally-enforceable only.**

17. GENERAL EMISSIONS TESTING AND REPORTING REQUIREMENTS - If emissions testing is required by this permit, or the DAQ, or if the Permittee submits emissions testing to the DAQ in support of a permit application or to demonstrate compliance, the Permittee shall perform such testing in accordance with 15A NCAC 02D .2600 and follow all DAQ procedures including protocol approval, regional notification, report submittal, and test results approval. Additionally, in accordance with 15A

NCAC 02D .0605, the Permittee shall follow the procedures for obtaining any required audit sample and reporting those results.

Permit issued this the 30th of October, 2019.
NORTH CAROLINA ENVIRONMENTAL MANAGEMENT COMMISSION

for William D. Willets, P.E., Chief, Permitting Section

Division of Air Quality, NCDEQ
By Authority of the Environmental Management Commission

Air Permit No. 10203R06

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 10
1200 Sixth Avenue, Suite 900
Seattle, WA 98101-3140

OFFICE OF
AIR AND WASTE

SEP 26 2017

Ms. Claudia Davis
Western Region Air Quality Manager
Oregon Department of Environmental Quality
4026 Fairview Industrial Drive S.E.
Salem, Oregon 97302-1142

Dear Ms. Davis:

This letter is in response to the Oregon Department of Environmental Quality's (ODEQ) letter dated June 29, 2017, regarding whether the proposed Jordan Cove liquefied natural gas (LNG) facility is a "fuel conversion plant" and/or a "petroleum storage and transfer plant with a total capacity more than 300,000 barrels" as these terms are used in provisions in the Clean Air Act (CAA) and the Environmental Protection Agency regulations that establish and govern the prevention of significant deterioration (PSD) permitting program. As explained below and based on the information ODEQ provided the EPA Region 10 in the letter, which included the applicability request as well as an attachment containing the facility's reasoning for it not being a fuel conversion plant, in our view, the proposed project should not be considered a fuel conversion plant as that term is used in the PSD permitting program provisions in CAA and the EPA regulations. Additionally, in our view, the proposed project should not be considered a petroleum storage and transfer facility as that term is used in the PSD permitting program provisions.

In part, CAA § 169(1) defines "major emitting facility" as "any of the following stationary sources of air pollutants which emit, or have the potential to emit, one hundred tons per year or more of any air pollutant from the following types of stationary sources: … fuel conversion plants, … petroleum storage and transfer facilities with a capacity exceeding three hundred thousand barrels, …" There is no definition of the terms "fuel conversion plants" or "petroleum storage and transfer facilities" in the statute and the statute does not otherwise contain a description of such types of facilities or plants. When the EPA defined the term "major stationary source" in its PSD regulations, the EPA incorporated these source category terms from the statutory definition of "major emitting facility" without further defining them. Thus, in the absence of more specific direction in the CAA and the EPA regulations, the EPA (and air agencies with approved programs) have some discretion to determine what types of facilities should be included in the "fuel conversion plant" and "petroleum storage and transfer facility" source categories.

The EPA has exercised this discretion in several prior situations. With respect to "fuel conversion plants," the EPA's past guidance describes such facilities as those which accomplish a change in state of a fuel.[1] However, the examples of "fuel conversion plants" given in the guidance statements involve

[1] *See* Memorandum from Kent Berry, Director Policy Analysis Staff, U.S. EPA, to Asa B. Foster, Jr., Director, Air and Hazardous Materials Division, U.S. EPA Region IV, "Clarification of Sources Subject

more than a simple change in state of a given fuel. The Clarification Memo, the EPA's earliest guidance on defining the source category, offers coal gasification, coal liquefaction, and oil shale processing as examples, all of which irreversibly produce a new type of fuel as the end product. Clarification Memo at 1. Similarly, the fuel conversion process described in the Cleveland Electric Memo involved the "production of low heat value fuel gas" from municipal solid waste and the facility was said to meet the source category criteria by "producing a low heat value fuel gas." Cleveland Electric Memo at 2-3. Implicit in these examples are irreversible changes to an initial fuel and a distinct final product that has generally undergone both a change in state and other chemical or physical changes.

More recent the EPA guidance regarding fuel conversion plants has directly addressed LNG facilities. For example, in 2003, the EPA's Region 6 office concluded, in response to a request for assistance regarding two proposed off-shore gas delivery systems, that the process of vaporization of LNG to natural gas at the proposed facilities would not qualify the facilities as fuel conversion plants as that term is used in the PSD permitting program.[2] While these facilities were not deemed to be fuel conversion plants, Region 6 based the conclusion on the nature of the conversion from LNG to natural gas as its rationale, rather than the fact that the natural gas itself is not converted into another type of fuel and the change in state is a temporary change, solely conducted for transport purposes. In 2007, the EPA's Region 10 office provided the State of Alaska its view that the ConocoPhillips Kenai LNG Plant was a fuel conversion plant for purposes of the best available retrofit technology requirement of the CAA regional haze program.[3] Region 10 followed the approach in the 2003 determination and focused its analysis on the process by which natural gas becomes LNG and whether such a process was naturally occurring.

In similar fashion to the Kenai LNG Plant, the proposed Jordan Cove LNG project would receive natural gas by pipeline, purify the incoming gas, cool it to form LNG, and store and load the LNG into marine tankers for export. However, after further consideration of the EPA's guidance in a context other than the LNG facility and the legislative history described below, it is now our view that LNG plants at marine terminals that cool natural gas into LNG for the purpose of transporting natural gas should not be considered "fuel conversion plants" as that term is used in the statutory definition of "major emitting facility" and the definition of "major stationary source" in the EPA regulations. Both the 2003 Region 6 and 2007 Region 10 letters assumed that a simple change of state was sufficient and moved on to other factors without considering an implicit characteristic of the earlier the EPA guidance—whether the facility was irreversibly converting one fuel type to another.

After a closer examination of the EPA's historical approach, our view is that a change in state is a possible characteristic of a fuel conversion plant but not the sole characteristic – i.e., not everything that accomplishes a change in state is a fuel conversion plant. Where a change of state occurs only for

transportation needs, the fuel remains natural gas throughout the process, and the process is necessarily reversible. Notably, in the case of an LNG export facility the change of state must be subsequently reversed at another facility before the natural gas is used as a fuel.

This view also appears to be consistent with the history and development of the source category. The term "fuel conversion plant" first appeared in EPA's re-proposed PSD rules on August 27, 1974. 39 FR 31000. The re-proposal included the following statement in the preamble: "[t]he list of sources subject to review has been expanded to include three additional source types - fuel conversion plants (such as coal gasification and oil shale plants) ...." Id. at 31003. The re-proposed rule itself did not contain a definition of the term "fuel conversion plants." Congress, when incorporating this term into the 1977 CAA Amendments, based on the July 29, 1976 debate of S. 3219, appears to have relied on the draft study developed by the Research Corp. of New England for EPA for the purpose of developing New Source Performance Standards. *See* Cong. Research Serv., A Leg. History of the Clean Air Act Amends. of 1977, Vol. 6 (Comm. Print 1980) at 5192. In this report, coal gasification again appears to be the predominant example referenced for the fuel conversion plants category. Id. at 5192-5199. There is no mention of LNG plants, let alone as fuel conversion plants, in the legislative history of the 1977 CAA Amendments.

Your letter also inquired as to whether the Jordan Cove LNG project should be included in the PSD source category "petroleum storage and transfer plant with a total capacity of more than 300,000 barrels." In one prior statement, the EPA has viewed this source category to be limited to those sources falling within SIC 5171 Petroleum Bulk Stations and Terminals, which includes "establishments primarily engaged in the wholesale distribution of crude petroleum and petroleum products, including liquefied petroleum gas, from bulk liquid storage facilities petroleum products."[4] Within the regional haze program, the EPA has also stated that this category includes the storage and transfer of gasoline and other petroleum-derived liquids.[5] Natural gas, by definition, is neither "a petroleum product" nor a "petroleum-derived liquid." Thus, in our view LNG storage tanks at LNG plants like the Jordan Cove LNG project, should not be considered part of the petroleum storage and transfer plant source category as that term is used in the PSD provisions described above.

Since the EPA Region 10 is not presently reviewing or taking action on a specific permit application for Jordan Cove facility or any other LNG facility, this letter does not have any legal force or effect or represent a final agency action with respect to any specific facility. Rather, this letter merely provides the EPA's view on one element of the PSD permitting requirements that ODEQ may consider as it evaluates which permitting requirements are applicable to the proposed Jordan Cove LNG project. We hope this letter is helpful. Please feel free to contact Dave Bray at (208) 553-4253 or me at (208) 553-1783 if you have any additional questions.

Sincerely,

Donald Dossett

How the Wood Biomass Industry Skirts the Clean Air Act

ENVIRONMENTAL INTEGRITY PROJECT

April 26, 2018

ACKNOWLEDGEMENTS

This report was researched and written by Patrick Anderson and Keri Powell of Powell Environmental Law on behalf of Environmental Integrity Project. Rachel Weber of Dogwood Alliance provided edits and suggestions.

THE ENVIRONMENTAL INTEGRITY PROJECT

The Environmental Integrity Project (http://www.environmentalintegrity.org) is a nonpartisan, nonprofit organization established in March of 2002 by former EPA enforcement attorneys to advocate for effective enforcement of environmental laws. EIP has three goals: 1) to provide objective analyses of how the failure to enforce or implement environmental laws increases pollution and affects public health; 2) to hold federal and state agencies, as well as individual corporations, accountable for failing to enforce or comply with environmental laws; and 3) to help local communities obtain the protection of environmental laws.

For questions about this report, please contact EIP Director of Communications
Tom Pelton at (202) 888-2703 or
tpelton@environmentalintegrity.org.

DIRTY DECEPTION:

How the Wood Biomass Industry Skirts the Clean Air Act

Executive Summary

Across the U.S. South, industrial-scale "wood pellet" facilities are converting trees into pellets and shipping them to Europe to be burned for electricity. The industry has grown almost 10-fold since 2009, converting millions of tons of trees into pellet fuel for power plants under the mistaken notion that this is carbon neutral and therefore good for the climate. In the midst of this fast growth, relatively little attention has been paid to the high levels of air pollution—such as soot and volatile organic compounds—generated by wood pellet manufacturing, pollution which can lead to a wide array of health and environmental problems. The Environmental Integrity Project (EIP) examined air permits and emissions information in federal and state records for 21 wood pellet mills in the U.S. that are exporting to Europe and found numerous schemes to skirt federal Clean Air Act regulations. EIP's survey also revealed a troubling record of dangerous fires and explosions, which cause serious episodes of heightened air pollution. EIP focused particular attention on the 15 "new generation" mills constructed since 2008 specifically to supply the international demand for wood pellets. These mills operate on a much larger scale and emit substantially more air pollution than traditional pellet mills that supply a domestic heating market.

Key Findings:

- In 2017, at least a third of the wood pellet plants (7 out of 21) violated their permit limits by releasing illegal amounts of pollution, while another four plants had faulty permits issued by state governments that failed to require pollution control equipment required by the federal Clean Air Act. Overall, more than half of the plants (11 out of 21) either failed to keep emissions below legal limits or failed to install required pollution controls.
- The 21 wood pellet mills exporting to Europe emit a total of 16,000 tons of health-threatening air pollutants per year, including more than 2,500 tons of particulate matter (soot), 3,200 tons of nitrogen oxides, 2,100 tons of carbon monoxide, and 7,000 tons of volatile organic compounds. These plants also emit 3.1 million tons of greenhouse gases annually.
- A factory northeast of Houston owned by German Pellets has emitted nearly ten times its permitted limits of volatile organic compound pollution since it began operation in 2013, releasing 580 tons per year. Rather than require the facility to comply with legal limits, Texas officials are proposing to simply raise the limits to let the facility continue to emit dangerous levels of pollution.
- At the Enviva Biomass wood pellet plant in Southampton County, Virginia, plant operators actually removed the pollution control equipment to evade upgrade requirements and switched from processing softwood to hardwood, which results in more carbon dioxide pollution and other harmful environmental impacts.

- Of the 15 largest operating facilities, at least eight have had fires or explosions since 2014, including at factories in North Carolina, Georgia, Arkansas, Alabama, and Texas that released vast amounts of air pollution and/or injured employees. A blaze at the German Pellets storage silo in Port Arthur, Texas, burned for two months in 2017, releasing smoke that forced dozens of local residents to seek medical attention and killed a worker during cleanup.

One of the most troubling trends in the wood pellet industry is that facilities that should face the most rigorous air permitting standards are actually the least controlled and dirtiest. Under a Clean Air Act program called "new source review," new or modified major sources of air pollution are required to reduce emissions to the level achievable by using the best available control technology. Contrary to that legal requirement, states allow construction of the country's largest wood pellet manufacturing plants without controls, or with inadequate controls, for volatile organic compounds (VOCs), an air pollutant that causes smog and respiratory problems. This is despite the fact that extremely effective VOC controls capable of reducing emissions by 90 to 95 percent are in widespread use at similar wood pellet manufacturing plants. These same controls are also very effective at reducing hazardous air pollutants, which can cause a variety of health effects including cancer. For instance, in North Carolina, wood dryers at two recently permitted major source facilities owned by Enviva Biomass emit nearly six times more VOCs and 50 to 60 times more hazardous air pollutants than comparable facilities with appropriate pollution control systems.

In other instances, states allow facilities to emit well beyond legal limits for years at a time. In Mississippi, Florida, and North Carolina, state permitting authorities continue to allow wood pellet manufacturing plants to emit well above a 250 ton per year threshold for major sources without installing legally required air pollution controls. For example, the Drax plant in Amite County, Mississippi, near McComb, emits more than 900 tons per year of VOCs – more than three times the amount that normally triggers a requirement for the installation of best available pollution control equipment. An Enviva plant in Jackson County, Florida, north of Panama City, emits more than 500 tons per year, and an Enviva plant in Northampton County, North Carolina near Roanoke Rapids emits 377 tons per year. In each of these cases, the Clean Air Act mandates that state permitting authorities require the facility to either reduce its VOC emissions to below 250 tons per year or undergo major source permitting and install the best available control technology. But these states have largely failed to follow the law.[1]

Finally, in addition to the air pollution emitted during the manufacturing process directly, pellet mills and storage facilities have experienced a rash of fires and explosions, injuring workers and releasing large amounts of uncontrolled air pollution. Because wood pellets are stored in massive and concentrated piles, these fires can burn for days or weeks. In fact, in the summer of 2017, a fire at a German Pellets in storage facility in Port Arthur, Texas, burned for 52 days, emitting vast amounts of air pollution and sickening nearby residents.

This report calls on state permitting authorities to take these pollution problems seriously and require full compliance with the federal Clean Air Act. In particular, EIP requests that states take the following steps to ensure wood pellet facilities operate legally:

1. **Reexamine existing air permits in light of new testing that shows much higher emissions of volatile organic compounds and hazardous air pollutants.** If a facility is polluting above legal limits, states must take immediate action to ensure facilities cease violating pollution limits, either by accepting enforceable production limits or by installing adequate pollution controls.

2. **Require major sources of air pollution to install the best available control technology.** Many pellet mills with major source permits evade using the best available control technology, or any control technology at all, while facilities with minor source permits, often the same size or larger, do use controls. States must not reward companies for refusing to install controls that would reduce emissions to minor levels. Rather, states must require new or modified major sources utilize controls that are at least as effective as those used by the best-controlled minor sources.

3. **Institute pellet production limits at facilities that claim to be too minor for the best available pollution controls.** If pollution controls will not keep emissions below legal limits when a facility is operated at full capacity, the facility's permit must restrict maximum production to a level that ensures the facility will not exceed the major source threshold. Although a few permits EIP surveyed do incorporate production limits, most minor source permits do not and are therefore legally deficient.

4. **Ensure Communities are Notified of and Able to Participate in Permitting Decisions.** Many of the air permits EIP surveyed were issued without any public notice or the ability to comment, including permits for the initial construction of facilities, in contravention of the Clean Air Act. This means communities were not informed of the decision to allow sources of air pollution to locate in their backyard. States should revise their regulations and procedures to include public notice and opportunity for meaningful input from those closest to proposed facilities.

5. **Require annual emissions testing for volatile organic compounds and hazardous air pollutants from all of the major emission points at pellet mills.** Many permits rely on emissions estimates—frequently outdated and inaccurate—rather than source-specific emissions testing to determine the level of emissions. While continuous emissions monitoring is the best method to determine actual levels of pollution emitted, where states do not require this they must at least require annual testing of each of the major units at pellet mills for volatile organic compounds and hazardous air pollutants.

6. **Reduce the risk of fires and explosions by requiring facilities to comply with their general duty under the Clean Air Act to design and maintain a safe facility.** Fires and explosions from wood dust plague the industry, and states should utilize a section of the Clean Air Act, called the "general duty clause," to develop site-specific management plans that will lower the risk of dangerous fires and explosions.

Introduction

The wood pellet manufacturing industry exploded in the U.S. South beginning in the late 2000s, when the European Union began subsidizing burning wood for electricity under the false presumption that doing so would be carbon neutral. Under a loophole in the EU carbon accounting system, neither the loss of carbon-absorbing trees in U.S. South, nor the emissions from burning trees in EU are accounted for in assessing greenhouse gas emissions from wood biomass. Many climate scientists have refuted the EU's premise that cutting whole trees to burn for electricity is carbon neutral, especially in a time scale relevant to fighting the worst impacts of climate change. While the industry frequently claims to process mostly forest residuals, multiple investigations have shown this to be false.[2] Ecologists have also pointed out that the industry is having a major impact on forests in the South, especially ecologically valuable hardwood forests which are being cut and replanted with faster-growing softwood plantations to feed expected demand.

Although the EU has provided substantial subsidies to enable the growth of the wood pellet industry, narrow profit margins have caused European power plants to look beyond the EU for cheap sources of wood. The U.S. South, with its vast forests growing on mostly unprotected private lands, along with state and local governments eager to provide their own industry subsidies, provide the EU plants with just such a source. In the span of only a few years, the U.S. South became the world's largest wood pellet supplier. At present, EU power companies import over 4.7 million metric tons of U.S. wood pellets each year, up from just 500,000 tons in 2009 – a nearly tenfold growth over a decade.[3] Projections show this growth rate continuing, and possibly accelerating if Asian nations begin importing comparable amounts of wood pellets, as many in the industry predict.[4]

As the industry has grown, so too have concerns over just how clean and sustainable it is to burn trees for electricity. Recent reports document the wood bioenergy industry's adverse impacts on southern forests as well as its role in causing global climate change.[5] This report is the first to focus on air pollution generated by wood pellet manufacturing plants and the industry's unlawful evasion of air pollution control requirements intended to protect human health and the environment in the communities where these plants are located.

To ascertain the local and regional impacts of air pollution from wood pellet plants, EIP analyzed air permits, emissions information, and other documents related to the 21 plants exporting wood pellets, as well as 10 facilities under construction or proposed which have air permits. EIP also estimated emissions from nine proposed facilities which do not yet have air permits. This survey placed particular attention on the 15 new-generation mills built specifically to supply the international biomass demand, all of which have production rates above 300,000 tons per year, and all but one of which were built after 2010. The vast majority of pellets produced at these plants are exported to Europe, while a limited but growing portion is exported to Japan and other Asian nations.

EIP's survey reveals that these facilities emit dangerous amounts of air pollution, and further finds that state agencies consistently fall well short of their duty to ensure that these facilities control their pollution to the levels required by law, frequently due to misleading information supplied by the industry. As a result, many large pellet mills have been allowed to emit air pollution, especially volatile organic compounds (VOCs) and hazardous air pollutants at levels well above legal limits for years at a time. When states do address these issues, they frequently fail to require actual compliance with Clean Air Act requirements. For instance, those states that have issued major new source review permits to large wood pellet plants concluded that the "best available control technology" for reducing VOCs is no controls, despite the fact that controls are in use at similar (and sometimes nearly identical) facilities. EIP's findings are particularly concerning when viewed in conjunction with another recent report showing that wood pellet mills are substantially more likely to be located in communities living below the median income level and with large minority populations, communities frequently burdened with excess pollution from multiple industrial sources.[6] This report provides a state-by-state analysis of the state failures and industry deceptions that riddle this emerging industry. Additionally, this report details the lengthy history of fires and explosions at pellet mills, which emit dangerous levels of air pollution.

How Pellet Mills Pollute

Before 2010, typical U.S. wood pellet mills were relatively small, producing between 10,000 and 100,000 tons of pellets per year for domestic consumption in home heating stoves. While these mills still had the potential to emit considerable amounts of air pollution, especially particulate matter, they weren't generally large enough to trigger significant attention from permitting agencies or watchdog groups. The newer generation of mills built to feed Europe's demand, on the other hand, are massive, producing up to 800,000 tons of wood pellets per year. While the large increase in scale came with an equally large increase in pollution, the full magnitude of emissions has not been well understood by permitting authorities. Consequently, states issued construction permits to many recent facilities under the assumption they would emit relatively low levels of air pollution (making them "minor" air pollution sources that are exempt from many control requirements), only to subsequently find that these facilities actually emit five or six times more pollution than legally allowed (making them "major" air pollution sources that should be subject to much more stringent pollution control requirements).

To understand the air pollution issues in the wood pellet industry, it is useful to understand the basics of how the facilities operate. A wood pellet manufacturing plant has two main tasks: to dry the wood to a point where it is efficient to burn in power plants, and to turn the wood into pellets for easy transport. To begin the process, wood arrives by truck (frequently whole trees from clear-cutting operations), often a half-dozen or more trucks per hour.[7] Once at the facility, the trees are debarked and then chipped in shredding machines called hammermills. The wood is then conveyed to the dryer, usually a large rotary dryer heated by burning wood and bark, where the moisture in the wood is reduced from about 50% by weight to around 10%. After the dryer, the wood is again processed by hammermills to reduce its size to a point where it can be formed into pellets. The next unit is the pellet press, which presses the wood through holes in a die to create pellets, a process that requires large amounts of pressure and heat. The pellets are then deposited into a pellet cooler to reduce their temperature back to safe levels. A typical facility produces between 50 and 70 tons of wood pellets per hour, or between 450,000 and 650,000 tons per year. The pellets are then ready for transport to a port, where they are usually stored for some time before being shipped to Europe.

Each step in the process has the potential to emit large amounts of air pollution. The most obvious source is the drying process, as burning wood emits substantial amounts of fine particulate matter, carbon monoxide, nitrogen oxides, and greenhouse gases. While each of these pollutants has serious health or environmental impacts, fine particular matter ($PM_{2.5}$) is particularly harmful to human health. $PM_{2.5}$ consists of airborne particles less than 2.5 micrometers which can pass deep into a person's lungs and even into the bloodstream, causing heart attacks, decreased lung function, worsening asthma symptoms, and premature death. Recent research published in the New England Journal of Medicine found that reducing $PM_{2.5}$ by just 1 microgram per cubic meter throughout the United States could save 12,000 lives each year.[8] Many wood pellet mills frequently emit 60 to 80 tons per year of $PM_{2.5}$, even after installing controls.[9]

In addition to the particulate matter emitted from burning wood, drying wood actually emits the largest share of air pollution. Green wood (that is, wood before it has been dried), contains significant amounts of volatile organic compounds (VOCs), and applying heat or mechanical energy to the wood releases the VOCs into the air. Once in the atmosphere, VOCs combine with sunlight to produce ground-level ozone, a major constituent of smog. Breathing ozone can trigger a variety of health problems, particularly for children, the elderly, and people of all ages who have lung diseases such as asthma. In addition to the ozone risk, VOC emissions from wood pellet mills also contain numerous individual pollutants which are classified by the EPA as hazardous air pollutants, such as acetaldehyde, formaldehyde, and methanol. Hazardous air pollutants are those pollutants which EPA has identified as especially toxic or carcinogenic even in small amounts and are the most tightly regulated pollutants under the Clean Air Act.

The industry and permitting agencies have long understood that drying wood emits large amounts of VOCs and hazardous air pollutants, in large part because the drying process at pellet plants is similar to the drying process in more traditional industries like particle board manufacturing. Because of this knowledge, even the earliest of the large wood pellet plants generally utilized control technology to reduce emissions from the dryers. The most common form of control is known as a regenerative thermal oxidizer, which uses very high temperatures to destroy 95 to 99 percent of the VOCs and organic hazardous air pollutants.

What the industry and permitting agencies did not understand at the outset is that units other than the dryer also emit substantial amounts of VOCs. Until recently, many permitting authorities simply assumed the hammermills, pellet presses, and pellet coolers did not emit any VOCs at all. That assumption began to fall apart in 2012, when a large facility, Georgia Biomass in Waycross, Georgia, decided to test all of the facility's units for VOC emissions. The results showed that not only did these units emit VOCs after all, they emitted a lot of them. Georgia Biomass found that their hammermills, pellet presses, and pellet coolers emitted more than 1,000 tons per year of VOCs, whereas the facility and the state previously believed the entire facility emitted less than 250 tons per year. This meant the facility had been operating in violation of its permit limits and the Clean Air Act's major source requirements for several years, leading Georgia to levy heavy fines and issue a consent order requiring the facility to reduce its facility-wide VOC emissions to below 250 tons per year.

Testing at a Florida facility in 2013 and an Alabama facility in 2014 soon confirmed Georgia's findings. Both tests showed that the facilities had likewise been emitting VOCs well beyond legal limits. Unfortunately, though by 2014 three sets of testing showed that large pellet mills emitted substantially more VOCs than most permits allowed, most states have yet to take meaningful action to address the problem.

Clean Air Act Permitting 101

In order to understand the systematic issues identified by EIP, this section provides a brief primer on the basic framework of Clean Air Act permitting and how it applies to the wood pellet industry (Appendix A contains a lengthier explanation). The basic scheme of Clean Air Act permitting is that facilities which either actually emit or have the potential to emit various pollutants above certain thresholds must apply for corresponding permits before beginning construction and/or operating, which contain certain requirements such as using pollution controls or limiting emissions. The key permits at issue in the wood pellet industry are "major source" permits and hazardous air pollutant permits. Major source permitting is a rigorous set of requirements meant to reduce emissions from the largest sources of air pollutants. For the wood pellet industry, facilities must go through major source permitting and install the best available control technology if they have the *potential* to emit more than 250 tons per year of any pollutant. Permitting for hazardous air pollutants, meanwhile, requires the use of the maximum achievable control technology, an even more stringent standard, for facilities which emit or have the potential to emit more than 10 tons per year of any hazardous pollutant, or more than 25 tons per year of all hazardous air pollutants. Note that both permitting requirements are triggered not only by actual emissions, but by potential emissions (which are usually the level of emissions when a facility operates at full capacity). Finally, one key thing to recognize is that these permitting programs are primarily administered by state environmental agencies, and while the federal EPA has some oversight, the vast majority of decision-making and enforcement occurs at the state level. This means permits and enforcement vary considerably from state to state.

Part One: State-by-State Analysis of Permits Reveals a Troubling Pattern

After the initial revelations that wood pellet mills emit substantially more VOCs than initially believed, states reacted in many different ways. A few states took the violations seriously and required some facilities to install controls and/or reduce their pollution levels. This includes Georgia, where the VOC discovery was first made, and Alabama, which required the installation of a second pollution control system at a facility after it discovered the violation. Most other states failed to address the problem in an adequate manner. This section details those issues and other permitting deficiencies which have allowed the industry to pollute above legal limits for years.

North Carolina

North Carolina is home to three wood pellet manufacturing plants owned by a company called Enviva Biomass in Sampson, Northampton, and Hertford Counties, and a fourth Enviva facility is under construction in Richmond County. The state has been the most egregious in terms of allowing unnecessary and unlawful pollution from the industry. While most wood pellet plants utilize at least some VOC and hazardous air pollutant controls, North Carolina illegally allows all three Enviva plants to operate without any VOC or hazardous air pollutant controls whatsoever and will do the same for the fourth when it begins operations. In fact, out of all of the large pellet mills in the country, only one other facility operates without VOC or hazardous air pollutant controls of any kind: the Enviva Southampton plant just across the border in southern Virginia, near Chesapeake. Due to North Carolina's lax oversight and Enviva's reluctance to install controls, the Enviva plants are the largest emitters of VOCs and hazardous air pollutants in the industry, emitting five to six times the level of VOCs and 50 times the level of hazardous air pollutants as comparable facilities.

Table A. Annual Air Pollution from Exporting Pellet Mills in North Carolina (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (3)	366	337	529	1,396	552,655
Existing (3) and Under-Construction (1)	511	568	749	2,024	782,483

Many North Carolina Plants Avoid Installing Best Available Control Technology

Typically, industrial facilities seek to avoid the most stringent Clean Air Act control requirements by voluntarily limiting their air pollution levels that qualify them as "synthetic minor" sources (synthetic in the sense that they could be major sources but have limited themselves to minor source levels of emissions). Ironically, the current situation in the wood pellet manufacturing industry is that the "synthetic minor" air pollution sources usually utilize VOC controls while the "major" sources that are subject to more stringent control requirements do virtually nothing to control VOC pollution. Enviva's existing Sampson plant, located 35 miles east of Fayetteville, NC, and Enviva's proposed Hamlet plant (40 miles west of Fayetteville) are prime examples of this phenomenon. Enviva conceded at the outset that both plants qualified as "major" sources due to their VOC emissions.[10] Accordingly, major source permitting requirements applied to both plants, including the requirement to control air pollution to the level that can be achieved using "best available control technology." The decision of what constitutes the best available control technology for controlling VOC emissions should be straightforward: what is the best type of pollution control technology utilized at similar facilities? As discussed above, every other non-Enviva facility of similar size operates with a regenerative thermal oxidizer controlling the facility's dryer. Many also reduce VOC emissions from other units by using additional pollution controls. These controls can reduce VOC and hazardous air pollutant emissions by 95% or more.[11] Accordingly, North Carolina plainly should have selected these same controls as "best available control technology" for the Enviva Hamlet and Enviva Sampson plants. It did not. Rather, North Carolina concluded that Enviva need not install any VOC controls whatsoever. The problem is clear when Enviva's plants are compared to similar facilities. For example, an older facility in Georgia, Georgia Biomass, actually produces more wood pellets than Enviva Sampson, yet the Georgia plant emits just 130 tons of VOC per year compared to Enviva Sampson's 628 tons per year. This is because Georgia Biomass utilizes VOC control technology, despite being a synthetic minor source, while Enviva Sampson, a major source that should use the best available control technology, uses no controls at all.

Neither Enviva nor North Carolina indicated it was infeasible to install the VOC controls—regenerative thermal oxidizers—on the Sampson and Hamlet plants.[12] Rather, Enviva argued that a regenerative thermal oxidizer would be cost prohibitive, despite the fact that every other comparable company in the industry is able to afford the technology at least for the wood drying operations.[13] Enviva further argued that adequate VOC reductions could be achieved at both facilities by restricting the wood processed to 25% hardwood and 75% softwood, rather than 100% softwood. This is because softwood emits more VOCs than hardwood.[14] While this reduction in softwood does result in a small reduction of VOCs, perhaps 20%, it pales in comparison to the reduction achievable by the use of regenerative thermal oxidizers, which reduce VOC and organic hazardous air pollutant emissions by at least 95%.[15] With the use of regenerative thermal oxidizers, Enviva would lower VOC emissions from 628 tons per year to less than 50 tons per year.

In addition to not being an effective control technology to reduce VOC and hazardous air pollutant emissions, processing hardwood presents other significant environmental impacts. The use of slow-growing hardwood forests as feedstock, forests which sequester more carbon than softwood pine forests, results in more carbon in the atmosphere, even decades after the wood pellets have been burned.[16] The harvesting of bottomland hardwood forests is also concerning because of the critical ecosystem services that will be lost if these wetland habitats are decimated. Wetland forests buffer communities from storms and floods, and remove nutrients and other pollutants from water to maintain the quality of streams, rivers, and estuaries.[17] Destruction of hardwood forests also depletes habitats of endangered and imperiled species.[18]

Violations of Air Pollution Regulations at Plants in Richmond and Sampson Counties Means Massive Emissions of Hazardous Air Pollutants.

In addition to allowing dangerously high VOCs, North Carolina's failure to require Enviva to install control devices at Enviva Hamlet and Enviva Sampson also means these facilities emit hazardous air pollutants at more than twice the legal threshold. In fact, emissions testing at Enviva Sampson recently revealed the facility's dryer emits up to 50 times more hazardous air pollution than comparable facilities, simply because North Carolina has not required pollution controls at the facility, and Enviva has refused to install the controls voluntarily.

Manufacturing wood pellets emits significant levels of hazardous air pollutants, especially acetaldehyde, formaldehyde, and methanol. EPA lists acetaldehyde and formaldehyde as probable human carcinogens, and both cause additional short term respiratory problems and chronic symptoms occur from long term exposure.[19] The health risks of methanol emissions, meanwhile, include "a decrease in gestation time, an increase in the number of required

Caesarian-section births, and, in prenatally exposed children, instances of a severe wasting syndrome, concentration-related delay in sensorimotor development and lower performance on an infant intelligence test."[20]

The Clean Air Act requires that major sources of hazardous air pollutants like Enviva Hamlet and Enviva Sampson utilize the maximum achievable control technology, which is meant to be even more stringent than the "best available control technology" standard for other pollutants. Unfortunately, North Carolina has not required any control technology at all to reduce hazardous air pollutants at Enviva Sampson and Enviva Hamlet. This is extremely problematic, as control technology which can massively reduce these hazardous air pollutant emissions is standard in the wood pellet industry.[21] The hazardous air pollutants emitted at wood pellet facilities are largely emitted from the burning and drying of wood, and because these hazardous air pollutants are also VOCs, control technologies that reduce VOCs also reduce these particular hazardous air pollutant emissions.[22] This means installing a regenerative thermal oxidizer on the dryers at Enviva Sampson and Enviva Hamlet would reduce hazardous air pollutant emissions by 95% or more. Every other non-Enviva facility that EIP surveyed has installed a regenerative thermal oxidizer on their dryer, vastly lowering their hazardous air pollutant emissions.

Without this technology, the Enviva plants emit 300 times more formaldehyde and 71 times more acetaldehyde than Hazlehurst Wood Pellets, a Georgia facility with a similar process rate but that uses a regenerative thermal oxidizer. The Enviva facilities' hazardous air pollutant emissions are substantially higher even than Georgia Biomass, the largest pellet mill in the country, because Georgia Biomass has installed regenerative thermal oxidizers while the Enviva plants have not. Although testing for hazardous air pollutant emissions is unfortunately rather rare, Table B below compares the available testing at similar facilities to the Enviva Sampson and Enviva Hamlet plants.

Table B. Enviva Sampson and Enviva Hamlet Emit Much More Hazardous Air Pollutants Than Comparable Facilities That Utilize Regenerative Thermal Oxidizers

Facility	State	Production Rate (tons per year)	Acetaldehyde Emissions (tons per year)	Formaldehyde Emissions (tons per year)	Methanol Emissions (tons per year)	Total HAP Emissions (tons per year)
Georgia Biomass	GA	826,000	1.7	7.6	5.0	15.4
Drax Amite	MS	578,000	No Data	0.4	No Data	No Data
Hazlehurst	GA	525,000	0.16	0.08	0.87	1.1
Enviva Sampson/Enviva Hamlet[A] (Initial Test)	NC	535,000	19.9	23.7	13.4	70.1
Enviva Sampson/Enviva Hamlet[A] (Second Test)[B]	NC	535,000	11.4	24.4	8.14	55.5

A. Although Enviva Hamlet is not yet operating, it is very similar to the Sampson facility.

B. After the first round of testing showed the facility was exceeding its VOC limits, Enviva tweaked their dryer, which somewhat reduced VOC emissions and some HAP emissions. It is unclear whether Enviva will continue to operate in this manner, but even if they do, emissions are still much higher than other facilities.

If Enviva Sampson and Enviva Hamlet installed regenerative thermal oxidizers on their dryers, hazardous air pollutant emissions would be cut by at least 95%.[23] Total hazardous air pollutants would be reduced from 55.5 tons per year to just 2.7 tons per year, and formaldehyde emissions would be lowered from around 24 tons per year to 1.2 tons. Acetaldehyde and methanol would both be reduced to less than one ton per year.

Enviva's Illegal Scheme to Avoid Major Source Permitting in Northampton County

North Carolina impermissibly removed limits intended to reduce VOCs from Enviva's mill in Northampton County, allowing the facility to emit 200 tons more VOCs than similar facilities. Like the other Enviva facilities, Enviva Northampton's VOC emissions are uncontrolled, despite the fact that it emits well over the 250 ton per year major source threshold that should require the use of the best available control technology. Initially, North Carolina allowed Enviva to construct without VOC controls based on Enviva's agreement to accept enforceable limits designed to ensure that the facility's emissions qualified as "minor" (and therefore exempt from control requirements).[24] Specifically, Enviva agreed to reduce VOC emissions by processing no more than 10% softwood and to not dry the wood to lower than 13% moisture content.[25] But only two years later, Enviva apparently decided those restrictions no longer fit within its business plan and asked North Carolina to remove them from the Northampton facility's air permit.[26] North Carolina obliged, but still did not require Enviva to comply with the permitting and pollution control requirements applicable to major air pollution sources.[27] The law is clear that North Carolina acted illegally: when a facility takes a limit to avoid stringent Clean Air Act requirements applicable to "major" sources, as Enviva Northampton did, any subsequent relaxation of that limit that allows the source to emit more than the major source threshold (here, 250 tons per year of VOCs) triggers the requirement to obtain a major source construction permit and install required pollution controls.[28] North Carolina disregarded that requirement and allowed Enviva to continue operating the Northampton plant without VOC controls. The facility now emits 377 tons per year of VOCs, and is authorized to emit up to 456 tons per year—despite being constructed as a "minor" air pollution source.[29]

Table C on the following page shows that Enviva Northampton is the largest wood pellet mill in the country that does not utilize VOC control technology. To further illustrate the high emissions, other facilities which process various rates of softwood are adjusted to operating at 30% softwood, the same rate the Enviva Northampton currently processes. Once this adjustment is made, it is clear that Enviva Northampton's VOC emissions are substantially higher than they could be if Enviva utilized a regenerative thermal oxidizer on their dryer. Further, had the facility gone through legitimate major source permitting, VOC emissions from the hammermills and pellet coolers would also be reduced because major source permitting's best available control technology requirement applies to each emission unit with significant emissions.

Table C. VOC Controls on Dryers at Pellet Mills Above 300,000 Tons Per Year Production Rate; Enviva Northampton Highlighted

Facility	State	Production Rate	VOC Controls On Dryer	Softwood Content	Actual VOC Emissions (tons per year)	VOC Emissions at 30% Softwood[A] (tons per year)
Georgia Biomass	GA	826,000	Yes (RTO and RCO)	100%	120	36
Enviva Cottondale	FL	821,000	Yes (RTO)	100%	517	155
Zilkha Monticello[B]	AR	661,000	Yes (RTO)	100%	249	74
Enviva Northampton	NC	628,000	No	30%	377	377
Drax Amite	MS	578,000	Yes (RTO)	100%	249[C]	63
German Pellets	TX	578,000	Yes (RTO)	100%	580	174
Enviva Southampton	VA	535,000	No	10%	245	321
Enviva Sampson	NC	535,000	No	75%	628	251
Enviva Hamlet[B]	NC	535,000	No	75%	628	251
Colombo (Now Enviva Greenwood)	SC	175,000[D]	Yes (RTO)	100%	249[D]	74
Hazlehurst	GA	525,600	Yes (Sent to burner, 90% reduction)	100%	216	64
Highland Pellets	AR	500,000	Yes (Sent to burner, 90% reduction)	100%	245	73
Drax Morehouse	LA	500,000	Yes (RTO)	98%	249[E]	76
Drax LaSalle	LA	500,000	Yes (RTO)	100%	611	183
Enviva Ahoskie	NC	420,000	No	30%	280	280
Westervelt	AL	320,000	Yes (Two RTOs)	100%	28	8
Zilkha	AL	300,000	Yes (RTO)	50-100%	246	73

A. Facilities utilize a range of softwood content, however, for comparison purposes, we assume in this column that all facilities are utilizing 30% softwood, which is what the Enviva Northampton plant currently utilizes.
B. Facility is permitted but not yet operating.
C. This facility's permit limit is 249 tons per year, but research by EIP shows it likely emits much higher levels, up 1,000 tons per year; see the section on Mississippi below.
D. Colombo Energy has the capacity to produce 669,000 tons per year, but without VOC controls on its post-dryer emissions, the facility must limit operations to avoid exceeding the 250 ton per year major source threshold. See the discussion on this facility below in the South Carolina section.
E. This facility's permit limit is 249 tons per year, but research by EIP shows it likely emits much higher levels, potentially more than 700 tons per year, see the section on Louisiana below.

Complete Lack of Public Input at Enviva's Northampton and Hamlet Plants When It Mattered.

The most troubling aspect of Enviva Northampton's permitting history is that it was completely opaque; the public never had notice or the opportunity to comment on the facility's construction or subsequent modification to emit more than 250 tons per year of VOCs.[30] This is because North Carolina's regulations do not require public notice or comment for minor source permits such as the one obtained by Enviva for Northampton, likely in contravention of the Clean Air Act.[31] This is in contrast to the major source permit process, for which North Carolina does require public notice and comment. In other words, residents who live near the Northampton facility—now emitting at major source levels—never knew about the levels of pollution emitted, or the decision to allow the facility to increase its emission above the major source threshold. Had the facility initially proposed to emit 377 tons per year of VOCs, the permits would have been subject to public notice and comment, but Enviva craftily avoided these requirements by taking initial limits and then eliminating those limits just two years later.

The public also lacked an adequate opportunity to provide input for the permit for Enviva Hamlet in Richmond County. As noted above, this permit allows the highest level of air pollution in the industry. In issuing this permit, the state failed to follow clear regulations which serve to inform the public about the proposed facility near the predominantly African American community of Dobbins Heights. North Carolina never held a public hearing on the permit, notwithstanding the Clean Air Act's clear mandate to do so and despite requests by the community.[32] North Carolina also issued public notice and draft permits for the facility with incorrect addresses, making it difficult for citizens to learn whether the facility would be built in their backyard or elsewhere.[33] While North Carolina dismisses these issues as minor typos, the failure to give the proper address meant that those who were most impacted could not reasonably discover the true location of the plant until after the opportunity to file comments or request a hearing.

Texas

Texas only has one exporting pellet plant, German Pellets northeast of Houston, but the facility has had a serious history of failing to comply with the Clean Air Act, as well as the worst record of fires in the industry, with at least five fires or explosions since 2014. One fire at a German Pellet's storage facility in Port Arthur burned for more than 50 days, sickening residents and leading to multiple lawsuits.

Table D. Annual Air Pollution from Exporting Pellet Mills in Texas (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing plants (1)	72	98	175	580	190,923

Pellet Plant in Woodville Has Violated Clean Air Law for Years, but Texas Proposes no New Controls

The German Pellets facility in the community of Woodville, Texas, 90 miles northeast of Houston, has emitted VOCs at nearly double its permitted limits and the major source threshold since it began operation in 2013, with VOC emissions approaching 600 tons per year. Despite the testing at multiple facilities dating to 2012 that proved large facilities like German Pellets could not remain below the major source threshold without additional controls, German Pellets apparently did not discover that it was itself violating its permit limit of 64 ton per year (as well as the 250 ton per year major source threshold) until late 2014. It turns out the facility actually emits 580 tons of VOCs per year.[34] Instead of punishing the facility for violating the terms of its permit and exceeding the Clean Air Act's major source threshold for nearly five years, Texas has allowed the facility to continue to operate at full capacity, emitting the same level of illegal VOC emissions. In fact, Texas is now proposing to issue a major source permit to the facility that simply raises the emissions limits to levels with which German Pellets can comply while requiring no additional VOC control measures.

While German Pellets does utilize a regenerative thermal oxidizer on its dryer, the hammermills and pelletizing lines are uncontrolled and emit substantial amounts of VOCs. The two pellet coolers emit 446 tons per year of VOCs, and the total post-dryer emissions are 514 tons per year. As discussed above, the major source permitting process must limit emissions to the level that can be achieved by using best available control technology. A regenerative thermal oxidizer or a regenerative catalytic oxidizer—controls which have been installed on hammermills and pelletizing units at several other facilities—should have been chosen as the best available control technology.

German Pellets submitted misleading information to the Texas permitting authority to justify not installing control technology. In particular, German Pellets dismissed from consideration all facilities which utilize control technology for the hammermills and pellet coolers on the grounds they were permitted as minor sources, and only submitted information on facilities that do not use controls.[35] German Pellets further stated that it was "consistent with other similar operations" not to install VOC controls on the post dryer units.[36] The fact of the matter is that many wood pellet mills do utilize these controls, as Table E below shows. The Clean Air Act's best available control technology mandate therefore requires the same level of controls at German Pellets, regardless of the type of permit in place at similar facilities (in fact a proper analysis must even evaluate international facilities if they achieve greater emission reductions).[37] Yet based on German Pellets' application, Texas authorities may not have even been aware that such controls were in use in the industry because the facility only submitted information on plants that do not use controls on their post-dryer units.

A regenerative thermal oxidizer, in use at several other facilities, would reduce the total post-dryer emissions from 514 tons per year to just 25 tons per year. Another alternative, in use at several facilities, is to route the post-dryer emissions to the dryer and its regenerative thermal oxidizer, a technique that achieves at least 95% VOC reduction. These are not extreme options; as Table E below shows, most similar facilities (i.e. facilities processing mostly softwood) utilize some form of technological control to reduce VOCs. Yet Texas is proposing a permit which would not require any technological controls on the relevant units, despite the best available technology requirement.

Table E. Despite German Pellets' Claim, Many Facilities Utilize Controls to Reduce Post-Dryer VOC Emissions

Post-Dryer Controls at Synthetic Minor Pellet Mills Processing More than 50% Softwood							
Facility Name	State	Production Rate	Softwood Content	Major Source	VOC Controls on Hammermills	VOC Controls on Pellet Presses and/or Coolers	Facility-wide VOC Emissions
Georgia Biomass	GA	826,000	100%	No	RTO (95% control)	RTO (95% control)	130
Enviva Cottondale	FL	821,000	100%	No	Sent to Burner-RTO (95% control)	Sent to Burner-RTO (95% control)	517
Zilkha Monticello (proposed and permitted)	AR	661,912	100%	No	Sent to Burner-RTO (95% control)	Sent to Burner-RTO (95% control)	249
Drax Amite	MS	578,000	100%	No	None	None	900+[A]
Colombo Energy (Now Enviva Greenwood)	SC	168,000[B]	100%	No	Limited Operating Hours	Limited Operating Hours	249
Hazlehurst	GA	525,600	100%	No	Sent to Burner-RTO (95% control)	Sent to Burner-RTO (95% control)	216

Highland Pellets South (proposed)	AR	500,000	100%	No	Sent to Burner (90% control)	Sent to burner (90% control)	208
Drax Morehouse	LA	500,000	100%	No	None	None	465[C]
Bord na Mona (proposed and permitted)	GA	330,000	50-100%	No	Sent to Burner-RTO (95% control)	None	192
Westervelt	AL	320,000	100%	No	RTO (95% Control)	RTO (95% Control)	139
Post-Dryer Controls at PSD Major Source Pellet Mills							
German Pellets	TX	578,000	100%	Yes	None	None	580
Enviva Sampson	NC	535,000	75%	Yes	None	None	628
Enviva Hamlet (proposed and permitted)	NC	535,000	75%	Yes	None	None	628
Drax LaSalle	LA	500,000	100%	Yes	None	None	611

A. This facility has never tested its post-dryer units; emissions based on Georgia Biomass emission factors. See the Mississippi section below.
B. Facility has the capacity to operate at up to 669,000 tons per year but is limiting operating hours to avoid exceeding permit limits.
C. This facility has never tested its pellet coolers. Pellet cooler emissions estimated based on average emission factor for pellet coolers derived from stack testing (see Louisiana section below). Actual emissions could be as high as 745 tons per year.

Mississippi

Mississippi is home to three pellet mills exporting to Europe: two relatively small Enviva plants, Enviva Amory ear Tupelo and Enviva Wiggins near Gulfport (Enviva is in the process of selling the Wiggins plant), and one large facility in Amite County owned by Drax Biomass. Drax also owns and operates the Drax power plant in the UK, which is the largest consumer of wood pellets in the world, and the single largest emitter of CO_2 in the UK. The Drax power plant is almost exclusively supplied by pellet plants in the U.S. South, including Drax's own mills, Enviva's mills, and others. In addition to the existing mills, a fourth facility is proposed in the state, Enviva Lucedale, north of Biloxi.

Table F. Annual Air Pollution from Exporting Pellet Mills in Mississippi (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (3)	462	309	325	1,400	270,617
Existing (3) and proposed (1)	607	540	545	2,028	500,445

Note: Particulate, CO, and Nitrogen Oxide emissions from Enviva Wiggins and Amory estimated based on similar facilities as this data was not available. Emissions from the proposed Enviva Lucedale are the same as Enviva Sampson, Enviva's most recently-constructed plant.

Drax Plant in Gloster Misleads Mississippi on VOC Emissions

Drax Biomass appeared to mislead Mississippi officials in order to avoid major source permitting requirements at its Drax Amite facility in Gloster. Drax submitted extremely low emissions estimates for certain units based on testing that Drax should have known was invalid. By doing so, Drax was able to convince Mississippi that the Amite facility's VOC emissions were below the 250 ton per year major source threshold, when more reliable testing data showed the facility's emissions were likely to be around 1,000 tons per year. Troublingly, Mississippi has never required that the facility conduct emissions testing on the relevant units, and instead has accepted Drax's estimates.

As with other large facilities initially permitted before 2013, Drax initially assumed that only Amite's dryer would emit VOCs. It took until 2016 for Drax to acknowledge that other units emit any VOCs at all.[38] Drax then asserted that these emissions were minor, and that emissions from these units would be just "0.704 lb/ton [pounds of VOCs per ton of wood pellet produced], based on testing performed at Green Circle Bio Energy with 10% additional margin included."[39] Drax did not provide the cited test data with its application, and supplied no further information on the test. It turns out that Drax was referring to 2010 tests performed at Green Circle Bio Energy in Florida.[40] Subsequent testing performed at that facility in 2013 showed that the 2010 tests were completely invalid, and that the Green Circle facility actually emitted more than 1,000 tons of VOCs per year.[41] The true emissions rate at Green Circle (now Enviva Cottondale) for all post-dryer units was 3.25 lb/ton, almost five times higher than the .704 lb/ton proposed by Drax.[42] Further, the 3.25 lb/ton rate is completely consistent with other wood pellet plant manufacturing plant tests such as the Georgia Biomass testing (showing 3 lb/ton).[43] This means Drax Amite's true facility-wide emissions are likely above 900 tons per year, vastly exceeding the major source threshold of 250 tons per year.

While it is hard to prove that Drax intentionally misled Mississippi, it is difficult to fathom that Drax, one of the most prominent companies in the industry, was not aware of the elevated VOC issue when it submitted its Title V permit application in August 2016, or likewise was unaware that Green Circle had conducted subsequent testing in 2013 disproving the 2010 tests. Regardless, it may have worked: Mississippi proposed to issue the operating permit without questioning the assumed .706 lb/ton emission rate Drax provided. Mississippi states that testing at Drax Amite showed a "large margin of compliance" with the 249 ton per year VOC limit.[44] The problem is that these tests only tested the facility's dryer and not the other significant sources of VOCs like hammermills and pellet coolers. In other words, Mississippi is still apparently operating under the impression that post-dryer units do not emit any VOCs, a completely incorrect assumption given the numerous tests conducted in the industry since 2013.

Mississippi's proposed permit continues to treat Drax Amite as a minor source, despite likely VOC emissions of nearly 1,000 tons per year, four times higher than the 250 ton-per-year major source threshold. Further, Mississippi did not even propose to require Drax to test the Amite facility's post-dryer units, so Drax can continue avoiding major source control requirements with impunity. EIP and a coalition of other concerned public interest groups recently filed comments with Mississippi during the public comment period on the draft permit that raised the above concerns regarding VOC emissions. Mississippi is currently reviewing the comments.

Mississippi Allows Unlawful Hazardous Air Pollutant Emissions from Enviva Mills in Stone and Monroe Counties

Enviva Wiggins in Stone County, north of Gulfport, and Enviva Amory in Monroe County southeast of Tupelo, are two relatively small pellet mills which Enviva purchased in 2010. Despite being smaller than Enviva's newer mills, both facilities have troublingly high hazardous air pollutant emissions because, as with the other Enviva mills, Enviva does not utilize any hazardous air pollutant controls, in contravention of the Clean Air Act. As explained below, potential hazardous air pollutant emissions from each of these facilities easily exceeds the level that triggers major source maximum achievable control technology requirements under the Clean Air Act, yet both sources claim to be minor sources that are exempt from these requirements. A compounding problem is that Mississippi issued utterly deficient permits to the two facilities authorizing wood pellet production rates that clearly lead to hazardous air pollutant emissions in excess of the major source threshold.

At Enviva Wiggins, emissions testing revealed that the facility, when operating at the permitted production rate of 185,550 tons per year, emitted 31 tons per year of hazardous air pollutants, including 10.3 tons of methanol.[45] The rates meant the facility was exceeding the threshold that triggers maximum achievable control technology for hazardous air pollutant emissions. Rather than install these controls, the facility decided to lower its emissions by restricting production. Based on the testing, Enviva's own consultant calculated that the facility would need to limit production to 140,000 tons per year to remain below the hazardous air pollutant limit, yet Mississippi inexplicably authorized wood pellet production of up to 165,000 tons per year, which only reduced total hazardous air pollutant emissions to 28 tons per year.[46] This means the facility is still a major source of hazardous air pollutants, but is not complying with the major source requirement to install maximum achievable control technology. Notably, if the facility installed a regenerative thermal oxidizer, total emissions would be less than two tons per year.

The hazardous air pollutant situation at Enviva Amory is also troublesome. Emissions testing there purportedly showed that the facility's hazardous air pollutant emissions were either zero or essentially zero, which is simply not plausible given that it has no hazardous air pollutant controls and operates at similar rates to Enviva Wiggins.[47] The testing found no acetaldehyde at all and just .64 tons per year of formaldehyde. These rates are highly inconsistent with stack tests at similar facilities, which generally show that wood drying emits considerable amounts of formaldehyde and acetaldehyde.[48] Although Mississippi apparently accepted Enviva's Amory test results, North Carolina rejected them when Enviva offered them as justification for not installing hazardous air pollutant control devices at its North Carolina facilities.[49] North Carolina's Stationary Source Compliance Branch found that the consultant that performed the testing for both Enviva facilities had used incorrect values for several significant pollutants, including acetaldehyde and formaldehyde, meaning the testing for both facilities underrepresented the facilities' hazardous air pollutant emissions.[50]

Enviva Facility Near Tupelo is Violating Major Source Permitting Requirements and Avoiding the Use of Pollution Controls

Enviva Amory, the Enviva facility southeast of Tupelo, also has major issues with its VOC emissions, with several past and continuing violations. Most concerning is that the facility is currently operating in violation of the Clean Air Act's major source requirements. Facilities that have the potential to emit 250 tons per year or more of pollutants like VOCs must go through major source permitting (which requires the use of the best available control technology) or take legally enforceable limits to ensure that actual emissions stay below the major source applicability threshold. As shown below, Enviva Amory has the potential to emit VOCs well above 250 tons per year but has neither obtained a major source permit nor agreed to an enforceable emissions limit that would enable it to avoid major source permitting. Further, the facility is operating without any VOC controls whatsoever, meaning it is not complying with major source permitting's best available control technology requirement.

When initially constructed, Enviva claimed that the Amory facility's VOC emissions would not only be below the 250 ton-per-year major source applicability threshold, but also below the 100 ton-per-year required to apply for a federal operating permit known as a Title V permit.[51] Accordingly, Enviva accepted a VOC emissions limit of 99 tons per year and a production limit of 99,000 tons of wood pellets per year to keep its actual emissions below the Title V threshold.[52] Subsequent emission testing at Enviva Amory in 2013 showed that VOC emissions were 185 tons per year when producing 99,000 tons per year of pellets, far exceeding its 99 tons-per-year permit limit and the Title V threshold.[53] In light of the test results, Enviva applied for a Title V operating permit, but when Mississippi issued the new permit, it altogether eliminated the limits on the facility's VOC emissions and production rate.[54] The new permit also does not limit the kind of wood the facility can process.[55] This is highly problematic, because the facility could easily emit more VOCs than the major source threshold of 250 tons even without increasing capacity beyond its current rate. Because softwood emits much higher levels of VOCs than hardwood, any increase in the softwood processed in the mix increases VOCs. Troublingly, the testing did not report what ratio the facility processed during the testing. This is basic information that is almost always included in testing reports. For instance, the Enviva Wiggins test states that it was conducted at 60% softwood.[56] If the testing at Amory occurred when the facility was processing relatively low levels of softwood, which is likely based on the results compared to similar facilities, then the resulting rate of 185 tons per year would not be representative of what the facility is capable of emitting. Since the permit contains no limit on the amount of softwood processed, Enviva Amory can process whatever it wants, including 100% softwood like many other wood pellet plants. At 100% softwood, the facility would emit 562 tons per year of VOCs at the current production rate.[57] This means the facility is currently violating major source rules, which require compliance with major source permitting and best available control requirements based on a facility's *potential* to emit pollution. Enviva Wiggins clearly has the potential to emit above 250 tons per year of VOCs and its permit has zero limits preventing it from doing so.

To illustrate how easy it would be for the facility to have emissions above the 250 ton per year major source threshold—assuming that during testing the facility was processing the same rate of softwood as Enviva Wiggins, 60% softwood—then an increase to just 65% softwood would place the facility's actual emissions beyond 250 tons per year (this is in part because Enviva Amory's testing occurred at a production rate of 99,000 tons per year, but now operates at 121,000 tons per year).[58]

Louisiana

Louisiana hosts two large pellet mills; both are currently owned by Drax Biomass. The Drax Morehouse facility is located about 30 miles north of Monroe, Louisiana, while Drax Lasalle is located 35 miles north of Alexandria.

Table G. Annual Air Pollution from Exporting Pellet Mills in Louisiana (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (2)	223	271	590	911	367,810

Drax Plant North of Monroe, Louisiana Likely Exceeds Major Source Limits, Yet Louisiana has Never Required Testing

Drax's plant in Morehouse County does not control VOC emissions from its post-dryer units, and likely emits well above the 250 ton per year major source threshold. Unfortunately, although Louisiana did require VOC emissions testing from the facility's dryers and hammermills, for reasons that are not clear the state did not require emissions testing on Drax Morehouse's pellet coolers. Pellet coolers can be massive sources of VOC emissions, with testing at several similar facilities finding VOC emissions above 400 tons per year.[59] Drax, however, claims the Morehouse facility's pellet coolers emit just 20 tons per year of VOCs based on their own in-house testing.[60] Such in-house testing is not subject to the rigorous regulations and review procedures meant to ensure testing is an accurate reflection of true emissions. For instance, unlike legitimate testing, Drax did not need to comply with any EPA-approved methodology, did not need to submit data and records from the test for review, did not need to test at full capacity (in fact the testing occurred at 35% capacity, which is well below the 80% or 90% minimum required by most states), nor did Drax need to notify the state that they were conducting the testing in order to allow state oversight. Nonetheless, Louisiana accepted Drax's proposed emissions rate without even reviewing Drax's testing protocols or the actual test results.[61]

Without adequate testing, it is hard to believe that Drax's self-reported emission rate, which is 20 to 30 times lower than similar facilities, is trustworthy. Table H below shows how Drax's emission factor compares to similar facilities:

Table H. Drax Morehouse's Self-Reported Emission Factor is an Extreme Outlier

Facility	State	Facility Production Rate at the Time of Testing (tons per year)	Uncontrolled Pellet Cooler VOC Emissions (tons per year)	Uncontrolled Pellet Cooler VOC Emission Factor (lb/ton)	Comparison to Drax Morehouse's Self-Reported Emission factor of .065 lb/ton
Drax Morehouse "engineering testing data"	LA	578,000	20	.065	-
Enviva Amory	MS	99,000	101	2.04	31 times higher
German Pellets	TX	578,000	446	1.54	23 times higher
Enviva Cottondale	FL	610,000	460	1.5	23 times higher
Georgia Biomass (with steam injection)	GA	820,000	533	1.3	20 times higher
Hazlehurst Wood Pellets	GA	525,000	166	.62	9.5 times higher
			Average Emission Factor:	1.07	16.4 times higher

Sources: Stack testing reports from plants other than Drax; Drax's emission factor from permit applications.

The issue of Drax Morehouse's pellet cooler emissions is not trivial. At the emission factors Louisiana accepted from Drax, Louisiana states that the facility is currently emitting 249.21 tons per year.[62] This means even a minute error in the pellet cooler emission rate would push the facility above the 250 ton per year major source threshold. In fact, applying any of the above test-derived emission rates to Drax Morehouse's pellet cooler results in a facility-wide VOC emission rate of at least 300 tons per year, and could be as high as 745 tons per year. Applying the average mission factor from the table above places the facility's total VOC emissions at 465 tons per year.

Notably, if Drax Morehouse installed a regenerative thermal oxidizer or other VOC control technology to its post dryer units, whether to remain below the major source threshold or to comply with major source permitting's best available control technology mandate, Drax could reduce VOC emissions to less than 50 tons per year.[63]

Virginia

One pellet plant, owned by Enviva, is currently operating in Virginia, and Enviva has proposed a second facility in the state. The existing facility, Enviva Southampton, is located about 40 miles west of Norfolk, and the proposed facility will be just outside of Danville.

Table I. Annual Air Pollution from Exporting Pellet Mills in Virginia (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (1)	88	56	163	245	160,535
Existing (1) and Proposed (1)*	223	287	383	873	390,363

* Emissions from the proposed Enviva Danville facility assume the new plant will have the same emissions as Enviva Sampson, the most recently-constructed Enviva plant.

After Discovering They Were Violating Limits, Enviva Southampton Actually Removed Pollution Control Technology

Enviva's Virginia facility, located in Southampton County, was originally permitted as a synthetic minor source processing 90% softwood in 2012.[64] Predictably, after the Georgia Biomass testing showed facilities like this could not comply with their synthetic minor limits without additional controls, Enviva found that the Southampton facility was indeed emitting well above 250 tons per year.[65] Rather than installing additional control technology or reduce production like other companies have done, Enviva actually *removed* their VOC and hazardous air pollutant control technology (a regenerative thermal oxidizer) and switched to processing hardwoods.[66] While this did allow Enviva Southampton to begin complying with the VOC limit, it is far from environmentally sound given the larger ecological footprint of harvesting hardwood trees. Furthermore—and of particular importance to nearby residents—the removal of the regenerative thermal oxidizer means Enviva Southampton is no longer controlling its hazardous air pollutant emissions in any way, and the facility almost certainly emits major levels of hazardous air pollutants, triggering the Clean Air Act's hazardous air pollutant requirements to install the maximum achievable control technology. Despite this, Virginia has not required any technology to reduce hazardous air pollutants. Worse yet, Virginia has not even required that Enviva test for hazardous air pollutants, so the true rates are impossible to know.

Rather than requiring emissions testing for hazardous air pollutants, a requirement found in almost every other state, Virginia has apparently relied on Enviva's in-house estimates of the total amount of hazardous air pollutants emitted by the facility, estimates which are based on unsupported assumptions.[67] Enviva assumes that the difference in emissions for each individual hazardous air pollutant is uniform between hardwood and softwood, such that decreasing the amount of softwood processed will uniformly reduce each hazardous air pollutant by an identical rate.[68] This is simply not true. Research and recent testing at other facilities indicates that drying hardwood actually emits certain hazardous air pollutants at higher levels than drying softwood.[69] At the very least, Enviva's assumption that reducing softwood content will reduce each hazardous air pollutant at the same rate is not scientifically sound. Instead, EIP estimated emissions of hazardous air pollutants individually, based on how each pollutant is emitted at 100% softwood and at 50% softwood, because these are known emission rates available in EPA databases.[70] From there, EIP can make a reasonable extrapolation to 10% softwood (the rate the Enviva Southampton currently processes). For formaldehyde, this produced an emission rate of 16.2 tons per year from the dryer alone, well above the 10 tons per year threshold for utilizing maximum achievable control technology, and three times higher than Enviva's own estimate for its dryer emissions of 5.87 tons per year.[71] The increase in formaldehyde emissions also means the facility is exceeding the 25 ton per year threshold for total hazardous air pollutant emissions, at 31 tons per year.[72]

Further, applying actual test results from a Georgia pellet mill that processes a similar ratio of hardwood shows that Enviva Southampton is almost certainly exceeding both its permit limits and the Clean Air Act's maximum achievable control technology threshold.[73] Based on those tests, Enviva Southampton emits 21.2 tons per year of methanol and 16.5 tons of formaldehyde, and emissions of total hazardous air pollutants are at least 46 tons per year. These rates are substantially higher than the 10 ton per year threshold for individual hazardous air pollutants and 25 tons per year for total hazardous air pollutants, meaning the facility should be required to install maximum available control technology—a regenerative thermal oxidizer. Had Enviva retained the regenerative thermal oxidizer to control hazardous air pollutants, these emissions would be less than one ton per year of formaldehyde, and total hazardous air pollutant emissions would be less than three tons per year.

Florida

Florida only has only one wood pellet plant exporting to Europe, Enviva Cottondale located near Panama City, but the plant is the second largest pellet mill in the nation, producing more than 800,000 tons of pellets per year. The facility has correspondingly high emissions of air pollutants, as detailed below. A second facility, Cornerstone Biomass, is proposed in Florida, which would be located between Tallahassee and Gainesville.

Table J. Annual Air Pollution from Exporting Pellet Mills in Florida (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (1)	411	22	245	517	229,336
Existing (1) and proposed (1)*	511	85	370	767	293,546

* Emissions from the proposed Cornerstone Biomass facility estimated based on similar-sized facilities.

Enviva Plant Near Panama City Emits More than 500 Tons Per Year of VOCs Without a Required Permit or Sufficient Controls

Enviva Cottondale, formerly Green Circle Bio Energy, was one of the first facilities to test and find higher than expected VOC emissions after learning of the original Georgia Biomass testing in 2013. As with Georgia Biomass, the facility-wide VOC emissions were well over 1,000 tons per year, violating that facility's 250 ton per year permit limit and exceeding the major source threshold. While Florida did require the facility to take some action to reduce

VOC emissions, the facility still emits more than 500 tons per year of VOCs because the facility's pellet coolers remain uncontrolled.[74]

Despite Florida's acknowledgement in 2013 that Enviva Cottondale emits VOCs at more than twice the major source threshold, Florida did not require the facility to go through major source permitting until EIP and a coalition of concerned public interest organizations submitted comments on the facility's permit renewal in August of 2017.[75] In 2013, Florida had excused the facility from complying with major source requirements, including the use of best available control technology, in part because the original owners acted in "good faith" when they originally represented that hammermills and pellet coolers do not emit VOCs.[76] While Green Circle, the owners at the time, may have indeed acted in good faith when they operated the facility prior to knowing about the VOC emissions, the Clean Air Act does not contain an exception for pollution emitted in good faith. While EIP is glad to see that Florida is now requiring the facility to go through major source permitting, it is imperative that Florida require the use of the best available control technology for the facility's pellet coolers. Major source permitting requires an analysis of the best available control technology for each unit which emits a significant amount of a pollutant, and the pellet coolers currently have no controls at all. Given that the similar-sized Georgia Biomass has been able to reduce facility-wide VOC emissions to 130 tons per year by installing a regenerative catalytic oxidizer that controls pellet cooler emissions, Florida must require Enviva to utilize this control technology, or other technology that is equally effective.

South Carolina

South Carolina has two pellet plants which export to Europe, and up to four more are proposed in the state. The largest facility, Colombo Energy, is located just outside of Greenwood and has the capacity to produce 669,000 ton of pellets per year. The facility was built in 2016 by the Portuguese paper company Portucel Soporcel, but was acquired by Enviva Biomass in February of 2018. A smaller facility, Thunderbolt Biomass, is located in Allendale County. The four proposed plants include an Enviva plant in Laurens County and a Drax Biomass plant in Abbeville County, each with a production capacity of 550,000 tons per year.

Table K. Annual Air Pollution from Exporting Pellet Mills in South Carolina (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (2)	94	244	243	786	218,347
Existing (2) and Proposed (4)*	665	876	1,094	2,742	984,822

Greenwood Facility Fails to Meet Testing Requirements, Fast-Tracks Inadequate Permit Behind Closed Doors

In February 2018, Enviva Biomass acquired the Colombo wood pellet manufacturing facility in Greenwood, South Carolina, with plans to more than triple production. The plant is permitted as a synthetic minor source, meaning that it is exempt from the Clean Air Act's requirement that it reduce air pollution using best available control technology. However, the Colombo plant discovered recently that it generates far more VOC emissions than it previously thought, and that it was capable of emitting more than 600 tons of VOCs per year. At that time, plant operators started limiting the plant's production to less than a third of its designed capacity to keep emissions to legal levels (the facility is designed to produce 669,000 tons per year, and Colombo has been operating at less than 200,000 tons per year). Now, Enviva has publicly stated that it wants to increase actual production to 660,000 tons per year, and to do that, the plant must install controls to reduce its VOC emissions.[77] While Enviva plans to install controls on some of the plant's VOC-emitting sources, it does not plan to install controls on its hammermills. As a result, the facility would still emit more than 300 tons per year of VOCs when operating at the capacity Enviva desires.[78] Based on its potential emissions, even with the new controls the plant plainly qualifies as a major source which must utilize the best available control technology on all of its sources. Instead, South Carolina issued a permit with no public notice or opportunity to comment which did not contain a production limit necessary to restrict the facility's emissions to legal levels.[79] In response to pressure from EIP and other groups, the facility agreed to amend their permit to include an enforceable production limit of 500,000 metric tons.

Another troubling issue with the Colombo facility is that it failed to conduct legally adequate emission testing, with one set of tests the facility submitted to South Carolina wildly inaccurate. After first failing to meet the permit deadline to submit testing within 180 days of start-up, Colombo eventually sent South Carolina test results that anyone familiar with emissions from wood pellet manufacturing plants could tell were wildly inaccurate. That testing underrepresented VOC emissions from the facility's pellet coolers by at least 259 tons per year, conveniently showing that the facility could operate at full production rates without exceeding the major source threshold.[80] Eventually, even Colombo acknowledged these tests were flawed, and arranged for a different consultant to perform a new round of testing in October 2017. The new testing showed significantly higher VOC emissions from the facility's pellet coolers: 370 tons per year compared to the original test's result of 111 tons per year.[81] However, this subsequent testing also failed to fulfill Colombo's testing obligation because Colombo did not follow proper procedures regarding planning and notification. Colombo's permit and South Carolina regulations set out numerous requirements for emission testing, including prior approval of a site-specific test plan and notification to South Carolina officials of the test date. Notification of the test date is crucial, because it allows South Carolina officials the ability to observe the testing. Despite these legal requirements, Colombo conducted its tests without notifying South Carolina and without an approved site-specific test plan.[82] This means the tests were conducted without approval and without any outside observers. While the facility may conduct proper testing in the future, the fact remains that South Carolina has allowed the facility to operate for 18 months without satisfying its requirement to conduct legitimate emissions testing.

Georgia

Georgia is home to five pellet mills exporting to Europe, and four more proposed facilities have either received permits or are under construction. The two largest mills, Georgia Biomass in Waycross, and Hazlehurst Wood Pellets in Jeff Davis County, produce more than 1.3 million tons of wood pellets per year. While Georgia was the first state to recognize the VOC issue from pellet mills and has generally done the best of any state to address the issue, permits in the state still allow for facilities to emit more VOCs and hazardous air pollutants than the Clean Air Act allows without installing pollution controls.

Table L. Annual Air Pollution from Exporting Pellet Mills in Georgia (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (5)	499	510	584	999	649,836
Existing (5) and Proposed (4)*	1,138	1,259	1,357	1,932	1,233,545

* Emissions from proposed plants based on permitting materials and similar facilities.

Georgia Permits Lack Enforceable Pollution Limits.

Permits for at least two facilities, Appling County Wood Pellets near Brunswick and Varn Wood Pellets near Waycross, fail to require best available control technology, or alternatively, fail to adequately limit emissions. At Appling County Pellets, which does not utilize any pollution controls for VOCs, the permit lacks any facility-wide VOC limit. While the latest draft permit does contain a production limit, which is a step in the right direction, the production limit fails to ensure the facility will not emit more than 250 tons per year of VOCs. This is because the facility could exceed 250 tons per year of VOCs even while producing less than the production limit. Georgia relied on emission factors—rates of pollution emitted per ton of product produced—to show that the production limit contained in the permit would keep emissions below 250 tons per year. The problem is, those emission factors are based on stack testing which does not adequately represent the maximum emissions. The facility processed mostly hardwood during the testing, but could process up to 100% softwood if it desired, because the permit does not restrict the softwood processed at the facility. Softwood emits substantially more VOCs than hardwood, and at the current production limit the facility would emit 540 tons per year of VOCs if it processed 100% softwood. Georgia must therefore implement facility-wide VOC limit. The problem with Varn Wood Pellets' permit is basically the opposite of that at Appling County: the permit contains a facility-wide limit on VOCs, but no production limit. For facilities like Varn Wood Pellets, which do not utilize adequate pollution controls to reduce VOC emissions below the major source threshold when operating at full capacity, permits must restrict production to a point where emissions are below the major source threshold. In response to comments submitted by EIP on behalf of other environmental groups, Georgia has proposed to issue a new permit that will contain a production limit.

Pellet Mill Near Valdosta Begins Construction Without Permit.

Under the Clean Air Act and Georgia law, it is illegal to commence construction of a source of air pollution without obtaining a permit. Blue Sky Biomass, however, ignored the law and began constructing a 400,000 ton per year pellet mill north of Valdosta, Georgia. The company's website shows considerable concrete work, and the installation of at least four pellet presses. Georgia officials have apparently not taken action to halt construction or require the facility to apply for a permit. Because the facility has not applied for a permit, it is impossible to know exactly how the facility will be designed and whether it will adequately control for VOC and hazardous air pollutants.

Alabama

Alabama hosts three pellet mills exporting to Europe, including Zilkha Biomass, near Selma, and Mohegan Renewable Energy (formerly Lee Energy Solutions) near Birmingham. Three new mills are proposed in the state, including two large Enviva plants—Enviva Childersburg outside of Birmingham, and Enviva Abbeville, north of Dothan.

Table M. Annual Air Pollution from Exporting Pellet Mills in Alabama (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (3)	499	510	584	999	649,836
Existing (3) and Proposed (3)*	1,138	1,259	1,357	1,932	1,233,545

* Emissions from proposed plants based on permitting materials and similar facilities.

Pellet Mill in Selma Vastly Exceeds Limits on Carbon Monoxide and VOC Emissions.

The Zilkha Biomass mill just east of Selma is regulated as a minor air pollution source based on permit restrictions that serve to limit facility-wide emissions of pollutants like VOCs and carbon monoxide to below the major source threshold of 250 tons per year. When Zilkha Biomass first conducted emissions testing in 2017, however, the tests revealed that the facility emits 456 tons of CO per year when operating at the plant's design capacity—nearly twice the major source threshold. This means the facility has triggered the Clean Air Act's New Source Review requirements for major sources, including the obligation to install the best available control technology. This technology would likely be a regenerative catalytic oxidizer.

The facility is also almost certainly a major source of VOCs. The permit improperly exempts units known as hammermills and pellet coolers from emissions testing requirements, so the true rate is not known. However, emissions testing from every comparable wood pellet mill shows these units emit hundreds of tons more VOCs than Alabama believes. Emission factors from tests at a pellet mill in Georgia show Zilkha's hammermills and pellet coolers emit between 450 and 570 tons per year; emission factors from tests at a mill in Florida show these units emit 487 tons per year, and emission factors from tests at a mill in South Carolina show these units emitting 316 tons per year. Given that the wood dryer and the facility's unique and proprietary "black pellet" system also emit substantial amounts of VOCs, it is simply not plausible that Zilkha's facility-wide VOC emissions are below the 250 ton per year major source threshold.

Alabama Facility Emitted Twice as Much Particulate Matter Pollution than Permitted and Exceeded the Title V Threshold Without Obtaining a Title V Permit.

Until late 2017, Lee Energy Solutions was a wood pellet manufacturer northeast of Birmingham (the facility is now owned and operated by Mohegan Renewable Energy). The facility has a capacity of 225,000 tons per year, although operations are limited to 150,000 tons per year in an attempt to avoid Title V permitting.[83] Unfortunately, even at this lower rate, the facility has violated both its permit limits and the Title V threshold for particulate emissions. In fact, the facility emitted more than double its hourly permit limits of particulates, and emitted 189 tons of particulates per year, well above the Title V threshold of 100 tons per year.[84] The facility claimed that the issue was a poorly functioning multicyclone control device on the dryer. Multicyclones are relatively low-tech devices which can be efficient at removing large particulates but remove 10% or less of the smallest particulates, which are the deadliest.[85] While a faulty multicyclone may have contributed somewhat, the larger issue is that the facility was utilizing only a multicyclone rather than control technology with much better removal capacity. All of the large facilities EIP surveyed utilize a particulate matter control device known as a wet electrostatic precipitator, which removes 99% of all particulate matter, and at least 90% of fine particulates ($PM_{2.5}$).[86] Many smaller facilities like Lee Energy do not utilize this technology, and consequently have higher than necessary particulate matter emissions.

Arkansas

Arkansas is home to one wood pellet facility currently operating, the Highland Pellets mill in Pine Bluff, and two proposed mills which have applied for or received initial construction permits (Zilkha Biomass in Monticello, and Highland Pellets South, in Ouachita County).

Table N. Annual Air Pollution from Exporting Pellet Mills in Arkansas (Tons)

	Particulates	CO	NOx	VOCs	CO_2
Existing Plants (1)*	174	191	201	245	238,510
Existing (1) and Proposed (2)*	631	631	651	739	655,902

* All emissions are estimates from permit reviews or applications, Highland Pellets has not submitted stack testing.

Arkansas Fails to Require Crucial Emissions Testing at Pine Bluff Mill

The Highland Pellets mill is one of the newer and larger mills constructed, and it controls VOC and hazardous air pollutants from most of its units by routing emissions to the wood dryer's furnace. This process generally achieves 90% destruction of VOCs and hazardous air pollutants. The problem is, Highland Pellets does not do this for its pellet cooler emissions.[87] As noted above, pellet coolers can be massive sources of VOC emissions, with uncontrolled pellet coolers at some facilities emitting around 500 tons of VOCs per year (see the Table H above). These rates would mean Highland Pellets is greatly exceeding the 250 ton per year major source threshold as well as its permit limits. Despite this fact, Arkansas has not required emissions testing for VOCs from the pellet coolers—in fact the pellet coolers are the only major unit that is not required to test for VOCs. Given that the total VOC emissions for the plant are estimated to be up to 245 tons per year, the facility only has a 5 ton per year margin of error to avoid exceeding the major source threshold.[88] Therefore, the true rate of VOC emissions from the pellet coolers is crucial to ensuring the facility does not exceed the major source threshold; yet Arkansas has inexplicably exempted these particular units from testing requirements.

Piles of Wood Smolder Endlessly at Pine Bluff Pellet Mill

In addition to the potential VOC issue identified above, the Highland Pellets mill in Pine Bluff has had major issues with smoke emissions. When nearby residents complained, stating that "smoke was leaving the site and blanketing the surrounding community," Arkansas officials inspected the site but apparently did not take any corrective action.[89] According to the inspection, wood piles at the facility smolder and emit smoke continuously. The inspector's report states: "As you drive by the property you will see several large piles of material . . . This morning, both of these kinds of piles were smoking, or more accurately, smoldering. Normal rainfall amounts do a good job of keeping the temperature inside the pile down and the wood wet enough to keep the smoldering in check. With the severe lack of rain this fall, that was evidently not the case and the smoke was worse than normal."[90]

Improperly stored wood chips will frequently spontaneously combust, as large piles of decomposing wood produce heat. The smoke from this combustion is particularly harmful, as the low heat and incomplete combustion produces substantially higher levels of particulate matter, carbon monoxide, and VOCs than other forms of burning wood.[91] Studies have shown that smoldering pine emits 75 times more particulate matter pollution and 7 times more carbon monoxide than flaming fires.[92] In addition to the smoke, smoldering wood chips present an obvious risk of larger fires. As discussed in Part Three below, fires are a common problem at wood pellet industries. Highland Pellets has already had one fire since commencing operations in 2017.

Part Two: Enviva is a Clear Outlier, Failing to Utilize Pollution-Reducing Controls Which are Standard in the Industry

As discussed above, most large pellet mills utilize at least a regenerative thermal oxidizer or other control device on their dryer. The only exceptions are facilities owned and operated by Enviva Biomass. Most of these are located in North Carolina, where the state has repeatedly allowed Enviva to avoid reducing pollution. EIP's survey of new-generation pellet mills in the nation reveals that regenerative thermal oxidizers or other control technology are fundamental control devices which greatly reduce VOCs, yet Enviva has consistently claimed such controls are too expensive to install.[93] The fact is, however, that Enviva's competitors are able to utilize controls not only on their dryers, but frequently on additional units as well.

Two of Enviva's mills, Enviva Sampson (constructed in 2017) and Enviva Hamlet (under construction), both of which are near Fayetteville, North Carolina, are subject to the Clean Air Act's "best available control technology" and "maximum available control technology" requirements. Under both requirements, the facility is required to reduce emissions to the level achieved by the best-controlled pellet mill in operation. Despite these requirements and the fact that other facilities do use very effective pollution controls, the two Enviva facilities utilize no control devices whatsoever for VOCs or hazardous air pollutants. Each facility will emit more than 600 tons of VOCs and more than 50 tons of hazardous air pollutants once they reach full operation. Had the facilities actually complied with the Clean Air Act's control technology requirements and installed controls used by other pellet mills, each plant would emit less than 100 tons of VOCs and less than three tons of hazardous air pollution per year.

Table O on the following page shows VOC controls on wood dryers at the largest wood pellet mills in the country. Notably, the only Enviva plants which do utilize controls, Enviva Cottondale and the Colombo plant, were built by previous owners. Enviva acquired both plants after states had required the facilities to utilize controls.

Table O. Enviva's Failure to Control Dryer VOC Emissions Makes Them the Dirtiest in the Industry

VOC Controls on Dryers at Pellet Mills Above 300,000 Tons Per Year Production Rate					
Facility	State	Production Capacity	VOC Controls on Dryer?	Current Softwood Percent	Dryer VOC Emissions (in tons per year)
Enviva Sampson	NC	535,000	No	75%	306
Enviva Hamlet (proposed and permitted)	NC	535,000	No	75%	306
Enviva Ahoskie	NC	420,000	No	30%	164
Enviva Cottondale	FL	821,000	Yes (RTO)	100%	136
Enviva Northampton	NC	628,179	No	30%	135
Drax LaSalle	LA	500,000	Yes (RTO)	100%	128
Enviva Southampton	VA	535,000	No	10%	122
Georgia Biomass	GA	826,000	Yes (RTO)	100%	55
Zilkha Monticello (proposed and permitted)	AR	661,000	Yes (RTO)	100%	51
Hazlehurst	GA	525,600	Yes (Sent to burner)[A]	100%	32
Highland Pellets	AR	500,000	Yes (Sent to burner)[A]	100%	22
Highland Pellets South (proposed, permit application submitted)	AR	500,000	Yes (Sent to burner)[A]	100%	22
German Pellets	TX	578,000	Yes (RTO)	100%	21
Westervelt	AL	320,000	Yes (RTO)	100%	20
Colombo (Now Enviva Greenwood)	SC	669,000	Yes (RTO)	100%	13
Zilkha	AL	300,000	Yes (RTO)	50-100%[B]	9
Drax Amite	MS	578,000	Yes (RTO)	100%	7
Drax Morehouse	LA	500,000	Yes (RTO)	98%	6

A. Emissions are routed to the furnace for VOC and HAP destruction, achieving 90% reduction
B. Facility processes a range of softwood, but is permitted as if it processed 100% softwood

Part Three: Fires and Explosions

Wood pellets are designed to burn as efficiently as possible, so it shouldn't be surprising that the facilities manufacturing and storing wood pellets face a substantial risk of fires and explosions. What is surprising, however, is just how common and severe these fires and explosions are.[94] Of the 15 new generation pellet mills EIP surveyed, at least eight have had fires or explosions since 2010, including several resulting in injuries.[95] A "flash fire" at the Hazlehurst pellet mill in Hazlehurst, Georgia—the facility's second fire since commencing operations in 2014—seriously injured four employees.[96] The Westervelt wood pellet mill in Tuscaloosa, Alabama had an explosion in 2016 which injured an employee.[97] Enviva has had news-worthy fires at its Florida facility (Enviva Cottondale near Panama City), two fires at its Virginia facilities (Enviva Southampton and its port storage facilities, both in or near Chesapeake), and a North Carolina facility (Enviva Ahoskie north of Greenville).[98] German Pellets Texas alone had fires or explosions in April 2014, April 2015, May 2015, and February 2017, culminating in a two-month long fire in 2017 at German Pellets storage's silo in Port Arthur, Texas.[99] The silo ultimately collapsed, and smoke from the smoldering pellets caused dozens of Port Arthur residents to seek medical attention. The city of Port Arthur and residents have filed multiple lawsuits over the fire, and a court has ordered German Pellets to empty all of its silos and install proper fire-fighting technology. During the process of removing the pellets, a worker was killed when a pile of wood pellets collapsed.

Fires in silos can be particularly difficult to fight, as the German Pellets silo fire demonstrated. Fires can start deep in the silo under many tons of wood pellets thanks to spontaneous combustion, a common phenomenon when a large amount of wood is not properly stored, due to the heat generated from decomposing wood and lack of ventilation. Once a silo fire begins, it may burn for days, weeks, or months. Water is usually ineffective in fighting these fires, as water causes the top layer of pellets to expand, creating an impenetrable crust, preventing water from reaching the fire itself. In the case of the German Pellets fire, even after the silo collapsed more than a month after the fire began, fire fighters still struggled for weeks to stop the fire.[100] In another instance, after a fire burned for four days at a small pellet mill in in West Monroe, Louisiana and injured a firefighter, the local fire chief reported that the fire was very difficult to extinguish, and that "there was really no safe way to do it quickly with a lot of wood chips smoldering and smoking."[101] The uncontrolled burning of so much wood biomass accounts for huge amounts of harmful air pollution.

Beyond fires, explosions also occur. The primary culprit of explosions at wood pellet facilities is airborne wood dust, which is generated at all stages of manufacturing, storage, and transporting of wood pellets. Once this fine dust is suspended in the air it is extremely combustible. For instance, a 2011 blast at Georgia Biomass in Waycross, Georgia, rattled windows up to five miles from the facility.[102] While mills in the U.S. South have thus far escaped fatal explosions, an employee was killed by a dust explosion at a mill in British Colombia in 2012.[103]

The Clean Air Act addresses the risk of fires and explosions, yet many states are not fully implementing the Act's provisions in order to best reduce the risk. The Clean Air Act contains a General Duty Clause which requires facilities producing or handling extremely hazardous substances to design, maintain, and operate their facilities in a safe manner.[104] As the long list of fires and explosions at wood pellet facilities show, wood dust qualifies as an extremely hazardous substance.[105] Unfortunately, permits issued to wood pellet manufacturing plants either fail even to mention the General Duty Clause, or provide only brief, non-specific references to it which do not discuss measures the facility needs to take to properly manage combustible dust. This is insufficient to prevent fires and explosions, and instead EIP believes permits must state that the General Duty Clause applies to the facility's handling of explosive dust and require the facility to perform specific steps that are sufficient to ensure that workers and others who live, work, recreate, or simply commute in the facility's vicinity are protected from the dangers posed by combustible dust. At a minimum, the permits should:

1. Identify the Clean Air Act's General Duty Clause as an applicable requirement with respect to the facility's handling of combustible dust.

2. Specifically require the facility to prepare a hazard analysis identifying the hazards associated with explosive dust and the facility's processes, potential fire and explosion scenarios, and the consequences of a fire or explosion.

3. Establish specific design and operation standards that the facility must meet to prevent a dust-related fire or explosion.

4. Establish recordkeeping and reporting requirements sufficient to demonstrate that the facility is meeting its General Duty Clause obligations.

Implementing these more specific requirements will not only aid in preventing releases of air pollution, but will serve to protect workers and neighbors from harm. Plant managers will benefit too, as EPA has brought enforcement actions against plants for failure to comply with the General Duty clause after accidents, and plant managers have responded that they were not aware of the Clause or its full requirements.

Conclusion and Recommendations

The Clean Air Act only works to protect health and the environment when state agencies are fully implementing all of the Act's requirements. EIP calls on state agencies across the U.S. South to address the errors and omissions identified in this report, and to further make proactive moves to better understand and control emissions from this emerging industry in the future. EIP makes the following recommendations as initial steps to remedy the numerous deficiencies identified in this survey:

1. **Reexamine existing air permits and reissue stronger permits where needed.** Many of the air permits for wood pellet mills were issued before permitting agencies fully understood the scope of VOC and hazardous air pollutant emissions from the industry. These permits allow facilities to exceed the Clean Air Act's major source threshold and are legally deficient. States should take a careful look at permits for

wood pellet mills and assess whether the existing permits account for VOC and hazardous air pollutant emissions from each of the major units at the facility. Where exceedances exist, states should take immediate action to ensure facilities cease violating pollution limits.

2. **Require "major" sources of air pollution to install the best available control technology.** As this report reveals, many pellet mills with major source permits evade using the best available control technology, or any control technology at all, while facilities with minor source permits, often the same size or larger, do utilize controls. This is an unacceptable perversion of the Clean Air Act. States must require facilities with major source permits to reduce emissions to at least the level achieved by the best-controlled minor source facility.

3. **Institute production limits at minor source facilities.** Court decisions and EPA guidance dictate that production limits are necessary aspects of ensuring that facilities do not exceed the major source threshold. This is especially vital at minor source facilities which do not utilize sufficient controls to keep their emissions below legal limits when operating at full capacity. If a facility can exceed legal limits when operating at or near maximum production rates, states must require production limits that ensure the facility does not emit more pollution than legally allowed. Further, production limits allow state agencies and the public a reasonable method to determine whether a facility is exceeding Clean Air Act thresholds. Although a few permits EIP surveyed do incorporate production limits, the overwhelming majority of permits which should have production limits do not and are therefore legally deficient.

4. **Ensure Communities are Notified of and Able to Participate in Permitting Decisions.** As noted above, several permits allowing the construction or modification of wood pellet plants were issued without public notice. Communities near the proposed facilities were not adequately informed of the decision to allow sources of air pollution to locate in their backyard. States should revise their regulations and procedures to include public notice and opportunity for meaningful input from those most affected by a plant's air pollution.

5. **Require annual emissions testing.** Many permits rely on emissions estimates—frequently outdated and inaccurate—rather than source-specific emissions testing to determine the level of air pollution emitted from wood pellet mills. This is especially true for VOC and hazardous air pollution, and from units other than the wood dryer such as pellet coolers and hammermills. While continuous emissions monitoring is the best method to determine actual levels of pollution emitted, where states do not require this they must at least require annual testing of each of the major units at pellet mills for volatile organic compounds and hazardous air pollutants.

6. **Reduce the risk of fires and explosions.** Fires and explosions from wood dust plague the wood pellet industry, and the Clean Air Act gives states a powerful tool to address the problem in the General Duty Clause. States must begin utilizing the

Genera Duty Clause effectively and require facilities to comply with their general duty under the Clean Air Act to design and maintain a safe facility.

Appendix A: Clean Air Act Permitting in the Context of Wood Pellet Manufacturing

This Appendix provides a brief primer on the basic framework of the Clean Air Act and how it applies to the wood pellet industry. The Clean Air Act requires sources of air pollution to obtain various types of permits based on the amount and type of pollution emitted, as well as the nature and location of the source. These permits generally contain emission limits, operating standards, or other requirements to protect air quality. One key thing to remember is that these permitting programs are primarily administered by state environmental agencies, and while the federal EPA has some oversight, the vast majority of decision-making and enforcement occurs at the state level. This means that permits and enforcement can vary considerably from state to state.

State Construction Permits

In general, sources of air pollution must obtain at least a state permit to construct and operate a new source of air pollution. These permits may or may not be open to public notice and comment, and states are relatively free to issue these permits on their own terms. Unless a facility triggers one of the other types of permits, this may be the only permit a facility needs. Wood pellet plants, especially large export-based plants, need additional permits due to their high emission rates.

Title V Permits

Title V of the Clean Air Act establishes a federal operating permit program. Title V permits incorporate all legal requirements for air pollution that apply to a facility into a single permit. Most importantly, Title V permits require facilities to demonstrate how they will comply with each of the legal requirements, with conditions for monitoring, record keeping, and reporting. Facilities which emit or have the potential to emit more than 100 tons per year of any regulated pollutant, 25 tons per year of HAPs, or 10 tons per year of any single HAP must apply for a Title V permit within a year after they begin operation. Large wood pellet facilities all emit VOCs, and frequently other regulated pollutants or HAPs, above the Title V threshold, so every facility in this report has at least a Title V permit. Finally, although Title V is a federal operating permit in that the requirement are specified by the Clean Air Act, responsibility for the issuance and enforcement of these permits rests mostly with state agencies.

New Source Review and Prevention of Significant Deterioration Permits

New Source Review is the Clean Air Act's permitting program designed to limit emissions from large sources of air pollution by requiring a permit before a "major source" begins construction or undertakes a modification. Although EPA has created a stricter definition of "major source" for many industries (a facility with the potential to emit 100 tons per year of a regulated pollutant), for wood pellet mills, "major source" means a facility with the potential to emit more than 250 tons per year of a regulated pollutant. It is worth pointing out that that the threshold is based on potential emissions rather than actual emissions, so even if a facility usually operates at 75% capacity, the relevant emissions are those produced while operating at 100% capacity.

New Source Review consists of several types of permits, but the permit at issue in the wood pellet industry is known as a Prevention of Significant Deterioration (PSD) permit. PSD permitting requires facilities to conduct impact analyses, air dispersion modelling, and other protective steps, but the heart of PSD permitting is the "best available control technology" requirement. On a technical level, PSD does not actually require a facility to install the best available control technology, but it does require a facility to limit emissions to the level achievable by using the best available control technology. In practice, however, PSD is synonymous with utilizing the best available control technology, and permitting agencies are supposed to select the best available control technology on a case-by-case basis and implement corresponding emission limits.

PSD permitting is meant to be rigorous, and most of the wood pellet industry has attempted to remain below the 250 ton per year threshold to avoid it (see the section on synthetic minor limits below). Only three facilities have gone through New Source Review and PSD permitting before construction: Enviva Hamlet, Enviva Sampson, and Drax LaSalle. Two other facilities, German Pellets and Enviva Cottondale, are currently going through PSD permitting after discovering they were exceeding 250 tons per year of VOCs. Many of the issues revealed in EIP's survey involve facilities either exceeding the 250 ton per year threshold and not going through PSD, or states failing to select controls which are widely used in the industry as the best available control technology.

Hazardous Air Pollutants and Permitting

Hazardous air pollutants (HAPs) are those pollutants which EPA considers especially toxic or carcinogenic, and are more strictly regulated under the Clean Air Act. Unlike the permits discussed above, there is no unique permit needed to emit HAPs; instead, facilities which have the potential to emit more than 10 tons per year of any single HAP, or more than 25 tons per year of all HAPs combined, must apply for a Title V permit and utilize the maximum achievable control technology, which is meant to be stricter than other requirements such as PSD's best available control technology. For most industries, EPA has promulgated national standards and limits which represent the maximum achievable control technology. The wood pellet industry, however, is so new that EPA has not established any standards. This means it is up to the states to develop, on a case-by-case basis, maximum achievable control technology standards and emissions limits for wood pellet facilities. Unfortunately, for facilities which qualify, states have frequently failed to require any control technology at all, and several facilities emit substantially more HAPs than they would if states actually required maximum achievable control technology.

Synthetic Minor Sources

Each of the above permitting realms has a triggering pollution threshold, e.g. 250 tons per year of any PSD pollutant. The key to these thresholds is that they are triggered by the *potential* to emit that pollutant, rather than whether a facility actually emits more than the threshold in a given 12-month period. Facilities with such a potential are known as "major sources," for example a facility which has the potential to emit more than 100 tons per year of a regulated pollutant is a major source in terms of Title V permitting. Facilities which have a potential to emit above a given threshold but wish to avoid the stricter permitting can opt to take limits to remain a minor source. These are known as "synthetic minor limits" because the facility is not truly a minor source, but will be treated as such if it complies with the limit. To be valid synthetic minor limit, the limit must be enforceable, ideally in terms of a production or operating limit. A good example would be a facility which would emit 275 tons per year of VOCs when operating at a production rate of 400,000 tons per year (and would therefore be a major source for PSD), but takes a legal limit which restricts operations to just 350,000 tons per year, which lowers VOC emissions to below 250 tons per year. Most wood pellet facilities are permitted as synthetic minor sources for PSD, but only have a blanket emission limit in their permits, such as "the facility shall emit less than 249 tons per year of VOCs," rather than an actual production limit. Unfortunately, such blanket limits are difficult to enforce in the real world if a facility does not accurately understand its rate of emissions. This is why many large pellet mills were in fact exceeding their 249 ton per year limits, because states and the industry did not realize that many units emitted much more VOCs than they believed.

Notes

[1] Florida has agreed to require Enviva Cottondale wood pellet plant to go through major source permitting in response to recent comments submitted by EIP. It remains to be seen whether Florida will require the best available control technology, despite the fact that the Clean Air Act requires it.

[26] Application to Modify Air Permit No. 10203R03 for Enviva Pellets Northampton (May 2015).
[27] North Carolina DEQ Air Quality Permit for Enviva Northampton, Permit No. 10203R04 (Oct. 12, 2015).
[28] North Carolina State Implementation 15A NCAC 2D .0530(i) ("[w]hen a particular source or modification becomes a major stationary source or major modification solely by virtue of a relaxation in any enforceable limitation which was established after August 7, 1980 on the capacity of the source or modification to emit a pollutant … then the provisions of [North Carolina's PSD regulations] shall apply to the source or modification as though construction had not yet begun on the source or modification."). The most recent version of North Carolina's PSD regulations includes the same language but in a different place: 15A NCAC 2D. 0530(k). Nearly identical language appears in EPA's federal PSD regulations at 40 C.F.R. 52.21(r)(4).
[29] *See supra,* note 15.
[30] The permit review document for both the original construction permit and the permit to increase VOC emissions contain the following statement: "Public notice is not required for this state-only construction permit under 15A NCAC 02Q .0300." North Carolina DEQ Air Permit Reviews for Air Permits No. 10203R00 and 10203R04.
[31] 40 CFR Part 51, Subpart I (Requirements for Preparation, Adoption, and Submittal of Implementation Plans—Review of New Sources and Modifications) requires 30 days public notice and opportunity to comment for both minor and major new sources of air pollution. 40 CFR §51.161.
[32] The Clean Air Act is clear that before a permit can be issued to a major facility like Enviva Hamlet, the state must hold a public hearing. North Carolina, however, believes it is their prerogative whether to hold a hearing, based on whether North Carolina regulators determine that there is sufficient public interest in the proposed permit. Even if this were a valid interpretation, North Carolina still failed to hold a hearing under the state's own guidelines. North Carolina ignored repeated requests for a hearing, and approximately 300 public comments, showing there was indeed substantial public interest.
[33] *See, e.g.* North Carolina DEQ Air Quality Permit for Enviva Hamlet, Permit No. 10365R00 (Mar. 29, 2016) (listing the facility's address with an incorrect zip code placing the facility some 90 miles east of its intended location). Other errors include public notice documents with no street address or an incorrect street address.

[55] *Id.*
[56] *See supra*, note 54.
[57] Because the stack testing report did not include the rate of softwood processed, it is impossible to develop a source-specific emission factor for Enviva Amory. Instead, EIP applied the emission factors from Georgia Biomass, which are widely considered to be the best emission factors for 100% softwood facilities, and applied those emission factors to Enviva Amory's capacity of 125,000 tons per year. *See supra* note 15. Notably, even if the Georgia Biomass factors give relatively higher-than-actual emission estimates, the facility would still be well above the 250 ton per year threshold.
[58] 185 tons per year of VOC emissions at 60% softwood and 99,000 tons per year production rate gives an emission factor of 3.73 lb/ODT. Scaling this emission factor to 65% softwood gives an emission factor of 4.04 lb/ODT, which applied to the facility's current production rate of 121,000 tons per year results in 253 tons per year of VOCs.
[59] Drax Morehouse operates at 620,000 tons per year and claims to emit 20 tons per year of VOCs, for comparison testing at Enviva Cottondale found 460 tons per year of VOCs when operating at 610,000 tons per year, testing at Georgia Biomass found up to 533 tons per year of VOCs while operating at 820,000 tons per year, and testing at German Pellets Texas reports up to 446 tons per year of VOC emissions when operating at 578,000 tons per year.
[60] Drax Title V Air Permit Modification Application for Drax Morehouse (Aug. 2016), Section 5.0 Emissions Calculations. Note that when Drax submitted this same testing to Mississippi to support its claims of low VOCs at Drax Amite, they added an asterisk to the pellet cooler testing, labelling it "engineering testing data." No other portion of Drax's testing contained such an asterisk, and EIP assumes this is to denote that the pellet cooler testing was not conducted pursuant to any requirement or EPA-methodology.
[61] Louisiana's Air Permit Briefing Sheet for the November 17, 2017 Title V Air Permit Modification gives 20.95 tons per year of VOCs from the pellet coolers, an identical rate to Drax's emission factor from their permit application, showing that Louisiana accepted Drax's emission factor. A December 22, 2017 phone conversation with Steven Schwartz, Louisiana DEQ's Waste Permits Division (the Division's officer responsible for reviewing Drax Morehouse's stack tests), confirmed that the department never received any

stack testing data concerning the pellet coolers. Further, Drax Morehouse's stack testing report only shows PM testing from the pellet coolers, and Louisiana DEQ's review of these tests also only show PM testing from the pellet coolers. *See* Letter from James Meyers, Engineering Manager, Waste Permits Division, LDEQ to Michael Bellow, Drax Environmental Health & Safety Monitor, RE: Compliance Tests Conducted February 10-24, 2016.

[62] Louisiana's Air Permit Briefing Sheet for the November 17, 2017 Title V Air Permit Modification.

[63] Assuming the worst-case scenario that the facility-wide emissions are 708 tons per year, and a VOC destruction rate for an RTO of 95%, total emissions from the dryer, hammermills, and pelletizing lines would be 35.4 tons per year.

[64] Virginia DEQ Stationary Source Permit to Construct and Operate, Registration No. 61653 for Enviva Pellets Southampton (Sep. 5, 2012).

[65] The exact rate is not available, but applying Georgia Biomass emission factors approximately 900 to 1,000 tons per year of VOCs.

[66] Letter from Joe Sullivan, Trinity Consultants to Troy Breathwaite, Virginia DEQ, Re: Air Quality Permit Application (May 9, 2013). *See also* Virginia DEQ Stationary Source Permit to Construct and Operate, Registration No. 61653 for Enviva Pellets Southampton (Aug. 15, 2013).

[67] A thorough review of Virginia DEQ permitting documents related to Enviva Southampton provided by the state in response to an EIP Freedom of Information Act request reveals no discussion of HAP emissions after the switch to hardwoods. The only reference to HAP emissions are found in Enviva's applications.

[68] Enviva developed a weighted emission factor by scaling HAP emissions based on VOC emissions, as such: "To account for hardwood HAP & TAP [toxic air pollutants] emissions, factors were conservatively calculated by taking the AP-42 HAP factors for 100% softwood (green) and multiplying by the ratio of the total listed VOC emission factors for hardwood and softwood (0.24 / 4.7)." Enviva Pellets Southampton Title V Air Permit Application (Jan. 4, 2016), Table 5 ("Rotary Dryer -HAP and TAP Wood Combustion Emissions"). Under this method, Enviva assumes each HAP is therefore reduced at the same rate total VOCs are reduced. Rather than base all the HAP emission factors for a given hardwood content on the sliding VOC scale, EIP used the ratio between a given HAP in in the 100% softwood AP-42 source category and the emission factor for the same HAP in the 40 to 60% source category to create a HAP-specific rate of decrease (AP-42 Table 10.6.2-3 SCC 3-07-006-25 and SCC 3-07-006-26 respectively). This method does not assume that all HAPs are reduced at the same rate, but instead accounts for the unique emission rates of each HAP. For formaldehyde the emission factor at 100% softwood is .14 lb/ODT, and at 50% softwood (e.g. the middle point of the 40 to 60% AP-42 category), the emission factor is .096 lb/ODT. This amounts to a reduction in formaldehyde emissions of 31.43%, whereas total VOCs between the same two source categories are reduced from 4.7 lb/ODT to 1.6 lb/ODT, for a reduction of 65.96%. This shows that formaldehyde emissions do not decrease at the same rate as total VOCs, and instead decrease much more slowly.

[69] Appling County Wood Pellets, a facility in Georgia, conducted three sets of HAP testing in 2017. In each set of testing, Appling tested at 70% hardwood, 80% hardwood, and 100% hardwood. In two out of three tests, acetaldehyde and formaldehyde increased as hardwood increased. Averages of all three tests revealed emissions of formaldehyde at .85 lb/hour at 70% hardwood and 1.11 lb/hour at 100% hardwood; acetaldehyde at .52 lb/hour at 70% hardwood and .61 lb/hour at 100% hardwood; methanol was emitted at 1.33 lb/hour at both 70% and 100% hardwood. Further, studies of lumber and engineered wood dryers show that during the wood drying process, hardwood emits significantly more methanol than softwood. For instance, one study assessing HAP emissions from oriented strandboard drying showed hardwood emitting nearly three times as much methanol as softwood southern pine, at .33 lb/ODT and .12 lb/ODT respectively. *See* Milota, Michael, "Emissions from Wood Drying: the Science and the Issues," Forest Products Journal, 2000, Issue 50(6). Another study of wood drying, conducted at lumber kilns, tested five species of softwood and one species hardwood for HAP emissions, including methanol. The results again showed that the hardwood species emitted much higher rates of methanol than any of the softwoods. *See* Milota, Mike and Mosher, Paul, "Emissions of Hazardous Air Pollutants from Lumber Drying," Forest Products Journal, July 2008 Issue 7/8, at 50-55. Notably, the raw data which Enviva relies upon for its methanol emission rate (known as AP-42 emission factors) is based on just three particle board dryers, and EPA gave the data one of the lowest reliability ratings. Enviva relies on the methanol emission factor at AP-42 § 10.6.2, Table 10.6.2-3 SCC 3-07-006-26. Out of the wood-fired rotary dryers tested to develop the methanol AP-42 emission factors,

there are only five sources processing any significant amount of hardwood (all of which processed 55% hardwood and 45% softwood pine). Of these five, two are noted to be pre-dryers and have substantially lower emissions than the other dryers, and therefore should not be used to estimate emissions from a full-scale rotary dryer. AP-42's emission factor, however, does not exclude the pre-dryer tests from the average for the emission factor, which means the final emission factor is biased low by these pre-dryer tests. *See* AP-42 § 10.6.2 Data Sets, Rotary Dryer category, Excel spreadsheet available at https://www3.epa.gov/ttn/chief/ap42/ch10/index.html.

[70] AP-42 § 10.6, *see* note 77.

[71] *See* note 77. At 10% softwood the emission factor is .0608 lb/ton. This rate applied to Enviva Southampton's production rate is 16.2 tons per year.

[72] Enviva estimated the dryer formaldehyde emissions at 5.87 tpy and facility wide HAP emissions at 21.8, while EIP estimates formaldehyde dryer emissions at 16.2 tpy, which pushes facility wide emissions to 31.4 tpy. See Title V Permit Application for Enviva Southampton.

[73] Appling County Wood Pellets, a facility in Georgia, conducted three sets of HAP testing in 2017. In each set of testing, Appling tested at 70% hardwood, 80% hardwood, and 100% hardwood. EIP averaged all three sets of testing at each softwood ratio, then averaged the emission factor for 80% hardwood and 100% hardwood to estimate emissions at 90% hardwood, which is what Enviva Southampton processes. These emission factors are .08 lb/odt for methanol, .033 lb/odt for acetaldehyde, and .061 lb/odt for formaldehyde.

MEMORANDUM

DATE: 1-29-2013

TO: Eric Cornwell- Stationary Source Permitting Manager

FROM: Manny Patel- VOC unit Manager

SUBJECT: Emission factors for Wood Pellet Manufacturing

BACKGROUND:

We are seeing a lot of wood pellet manufacturing application being submitted to GAEPD. These applications are all using different emission factors. It is GAEPD's desire to provide standardized emission factors for applicant's to use in wood pellet manufacturing application. This will make the applications consistent and aide in faster review of these applications.

GAEPD has done extensive testing at Georgia Biomass and have come to conclusion that in addition to dryers there a significant amount of VOC emissions from Hammermill, Pellet Coolers and storage and handling from wood pellet manufacturing operations.

BASIS OF RECOMMENDATION:

1. **VOC Emissions:**

   a. **Dryers:**
   It is our understanding that from the applications submitted to us that the operating temperatures of the dryer's used in pellet mill are very similar to that of particle board dryers. Additionally, the moisture content of the chips entering and exiting the pellet mill dryer and green particle board dryers are very similar. Hence, VOC emissions from the pellet mill dryers are same in amount and characteristics of particle board dryers.

   This approach was further validated when we took VOC emissions test from Georgia Biomass (May 2012, Agri Products Thomasville, GA (March 22, 2010), Agri products Fitzgerald, GA(March 19 2009), Telfair Products, Lumber City GA(August 27,2009) and compared to that of particle board dryer emissions factors from AP-42 for green wood as shown in the attached Table. Based on the comparison of different VOC emission factors we concluded that the particleboard dryers VOC emission factors from AP-42 Chapter 10, Table 10.6.2-3(SCC 3-07-006-25) are a good representation for the wood pellet dryers.

   b. **Hammermill, Pellet Cooler and Storage and Handling**

   The VOC emission factors for Hammermill, Pellet Cooler and storage were taken from May 16, 2012 testing for Georgia Biomass. This is the only current data we have so we suggest using these until more test becomes available.

2. HAP and HCl Emissions:

a. Dryers:

The emission of Formaldehyde, Acetaldehyde and Methanol from Georgia Biomass test (May 16,2012) were compared to emissions from Particle board dryers from AP-42 Chapter 10, Table 10.6.2-3(SCC 3-07-006-25) and OSB dryes from AP-42 Chapter 10, Table 10.6.1-3(SCC3-07-010-09). All of these emission factors are almost identical to each other. Hence it is suggested that HAP emission factors for Particle board dryer from AP-42 Chapter 10, Table 10.6.2-3(SCC 3-07-006-25) be used for Formaldehdye, acetaldehyde and methanol and adjusted where deemed necessary for worst case emissions.

HCl emissions from AP-42 Chapter 1, Table 1.6-3 for wood residue combustion should be used for estimating HCl emissions from wood pellet dryers.

b. Hammermill, Pellet Cooler and Storage and Handling

Georgia Biomass has performed HAP testing on the pellet cooler exhaust. We estimated the HAP emissions from the Hammermill and storage areas by taking the ratio of the VOC emissions from pellet cooler to hammer mill and storage areas and applied the same ratio to estimate HAP emissions.

3. NOX and CO and PM emissions:

a. Dryers:

Both NOx and CO are temperature dependent. OSB dryer operate at lower temperature and hence generate more CO and less NOx. While particle board dryers operate at higher temperature and hence generate less CO and more NOx. Hence, a worst case emission from both data sources is recommended for CO and NOx.

NOx emission factor from AP-42 Chapter 10 Table 10.6.2-2 for particleboard dryer (SCC3-07-007-08) should be used.

CO emission factor from AP-42 Chapter 10 Table 10.6.1-2 for OSB dryer (SCC3-07-0010-09) should be used.

b. **PM Total and Condensible**:

PM total and condensible should be calculated by using AP-42 Chapter 6, Table 10.6.2-1 for Particle board dryer (SCC 3-07-006-25).

GAEPD RECOMMENDED EMISSION FACTORS FOR WOOD PELLET MANUFACTURING

Emission Source	**Uncontrolled Emission Factor**	**Basis of Emission factor**	**Control Device**
Rotary Dryer Direct wood fired processing green softwood	6.0 lb/ODT for VOC	AP-42 Table 10.6.2-3 SCC 3-07-006-25 (Adjusted)	If emissions are routed to the dryer with WESP/RTO controls use 95% DRE for VOC and HAP
	5.3 lb/ODT for CO	AP-42 Table 10.6.1-2 SCC3-07-010-09	
	2.7 lb/ODT for NOx	AP-42 Table 10.6.2-2 SCC 3-07-006-25	
	2.2 lb/ODT for PM total	AP-42 Table 10.6.2-1 SCC 3-07-006-25	
	1.1 lb/ODT for PM Condensible	AP-42 Table 10.6.2-1 SCC 3-07-006-25	
	0.11 lb/ODT for Acetaldehyde	AP-42 Table 10.6.2-3 SCC 3-07-006-25 (Adjusted)	
	0.14 lb/ODT for Formaldehyde	AP-42 Table 10.6.2-3 SCC 3-07-006-25	
	0.11 lb/ODT ton for Methanol	AP-42 Table 10.6.2-3 SCC 3-07-006-25	If WESP is used for PM control use 70% removal efficiency for HCl (pH of the water needs to be monitored and maintained)
	1.9 E-02 lb/MM Btu for HCl	AP-42 Table 1.6-3	
Hammermill	2.5 lb VOC/ton product	Georgia Biomass Testing	If emissions are routed to dryer 90 % DRE for VOC and HAP
	0.004 lb/ton of product for Acetaldehyde	Georgia Biomass- prorated from Pellet Cooler testing	
	0.008 lb/ton of product for Formaldehyde	Georgia Biomass-prorated from Pellet Cooler testing	If emissions are routed to RTO use 95 % DRE for VOC and HAP. .
	0.004 lb/ton for Methanol	Georgia Biomass-prorated from Pellet Cooler testing	

Emission Source	Uncontrolled Emission Factor	Basis of Emission factor	Control Device
Pelletizer/Pellet Cooler (without Steam injection or extraction)	0.5 lb VOC/ton of Product	Georgia Biomass Testing	If emissions are routed to dryer 90 % DRE for VOC and HAP
	0.001 lb/ton of product for Acetaldehyde	Georgia Biomass Testing	
	0.002 lb/ton of product for Formaldehyde	Georgia Biomass Testing	If emissions are routed to RTO use 95 % DRE for VOC and HAP.
	0.001 lb/ton of product for Methanol	Georgia Biomass Testing	
Pelletizer/Pellet Cooler (with Steam injection)	1.3 lb VOC/ton of product	Georgia Biomass Testing	If emissions are routed to dryer 90 % DRE for VOC and HAP
	0.002 lb/ton of product for Acetaldehyde	Georgia Biomass- prorated from Pellet Cooler testing	
	0.004 lb/ton of product for Formaldehyde	Georgia Biomass- prorated from Pellet Cooler testing	If emissions are routed to RTO use 95 % DRE for VOC and HAP.
	0.002 lb/ton of product for Methanol	Georgia Biomass- prorated from Pellet Cooler testing	
Storage/Handling	0.4 lb VOC/ton of product	Georgia Biomass Testing	If emissions are routed to dryer 90 % DRE for VOC and HAP
	0.001 lb/ton of product for Acetaldehyde	Georgia Biomass- prorated from Pellet Cooler testing	
	0.002 lb/ton of product for Formaldehyde	Georgia Biomass- prorated from Pellet Cooler testing	If emissions are routed to RTO use 95 % DRE for VOC and HAP
	0.001 lb/ton of product for Methanol	Georgia Biomass- prorated from Pellet Cooler testing	

Note: These are GAEPD recommended emission factors. Use of these emission factors does not guarantee compliance with all state and federal regulations

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Washington, D.C. 20460

JUN 13 1989

MEMORANDUM

SUBJECT: Guidance on Limiting Potential to Emit in New Source Permitting

FROM: Terrell E. Hunt
Associate Enforcement Counsel
Air Enforcement Division
Office of Enforcement and Compliance Monitoring

John S. Seitz, Director
Stationary Source Compliance Division
Office of Air Quality Planning and Standards

TO: Addressees

This memorandum transmits the final guidance on conditions in construction permits which can legally limit a source's potential to emit to minor or de minimis levels. We received many helpful comments on the January 24, 1989 draft of this guidance, and have incorporated the comments into the final document wherever possible. A summary of the major changes which have been made to the guidance in response to these comments is provided below.

Several commenters noted that the draft guidance used the term "federally enforceable" to mean both federally enforceable as defined in the new source regulations (40 C.F.R. Sections 52.21(b) (17), 51.165(a) (1) (xiv), 51.166(b) (17)), and enforceable as a practical matter. We have tried to distinguish the places where each term should be used, explained the relationship between the two terms, and indicated that in order to properly restrict potential to emit, limitations must be both federally enforceable as defined in the regulations and practically enforceable.

Some commenters requested that the section on averaging times for production limits be more specific as to when it is appropriate to use limitations which exceed a one month time basis. We have tried to explain why it is not possible to develop generic criteria for making this distinction, and to indicate situations where exceptions to the policy that production and operation limitations not exceed one month may be warranted.

There were some requests for a section on enforcement. We have included a new Section VI which addresses this topic. We also received many good suggestions on the example permit limitations. The section on examples has been substantially reworked to reflect your comments.

Finally, we learned through the comments that in two specific circumstances, short term emission limits are the most useful and reasonable way to restrict and verify limits on potential to emit. These circumstances are: 1) when control equipment is installed but control equipment operating parameters are difficult to measure during enforcement inspections; and 2) in surface coating operations with numerous and unpredictable use of coatings containing varying VOC content, where add-on control equipment is not employed. Therefore, we have made a narrow exception to the flat prohibition on use of emission limits to restrict potential to emit for these specific circumstances, and only when certain additional conditions have been met.

Again, we appreciate the thoughtful comments we have received on this guidance. Please insert this document into your Clean Air Act Compliance/Enforcement Policy Compendium as Item Number H.3. If you have any questions, please contact Judith Katz in the Air Enforcement Division at FTS 382-2843, or Sally Farrell in the Stationary Source Compliance Division at FTS 382-2875.

OFFICE OF AIR QUALITY PLANNING AND STANDARDS

Limiting Potential to Emit in New Source Permitting

I. Introduction

II. The Louisiana-Pacific Case

III. Types of Limitations that will Limit Potential to Emit

IV. Time Periods for Limiting Production and Operation

V. Sham Operational Limits

  A. Permits with conditions that do not reflect a source's planned mode of operation are void ab initio and cannot act to shield the source from the requirement to undergo preconstruction review.

    1. Sham permits are not allowed by 40 CFR 52.21(r) (4)

    2. Sham permits are not allowed by the definition of potential to emit: 40 CFR 52.21(b) (4), 51.165(a) (1) (iii), 51.166(b) (4)

    3. Sham permits are not allowed by the Clean Air Act

  B. Guidelines for determining when minor source construction permits are shams.

    1. Filing a PSD or nonattainment NSR application

    2. Applications for funding

    3. Reports on consumer demand and projected productions levels

    4. Statements of authorized representatives of the source regarding plans for operation

VI. Enforcement Procedures

VII. Examples

VIII. Conclusion

Limiting Potential to Emit in New Source Permitting

I. Introduction

Whether a new source or modification is major and subject to new source review under Parts C and D of the Clean Air Act is dependent on whether that source or modification has or will have the potential to emit major or significant amounts of a regulated pollutant. Therefore, the definition of "potential to emit" under the new source regulations is extremely important in determining the applicability of new source review to a particular source. The federal regulations define "potential to emit" as:

> the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of fuel combusted, stored or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable.

40 C.F.R Sections 52.21(b) (4), 51.165(a) (1) (iii), 51.166(b) (4).

Permit limitations are very significant in determining whether a source is subject to major new source review. This is because they are the easiest and most common way for a source to obtain restrictions on its potential to emit. A permit does not have to be a major source permit to legally restrict potential emissions. A minor source construction permit issued pursuant to a state program approved by EPA as meeting the requirements of 40 C.F.R. Section 51.160 is federally enforceable. In fact, any permit limitation can legally restrict potential to emit if it meets two criteria: 1) it is federally enforceable as defined by 40 C.F.R. Sections 52.21(b) (17), 51.165(a) (1) (xiv), 51.166(b) (17), i.e., contained in a permit issued pursuant to an EPA-approved permitting program or a permit directly issued by EPA, or has been submitted to EPA as a revision to a State Implementation Plan and approved as such by EPA; and 2) it is enforceable as a practical matter. The second criterion is an implied requirement of the first criterion. A permit requirement may purport to be federally enforceable, but, in reality cannot be federally enforceable if it cannot be enforced as a practical matter.

Non-permit limitations can also legally restrict potential to emit. These limitations include New Source Performance Standards codified at 40 C.F.R. Part 60 and National Emission Standards for Hazardous Air Pollutants codified at 40 C.F.R. Part 61.

The appropriate means of restricting potential to emit through permit conditions has been an issue in recent enforcement cases. Through these cases and through guidance issued by EPA, the Agency has addressed three questions: what types of permit limitations can legally limit potential to emit; whether long averaging times for production limitations are enforceable as a practical matter; and whether sources may limit potential to emit to minor source levels as a means of circumventing the preconstruction review requirements of major source review.

II. The Louisiana-Pacific Case

In United States v. Louisiana-Pacific Corporation, 682 F. Supp. 1122 (D. Colo. Oct. 30, 1987) and 682 F. Supp. 1141 (D. Colo. March 22, 1988), Judge Alfred Arraj discussed the type of permit restrictions which can be used to limit a source's potential to emit. The Judge concluded that:

> ... not all federally enforceable restrictions are properly considered in the calculation of a source's potential to emit. While restrictions on hours of operation and on the amount of materials combusted or produced are properly included, blanket restrictions on actual emissions are not.

682 F. Supp. at 1133.

The Court held that Louisiana-Pacific's permit conditions which limited carbon monoxide emissions to 78 tons per year and volatile organic compounds to 101.5 tons per year should not be considered in determining "potential to emit" because these blanket emission limits did not reflect the type of permit conditions which restricted operations or production such as limits on hours of operation, fuel consumption, or final product.

The Louisiana-Pacific court was guided in its reasoning by the D.C. Circuit's holding in Alabama Power v. Costle, 636 F. 2d 323 (D.C. Circuit 1979). Before Alabama Power, EPA regulations required potential to emit to be calculated according to a source's maximum uncontrolled emissions. In Alabama Power, the D. C. Circuit remanded those regulations to EPA with instructions that the Agency include the effect of in-place control equipment in defining potential to emit. EPA went beyond the minimum dictates of the D.C. Circuit in promulgating revised regulations in 1980 to include, in addition to control equipment, any federally enforceable physical or operational limitation. The Louisiana-Pacific court found that blanket limits on emissions did not fit within the concept of proper restrictions on potential to emit as set forth by Alabama Power.

Moreover, Judge Arraj found that:

> ...a fundamental distinction can be drawn between the federally enforceable limitations which are expressly included in the definition of potential to emit and (emission) limitations.... Restrictions on hours of operation or on the amount of material which may be combusted or produced ... are, relatively speaking, much easier to "federally enforce." Compliance with such conditions could be easily verified through the testimony of officers, all manner of internal correspondence and accounting, purchasing and production records. In contrast, compliance with blanket restrictions on actual emissions would be virtually impossible to verify or enforce.

Id. Thus, Judge Arraj found that blanket emission limits were not enforceable as a practical matter.

Finally, the Court reasoned that allowing blanket emission limitation to restrict potential to emit would violate the intent of Congress in establishing the Prevention of Significant Deterioration (PSD) program.

III. Types of Limitations that will Restrict Potential to Emit

As an initial matter in this discussion, a few important terms should be defined. Emission limits are restrictions over a given period of time on the amount of a pollutant which may be emitted from a source into the outside air. Production limits are restrictions on the amount of final product which can be manufactured or otherwise produced at a source. Operational limits are all other restrictions on the manner in which a source is run, including hours of operation, amount of raw material consumed, fuel combusted, or conditions which specify that the source must install and maintain add-on controls that operate at a specified emission rate or efficiency. All production and operational limits except for hours of operation are limits on a source's capacity utilization. Potential emissions are defined as the product of a source's emission rate at maximum operating capacity, capacity utilization, and hours of operation.

To appropriately limit potential to emit consistent with the opinion in Louisiana-Pacific, all permits issued pursuant to 40 C.F.R. Sections 51.160, 51.166, 52.21 and 51.165 must contain a production or operational limitation in addition to the emission limitation in cases where the emission limitation does not reflect the maximum emissions of the source operating at full design capacity without pollution control equipment. Restrictions on production or operation that will limit potential to emit include limitations on quantities of raw materials consumed, fuel combusted, hours of operation, or conditions which specify that the source must install and maintain controls that reduce emissions to a specified emission rate or to a specified efficiency level. Production and operational limits must be stated as conditions that can be enforced independently of one another. For example, restrictions on fuel which relates to both type and amount of fuel combusted should state each as an independent condition in the permit. This is necessary for purposes of practical enforcement so that, if one of the conditions is found to be difficult to monitor for any reason, the other may still be enforced.

When permits contain production or operational limits, they should also have recordkeeping requirements that allow a permitting agency to verify a source's compliance with its limits. For example, permits with limits on hours of operation or amount of final product should require an operating log to be kept in which the hours of operation and the amount of final product produced are recorded. These logs should be available for inspection should staff of a permitting agency wish to check a source's compliance with the terms of its permit.

When permits require add-on controls operated at a specified efficiency level, permit writers should include, so that the operating efficiency condition is enforceable as a practical matter, those operating parameters and assumptions which the permitting agency depended upon to determine that the control equipment would have a given efficiency.

An emission limitation alone would limit potential to emit only when it reflects the absolute maximum that the source could emit without controls or other operational restrictions. When a permit contains no limits on capacity utilization or hours of operation, the potential to emit calculation should assume operation at maximum design or achievable capacity (whichever is higher) and continuous operation (8760 hours per year).

The particular circumstances of some individual sources make it difficult to state operating parameters for control equipment limits in a manner that is easily enforceable as a practical matter. Therefore, there are two exceptions to the absolute prohibition on using blanket emission limits to restrict potential to emit. If the permitting agency determines that setting operating parameters for control equipment is infeasible in a particular situation, a federally enforceable permit containing short term emission limits (e.g. lbs per hour) would be sufficient to limit potential to emit, provided that such limits reflect the operation of the control equipment, and the permit includes requirements to install, maintain, and operate a continuous emission monitoring (CEM) system and to retain CEM data, and specifies that CEM data may be used to determine compliance with the emission limit.

Likewise, for volatile organic compound (VOC) surface coating operations where no add-on control is employed but emissions are restricted through limiting VOC contents and quantities of coatings used, emission limits may be used to restrict potential to emit under the following limited circumstances. If the permitting agency determines for a particular surface coating operation that operating and production parameters (e.g. gallons of coating, quantities produced) are not readily limited due to the wide variety of coatings and products and due to the unpredictable nature of the operation, emission limits coupled with a requirement to calculate daily emissions may be used to restrict potential to emit. The source must be required to keep the records necessary for this calculation, including daily quantities and the VOC content of each coating used. Emission limits may be used in this limited circumstance to restrict potential to emit since, in this case, emission limits are more easily enforceable than operating or production limits.

IV. Time Periods For Limiting Production and Operation

As discussed above, a limitation specifically recognized by the regulations as reducing potential to emit is a limitation on production or operation. However, for these limitations to be enforceable as a practical matter, the time over which they extend should be as short term as possible and should generally not exceed one month. This policy was explained in a March 13, 1987 memorandum from John Seitz to Bruce Miller, Region IV. The requirement for a monthly limit prevents the enforcing agency from having to wait for long periods of time to establish a continuing violation before initiating an enforcement action.

EPA recognizes that in some rare situations, it is not reasonable to hold a source to a one month limit. In these cases, a limit spanning a longer time is appropriate if it is a rolling limit. However, the limit should not exceed an annual limit rolled on a monthly basis. EPA cannot now set out all inclusive categories of sources where a production limit longer than a month will be acceptable because every situation that may arise in the future cannot now be anticipated. However, permits where longer rolling limits are used to restrict production should be issued only to sources with substantial and unpredictable annual variation in production, such as emergency boilers. Rolling limits could be used as well for sources which shut down or curtail operation during part of a year on a regular seasonal cycle, but the permitting authority should first explore the possibility of imposing a month-by-month limit. For example, if a pulp drier is periodically shut down from December to April, the permit could contain a zero hours of operation limit for each of those months, and then the appropriate hourly operation limit for each of the remaining months. Under no circumstances would a production or operation limit expressed on a calendar year annual basis be considered capable of legally restricting potential to emit.

V. Sham Operational Limits

In the past year, several sources have obtained purportedly federally enforceable permits with operating restrictions limiting their potential to emit to minor or de minimis levels for the purpose of allowing them to commence construction prior to receipt of a major source permit. In such cases where EPA can demonstrate an intent to operate the source at major source levels, EPA considers the minor source construction permit void ab initio and will take appropriate enforcement action to prevent the source from constructing or operating without a major source permit.

The following example illustrates the kind of situation addressed in this section: An existing major stationary source proposes to add a 12.5 megawatt electric utility steam generating unit, and applies for a federally enforceable minor source permit which restricts operation at the unit to 240 hours per year. Because the project is designed as a baseload facility, EPA does not believe that the source intends to operate the facility for only 240 hours a year. Further investigation would probably uncover documentation of the source's intent to operate at higher levels than those for which it is permitted.

This situation raises the question of whether a source can lawfully bypass the preconstruction or premodification review requirements of Prevention of Significant Deterioration (PSD) and nonattainment New Source Review by committing to permit conditions which restrict production to a level at which the source does not intend to operate for any extensive time. If, after constructing and commencing operation, the source obtains a relaxation of its original permit conditions prior to exceeding them, does this constitute a violation of the preconstruction review requirements? This section discusses why it is improper to construct a source with a minor source permit when there is intent to operate as a major source, and provides guidelines for identifying these "sham" permits.

A. Permits with conditions that do not reflect a source's planned mode of operation are void ab initio and cannot act to shield the source from the requirement to undergo preconstruction review.

1. Sham permits are not allowed by 40 CFR Section 52.21(r) (4) Section

52.21(r) (4) states:

> At such time that a particular source or modification becomes a major stationary source or major modification solely by virtue of a relaxation in any enforceable limitation which was established after August 7, 1980 on the capacity of the source or modification otherwise to emit a pollutant, such as a restriction on hours of operation, then (PSD) shall apply to the source or modification as though construction had not yet commenced on the source or modification.

When a source that is minor because of operating restrictions in a construction permit later applies for a relaxation of that construction permit which would make the source major, Section 52.21(r) (4) prescribes the methodology for determining best available control technology (BACT). However, it does not foreclose EPA's ability, in addition to the retroactive application of BACT and other requirements of the PSD program, to pursue enforcement where the Agency believes that the initial minor source permit was a sham. EPA will limit its activity to requiring application of 40 CFR 52.21(r) (4) only for the cases where a source legitimately changes a project after finding that the operating restrictions which were taken in good faith cannot be complied with. Whether a source has acted in good faith is a factual question which is answered by available evidence in the particular case.

2. Sham permits are not allowed by the definition of potential to emit:

40 C.F.R. Sections 52.21(b) (4), 51.165(a) (1) (iii), 51.166(b) (4).

The definition of potential to emit enables sources to obtain federally enforceable permits with operational restrictions as a means of limiting emissions to minor source levels. However, implicit in the application of these limitations is the understanding that they comport with the true design and intended operation of the project.

3. Sham permits are not allowed by the Clean Air Act

Parts C and D of the Clean Air Act exhibit Congress's clear intent that new major sources of air pollution be subject to preconstruction review. The purposes for these programs cannot be served without this essential element. Therefore, attempts to expedite construction by securing minor source status through the receipt of operational restrictions from which the source intends to free itself shortly after operation are to be treated as circumvention of the preconstruction review requirements.

B. Guidelines for determining when minor source construction permits are shams.

EPA's determination that a purportedly federally enforceable construction permit is a sham is made based on an evaluation of specific facts and evidence in each individual case. The following are criteria which should be scrutinized when making such a determination:

1. Filing a PSD or nonattainment NSR permit application

If a major source or major modification permit application is filed simultaneously with or at approximately the same time as the minor source construction permit, this is strong evidence of an intent to circumvent the requirements of preconstruction review. Even a major source application filed after the minor source application, but either before operation has commenced or after less than a year of operation should be looked at closely.

2. Applications for funding

Applications for commercial loans or, for public utilities, bond issues, should be scrutinized to see if the source has guaranteed a c ertain level of operation which is higher than that in its construction permit. If the project would not be funded or if it would not be economically viable if operated on an extended basis (at least a year) at the permitted level of production, this should be considered as evidence of circumvention.

3. Reports on consumer demand and projected production levels.

Stockholder reports, reports to the Securities and Exchange Commission, utility board reports, or business permit applications should be reviewed for projected operation or production levels. Ifreported levels are necessary to meet projected consumer demand but are higher than permitted levels, this is additional evidence of circumvention.

4. Statements of authorized representatives of the source regarding plans for operation.

Statements by representatives of the source to EPA or to state or local permitting agencies about the source's plans for operation can be evidence to show intent to circumvent preconstruction review requirements.

Note that if a determination is made that a permit is a "sham" for one pollutant and, therefore, the source is a major source or major modification, the permit may possibly still contain valid limits on potential to emit for other pollutants.

In such cases, the entire source must still go through new source review, during which, for PSD review, all pollutants for which there is a net significant increase must be analyzed for BACT. In nonattainment new source review, new sources must have LAER determinations only for pollutants for which they are major. Major modifications, however, must have LAER determinations for all nonattainment pollutants emitted in significant amounts. If the valid limits in a partially void minor source construction permit keep certain pollutants below significance levels, then those pollutants would not have to be analyzed for BACT or LAER. However, if a source or modification is determined to be major for PSD or NSR because part of its minor permit is deemed void, it would have to undergo BACT or LAER analysis for all significant pollutants.

VI. Enforcement Procedures

This guidance has discussed permit conditions which will legally restrict potential to emit, shielding a source from the requirement to comply with major new source permitting regulation. Failure by a permitting agency to adhere to these guidelines may result in a permit that does not legally restrict potential to emit, thereby subjecting a source to major new source review. If that source has not gone through preconstruction review, it is a significant violator of the Clean Air Act and is subject to enforcement for constructing or modifying without a major new source permit.

The enforcement options available to EPA in these situations include administrative action under Sections 167 or 113 (a) (5) of the Act or federal judicial action under Sections 113 (b) (2), 113 (b) (5), 113(c), or 167. Which enforcement option is selected depends on the facts of the particular situation. (See July 15, 1988 guidance on EPA Procedures for Addressing Deficient New Source Permits.)

VII. Examples

The following examples are provided to illustrate the type of permit restrictions which would and would not legally limit potential to emit to less than major source thresholds. These examples are provided for purposes of clarifying the potential to emit and averaging time guidance only. They are not intended to reflect all the permit conditions necessary for a valid permit. Specific test methods, compliance monitoring and recordkeeping and reporting requirements are necessary to make permit limitations enforceable as a practical matter. The use of examples where averaging times are the longest times allowed under EPA policies is not intended to necessarily condone the selection of the longest averaging times; averaging times should in practice be as short as possible.

1. The minor source construction permit for a boiler contains the following restrictions: 250,000 gal fuel/month; 0.8% S fuel; 8000 hours/year.

These conditions are federally enforceable production and operation limits, but do not limit potential to emit because one of them does not meet EPA policies on enforceability as a practical matter. The averaging time for hours of operation, one of the operational limits necessary to restrict emissions to less than 250 tpy, exceeds a monthly or rolling yearly limit. If, instead of 8000 hours/year, the hourly restriction were stated as 666 hours/month, the permit would serve to keep the source a minor source, assuming the permit contains appropriate recordkeeping provisions.

2. A waferboard plant which has the physical capacity to emit over 300 tpy of carbon monoxide in the absence of using specific combustion techniques has the following permit restriction as the sole emission limitation: 249 tpy.

This does not limit potential to emit since an operational or production restriction is necessary for the source to be restricted to 249 tpy. The permit must contain a restriction on hours of operation or capacity utilization which, when multiplied by the maximum emission rate for the CO sources at the plant, results in emissions of 249 tpy. Additionally, while the emission limit alone cannot restrict potential to emit, the emission limit is unenforceable as a practical matter since it is limited on an annual basis. The permit should contain a short term emission limit (in addition to the annual emission limit), consistent with the compliance period or parameter in the applicable test method for determining compliance.

3. A small scale rock crushing plant that cannot emit more than 240 tpy under maximum operation without controls (including plant-wide particulate emissions from transfer and storage operations) has the following permit restriction as the sole emission limitation: 240 tpy particulate matter.

Since no operational limitations are necessary for the source to emit below 250 tpy, no operational restrictions need be in the permit to limit potential to emit. However, although this is not a major source, the state agency should express the emission limit in this permit as a lb/hour measure or gr/dscf so that it will be enforceable as a practical matter.

4. A plant consisting solely of a small rock crusher has the following permit restrictions: 0.05 lb gr PM/dscf; fabric filter must be employed and maintained at 99% efficiency.

Assuming that maintaining the fabric filter at 99% efficiency will result in emissions of less than 250 tpy, this permit would limit potential to emit if it also contained either 1) parameters that allowed the permitting agency to verify the fabric filter's operating efficiency or 2) a requirement to install and operate continuous opacity monitors (COMs) and a specification that COM data may be used to verify compliance with emission limits. Note that if this second alternative were adopted, it would not be necessary to require that the fabric filter be maintained at 99% efficiency.

To determine potential to emit, the efficiency rate of the fabric filter would be multiplied by the maximum uncontrolled emission rate, the maximum number of operating hours and maximum throughput capacity since there are no other operating or production limits. However, the efficiency rate of the fabric filter would not be enforceable as a practical matter unless there were an enforceable means to monitor ESP performance on a short term basis. The two alternatives mentioned above would satisfy this requirement.

5. A surface coating operation has the capability of utilizing 15,000 gal coating/month, with the following permit restrictions: 3.0 lb VOC/gal coating minus water; 20.5 tons VOC/month; monthly VOC emissions to be determined from records of the daily volumes of coatings used times the manufacturers specified VOC content.

This does not limit potential to emit since the source has the physical capacity to exceed 250 tpy of VOC, and the permit does not contain a production or an operational limitation. A monthly limit on gallons of coating used which when multiplied by 3.0 lb/gal equates to less than the 250 tpy threshold 13,500 gallons/month), with appropriate recordkeeping, would generally be necessary to limit potential to emit. If, however, the permitting agency determines, due to the wide variety of coatings employed and products produced, that restrictions on operation or production are not practically enforceable, then the above emission limits could restrict potential to emit if there are requirements that the source calculate emissions daily, and keep the appropriate records.

If the source was alternatively to meet the 20.5 ton/month limit by employing add-on controls, the permit would need to contain an operational limit, such as the requirement to install and operate an incinerator at 99% efficiency. A requirement to monitor incinerator efficiency (either directly or indirectly via temperature monitoring for example), and appropriate recordkeeping retirements to verify compliance with each of the permit conditions would also be necessary to make the permit conditions enforceable as a practical matter. Note, however, that in the case where add-on controls are employed, the source may be able to meet a shorter term emission limit than the ton per month figure.

VIII. Conclusion

We hope this guidance will help EPA Regions identify sources which have the potential to emit major amounts of an air pollutant which will subject those sources to the requirements of preconstruction new source review. Every source which is subject to these requirements but has not obtained a major new source permit should be seriously considered for enforcement action.

Facility Name: **Hazlehurst Wood Pellets, LLC**

Introduction

This narrative is being provided to assist the reader in understanding the content of the referenced SIP permit to construct and draft operating permit amendment. Complex issues and unusual items are explained in simpler terms and/or greater detail than is sometimes possible in the actual permit. This permit is being issued pursuant to: (1) Sections 391-3-1-.03(1) and 391-3-1-.03(10) of the Georgia Rules for Air Quality Control, (2) Part 70 of Chapter I of Title 40 of the Code of Federal Regulations, and (3) Title V of the Clean Air Act Amendments of 1990. The following narrative is designed to accompany the draft permit and is presented in the same general order as the permit. This narrative is intended only as an adjunct for the reviewer and has no legal standing. Any revisions made to the permit in response to comments received during the public comment period and EPA review process will be described in an addendum to this narrative.

I. Facility Description

A. Existing Permits

Table 1 below lists the current Title V permit, and all administrative amendments, minor and significant modifications to that permit, and 502(b)(10) attachments.

Table 1: Current Title V Permit and Amendments

Permit/Amendment Number	Date of Issuance	Description
2499-161-0023-V-02-0	8/18 2015	Initial Title V Permit
2499-161-0023-V-02-1	5/25/2016	502(b)(10) change wood-fired burner replacement
2499-161-0023-V-02-2	7/6/2016	Sig Mod without construction – removal of fuel oil firing in burners and remove pressure drop monitors in exhaust recycle duct from hammermills, pellet press and pellet coolers
2499-161-0023-V-02-3	11/15/2017	502(b)(10) change – addition of a baghouse parallel to existing baghouse in each production line

B. Regulatory Status

1. PSD/NSR/RACT

The facility is synthetic minor under PSD/NSR regulations for CO, NOx and VOC. Emissions of CO, VOC and NOx are limited to 249 tons/year in order to avoid going through a New Source Review under the PSD rules. The facility will continue to be a PSD SM source for CO, NOx and VOC after the proposed modifications. This permit amendment also limits PM emissions to less than 250 tpy as a matter of precaution.

2. Title V Major Source Status by Pollutant

Table 2: Title V Major Source Status

Pollutant	Is the Pollutant Emitted?	If emitted, what is the facility's Title V status for the Pollutant?		
		Major Source Status	Major Source Requesting SM Status	Non-Major Source Status
PM	yes	✓		
PM_{10}	yes	✓		
$PM_{2.5}$	yes	✓		
SO_2	yes			✓
VOC	yes	✓		
NO_x	yes	✓		
CO	yes	✓		
Individual HAP	yes			✓
Total HAPs	yes			✓

II. Proposed Modification

A. Description of Modification

The Permittee proposes to construct and operate one new furnace, one new dryer, one new chipper, 2 green hammermills, 7 dry hammermills, and 3 pellet lines with a total of 15 presses and 3 coolers. Some of the equipment will be new, some existing. The new wood-fired furnace will be rated at a nominal, approximate 200 MMBTU/hour. Particulate (PM) emissions from the furnace and dryer will be controlled with a wet electrostatic precipitator (WESP). PM emissions from the dry hammermills will be controlled by cyclofilters. PM emissions from the presses and coolers will be controlled by baghouses. Volatile organic compound (VOC) and organic hazardous air pollutant (HAP) emissions from the furnace and dryer will be controlled with a Regenerative Thermal Oxidizer (RTO). VOC and HAP emissions from the dry hammermills, presses, and coolers will be controlled with a Regenerative Catalytic Oxidizer (RCO). The RTO and RCO will each have a gas-fired burner rated at 6 MMBTU/hour. The new dryer has a capacity of 78 oven dried tons per hour, and an annual throughput capacity of 675,000 oven dried tons (ODT). ODT = weight of wood in short tons at 11% moisture, calculated.

No pre-dried wood product will be brought from off-site; all wood will be routed through the dryer through the pellet-forming equipment.

Because of the significant changes to the plant, and to the permit requirements, all Conditions in the existing permit and its amendments (in Sections 2-6) are deleted and completely replaced by the conditions in Amendment 2.

B. Emissions Change

After the proposed change emissions of PM, PM_{10}, $PM_{2.5}$ are expected to be lower for the furnace/dryer, dry hammermills, pellet press and pellet coolers due to WESP (dryer control) and baghouses for the downstream units. The regenerative thermal oxidizer and catalytic oxidizer (RTO and RCO) will result in more than 95% reduction of VOC and HAPs emissions from the furnace/dryer, dry hammermills, pellet press and pellet coolers. Due to the proposed PM, VOC and HAPs controls, the facility will be able to increase production from the dryers, hammermills, pellet presses and pellet coolers without becoming a PSD major source.

Development of emission factors

Dryer DRY RTO

VOC: GA EPD default emission factor of 6lb/ODT x 95% DRE

HAP: GA EPD default emission factors for acetaldehyde, formaldehyde, and methanol x 95% DRE; other HAP emission factor from Appling County Pellets testing x 95% DRE.

NOx: Applicant provided emission factor of .25 lb/mmbtu x 200 mmbtu/hr 8760 (219 tpy)
219 tpy divided by production limit of 675,000 ODT/yr = 0.65 lb/ODT- then a slight buffer is added yielding 0.66 lb/ODT. This EF compares conservatively to the results from a similar sized dryer with RTO controls at GA Biomass – the latest NOx test there yields an EF of 0.38 lb/ODT

CO: Applicant provided emission factor of .25 lb/mmbtu x 200 mmbtu/hr 8760 (219 tpy)
219 tpy divided by production limit of 675,000 ODT/yr = 0.65 lb/ODT- then a slight buffer is added yielding 0.66 lb/ODT. This EF compares conservatively to the results from a similar sized dryer with RTO controls at GA Biomass – the latest CO test there yields an EF of 0.07 lb/ODT

PM: Applicant provided emission factor of ..015 gr/cf exhaust airflow x airflow x 8760 = 98 tpy
98 tpy divided by production limit of 675,000 ODT/yr = 0.29 lb/ODT- then a slight buffer is added yielding 0.30 lb/ODT. This EF compares conservatively to the results from a similar sized dryer with RTO controls at GA Biomass – the latest CO test there yields an EF of 0.05 lb/ODT

Hammermill/Pellet Presses/Cooler RCO

VOC: GA EPD default emission factors of 2.5 lb/ ton (hammermills) + 1.3 lb/ton (steam injected pelletmills/coolers) x 95% DRE

HAP: GA EPD default emission factors for acetaldehyde, formaldehyde, and methanol x 95% DRE;

NOx: Applicant provided AP-42 fuel burning emission factor of .1 lb/mmbtu x 6 mmbtu/hr 8760 (2.6 tpy) 2.6 tpy divided by production limit of 675,000 ODT/yr = 0.008lb/ODT- then a large buffer is added to account for btu from voc-laden exhaust burned yielding 0.06 lb/ODT.

CO: Applicant provided AP-42 emission factor of .084 lb/mmbtu x 6 mmbtu/hr 8760 (2.2 tpy)
2.2 tpy divided by production limit of 650,000 ODT/yr = 0.007 lb/ODT- then a large buffer is added yielding 0.06 lb/ODT.

PM: Applicant provided emission factor of .015 gr/cf exhaust airflow x airflow x 8760 = 98 tpy

98 tpy divided by production limit of 650,000 ODT/yr = 0.30 lb/ODT- then a slight buffer is added yielding 0.31 lb/ODT.

HAND silos
VOC: GA EPD default factor is 0.4 lb/ODT; the applicant argues that the default factor is based on a test configuration at GA Biomass that handled uncooled pellets, yielding a higher than normal emission factor. GA EPD will allow a factor of ½ the default factor (0.2 lb/ODT); the permittee will be required to test to determine the validity of the factor and use the higher of the factor or the test result.

PM: GA EPD estimates a conservative value of 18 tons per year from the storage silos in the handling group HAND

HAP: GA EPD default emission factors for acetaldehyde, formaldehyde, and methanol

Emissions from the woodyard (Unit ID WOOD), including chip piles, and chipper are estimated using the Applicant's estimates, however these emissions are fugitive in nature and not accounted toward PSD applicability because the pellet plant is not one of the "list of 28" in 40 CFR 52.21.

Emission Factors

	VOC EF	meoh ef	hcoh ef	acet ef	Other hap ef	PM EF	NOX EF	CO EF	Production (per year)
RTO	0.300	0.006	0.007	0.006	0.010	0.300	0.660	0.660	675000 ODT
RCO	0.190	0.001	0.001	0.001	0.000	0.310	0.060	0.060	650000 tons
HAND	0.200	0.001	0.002	0.001	0.000				650000 tons
Annual Emissions									
	voc	meoh	hcoh	acet	Other hap	PM	Nox	CO	total HAP
RTO	101.250	2.025	2.363	2.025	3.375	101.250	222.750	222.750	9.788
RCO	61.750	0.163	0.325	0.163	0.000	100.750	19.500	19.500	0.650
HAND	65.000	0.325	0.650	0.325	0.000	0.000	0.000	0.000	1.300
Total	**228.000**	**2.513**	**3.338**	**2.513**	**3.375**	**202.000**	**242.250**	**242.250**	**11.738**

Emission factors are in lb/actual ton. For the dryer RTO, this is measured as ODT, for other downstream equipment it is measured as actual tons. The production rate listed in the above table for the RCO-controlled equipment is the production weight existing the dry hammermills.

The moisture content of the wood exiting the dryer ("oven dried) is typically 11% . As the wood is further processed, the moisture content continues to decrease slightly. For example, the estimated moisture content of the wood fibers after the hammermills is 8%, and the moisture content of the pellets exiting the coolers is 4%. Converting 675,000 ODT to actual tons existing the cooler is:

Actual tons at 8% moisture = 675,000 x (1-11%) / 1-8%) = 653,000 tons
Actual tons at 4% moisture = 675,000 x (1-11%)/(1-4%) = 625,800 tons.

C. PSD/NSR Applicability

Currently the facility is a PSD minor source for VOC, CO, NOx and PM. The facility will continue to be a PSD minor source after the proposed modification since potential emissions of all PSD pollutant will be less than 250 tons per year.

III. Facility Wide Requirements

All existing Conditions in Section 2 are deleted and replaced with conditions limiting HAP below 10/25 to avoid 112(g), limiting PM, VOC, NOx, and CO below 250 tons per year to avoid PSD major source status, and a dryer production limit of 675,000 ODT/yr to further bolster the PSD avoidance limits. It should be noted that production limit may be changed in the future via a permit action if the Division determines that the operations at the plant have lower emission factors than those currently established in this permit. These facility-wide emission limits are made enforceable by tracking production throughput in both the dryer and the pelletizing process, and using emission factors to calculate emissions.

The applicant submitted a Toxic Impact Assessment following Georgia's 2017 Toxic Guidelines. The compounds evaluated were formaldehyde, methanol, and acetaldehyde. The results demonstrate that compliance with the Acceptable Ambient Concentrations (AACs) for these compounds.

IV. Regulated Equipment Requirements

A. Brief Process Description

The facility has proposed to replace the existing three burners/dryers with one single wood-fired burner/furnace (FUR) rated at 200 MMBTU/hr for providing direct heat to a new dryer (DRY). PM emissions from the new burner/dryer will be controlled using a new wet electrostatic precipitator (WESP). VOC and HAPs emissions will be controlled using a Regenerative Thermal Oxidizer (RTO).

Downstream of the dryer, the 7 dry hammermills will be vented individually to its own cyclo-filter (CYFL1-7) and then to a regenerative catalytic oxidizer (RCO) which is shared with the pellet presses and pellet coolers.

PM and VOC emissions from the 15 pellet presses and 3 pellet coolers (3 pellet lines) will be controlled using a baghouse on each line, then all baghouse exhausts will be routed to the RCO.

Hazlehurst Pellet Plant is designed to produce up to 675,000 Oven dry ton/year (625,000 actual tons at final moisture of ~4%) of wood pellets. The dryer DRY can product up to 675,000 ODT/yr of wood pellet sawdust furnish. The difference in production between 675k tpy and 625k tpy was explained as water loss; although the measuring unit is the same (Oven dried tons = 11% moisture), actual moisture content goes from 11% out of the dryer to 8% out of the hammermills, to 4% out of the pellet cooler.

The applicant does not intend to purchase pre-dried material and pelletize that material. However, if they do, the emissions from the pelletizing will be accounted for because production will be tracked both from the dryer exit and the finished pellet exit (after the pellet coolers near the final product handling and loadout area (HAND).

B. Equipment List for the Process

Emission Units		Specific Limitations/Requirements		Air Pollution Control Devices	
ID No.	**Description**	**Applicable Requirements/Standards**	**Corresponding Permit Conditions**	**ID No.**	**Description**

* Generally applicable requirements contained in this permit may also apply to emission units listed above. The lists of applicable requirements/standards and corresponding permit conditions are intended as a compliance tool and may not be definitive.

C. Equipment & Rule Applicability

NSPS Subpart Dc does not apply to the proposed wood burner/furnace since it supplies direct heat to the pellet furnish dryer. The burner/furnace does not produce steam, heat water or other heat transfer fluid and is not a boiler or fuel burning equipment. The opacity of visible emissions from the dryers, hammermills, pellet presses and pellet coolers are limited to 40% by Georgia Rule (b). PM emissions from the pellet furnish dryer, hammermill, pellet presses and pellet coolers will be subject to Georgia Rule (e).

The sulfur content of sawdust fired in the dryer burner is limited to 3% by weight by Georgia Rule (g)2 ; no sulfur monitoring is necessary due to the natural low sulfur content of the wood. Fugitive emissions from the dryer, Hammermills, Pellet presses and Pellet coolers are limited to 20% by Georgia Rule (n)2.

D. Permit Conditions

Condition 3.2.1 requires the operation of WESP and RTO whenever the pellet furnish dryer operates for compliance with the VOC and HAPs PSD avoidance limit.

Condition 3.2.2 requires the Permittee to operate and maintain all baghouses and RCO during operation of the dry hammermills, pellet presses and pellet coolers to comply with the PSD avoidance limits for PM, CO and VOC.

Condition 3.2.3 requires operation of RTO at 1500 ^{o}F or the temperature established during the most recent destruction efficiency test that demonstrates compliance with the 95% reduction/destruction efficiency, whichever is higher.

Condition 3.2.4 requires operation of RCO at 800 ^{o}F or the temperature established during the most recent destruction efficiency test that demonstrates compliance with the 95% reduction/destruction efficiency, whichever is higher.

Existing Condition 3.3.1 and 3.3.2 were deleted since the new wood-fired burner/furnace is not subject to the requirements of NSPS Subpart Dc. The new burner is not a boiler or a fuel burning equipment and it does not heat water or any other heat transfer fluid or generate steam.

Existing Conditions 3.4.3 and 3.4.4 are not included in this permit amendment since the sources to which the conditions pertain will no longer be at the facility.

Existing Conditions 3.4.8 and 3.4.9 are not included in this permit amendment, since the sources to which the conditions pertain will no longer be at the facility.

Existing Condition 3.5.3, 3.5.4 and 3.5.5 are not included in this permit amendment since the sources to which the conditions apply will no longer be at the facility.

V. Testing Requirements (with Associated Record Keeping and Reporting)

To ensure that the emission factors used reflect actual emissions, the facility must test the RTO and RCO within 120 days after startup and thereafter every 3 years. If the test results are higher than the permitted emission factors, the permittee must use the new, higher test result-based factor and submit an application to revise the permitted factor upward accordingly. If the tests show lower emission factors, the permitted factors will still be used. The permitted emission factors can be altered down only via a permit application that has been reviewed and permit amendment issued by GEPD.

HAND must be tested for VOC since the factor to be used is lower than the EPD default factor. EPD proposes to require testing on only one silo in HAND to represent the emissions profile for the four identical silos. This is a one-time test requirement.

VI. Monitoring Requirements (with Associated Record Keeping and Reporting)

The control device operating parameters to be monitored are pressure drop across the three baghouses (even though the downstream RCO will also serve as additional PM control), total power in the WESP (even though the downstream RTO will also serve as additional PM control), and RTO/RCO temperature.

The daily visibility check has a 20% opacity action level, which is lower than the 30% proposed because EPD has determined that any opacity from these sources over 20% would likely indicate a mechanical problem and the applicant has not provided any data demonstrating that opacity above 20% is normal "compliant" operation.

To ensure proper operation of the RCO, the permit will require a maintenance plan, as well as annual catalyst bed core samples to ensure activity.

CAM conditions address the selected operating parameters accordingly. VOC and PM from both RTO and RCO are subject to CAM because pre-control emissions exceed 100 tpy and controls are used to comply. PM is subject to the emission standard of Georgia Rule (e). It is not clear in Part 64 if annualized PSD avoidance limits are considered "emissions standards" for the purposes of CAM, but in an abundance of caution, EPD has included this for VOC.

Existing Condition 5.2.13 is not included in this permit amendment since the baghouse Preventive Maintenance Program (PMP) is addressed by Condition 5.2.4.

VII. Other Record Keeping and Reporting Requirements

Condition 6.1.7.c. requires reporting of excursion of wood-fired furnace exhaust visible emissions, visible emission exceeding the 20% opacity action level from dry hammermills, pellet presses and pellet coolers for two or more consecutive days. RTO and RCO combustion temperature excursions also need to be reported. Fugitive dust emission episodes need to be reported as excursions. Any failure to perform the daily fugitive dust source inspection need to be reported as well. Any baghouse pressure drops outside the normal range also needs reporting.

Conditions 6.2.1-6.2.6 require tracking of production and calculation of emissions using the factors cited in previous sections of this amendment.

VIII. Specific Requirements

A. Operational Flexibility
None requested in this permit application.

B. Alternative Requirements
None

C. Insignificant Activities
No insignificant activities are added as part of this minor modification.

D. Temporary Sources
Not applicable.

E. Short-Term Activities
No short term activities were included in this modification.

F. Compliance Schedule/Progress Reports
Not applicable.

G. Emissions Trading
Not applicable.

H. Acid Rain Requirements/CAIR/CSPAR
Not applicable.

I. Prevention of Accidental Releases
This modification doesn’t change the source's applicability which remains non-applicable

J. Stratospheric Ozone Protection Requirements
This modification doesn’t change the source's applicability to Title VI.

K. Pollution Prevention
None.

L. Specific Conditions
None.

Addendum to Narrative

The 30-day public review started on month day, year and ended on month day, year. Comments were/were not received by the Division.

Homeowners seek EPA's help with pollution complaints

By Zach Parker The Citizen
Nov 5, 2014

1 of 2

HOMEOWNERS IN in the Cheniere Drew community in West Monroe are reaching out to the EPA for help over the emission of sawdust from Bayou Wood Pellets on Hwy 15 (above) over their homes and properties. The group of homeowners claim the sawdust falls so regularly that washed vehicles accumulate thick layers of dust over several hours.

Citizen photo by Zach Parker

A group of homeowners in the Cheniere Drew community in West Monroe asked the Environmental Protection Agency to investigate sawdust emissions from a wood pellets factory near their homes.

Representatives of the Drew Community of Concerned Citizens group sent a letter to the EPA's Region 6 headquarters in Dallas, Texas, last month, asking the agency to investigate Bayou Wood Pellet LLC's plant off Highway 15. The group is made up of homeowners who live near the plant, which manufactures wood pellets.

The plant has "been polluting our community for many months with wood dust and noise," the group's letter said. "Many people have recently moved from this area because of the pollution and noise."

The group claims its complaints and pleas to the state Department of Environmental Quality (DEQ) have not yielded a reduction in the pollution. The group decided to reach out to the EPA since DEQ inspections of Bayou Wood did not halt sawdust emissions.

“They (DEQ) have not helped us in any manner,” the letter said.

In its letter, the group describes the area as a “nice community,” made up of churches, businesses, many homes, Glenwood Family Medical Practice and Drew Elementary School. Some 800 students attend Drew Elementary, which is located across the highway from Bayou Wood’s plant.

“The sawdust falling on us is a fine powdered dust and it goes everywhere,” said Johnny Holyfield, a spokesman for the group. Holyfield and his family live in the neighborhood around Bayou Wood’s plant. He also is a minister at Faith Christian Church, located next door to the wood pellet factory.

Holyfield said Bayou Wood’s plant sprays dust continually over the area’s homes and vehicles. The dust covering their properties was not simply the result of seasonal pollen or of dust kicked up in yards or on blacktop roadways, Holyfield said.

On several occasions, members of the group showed The Ouachita Citizen sawdust falling from the sky onto their properties as well as thick layers of sawdust on area foliage.

“When the leaves fall during autumn, the dust gets twice as bad,” said Jerry Walker, a group member whose home is located west of Bayou Wood’s plant.

According to group members, the sawdust sprayed over their community has made enjoying the outdoors difficult. The sawdust, the group’s members claim, falls into their swimming pools like sand, infiltrates automobile engines, slips into attic spaces and has become a breathing hazard for humans as well as for pets and Drew Elementary students at recess.

“We’ve lived here 17 years, built this deck so we could sit outside but we can’t because of the dust,” said Walker’s wife, Kaila Walker. “I have asthma, and have to take breathing treatments sometimes when it’s so heavy. Sometimes, the smell of fresh sawdust gets overpowering. It’s terrible.”

In its letter, the group said it approached Steve Tippen, president at Bayou Wood, on numerous occasions.

“He has flatly refused to help,” the letter said. “Mr. Tippen has at night, on many occasions, turned out the lights and run machinery at maximum effort, possibly without filters and polluting our wildlife and domestic animals.”

Tippen was unavailable for comment.

“They (Bayou Wood) seem to be running the most at night, and they used to have lights on at night so you could easily see all the dust but they don’t turn those lights on at night anymore,” Holyfield said.

Since the beginning of the year, the group contends the plant runs machinery 24 hours a day, seven days a week, often becoming much louder at night than during the day and resulting in a heavier spread of sawdust over their community.

“They’re (Bayou Wood) not supposed to have the trucks going at night but that happens all the time,” Kaila Walker said. “Late at night, those trucks keep going and the front loader as well and it all sounds like a train coming through my bedroom wall.”

The group’s members agreed the sawdust emissions and factory noise did not become a problem until about a year ago.

“More than a year ago, Mr. Tippen would only run it during daylight hours,” Kaila Walker said. “I don’t understand. We didn’t have this problem back then.”

According to published reports, Bayou Wood was bought in August 2013 by Gulf Coast Renewable Energy LLC. At the time of the purchase, Bayou Wood's plant had the capacity to produce 54,000 metric tons of wood pellets per year. Gulf Coast Renewable Energy announced last year it would expand production capacity to 120,000 metric tons per year with the expansion set to be completed by the end of January 2014.

In January and February, DEQ observed wood particle emissions released at the facility's unloading and loading bay areas during two separate inspections. The emissions detailed during the two inspections were in violation of state law and department regulations since the facility was not permitted to emit wood particles from those areas.

"The trucks going in and out of the plant create dust going everywhere," Holyfield said. "They're supposed to have curtains, an enclosed space, everything to keep these trucks from creating dust, too."

According to reports filed with DEQ, the department issued a warning letter to Bayou Wood Products (Pellets) in February concerning the facility's compliance with the Louisiana Environmental Quality Act and Air Quality Regulations. Bayou Wood responded to DEQ after a third inspection on May 1 with

details of measures taken to ensure compliance with environmental regulations.
At the end of May, DEQ inspector Blake Watson conducted an inspection at the facility and surrounding area. The reports and citizen complaints prompting the inspection indicated “the facility was releasing sawdust into the air covering the community,” according to Watson’s field interview form.

“At the time of arrival (on May 27), emissions were observed at the loading and unloading area,” Watson said in his field interview form.

When Watson contacted Jerry Coleman, general manager at Bayou Wood, about the emissions during his inspection, Coleman said the wood pellet company was still in the process of installing a damper in the plant’s exhaust stack to reduce emissions.

Following Watson’s inspection, DEQ issued a compliance order to Bayou Wood on June 11 for violations of environmental regulations. The compliance order required Bayou Wood to become compliant by Aug. 15 in light of the unlawful emissions observed throughout the year.

On June 30, PPM Consultants Inc., submitted a response to DEQ on behalf of Bayou Wood, claiming the wood pellet company “immediately addressed wood particulate emissions that were documented” in the January inspection. Bayou Wood, according to PPM’s letter, also installed control measures and began building other facilities to help contain emissions in response to DEQ’s compliance order.

PPM Consultants is an environmental consulting firm headquartered in Monroe.

According to Greg Langley, a spokesman for DEQ Secretary Peggy Hatch, Bayou Wood had met all requirements in the compliance order by the deadline.

“They are under compliance according to the compliance order for their earlier violations,” Langley said.

Langley said DEQ had received additional citizen complaints after the compliance order’s deadline and that the issue was still under investigation.

Though Bayou Wood said it would add a damper to the plant’s exhaust stack, members of the homeowner’s group claim the damper is only used on some occasions.

“The Sunday after they first had the crane up putting the filter in the exhaust stack, a fire truck responded,” Holyfield said. “There was a fire inside, smoke, but still a fire. After that, the stack began blowing like usual again.”

The group’s members contend the factory does not use the damper most of the time because it impedes the plant’s production.

1. Wet material based on mass balance flowchart provided by client.
2. PM emission factors from USEPA Memo "Particulate Matter Potential to Emit Emission Factors for Activities at Sawmills, Excluding Boilers, Located in Pacific Northwest Indian Country," May 8, 2014. While the emission factors are in units of pounds per bone dry ton of material, the calculation conservatively uses the heavier estimate of "wet" material throughput to represent material flow through this process.
3. Emissions are generated from each "drop" of material from one surface to another. This includes each mechanical conveyance drop between point of generation and storage bin. In this instance, there is (1) drop from truck dumper to ground, (2) front end loader drop to storage pile, and (3) front end loader drop to walking floor bin.
4. As an alternating stockpiling scenario for white wood, PNWRE is considering using a radial stacker rather than using a front end loader for moving and stacking the white wood. Using a radial stacker would represent the same number of drop points as the front end loader method (truck unload to conveyor pickup, drop from conveyor to storage pile, conveyor drop to walking floor bin) while eliminating any associated front end loader traffic emissions for that material.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 10
1200 Sixth Avenue, Suite 900
Seattle, WA 98101-3140

OFFICE OF
AIR, WASTE, AND TOXICS

MAY 08 2014

MEMORANDUM

SUBJECT: Particulate Matter Potential to Emit Emission Factors for Activities at Sawmills, Excluding Boilers, Located in Pacific Northwest Indian Country

FROM: Dan Meyer, Environmental Engineer
Air Permits & Diesel Unit

THRU: Donald A. Dossett, P.E., Manager
Air Permits & Diesel Unit

TO: Permit File

EPA Region 10 has compiled the attached list of particulate matter (PM – CAA § 111 pollutant, PM_{10} and $PM_{2.5}$ – criteria pollutants) emission factors ("EFs") for use in determining the potential emissions, more commonly referred to as potential to emit ("PTE"), for activities at sawmills, excluding boilers, located in Pacific Northwest Indian Country.[1] The EFs are presented in units appropriate for the particular activity. PTE generally represents the maximum capacity of a source to emit a pollutant under its physical and operational design taking into consideration restrictions that are federally enforceable. While PM, PM_{10} and $PM_{2.5}$ PTE are all used to determine applicability of the Compliance Assurance Monitoring program and Prevention of Significant Deterioration construction permit program, only PM_{10} and $PM_{2.5}$ are employed to determine applicability of the Title V operating permit program.[2]

The Federal Air Rules for Reservations ("FARR") limit particulate matter emissions from applicable activities at sawmills. The rules and the rationale for not employing them to determine PTE are as follows: (a) 20 percent opacity limit (40 CFR § 49.124) – lack of a correlation between opacity and particulate matter emissions, (b) requirements for limiting fugitive emissions (40 CFR § 49.126) – lack of a correlation between compliance with requirements and particulate matter emissions, (c) non-combustion stack 0.1 grain per dry standard cubic foot PM emission limit (40 CFR § 49.125) – resultant PTE would be unrealistically high as we assume that an unreasonable amount of wood residue is exhausted to atmosphere rather than recovered for sale or combustion in on-site boiler.

There are no other federal regulations beyond the FARR that limit particulate matter emissions from activities addressed by this memorandum. Under the circumstances, it is appropriate to employ the EFs presented in the attachment to estimate PTE, unless a more representative (e.g. site-specific) EF is available.

---

[1] Activities include log bucking and debarking, sawing, lumber drying, mechanical and pneumatic conveyance of wood residue, wind erosion of wood residue piles and traffic along paved and unpaved roads.

Acronyms

bdt: bone dry ton
mbf: 1000 board foot lumber
VMT: vehicle mile traveled

1 If any activity occurs within a building, reduce the PM, PM_{10} and $PM_{2.5}$ emission factor ("EF") by 100 percent (engineering judgement) as emissions struggle to escape through doorways and other openings. If an activity's by-products are evacuated pneumatically to a target box, cyclone or bag filter system, then only the associated downstream conveyance emissions are counted.

2 PM refers to the CAA § 111 pollutant generally measured using EPA Reference Method 5 to determine the filterable fraction of particulate matter. "Particulate matter" is a term used to define an air pollutant that consists of a mixture of solid particles and liquid droplets found in the ambient air. PM does not include a condensable fraction.

3 EF for log bucking, debarking and sawing are expressed in units of "lb/ton log" in the table above. The EF can be expressed in units of "lb/mbf" lumber as follows:

$$\text{lb/mbf} = (\text{lb PM/ton log}) \times (\text{ton/2000 lb}) \times (\text{LD lb/ft}^3) \times (\text{LRF bf lumber/ft}^3\text{ log}) \times (\text{1000 bf/mbf})$$

where "LD" stands for log density and "LRF" stands for log recovery factor

• LD values are species-specific and are provided by The Engineering ToolBox and are listed at http://www.engineeringtoolbox.com/weigt-wood-d_821.html

• LRF value of 6.33 bf/ft^3 log is specific to softwood species of the Pacific Coast East. See Section 2 of Appendix D to Forest Products Measurements and Conversion Factors with Special Emphasis on the U.S. Pacific Northwest. College of Forest Resources, University of Washington. 1994. See http://www.ruraltech.org/projects/conversions/briggs_conversions/briggs_append2/appendix02_combined.pdf

4 Douglas Fir, Engelmann Spruce, Larch, Lodgepole Pine, Ponderosa Pine and Western White Pine

5 White Fir, Western Hemlock and Western Red Cedar

6 The "material" in this entry refers to bark, hogged fuel, green chips, dry chips, green sawdust, dry sawdust, shavings and any other woody by-product of lumber production.

<table>

• For PM_{10} and $PM_{2.5}$ EF, apply engineering judgement to estimate that (a) PM_{10} emissions are one-half PM emissions and (b) $PM_{2.5}$ emissions are one-half PM_{10} emissions.</td></tr>
<tr><td>7</td><td>• For PM EF, see ODEQ ACDP Application Guidance AQ-EF02 (4/25/00). Douglas fir is a resinous softwood species and western hemlock is a non-resinous softwood species.
• For PM_{10} and $PM_{2.5}$ EF, apply engineering judgement to estimate that all PM emitted is organic aerosols and fully PM_{10} and $PM_{2.5}$ emissions.</td></tr>
<tr><td>8</td><td>• See Section 13.2.4 of EPA's AP-42, November 2006 at http://www.epa.gov/ttn/chief/ap42/ch13/final/c13s0204.pdf. Apply Equation 1 on page 13.2.4-4 to estimate emissions resulting from material drops as follows: E [lb PM/ton] = (k) X (0.0032) X $(U/5)^{1.3}$ / $(M/2)^{1.4}$

<u>Wet</u> Material Drop
<table>
<tr><th>Particulate</th><th>k ×</th><th>0.0032 ×</th><th>$(U/5)^{1.3}$ /</th><th>$(M/2)^{1.4}$ =</th><th><u>lb PM</u>
ton</th></tr>
<tr><td>PM</td><td>0.74</td><td rowspan="3">0.0032</td><td rowspan="3">6.6693</td><td rowspan="3">21.0552</td><td>0.00075</td></tr>
<tr><td>PM_{10}</td><td>0.35</td><td>0.00035</td></tr>
<tr><td>$PM_{2.5}$</td><td>0.053</td><td>0.00005</td></tr>
</table>
The following conservative assumptions were made in applying Equation 1:
Mean wind speed (U) = 15 miles per hour
$(U/5)^{1.3}$ = 6.66930
Material moisture content (M) = 34 percent. Value based upon observations
$(M/2)^{1.4}$ = 21.05520

Note: • Mean wind speed of 15 mph is a reasonable upper bounder estimate.
• Moisture content of 34 percent for "wet" material is based upon observation that average moisture content (dry basis) of green douglas fir lumber (common to the Pacific Northwest) is 51 percent as recorded prior to lab scale kiln VOC emissions testing conducting by Oregon State University's Mike Milota and organized in Microsoft Excel workbook entitled, "EPA Region 10 HAP and VOC Emission Factors for Lumber Drying, December 2012." 51 percent moisture content (dry basis) is equivalent to 34 percent moisture content (wet basis) as illustrated below:
MCD = MCW / (1-MCW); where
MCD: moisture content dry basis
MCW: moisture content wet basis

0.51 = MCW / (1 - MCW)
0.51 - (0.51)(MCW) = MCW
(1.51)(MCW) = 0.51
MCW = 0.34, or 34 percent</td></tr>
</table>

	<u>Dry</u> Material Drop Particulate | k × 0.0032 × (U/5)^1.3 / (M/2)^1.4 = lb PM/ton PM | 0.74 | 0.0032 | 6.6693 | 10.5552 | 0.0015 PM_{10} | 0.35 | 0.0032 | 6.6693 | 10.5552 | 0.0007 $PM_{2.5}$ | 0.053 | 0.0032 | 6.6693 | 10.5552 | 0.0001

Dry Material Drop

Particulate	k ×	0.0032 ×	$(U/5)^{1.3}$ /	$(M/2)^{1.4}$ =	lb PM / ton
PM	0.74	0.0032	6.6693	10.5552	0.0015
PM_{10}	0.35				0.0007
$PM_{2.5}$	0.053				0.0001

The following conservative assumptions were made in applying Equation 1:

Mean wind speed (U) =	15	miles per hour
$(U/5)^{1.3}$ =	6.6693	
Material moisture content (M) =	13	percent
$(M/2)^{1.4}$ =	10.5552	

Note: • Mean wind speed of 15 mph is a reasonable upper bounder estimate.

• Moisture content of 13 percent for "dry" material is based upon observation that typical moisture content (dry basis) of kiln-dried lumber is 15 percent as recorded during lab scale kiln emissions testing conducting by Oregon State University's Mike Milota and organized in Microsoft Excel workbook entitled, "EPA Region 10 HAP and VOC Emission Factors for Lumber Drying, December 2012." 15 percent moisture content (dry basis) is equivalent to 13 percent moisture content (wet basis) as illustrated below:

MCD = MCW / (1-MCW); where
MCD: moisture content dry basis
MCW: moisture content wet basis

0.15 = MCW / (1 - MCW)
0.15 - (0.15)(MCW) = MCW
(1.15)(MCW) = 0.15
MCW = 0.13, or 13 percent

1. Flow rates, grain loading factors, and PM emission rates provided by vendor in metric units, which have been converted to Imperial units.
2. For units with cyclone control only, size speciation based on EPA AP42 Chapter 9.9, Table 9.9.1-1 footnote for Grain Cleaning/Internal Vibrating with cyclone control, where PM_{10} = 25% of PM and $PM_{2.5}$ = 17% PM_{10}.
3. Assumption of PM = PM_{10} = $PM_{2.5}$ for filterable emissions.
4. Pellet Storage Silos utilize aeration fans and venting to maintain low pellet temperature. PM_{10} and $PM_{2.5}$ speciation estimated based on EPA AP42 Appendix B.2, Table B.2.2, Category 7 for Grain Processing as the pellets experience some forced air flow. Category 7 Cumulative Particle Size Table indicates PM_{10} = 61% of PM and $PM_{2.5}$ = 23% of PM.

Table C-8a - Drying Line Emissions (EP-04)

Parameter	Value	Units	Notes
Max Annual Throughput	440800	ODT/yr	Dried product, maximum plant capacity
Max Hourly Throughput	51.1	ODT/hr	Dryer Design Rating
Furnace Burner Capacity	164.81	MMBtu/hr	Burner Design Rating
RTO Burner capacity	8	MMBtu/hr	Burner Design Rating
RTO Burner capacity	7.84E-03	MMcf/hr	Conversion from MMBtu/hr, 1020 Btu/scf NG heat content
Max Annual Operation	8760	hr/year	Unrestricted operation

Vendor Design Rates for WESP/RTO Stack Emissions

Pollutant	Emission factor	Units	Potential Annual Emissions (TPY)
PM filterable	7.735	lb/hr	33.9
PM10 filterable	7.735	lb/hr	33.9
PM2.5 filterable	7.735	lb/hr	33.9
NOx	52	lb/hr	227.8
CO	42	lb/hr	184.0
VOC	6.575	lb/hr	28.8

Notes:

Emission rates are based on vendor data

Estimated Maximum Rates from Furnace and Dryer for Other Pollutants for WESP/RTO Stack

Pollutant	Emission factor	Units	Potential Annual Emissions (TPY)
PM condensable	0.098	lb/ODT	21.9
Methane (CH4)	0.013	lb/ODT	2.9
SO2	0.025	lb/MMBtu	18.0
CO2	720	lb/ODT	161149

Notes:

PM condensable emission factor is from AP 42, Table 10.6.1-1, Rotary dryer, direct wood-fired, softwood, WESP/RTO, 3/02

Methane emission factor is from AP 42, Table 10.6.2-3, Rotary dryer, direct wood-fired, softwood, 6/02, with 95% control applied

SO2 emission factor is from AP 42, Table 1.6-2, Bark/Bark and Wet wood - No Control, 9/03

CO2 emission factor is from AP 42, Table 10.6.1-2, Rotary dryer, direct wood-fired, softwood, RTO, 3/02

Estimated RTO Combustion Emissions Not Already Accounted for Above

Pollutant	Emission factor	Units	Potential Annual Emissions (TPY)
SO2	0.6	lb/MMcf	0.0
Nitrous Oxide (N2O)	2.2	lb/MMcf	0.1

Notes:

RTO natural gas combustion emissions are from AP 42, Table 1.4-2, 7/98

Greenhouse Gas Emission Summary for WESP/RTO Stack

Pollutant	TPY	GWP	CO2e
Methane (CH4)	2.9	25	73
Nitrous Oxide (N2O)	0.1	298	23
CO2	161149	1	161149
Total CO2e			161244

Notes:

Global Warming Potential (GWP) from 40 CFR 98, Subpart A, Table A-1

CO2e = emission rate multiplied by its GWP

POM

1. HAP emission factors from USEPA AP-42 1.4, Tables 1.4.1-4. 1.4_natural_gas_combustion.pdf (epa.gov)
2. **Blue Cell**: CAS not identified as HAP; however, AP-42 footnote assigns as a HAP as Polycyclic Organic Matter (POM).
3. RTO burner capacity of 8 MMBtu/hr
4. Natural gas heating value 1020 Btu/scf

Table C-9a - Dry Hammermill and Pellet Cooler Combined/RCO Stack Emissions (EP-08)

Parameter	Value	Units	Notes
RCO Burner capacity	4.5	MMBtu/hr	Burner Design Rating
RCO Burner capacity	4.41E-03	MMcf/hr	Conversion from MMBtu/hr, 1020 Btu/scf NG heat content
Max Annual Operation	8760	hr/year	Unrestricted operation

Vendor Design Rates for RCO Stack Emissions

Pollutant	Emission factor	Units	Potential Annual Emissions (TPY)
PM filterable	1.87	lb/hr	8.19
PM10 filterable	1.87	lb/hr	8.19
PM2.5 filterable	1.87	lb/hr	8.19
VOC	8.6	lb/hr	37.67

Estimated RCO Combustion Emissions Not Already Accounted for Above

Pollutant	Emission factor	Units	Potential Annual Emissions (TPY)
PM condensable	5.7	lb/MMcf	0.11
NOx	94	lb/MMcf	1.82
CO	40	lb/MMcf	0.77
SO2	0.6	lb/MMcf	0.01
CO2	120000	lb/MMcf	2319
Methane (CH4)	2.3	lb/MMcf	0.04
Nitrous Oxide (N2O)	2.2	lb/MMcf	0.04

Notes:
PM condensable, NOx, CO, SO2, and CO2 emissions are from combustion of natural gas in RCO.
Combustion emission factors are from AP 42, Table 1.4-1, No SCC - Uncontrolled, 7/98, and Table 1.4-2

Greenhouse Gas Emission Summary for RCO Stack

Pollutant	TPY	GWP	CO2e
Methane (CH4)	0.0	25	1
Nitrous Oxide (N2O)	0.0	298	13
CO2	2319	1	2319
Total CO2e			2333

Notes:
Global Warming Potential (GWP) from 40 CFR 98, Subpart A, Table A-1
CO2e = emission rate multiplied by its GWP

Table C-9b - Dry Hammermill and Pelletizing organics

POM

1. HAP emission factors from USEPA AP-42 1.4, Tables 1.4.1-4. 1.4_natural_gas_combustion.pdf (epa.gov)
2. **Blue Cell**: CAS not identified as HAP; however, AP-42 footnote assigns as a HAP as Polycyclic Organic Matter (POM).
3. RCO burner capacity of 1.8 MMBtu/hr
4. Natural gas heating value 1020 Btu/scf

Table C-10 - Product Loadout - Truck Loadout (EP-15)

Emission Point ID	Point or Fugitive	Emission Source	Throughput [1] (short tons/year)	(short tons/day)	Pollutant[2]	Emission factor (lb/ton)	Number of "Drops" [3]	Potential Emissions (lb/day)	(ton/year)
EP-15	Fugitive	Truck Loadout	32000	330	Filterable PM[3]	0.0015	1	0.50	0.02
					Filterable PM_{10}[3]	0.0007		0.23	0.01
					Filterable $PM_{2.5}$[3]	0.0001		0.03	0.00

1. PNWRE proposes no more than 32,000 tons per year for use of the truck loadout capability for annual emissions and and no more than 10 trucks per day (330 tons of product per day, assuming no more than 33 tons of product per loaded truck) for daily emissions.
2. PM emission factors for truck loadout from US EPA Memo "Particulate Matter Potential to Emit Emission Factors for Activities at Sawmills, Excluding Boilers, Located in Pacific Northwest Indian Country," May 8, 2014.
3. Emissions are generated from each "drop" of material from one surface to another. All conveyor transitions are enclosed; therefore, not counted as emissions points. There is one drop from loadout spout to truck.

Table C-12a - Emergency Generator (GEN-01)

Parameter	Value	Units	Notes
Engine size	500	hp	Assumed size for 300 kW generator
Max Annual Non-Emergency Operation	100	hours	Limited by 40 CFR 60, Subpart IIII

Estimated Maximum Rates from Emergency Generator

Pollutant	Emission Factor	Units	Potential Annual Emissions (TPY)
$PM/PM_{10}/PM_{2.5}$	3.31E-04	lbs/hp-hr	0.01
NO_x	6.61E-03	lbs/hp-hr	0.17
CO	5.73E-03	lbs/hp-hr	0.14
VOC	2.51E-03	lbs/hp-hr	0.06
SO_2	2.05E-03	lbs/hp-hr	0.05
CO_2	1.15E+00	lbs/hp-hr	28.75

Notes:

Emission factors for PM, NOx, and CO are based on EPA Tier 3 emission standards

All PM assumed to be less than 2.5 micron diameter; therefore, PM=PM10=PM2.5

Emission factors for VOC, SO2 and CO2 are based on EPA AP-42, Section 3.3, Table 3.3-1, 10/96

GOVERNOR
MISSISSIPPI DEPARTMENT OF ENVIRONMENTAL QUALITY
GARY C. RIKARD, EXECUTIVE DIRECTOR

May 23, 2017

CERTIFIED MAIL: 7010 1670 0000 1401 4884

Mr. Joe Harrell, Corp. EHS Mgr.
Enviva Pellets Amory LLC
142 N C Route 561 East
Ahoskie, NC 27910

Re: Notice of Violation
Enviva Pellets Amory LLC
Amory, Mississippi
Monroe County
Air-Title V Operating Permit No. 1840-00082

Dear Mr. Harrell:

Our office has received multiple complaints over the past year pertaining to sawdust and smoke leaving the above referenced facility impacting neighboring properties and vehicles. It has also been stated that the dust and smoke is causing respiratory problems for some of the citizens in the area.

As a result of these complaints, our Regional Office inspectors have been on site to investigate, and I was in contact with Enviva personnel to discuss the means by which the facility decided would prevent or minimize the dust that leaves the site. The controls and operating procedures put in place as a result of our conversations are proving to be insufficient in preventing further contamination of the surrounding properties and problems for the citizens. An inspector was on site as recent as April 6, 2017 to investigate additional complaints received in March and April, 2017. While our inspector was on site, he spoke with Mr. Paul Pigg and Davis Lovelace, both personnel of Enviva about potential dust and smoke areas of concern. Since the April 6th investigation, we have continued to receive similar complaints. Based upon our findings during the investigations, we hereby cite the following alleged violations:

- Failure to prevent materials, particularly sawdust and smoke, in unnecessary amounts from leaving the site.

Agency Interest No. 24301
ENF20170001

No person shall cause, permit, or allow the emission of particles or any contaminants in sufficient amounts or of such duration from any process as to be injurious to humans, animals, plants, or property, or to be a public nuisance, or create a condition of air pollution.

(1) No person shall cause or permit the handling or transporting or storage of any material in a manner which allows or may allow unnecessary amounts of particulate matter to become airborne.

(2) When dust, fumes, gases, mist, odorous matter, vapors, or any combination thereof escape from a building or equipment in such a manner and amount as to cause a nuisance to property other than that from which it originated or to violate any other provision of this regulation, the Commission may order such corrected in a way that all air and gases or air and gasborne material leaving the building or equipment are controlled or removed prior to discharge to the open air. ***(Ref: Title V Operating Permit No. 1840-00082, Item 3.B.6 and 11 Miss. Admin. Code Pt. 2, R.1.3.C.(1 & 2))***

We request that you respond to these alleged violations no later than ***June 9, 2017***. We will review the information submitted before determining if further action is warranted. Failure to submit a response to this request may result in enforcement action.

If you have any questions concerning this matter, please contact me at (601) 961-5793.

Sincerely,

Trayce Moore-Thomas

Subject: RE: Enviva Amory MS Facility

Dear all,

This email intent is just to notify that the weather today has duplicated the conditions we continue to have issues with. I have contacted our regional DEQ rep per his request. I know the entire town is experiencing this as I have had many complaints of smoke and saw dust as we are preparing for the annual railroad festival. This email is just for documentation, I will continue to send these as record of the problems as they occur. Our shop is filled with smoke and lose flying saw dust that continues to cause health and safety risk for my workers as well as in the open air around the area.

Best Regards,

Matt Hannon - VP

Subject: Enviva Amory MS Facility

Good day Mr. McCulloch,

Thank you for your time on the phone Tuesday regarding our ongoing issues here with the Amory Enviva facility impacting our business and health. I have a link below to a Dropbox folder that contains stills and video of the issues we have experienced for many years. Some of the photos are from Google Earth and reference the date taken from satellite imagery and you can see the condition of our roof deteriorate as the plant increased its production over time to the point of having to replace our entire roof in 2015 as it expedited the rusting process with the saw dust and smoke that is air borne combined with rain water to form acid rain. Also notice the buildings surround had the same effect from year 2012 -2013. The brunt of the major affect is driven by the weather behavior and seems to coincide with days the facility is not functioning as to spec by MDEQ and operating efficiently. We just want a fair approach to this matter especially on days where the weather is pushing this material into our facility and affecting the health and safety of my workers. Please feel free to contact myself, the Amory Mayor Mr. Brad Blalock @ 662-256-5635, the Amory City Attorney Mr. John Creekmore @ 662-256-8208 or Mr. Tim Aultman with Mississippi Department of Environmental Quality @ 601-961-5653 as they are all aware from myself as well as MANY other individuals in the community who are ready to speak to you and voice their experiences and issues it has physically caused to their facilities and health of the ongoing and growing issue. If you need others in the community to hear from I can provide as many contacts as you would like or have them contact you directly. The photos and video do not do the issue justice as to the level of health danger on the days like we had on Tuesday when the plant manager came over and witnessed firsthand the direct affects and admitted the issue is real and needful of addressing. I am grateful for you working with us and look forward to your response and plan of action going forward.

Received 23 June 2003; in final form 15 October 2003; published online on 10 March 2004

Objectives: The objective of the present study was to investigate and describe the emissions of volatile compounds, particularly hexanal and carbon monoxide, from large- and small-scale storage of wood pellets.

Methods: Air sampling was performed with Fourier transform infrared spectroscopy and adsorbent sampling in pellet warehouses, domestic storage rooms, lumber kiln dryers and experimental set-ups. Literature studies were included to describe the formation of hexanal and carbon monoxide and the toxicology of hexanal.

Results: A geometric mean aldehyde level of 111 ± 32 mg/m^3 was found in one warehouse, with a peak reading of 156 mg/m^3. A maximum aldehyde reading of 457 mg/m^3 was recorded at the surface of a pellet pile. Hexanal (70–80% w/w) and pentanal (10–15% w/w) dominated, but acetone (83 ± 24 mg/m^3), methanol (18 ± 7 mg/m^3) and carbon monoxide (56 ± 4 mg/m^3) were also found. The emissions in a domestic storage room varied with the ambient temperature and peaked after 2 months storage in the midst of the warm season. Aldehyde levels of 98 ± 4 mg/m^3 and carbon monoxide levels of 123 ± 10 mg/m^3 were recorded inside such storage rooms. Elevated levels of hexanal (0.084 mg/m^3) were recorded inside domestic housing and 6 mg/m^3 in a room adjacent to a poorly sealed storage area. Experimental laboratory studies confirmed the findings of the field studies. A field study of the emissions from industrial lumber drying also showed the formation of aldehydes and carbon monoxide.

Conclusions: High levels of hexanal and carbon monoxide were strongly associated with storage of wood pellets and may constitute an occupational and domestic health hazard. The results from lumber drying show that the emissions of hexanal and carbon monoxide are not limited to wood pellets but are caused by general degradation processes of wood, facilitated by drying at elevated temperature. Emission of carbon monoxide from wood materials at low temperatures (<100°C) has not previously been reported in the literature. We postulate that carbon monoxide is formed due to autoxidative degradation of fats and fatty acids. A toxicological literature survey showed that the available scientific information on hexanal is insufficient to determine the potential risks to health. However, the data presented in this paper seem sufficient to undertake preventive measures to reduce exposure to hexanal.

INTRODUCTION

The production of wood pellets is a relatively new industrial activity in Sweden. Wood pellets are increasingly used as a source of renewable energy for industrial, municipal and domestic heating. According to the Swedish Pellet Producers Association the annual production in Sweden increased from 90 000 tons in 1994 to 714 000 tons in 2001. The raw material for wood pellets in Scandinavia is primarily wooden by-products from the sawmill industry. The dominant timbers are the common Scandinavian conifers Norway spruce (*Picea abies*) and Scots pine (*Pinus sylvestris*). The unprocessed material is stored in the open. It is ground and dried to ~8% water content and without any other additives pressed to pellets. The raw material is handled in a closed process under negative air pressure until the pellets are pressed, after which it is handled in the open in the warehouses. The typical wood pellet is 6 or 8 mm in diameter and 10–12 mm long and shipped to customers in sacks or in bulk on trucks or cargo vessels.

Information about the potential health hazards associated with the production and handling of wood pellets is sparse in the scientific literature and the emissions and occupational exposures in the workers' zones of wood pellet manufacturing have not previously been described. A screening study was performed in a pellet factory, initiated by workers' complaints of odour and irritation of the eyes and respiratory system, particularly while working in the pellet warehouse (Svedberg and Galle, 2001). Hexanal, pentanal, methanol, acetone and carbon monoxide were identified by Fourier transform infrared (FTIR) spectroscopy and adsorbent sampling in the pellet warehouse. The closed production system minimized emissions inside the production plant.

The objective of the present study was to investigate and describe the presence and formation of volatile compounds, particularly hexanal and carbon monoxide, from storage of wood pellets. Supplementary monitoring of emissions from kiln drying of wood was performed to determine if the emissions were specific for wood pellet production or more general in nature. Experimental laboratory studies were carried out to confirm the results from the field studies. Literature surveys were made on the formation of hexanal and carbon monoxide and on the toxicology of hexanal.

MATERIALS AND METHODS

FTIR sampling

Air sampling was performed using FTIR technique. An FTIR instrument (MB100; Bomem, Quebec, Canada) was equipped with a mercury–cadmium–tellurium (MCT) detector with a 1 mm^2 detector area (Belov Technology, New Brunswick, NJ). The sample air was continuously pumped (4–30 l/min) through a Teflon tube (13 mm) into the analytical gas cell (5.7 l, variable path length, 0.75–20.25 m; Foxboro Inc.). During sampling in the field, a particle filter type P3 was installed at the sampling tube inlet to protect the tubing and the analytical cell from contamination. The spectral information generated by the FTIR instrument was stored in a computer and the succeeding spectral analysis was made at the end of the sampling sessions. One location was sampled by filling Tedlar sampling bags (SKC) with sample air, that was then evacuated into the FTIR gas cell.

Spectral information was collected in the 600–4000 cm^{-1} wavelength region with 1 cm^{-1} spectral resolution. Qualitative and quantitative analysis was performed using LabCalc software (Galactic Inc., Salem, NH). When the spectral information displayed stable baselines with no interference by unknown compounds in the regions of interest, a classical least squares (CLS) method was used for the quantitative analysis, analogous to our application described elsewhere (Svedberg and Galle, 2000). The CLS analysis was modified to fit each set of sample spectra embracing the choice of the wavelength region, inclusion or exclusion of compounds and baseline adjustment. When the CLS method did not work satisfactorily, a peak area proportionality comparison was used. Both methods required the use of pre-calibrated spectra that were either generated in the laboratory by injecting known aliquots into the analytical cell or obtained from commercial spectral databases (Infrared Analysis).

The limits of detection (LOD) were calculated as three times the peak-to-peak noise level in an absorbance spectrum at 258 scans created by ratioing two consecutive background spectra. The LOD obtained for the identified compounds are presented in Table 1. The actual LOD may be less, due to spectral noise, skewed baselines and interfering peaks. The IR signal in the 'fingerprint region' (600–1300 cm^{-1}) is too weak to resolve individual straight chain aldehydes at the concentrations found. The strong aldehyde peak at 2712 cm^{-1} has approximately equal absorption for

Table 1. Limits of detection (LOD) limits with the FTIR system for identified compounds

	IR frequency (cm^{-1})	LOD (mg/m^3)
Aldehydes	2680–2740	1
Formaldehyde	2775–2783	0.5
Formic acid	1061–1144	0.03
Acetone	1180–1250	0.15
Methanol	970–1096	0.15
Carbon monoxide	2109–2092	0.27

the dominant straight chain aldehydes found in this study and the FTIR results are therefore expressed as hexanal equivalents based on this peak. Formaldehyde has a characteristic spectrum and can be singled out from other aldehydes.

Adsorbent sampling and analysis

Pumped and diffusion sampling was performed using thermal desorption tubes with Tenax TA and Air Toxics™ adsorbents (Supelco) (200 mg, 60–80 mesh). All pumped sampling was carried out with SKC pumps (model 224-30) and a flow rate of 30 ml/min.

Thermal desorption was performed with an automatic thermal desorption system (ATD-400; Perkin-Elmer). The sample was desorbed from the adsorbent into a cold trap packed with ~10–20 mg of Tenax TA. After injection the cold trap was heated at a rate of 40°C/s to the specified temperature. An outlet split was used. The parameters for the ATD-systems were: desorption temperature 250°C, desorption time 5 min, purge time 1 min, cold trap low temperature –30°C, cold trap high temperature 300°C, cold trap time at high temperature 5 min, desorption flow rate 30 ml/min, inlet split 0 ml/min, outlet split 10 ml/ min.

Gas chromatographic separation using an Autosystem XL (Perkin-Elmer) was performed by the use of a high resolution capillary column (CP Wax 52CB, catalogue no. CP8073; Varian), 60 m × 0.32 mm, DF 1.2 µm. The temperature program was 60°C (0 min), 6°C/min to 250°C (5 min). Detection was performed with a TurboMass mass selective detector (Perkin-Elmer).

Data collection was done at full scan in the mass range 35–300 *m/e*. The calculations were done by use of both full scan areas and areas at specified *m/e* values, depending on which compound was to be determined. The analyses were performed by Chemik Lab AB, Sweden.

Sample locations

Industrial warehouses. Three industrial production plants (A, B and C) using different methods for drying the raw material were included in the study. Plant A used a direct drying method with flue gases from a pellet-fired hot gas generator (400–500°C); plant B used a direct drying method using flue gases from a nearby iron blast furnace (450°C); plant C used an indirect drying method with a heat exchanger where the sawdust did not come into contact with the drying gases (195°C). Air sampling was carried out in the pellet warehouses. In plants A and B the samples were collected on the service walkways suspended over the pellet piles. Below and along the walkways, conveyor belts distributed freshly produced pellets into oblong piles. In plant C the samples were collected on top of the pile in Tedlar sampling bags.

Domestic storage rooms. In Sweden, wood pellets are increasingly finding their way into domestic houses, replacing in particular oil as the principal source of energy for heating purposes. Many house owners have built or set aside separate rooms where 3–6 tons of wood pellets can be stored. The rooms are normally filled with pellets by means of compressed air from bulk loading trucks. The emissions from three household storage rooms were investigated. In one storage, after delivery of 5 tons of freshly produced pellets in a closed storage bin, the emissions and the temperature in the centre and above the pile were monitored continuously over 3 months. FTIR samples were collected in the air space (7 m^3) above the pellet pile. The air was circulated to the FTIR and back to the bin. The specific air exchange rate of the bin was calculated using a tracer gas (N_2O) decay method and FTIR for detection. A second continuous measurement lasted for 18 h after delivery of 6 tons of freshly produced pellets. This time the air was pumped from the bin to the gas cell and vented outdoors (30 l/min). The concentration due to leakage of emissions into the room adjacent to the storage bin was also determined. Emission leakage was further investigated inside two other houses adjacent to the in-house closed storage rooms. Sampling was performed by diffusion sampling on Tenax adsorbent over 10 days.

Laboratory tests. Emissions from wood pellets produced at the three production plants A, B and C were investigated in the laboratory. Pellets (10 kg) were placed in a galvanized steel canister, with a 1 cm air gap, on a thermostatically controlled hot plate. The canister had an air inlet in the bottom and an outlet at the top that was connected by Teflon tubing to the FTIR analytical cell and an air pump. The room air was thus pulled through the pellets and into the analytical cell. The flow rates were either 4 or 30 l/min depending on the application. Temperature sensors were positioned at the bottom and in the surface layer of the pellet bed. The thermostat was adjusted until a dynamic temperature at the bottom of the canister of ~80°C was achieved, producing a surface temperature of 35–40°C. To minimize the risk of condensation the analytical cell was heated to ~70°C and the canister and the connecting tubing were thermally insulated. Samples of the room air were used as reference spectra, thus reducing possible interference from background levels of carbon monoxide.

Kiln drying of lumber. The emissions from industrial kiln drying of Scots pine were investigated. The dryer was loaded with 115.5 m^3 of lumber (25 × 125 mm). The FTIR instrument was connected by 10 m of Teflon tubing to the exhaust duct of the kiln. The analytical cell was preheated to ~70°C. The

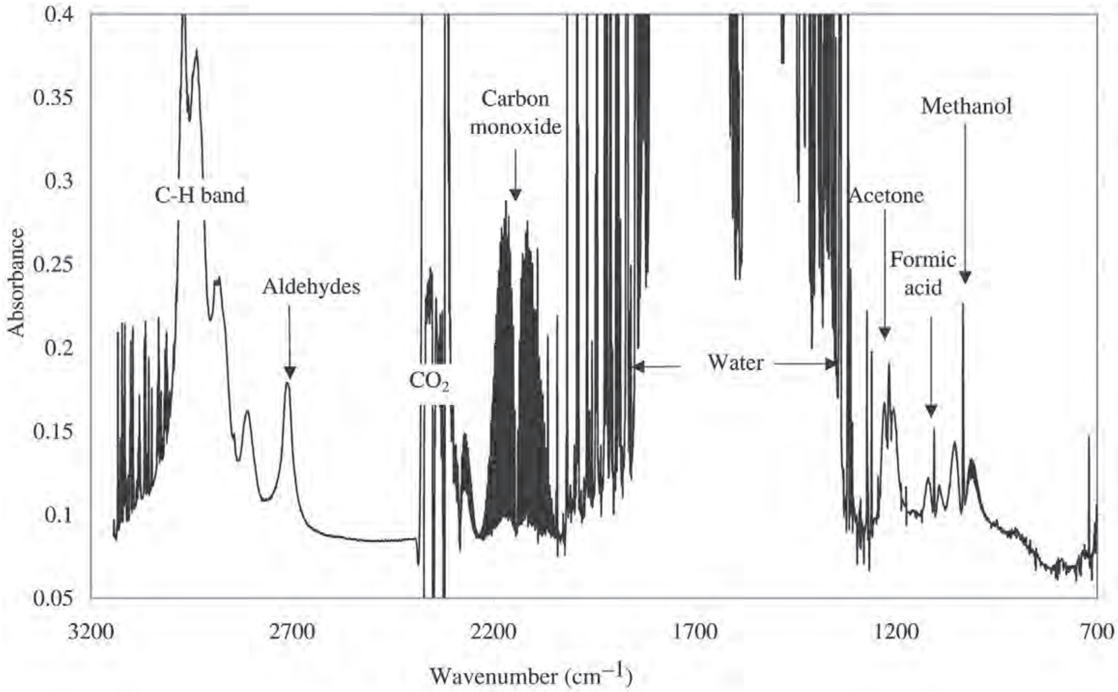

Fig. 1. An FTIR spectrum from the service walkway in plant A.

drying schedule was automatically regulated to control the rate of water removal. Initially the drying chamber was heated to 55°C before ventilation was started. The temperature was then slowly increased to a final value of 68°C. The total drying time was 95 h, during which the moisture content was reduced from ~50 to 10% (w/v).

RESULTS

Industrial warehouses

The FTIR measurements inside the warehouses at plants A (3 h) and B (18 h) showed that the dominant organic compounds were aldehydes (50–60% w/w), acetone (30–40% w/w) and methanol (10% w/w) (Fig. 1). A geometric mean aldehyde level of 111 ± 32 mg/m^3 was found in plant B on the service walkway, with a peak reading of 156 mg/m^3. Hexanal (70–80% w/w) and pentanal (10–15% w/w) predominated, but acetone (83 ± 24 mg/m^3), methanol (18 ± 7 mg/m^3) and carbon monoxide (56 ± 4 mg/m^3) were also found. A maximum aldehyde reading of 457 mg/m^3 was recorded with the sampling probe resting on the top of the pellet pile. The measurement was taken during a period with elevated pile surface temperature (0.2 m down the temperature was 88°C; 1.5 m down, 67°C; and 2.0 m down, 54°C.). A Tenax sample taken in parallel with the FTIR sample in Plant B showed the presence of the compounds indicated in Fig. 2, some of which are quantified and listed in Table 2. Formic acid was only found in plant A at a level of 1.6 ± 0.4 mg/m^3, while the levels of the other compounds were two to three times lower than in plant B. The warehouse at plant C had low pellet levels and an ambient temperature of –10°C during sampling. The measured concentrations were below the detection limit for FTIR except for carbon monoxide (0.8 mg/m^3).

Domestic storage rooms

The first measurement during 3 months inside a closed but passively ventilated storage bin showed that the emissions increased with the ambient temperature (Fig. 3). The mean aldehyde level was 21 ± 7 mg/m^3 and that of carbon monoxide was 21 ± 8 mg/m^3 (geometric means). The highest level, 49 mg/m^3, was recorded 2 months after delivery of the pellets. The second measurement during the initial 18 h after a new pellet delivery showed considerably higher levels of aldehyde (98 ± 4 mg/m^3) and carbon monoxide (123 ± 10 mg/m^3). The aldehyde level in the room adjacent to the storage bin reached 6 mg/m^3 during this period. The mean specific emissions of aldehydes for the two different loads of pellets were 96 and 703 mg/ton/day, respectively. The corresponding emissions for carbon monoxide were 100 and 885 mg/ton/day. The carbon monoxide levels correlated roughly with the aldehydes, but with a larger diurnal amplitude (r^2 = 0.72). Diffusion sampling on Tenax adsorbent inside two domestic houses

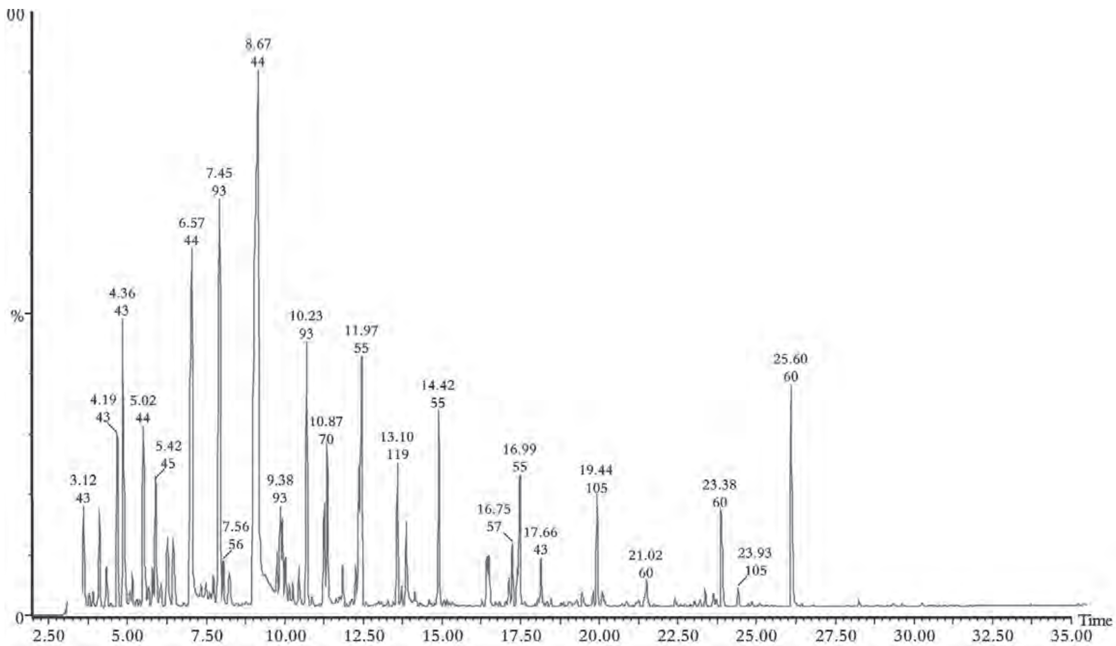

Fig. 2. GC-MS chromatogram from a Tenax sample also described in Table 2. The identified peaks with retention times are: 3.12, hydrocarbon; 4.19, acetone; 4.36, butanal; 5.02, isopropanol; 5.42, pentanal; 6.57, a-pinene; 7.45, *n*-hexanal; 8.67, b-pinene; 9.38, carene; 10.23, heptanal; 10.87, hydrocarbon (?); 11.97, methyl-isopropylbenzene; 13.10, octanal; 13.25, 2-heptenal; 14.42, nonanal; 16.00, 2-ethylhexanal; 16.99, benzaldehyde; 19.44, an acid; 21.02, pentanoic acid; 23.38, hexanoic acid; 25.60. Overloading of the sample is shown by the tailing of the peak for hexanal (8.67) and pentanal (6.57). This does not seriously affect the quantification according to laboratory sources.

adjacent to the closed pellet storage rooms showed raised levels of hexanal (0.056 and 0.084 mg/m^3), compared with zero levels in a reference sample outdoors.

Laboratory tests

The emission during an experiment with a 4 l/min air flow rate through the pellet bed is illustrated in Fig. 4. Aldehydes, methanol, acetone, monoterpenes, hexanoic acid and carbon monoxide were identified. The temperature at the bottom of the pellet bed was 40°C after 20 min, 50°C after 60 min and 60°C after 4 h. A steady temperature range of 72–75°C was reached after ~15 h. A flow rate of 30 l/min yielded 63% more total emissions after 130 h (5728 versus 3475 mg), compared with a flow rate of 4 l/min (Table 3). The total weight of the pellet bed decreased by 580 (30 l/min) and 502 g (4 l/min). The removal of water explains 99% of the weight loss.

Parallel sampling with Air Toxics, Tenax and FTIR for 8 min showed good agreement between the FTIR and Tenax samples, while the Air Toxics sample appeared to underestimate the concentrations (Table 4). Neither acetaldehyde nor its oxidized form acetic acid was detected.

Drying of lumber

The gradual formation of aldehydes and carbon monoxide during a complete drying cycle of lumber is described in Fig. 5. The levels were strongly correlated ($r^2 = 0.96$). The formation of other compounds like terpenes, methanol and ethanol were also detected, but are not described further.

DISCUSSION

Emission monitoring

Hexanal and carbon monoxide were found in the emissions from wood pellets and drying of lumber. The levels of carbon monoxide were at times above

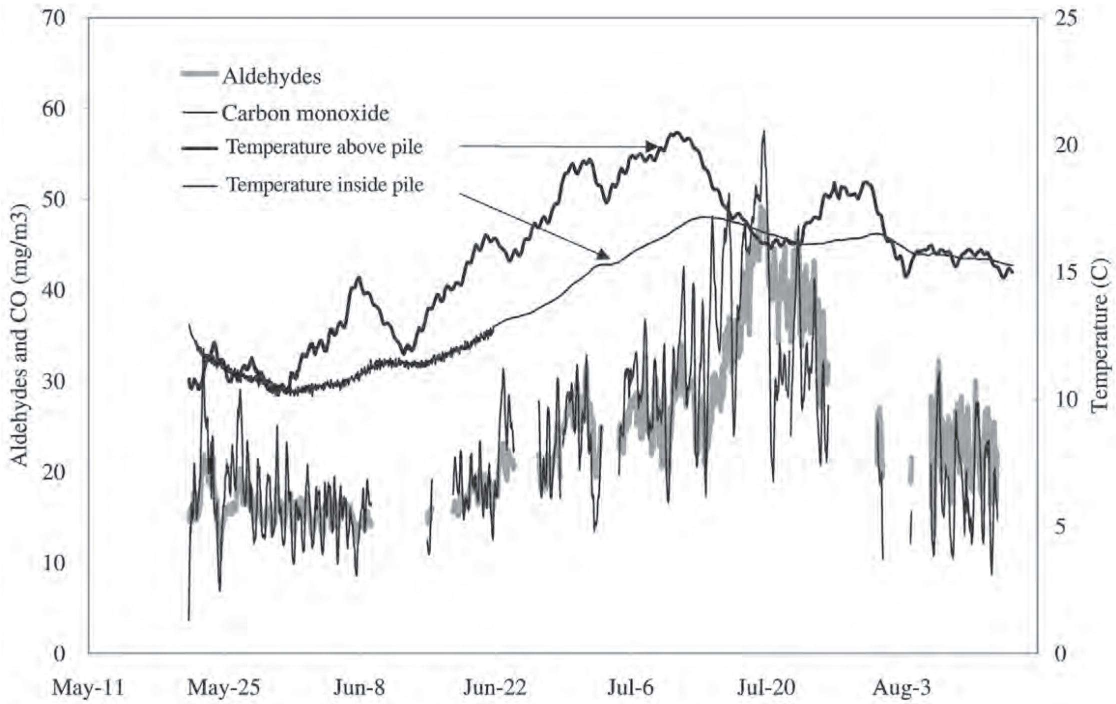

Fig. 3. Long-term FTIR measurement of aldehydes and carbon monoxide in a domestic storage room.

Table 3. Comparison of emissions in a flow-through experiment

	Emitted amount (mg)	
	4 l/min	30 l/min
Aldehydes	1739	1800

the permissible occupational exposure level in the warehouses. The formation of hexanal and carbon monoxide in the experimental studies confirmed the findings of the field studies.

Pentanal, methanol, acetone and formic acid were identified and quantified by the FTIR method. Monoterpenes, other aldehydes and organic acids were found in substantially lower levels and required adsorbent sampling and GC-MS analysis for detection.

During the laboratory experiments the occasional occurrence of formaldehyde was observed at levels close to the detection limit of FTIR. Formaldehyde was not detected in the warehouses but it is likely that it would be detected using a more sensitive method. The absence of acetaldehyde in the results from the Air Toxics adsorbent samples indicate that high levels of acetaldehyde are not likely to occur in pellet warehouses. The laboratory experiments further showed no significant qualitative difference in the emissions from pellets produced by different drying methods.

Monoterpenes dominate the organic compounds emitted from fresh pine and spruce wood. However, both adsorbent sampling and FTIR results showed low monoterpene concentrations in the warehouses. The conclusion is that the greater part of the monoterpenes is emitted during the production of sawdust in the sawmills and the following storage, grinding and drying processes, before pressing of the pellets. A previous study has shown that the escape of

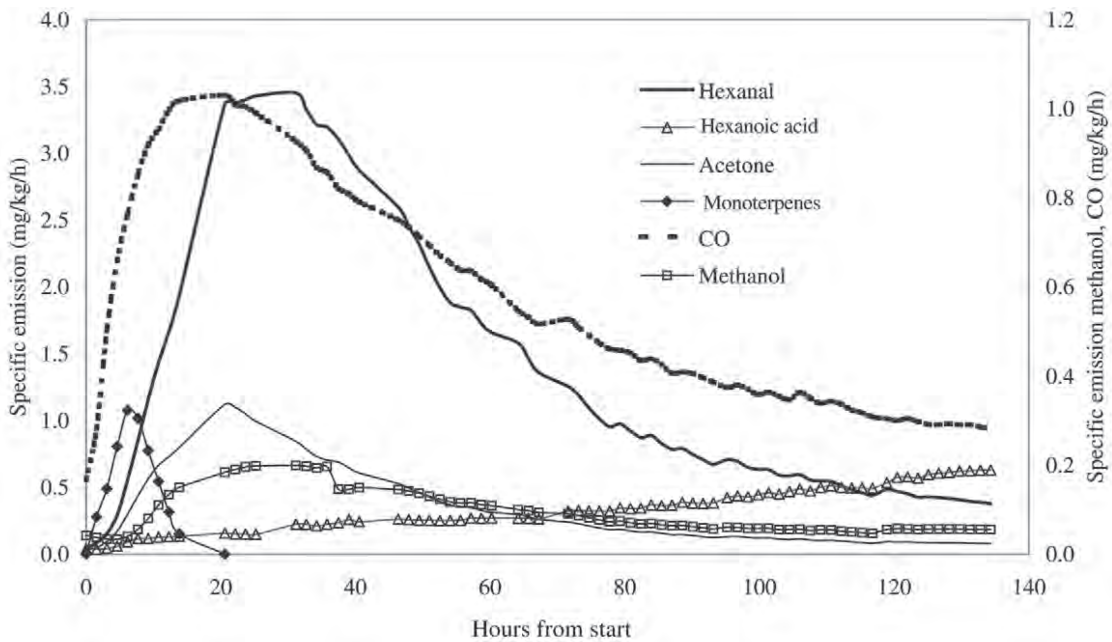

Fig. 4. Specific emissions from 10 kg pellets exposed to 4 l/min airflow.

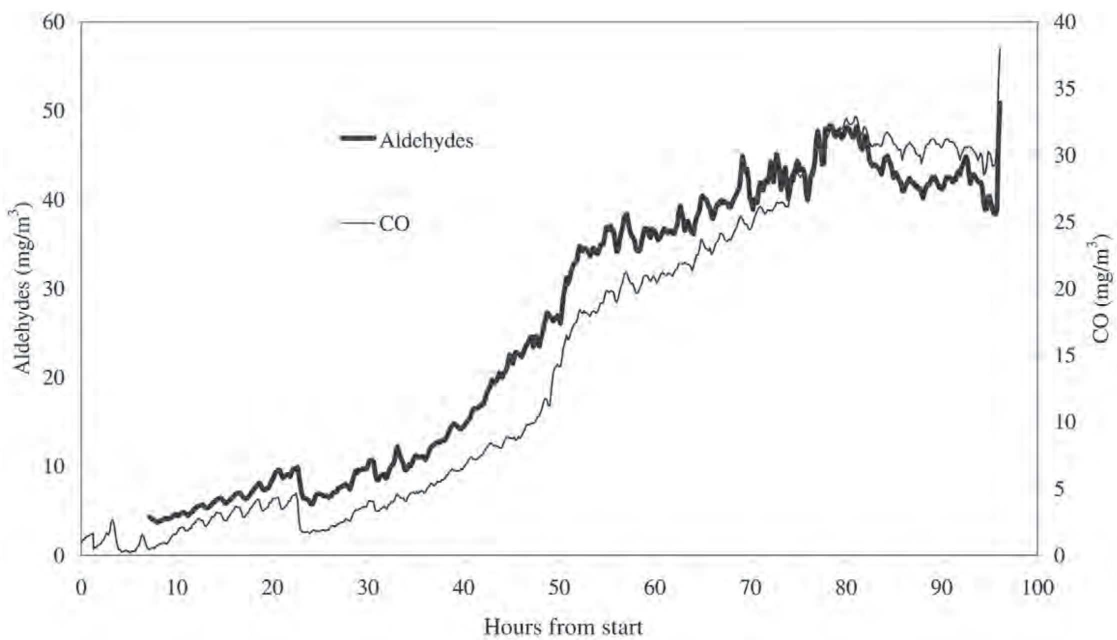

Fig. 5. The concentration of aldehyde and carbon monoxide in emissions from pine lumber drying.

terpenes from sawdust may be rapid (Risholm-Sundman *et al.*, 1998).

Considering the results from lumber drying it is concluded that the dominant emissions from wood pellets originate from general degradation processes in wood, which are initiated or facilitated by drying at elevated temperatures. When the processes take place in a confined space with large amounts of pellets, leading to a large surface area, the concentration of the emitted compounds may become high. From a working environment perspective the aldehyde levels in the warehouses may become too high. A maximum value of 457 mg/m^3 was recorded at the top of a pellet pile. It is not unlikely that operators may be exposed to such levels while working on the pile, for example, during leveling of the pile with graders and while sampling temperature data. Carbon monoxide is well known to be toxic (Clayton and Clayton, 1982). The carbon monoxide levels were at times above the Swedish permissible exposure level of 40 mg/m^3 and it may be justified to install carbon monoxide alarms in warehouses and confined storage places which people enter. Formic acid levels sporadically reached 2 mg/m^3 in the warehouse, almost half the permissible exposure level in Sweden.

The laboratory tests with wood pellets identified the same group of compounds as found in the warehouses. The conclusion is that the drying process that takes place in the warehouses is well simulated by the experimental set-up used in the laboratory tests, although not driven to such an extreme. It was assumed that a limited upward air flow also exists inside the pellet piles in the warehouses. Heating of the laboratory sample aimed to resemble the conditions in the warehouse when elevated pile temperatures prevail. The total amount of aldehydes emitted was identical after 130 h, regardless of the flow rate. When all compounds were considered, the result was a higher total emission with the higher flow rate, which is principally explained by the increased emission of hexanoic acid, an oxidation product of hexanal. However, this was not accompanied by a corresponding decrease in the hexanal emission, which would be expected. The formation of degradation compounds may be limited by diffusion of oxygen into the wood structure analogous to what is described for other wood products (Back and Allen, 2000).

The conclusion is that the same compounds that were found in the warehouses caused the odour noticed by the end-user. The episodes with odour from the pellets seem to be more frequent during the winter months, based on informal discussions with end-users. The results show that the emissions vary greatly with different loads of pellets. A plausible explanation is that pellets that are produced, stored and distributed in the warm season have already emitted a large part of their volatile compounds in the warehouses. During the cold season the warehouse storage time of newly produced pellets is short and the emissions are released instead in the storage rooms of the end-users. A poorly designed storage room may cause leakage to the adjacent rooms and constitute a potential exposure risk, as demonstrated by the 6 mg/m^3 level measured outside a storage bin, accompanied by a strong odour. Measurements outside two closed domestic storage rooms, during a period when odour was not reported, indicated levels of hexanal of 0.056–0.085 mg/m^3, compared with 0–0.005 mg/m^3 normally found in the indoor environment (Brown *et al.*, 1994). The results show that the emissions from a domestic storage room can linger for several months and increase if the ambient temperature increases. If pellets are additionally vented or stored in the production step, it might reduce emissions in the storage rooms of end-users, however, storing at cold temperatures limits the release of emissions, as demonstrated in Fig. 3. Storage rooms should also be equipped with ventilation systems designed to prevent emissions from entering the living space.

The FTIR method is subject to calibration errors, spectral interference and sampling errors. The calibration error is estimated to be <5% and the error due to spectral interference <10%, but increasing when approaching the LOD. Condensation in sampling lines and leakage from line connections are potential sampling errors. Leakage was checked by periodic monitoring of the flow rate at the sampling tube inlet. Condensation of water was a problem in the kiln drying study. The condensate was therefore collected and analysed separately. The local variation in airborne concentrations in the pellet warehouses was probably the principal factor of measurement uncertainty. The measurements in the kiln dryer, the domestic storage room and in the experimental set-up were not affected by such variations. The present study further shows that the principal risk of relying on adsorbent sampling alone is that essential compounds in the investigated environments are simply not detected.

Formation of hexanal

Hexanal (CAS no. 66-25-1) was the predominant straight chain aldehyde found in the volatile organic compound mixture emitted from wood pellets. Apart from carbon monoxide, the volatile compounds identified in this report are previously known as low level emittants from wood and wood products and are often identified in indoor air investigations. Medium density fiberboard products (MDF) have been shown to emit hexanal for several months (Brown, 1999). The short chain aldehydes make up >50% of the volatile organic compounds which are emitted from MDF (Baumann *et al.*, 2000).

Hexanal and the other alkanals are probably formed by the oxidative degradation of natural lipids present in wood. The dry woods of Scots pine and Norway spruce contain 3–5% triglycerides and free fatty acids. A polyunsaturated acid, linoleic acid, is the major constituent in the mixture of free fatty acids and triglycerides found in such wood (Hoell and Piezconka, 1978; Piispanen and Saranpaa, 2002). Radical-induced oxidation by oxygen of linoleic acids or its esters yields hexanal as the major volatile component (Back and Allen, 2000). Such reactions can be either enzyme catalysed or occur through a so-called autoxidation process (Schieberle and Grosch, 1981; Frankel *et al.*, 1989; Noordermeer *et al.*, 2001). Because of the high temperature involved in pellet production, with enzyme denaturation as a probable consequence, the major path for this process in pellets most likely proceeds through autoxidation.

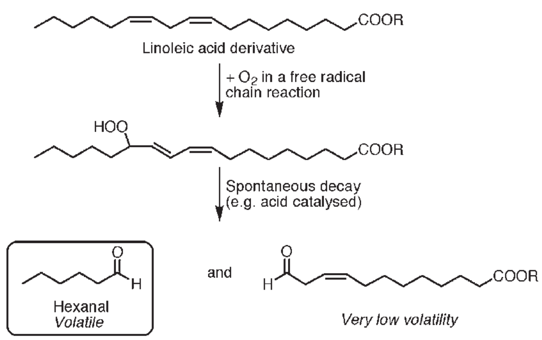

Fig. 6. Proposed pathway for the formation of the volatile aldehyde hexanal in wood pellets.

One possible route leading to hexanal is shown in Fig. 6.

Formation of carbon monoxide

The emission of one carbon compounds containing oxygen and hydrogen, such as methanol, formaldehyde and formic acid, from pellets is not surprising. The last two compounds may be autoxidation products of methanol. Other one carbon compounds are carbon monoxide and carbon dioxide. The high levels of carbon monoxide found in each of the measurements presented in this report were unexpected. It is well known that during the thermal anaerobic degradation of wood (pyrolysis) carbon monoxide emission occurs. The low temperature emission of carbon monoxide from wood products such as pellets has not been reported previously and the underlying chemical mechanism is uncertain. Carbon monoxide has a characteristic infrared spectrum and cannot be mistakenly identified. The possible interference of external sources of carbon monoxide was ruled out by the results obtained from laboratory tests with pellets produced by indirect drying (not exposed to drying gases containing carbon monoxide) and the results from the lumber dryer.

When various organic matters were stored at room temperature, particularly in the presence of air and light, small amounts of carbon monoxide were observed and the formation was enhanced by increased temperature (Levitt *et al.*, 1995). Microsomal lipids also produce carbon monoxide during peroxidation, initiated via different Fe(III) complexes. After initiation the reaction appears to be non-enzymatic, i.e. an autoxidative process (Wolff and Bidlack, 1976). Carbon monoxide (300–400 p.p.m.) has been observed in the air above 7000 tons of rapeseed stored in a sealed warehouse and the calculated specific emission rate has been estimated to be 200 mg/ton/day (Reuss and Pratt, 2001). Carbon monoxide has also been found in a wheat grain warehouse with a calculated specific emission rate of 9 mg/ton/day (Whittle *et al.*, 1994). These emission rates can be compared with the specific emission rates we found in the small pellet storage, ranging from 100 to 885 mg/ton/day.

The more rapid formation of carbon monoxide in materials with a high fat content (rapeseed) compared with those with a low fat content (wheat) indicates that carbon monoxide may be formed through the autoxidative degradation of fats. The measurements in this study indicate that the carbon monoxide and hexanal emissions are often correlated. We suggest that carbon monoxide formation during storage of the wood pellets is caused by the autoxidation of residual lipophilic extractives present in pellets, mainly fats and fatty acids. However, carbon monoxide formation from other organic materials present in wood, like cellulose, hemicellulose and lignin, cannot be ruled out.

Toxicology of hexanal

Hexanal was identified as a major component in emissions from wood pellets stored in industrial warehouses and under experimental conditions. Occupational exposure routes for aldehydes include inhalation and skin uptake. Food intake may also contribute to exposure (Feron *et al.*, 1991). Hexanal is rapidly metabolized in the body, the aldehyde being oxidized by aldehyde dehydrogenase to the corresponding acid (Marselos and Lindahl, 1988; Yoshino *et al.*, 1993; Fujita *et al.*, 1994; Townsend *et al.*, 2001). This seems to be the dominant metabolic route, but reduction of hexanal to the alcohol has also been suggested (Jaar *et al.*, 1999).

Low molecular weight aldehydes are strongly irritant to the mucous membranes in the nose, mouth and airways in humans (Clayton and Clayton, 1981). In eye irritation tests on rabbits hexanal was given grade 5 on a 10 grade scale (Grant, 1986). There are some reports concerning the genotoxicity of hexanal, however, most authors conclude that the risk to humans is negligible (Marinari *et al.*, 1984; Brambilla *et al.*, 1989; Martelli *et al.*, 1994).

Hexanal has cytotoxic potential in most cells tested but only in relatively high doses (Kaneko *et al.*, 1988; Martelli *et al.*, 1994; Muller *et al.*, 1996; Girona *et al.*, 2001). It should be noted, however, that *in vitro* studies suggest that insulin-producing cells in pancreas and sperm might be more sensitive than other cell types (Suarez-Pinzon *et al.*, 1996).

It is not possible to define a critical effect for hexanal. However, the high readings for hexanal and the relatively low readings for other emissions, as well as a general knowledge of the irritating effects of aldehydes, suggest that hexanal in the present settings can cause skin and mucous irritations and possibly also other health problems. As indicated in the Introduction, complaints about odour and irritation have been reported among exposed workers, but the frequency as compared with that in control groups is not known.

Conclusions

High levels of hexanal and carbon monoxide were strongly associated with storage of wood pellets and may constitute an occupational and domestic health hazard. The results from lumber drying show that the emissions of hexanal and carbon monoxide are not limited to wood pellets but are caused by general degradation processes of wood, facilitated by drying at elevated temperature. Emission of carbon monoxide from wood materials at low temperatures (<100°C) has not previously been reported in the literature. We postulate that carbon monoxide is formed due to autoxidative degradation of fats and fatty acids. The depletion of oxygen and simultaneous formation of carbon monoxide may be particularly dangerous in closed spaces.

A toxicological literature survey showed that the available scientific information on hexanal is insufficient to determine the potential risks to health. However, the data presented in this paper seem sufficient to undertake preventive measures to reduce exposure to hexanal both in the industrial environment as well in the domestic setting, where children and sensitive persons may be involuntarily exposed.

Amory board of aldermen discusses deficit, dust complaints and a tank

jward

Oct 13, 2016

AMORY – The majority of the time during the Oct. 4 board of aldermen meeting was devoted to revisiting an item tabled from its last meeting. Tracy Hadley, representing the local Order of the Eastern Star, returned to continue her petition to the board for waiver of rental fee to use community center space for their meetings.

The petition launched a wide-ranging discussion of the financial standing of the city's community centers. City clerk Lee Barnett provided reports, stating most of the city's revenue to operate the facilities is derived from space rentals.

The bad news was that the rent collected has not even come close to paying the cost of utilities, let alone salaries and maintenance – to the tune of $24,000 in the red for the past year. Barnett went on to say that the expenses to operate the West Amory Community Center were more than its East Amory counterpart due to the fact that East Amory Community Center was equipped with a newer, more energy-efficient HVAC system.

“If we keep giving stuff away, how can we continue to operate,” asked Ward 4 Alderman Glen Bingham, citing a long previous record of helping community service providers with free or reduced rent.

He asked Hadley if the $30 rent is an excessive fee. She said she would take the matter back to her board to reconsider its request to the city but asked whether other nonprofit community service groups would be asked to step up and pay rent to which Bingham replied, “Yes.”

The discussion branched out even further to explore community response to enhancements at East Amory Community Center, located in a predominantly white neighborhood, as opposed to West Amory, where the population of the service area is predominantly African-American.

Hadley emphasized that equal treatment to both centers was vital to prevent racial friction in the city.

“A lot of issues are due to ignorance of the facts, not race,” Hadley said.

Ward 2 Alderman John Darden said that people who don't go to meetings need to be informed of events such as church services.

“The problem is perception. Effective communication is the key,” said Mayor Brad Blalock, who pledged to meet with Hadley and Amory Park and Recreation Director Rory Thornton to work out suitable arrangements for the Eastern Star chapter as well as other nonprofit community groups that would follow suit.

As the discussion wound down, the motion to grant Hadley’s request for a fee waiver died for lack of a second to Darden’s motion.

Another scheduled guest appearance from Monroe County Veteran’s Association representative Carolyn Goldsboro presented to the city a very unusual proposition. An M60A1 Patton battle tank from the deactivated Nettleton National Guard Armory was offered to the City of Amory for adoption at no cost if the city could provide a site.

Goldsboro provided a visual of not only the tank but a map showing the proposed location on a city-owned island across Highway 278 from the existing Veteran’s Memorial near Wilkerson’s Furniture. The development of the site would consist primarily of the installation of a suitable concrete pad for the 50-ton tank.

Goldsboro said the veteran’s group would approach local contractor Hob Sanderson about donating the concrete for the project. Blalock expressed his support for the initiative, as did Amory Police Chief Ronnie Bowen, who didn’t foresee any traffic issues that might result from locating the tank at the site.

Goldsboro added that funds are in place for landscaping the site once the installation is complete. Further action on this item is pending.

Finally, Darden relayed complaints from residents of his ward, who he said are wheezing, coughing and constantly washing the dust off of their vehicles generated by the Enviva pellet plant.

Blalock responded that while the plant was in compliance with Mississippi Department of Environmental Quality (MDEQ) standards, he would follow up on looking into any remedies possible, while the area still waits for relief from the extended hot and dusty summer conditions.

Amory Street Department Director David Moore added that recently, the prevailing winds have been easterly, causing more dust over sections of Ward 2.

Ironically, Enviva's introductory statement on its website proclaims its mission is to "develop a cleaner energy alternative to fossil fuels." It continues to say, "We work for lower emissions, healthy forests and strong communities."

While the emissions may not be environmentally threatening, the funnel cloud of dust over the plant can be unsettling when seen reaching into another cloud above, and the dust by-product persists for the time being.

Local officials at Enviva did not return request for comment.

Exposures to Carbon Monoxide from Off-Gassing of Bulk Stored Wood Pellets

Lydia Soto-Garcia, Xinrui Huang, Devraj Thimmaiah, Alan Rossner, and Philip K. Hopke*

Center for Air Resources Engineering and Science, Clarkson University, Potsdam, New York 13699, United States

Supporting Information

ABSTRACT: There has been a significant increase in use of wood pellets in residential and commercial scale boiler systems within New York State, such an increase will lead to increased storage of bulk pellets in homes and buildings. Serious accidents in Europe have been reported over the past decade in which high concentrations of carbon monoxide (CO) have been found in bulk pellet storage bins. Thus, additional exposure data for CO in pellet bin storage areas are needed to assess the potential hazards. Using calibrated CO sensors, continuous CO measurements were made from the spring 2013 to spring 2014 in a number of wood pellet storage bins in New York State. The CO sensors, in some cases, in conjunction with sensors for CO_2, O_2, relative humidity, and temperature, were installed in a residential basement, an external storage silo, and several boiler room storage areas in schools and a museum. Peak concentrations in these pellet storage locations ranged from 14 ppm in the basement residence to 155 ppm inside the storage silo at a school. One-hour CO concentrations in the boiler rooms were typically 10−15 ppm. The measured concentrations were compared to regulatory standards of 50 ppm and recommended guidelines of 35 and 9 ppm for work and nonworking environments, respectively. The concentrations at the three locations in the middle school never exceeded the 35 ppm guideline. At the museum, the CO concentrations after pellets delivery did reach a maximum of 55 ppm for a 1-h average. However, high concentrations remained for only 4 days due to natural ventilation in this storage location. Storage areas for pellets must be considered confined spaces and require appropriate entry procedures. As the biomass heating with pellets becomes more prevalent, improved designs for storage bins must be considered to minimize the risk of exposure to CO to building occupants.

■ INTRODUCTION

The rise in fossil fuels costs, the need of energy security, and the desire for clean and renewable energy has stimulated the use of alternative heating fuels. Wood pellets are a biofuel that has gain popularity in many places, such as the Northeastern United States.[1,2] The New York State Energy Research and Development Authority (NYSERDA) has initiated multiple demonstration projects to introduce advanced wood-pellet fired boilers into New York State (NYS) including a European-built 150 kW (500 MBTU/h) wood pellet boiler installed at the Walker Center at Clarkson University and a 500 kW (1.7 MMBTU/h) installed at the Wild Center Museum in Tupper Lake, NY.

Storage of bulk wood pellets can involve a variety of storage bins. Many pellet bin configurations have been developed, including bins within the structure and bins external to the building. Supporting Information Figure S1 shows an external pellet silo. Interior bins can be configured in a number of ways as shown in Supporting Information Figures S2−S6. The most common storage bin designed for homes is the fabric storage bins (Supporting Information Figure S6). The best storage bin for a building depends on the budget, space available, among other factors. The bins can range in size according to the consumer needs from 3 tons to more than 100 tons.

The storage of wood pellets in confined spaces produce various gases including carbon monoxide (CO), carbon dioxide (CO_2), methane (CH_4), and volatile organic carbons (VOCs)[3−6] that will accumulate in the air and can potentially reach toxic levels. Fatal accidents have been reported on maritime vessels providing bulk transport of wood pellets[7,8] and in large pellet storerooms of private households in Europe.[9] Thus, it is important to understand the potential health threat posed by stored pellets.

Elevated levels of CO can cause serious illness and death of exposed people. The adverse health effects associated with CO vary with its concentration and duration of exposure.[10,11] The most important health effects associated with exposure to CO are due to its strong bond with the hemoglobin molecule, forming carboxy-hemoglobin (COHb). COHb impairs the oxygen-carrying capacity of the blood, putting a strain on tissues with high oxygen demand, such as the heart and the brain.[10−13] Health effects observed from exposure to 10−2500 ppm of CO include early onset of cardiovascular disease, behavioral impairment; decreased exercise performance, reduced birth weight, sudden infant death syndrome, increase daily mortality rate, serious headache, dizziness, nauseas, unconscious, convulsions, and death, among others.[10,11,14] In order to protect peoples' health, a COHb level of 2.5% should not be exceeded.[10] Recommended guidelines for homes are 9 ppm of CO averaged over 8 h as proposed by American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) and the World Health Organization (WHO). The National Institute of Occupational Safety and Health (NIOSH) guideline for work environments is 35 ppm over 8 h

while the Occupational Safety and Health Administration (OSHA) has established a standard of 50 ppm over 8 h that is not to be exceeded. More detailed information on CO health effects and recommended maximum exposures is provided in the Supporting Information and Table S1.

The CO generation in bulk storage bins, such as the ones in this study, is the result of an oxidation process of the wood pellets that produces CO, CO_2, CH_4, and VOCs.[4,5] The nature of this process still needs to be determined. Prior studies found the process to be mass, temperature, moisture content, and volume dependent.[5−7] In addition, it has been hypothesized that the mechanism of formation of VOCs is due to the oxidation of fatty/resin acids by observing the emitted amount of aldehydes and ketones decreased by 45% during storage.[15] However, that study does not relate any of these carbonyl concentrations to the CO emissions, raising the question of how the CO is formed. Other research has related the CO emissions to microbial activities in the wood pellets and wood chips.[9,16] However, wood pellets are dried at around 500 °C in the production process and have a low water content (<7%) that creates unfavorable conditions for microbiological activity.[9]

In an attempt to understand the emission rates of stored wood pellets and be able to predict indoor concentrations, Fan and Bi studied the kinetics of CO off-gassed from stored wood pellets in small containers and developed a model that predicts the CO emissions per unit mass of stored pellets.[17] While Fan and Bi's model provided a framework for understanding the emission rates, validation of the model is still necessary particularly since the only data they employed was for softwood pellets. Models can never account for all aspects of an in situ situation (actual environments). Hence, field sampling is necessary to characterize the actual airborne CO concentrations in in-use systems. The purpose of this study is to characterize the potential exposures of CO from bulk storage pellets used in different typical U.S. storage systems, including in-use bins in schools, work places, and a residence.

EXPERIMENTAL DETAILS

Sampling Sites. Six different pellet bins were monitored during this study: the Walker Center and Energy Cabin at Clarkson University, the Wild Center Museum in Tupper Lake, NY, Malone Middle School in Malone, NY, Petrova Elementary School in Saranac Lake, NY, and a residential basement in Massena, NY. In several cases, multiple monitors were deployed to assess leakage of CO from the storage bins into normally occupied spaces. Table 1 summarizes the specific sites together with the monitoring system deployed.

Monitoring Systems. Sensor systems were constructed from commercially available gas sensors as described in Table 2 and the Supporting Information for this report. Two types of systems were developed. One system included only a CO sensor and in the other, CO, CO_2 and O_2 as well as temperature (T) and relative humidity (RH) were measured.

The systems were then deployed into the various locations monitored. At the Petrova Elementary School, the pellet storage system is a silo external to the building with 20 tons capacity. The sensor was connected at the end of the pneumatic delivery tube as shown in Supporting Information Figure S1.

For Malone Middle School, the CO and particulate matter (PM) sensors were placed in an air duct constructed to ventilate the storage bin at this site. The air in the duct should be representative of the concentrations within the bin. Supporting Information Figure S2 shows the CO and PM monitor connected into the side of the duct.

The more complete sensor systems were placed into the Walker Center pellet bin with 10 ton capacity (Supporting Information Figure S3), the container that serves as the pellet bin at the Wild Center with 30 ton capacity (Supporting Information Figure S4) and into the Energy Cabin pellet bin at Clarkson University with 3 tons capacity (Supporting Information Figure S5).

A monitor was placed in the basement of a home heated with a wood pellet boiler (Supporting Information Figure S6). The pellets are stored in a 10 ton gas permeable bag storage system. This bag system is a commercially available storage system that has been commonly installed in homes although more commonly as a 3 ton system rather than this 10 ton facility.

The monitoring systems came online at various times. The Massena, Saranac Lake, and Malone sites started in spring 2013. Most locations consumed their pellets by the end of April 2013 so there were little or no pellets in most of the storage facilities over the summer, so no monitoring was performed. New pellets were obtained at the end of the summer 2013 with different locations staring their monitoring (Tupper Lake and Potsdam sites) for the first time during summer 2013 and getting deliveries at different times until April 2014. The sampling dates are provided in Table 1. All of the CO concentration presented here are 1-h averages in order to understand the dynamics of the CO build up in storage bins. However, the 8-h guidance values are shown for reference since they provide conservative values. The 8-h average values that exceed the guidance levels are discussed since most of the sampling sites are occupational spaces. Only the Massena residence and the Energy Cabin at Clarkson University are nonworking environments.

■ RESULTS AND DISCUSSION

Massena Residence. The measurements in the Massena residence started on March 5, 2013 as shown in Figure 1a). Based on health guidelines presented in Supporting Information Table S1, 8-h exposure guidance levels of 9 and 35 ppm, respectively, are highlighted with dash−dot lines in all of the presented results. An initial spike of ∼60 ppm of CO was observed. Subsequently, the values decreased to less than 9 ppm (ASHRAE threshold limit) for the rest of the spring 2013 heating season. In June, a rise in CO was observed although there was only a small quantity of pellets (∼less than a ton) in storage as reported by the owner. Thus, the origin of this peak is not understood. The sensor was tested and recalibrated and reconnected on Aug. 2. Fresh softwood pellets were added to the storage bin in August. Figure 1b highlights this period. Concentrations above 9 ppm were observed, but as reported by the house owner, ventilation was applied because of the intense VOC odors emitted by the pellets. The concentration of CO decreased to below 9 ppm in less than 3 days and throughout the winter heating season with the measurements ending on April 18, 2014. Clearly, the ventilation (natural and/or mechanical) together with the difference in temperature (inside and outside the storage) reduced the concentration of CO as suggested by Emhofer.[18]

Petrova Elementary School. At the Petrova Elementary School in Saranac Lake, the storage bin is an outdoor silo (Supporting Information Figure S1) with a CO sensor at the bottom. In the spring of 2013, CO was monitored at the silo and at the containerized boiler room, and then, from the end of August 2013, only the silo was monitored. The monitoring at two sites was performed to check for leaks from the silo into the boiler room.

Figure 2 shows a 1-h CO value of approximately 20 ppm in the boiler room (maximum of 14 ppm for 1-h and 9 ppm for 8-h average), below the occupational guidelines, and up to approximately 155 ppm in the silo that is well above the guidelines and standards. By April 15, 2013, most of the pellets had been consumed and the concentrations returned to background conditions (<5 ppm). In the summer of 2013, the sensors were recalibrated and installed in just the silo. New pellets were delivered in October 2013. Concentrations at the silo rose to approximately 50 ppm in average, and only in one occasion reached to approximately 150 ppm. The values might be lower than previous heating season because of colder condition or pellets had an opportunity to age before they were delivered to the site. However, clearly enclosed silos such as this one need to be treated as confined spaces as per OSHA regulations if maintenance is required.

Malone Middle School. The Malone school uses the space in the basement that had been the coal bin for pellet storage. This bin had an active ventilation system producing a flow of 300 cubic feet meter. Three CO sensors were installed in this facility along with a particulate matter monitor (PM). One of the CO sensors was placed in hallway near the entrance door to the bin. A second sensor was deployed in the area around the two 1 MMBTU/h boilers. The third CO sensor and the PM monitor were installed in the outlet duct for the ventilation system (Supporting Information Figure S2). Data were collected in the spring of 2013 at the hallway and boiler room only. CO concentration increases as spikes between 10 and 15 ppm during the month of April for data averaged for 15 min and 1 h. The spikes lasted for less than an hour. It is likely

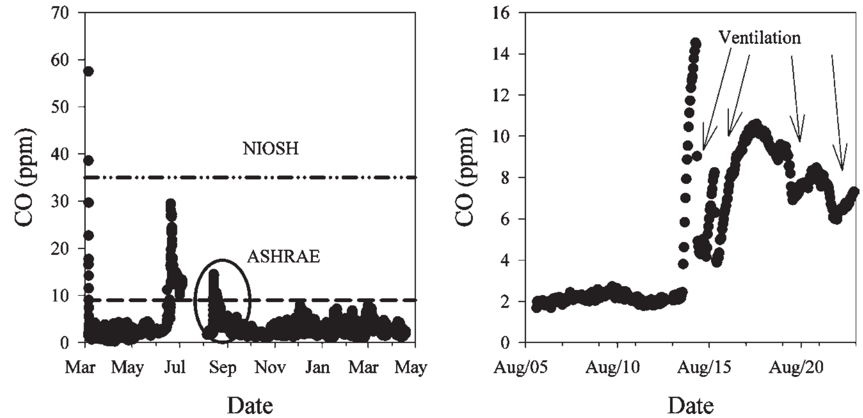

Figure 1. (a) CO measurement at the Massena Residence Basement (March 2013−April 2014). Dashed line refers to the ASHRAE limit (9 ppm of CO) and dotted line to NIOSH guidance level of 35 ppm of CO. (b) Time series (August 2−23, 2013) of CO measurement enlarged (inside the circle) from part a).

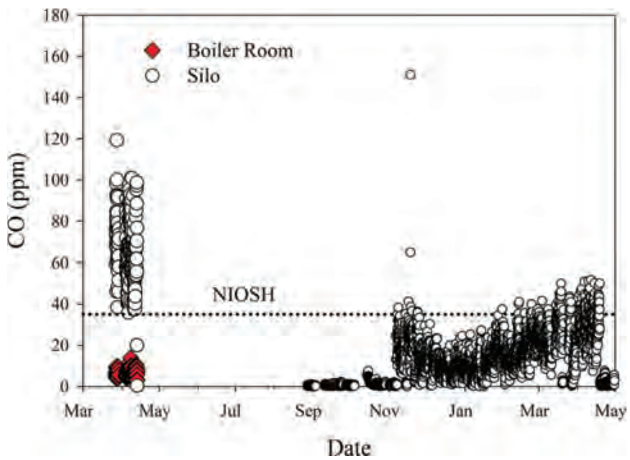

Figure 2. Time series of CO measurements inside the boiler room and pellet silo located outside of the Petrova Elementary School.

that the high CO concentrations were due to other causes (gasoline powered equipment brought in from outdoors and still operating) and not due to the storing of wood pellets.

The sensors were returned to the laboratory for calibration and reinstall at the end of September and beginning of October 2013. Figure 3 shows the 1-h average CO concentrations at the three locations in the school basement. Peaks of CO were observed in the month of October that were reported as a result of storing and operating various gasoline-powered grounds keeping equipment in the hallway where the motors might be running as they moved them in from outside the building.

There were no pellets in the bin until November fourth when the first delivery of the season was made. At the hallway door, there are 6 peaks that correlate with high concentrations of CO in the air duct ventilation, but they were only spikes for short periods of less than 5 ppm. The pattern in boiler room from November until December suggest that the two boilers were leaking CO or that there might be a leak from storage bin to the boiler room. However, concentrations never exceeded the NIOSH recommendation (35 ppm) and OSHA limits (50 ppm) for occupational space. From the end of January, these concentrations diminished to well below guideline levels.

Since the delivery of the wood pellets generate combustible wood dust, it was imperative to measure the concentration of

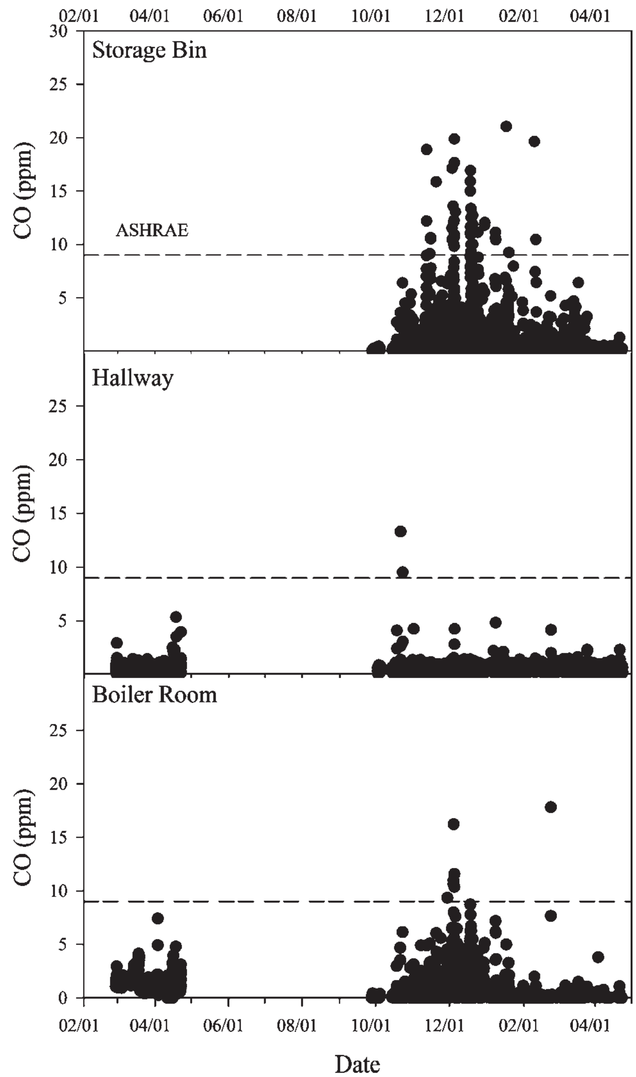

Figure 3. Time series of CO measurements at three locations (storage bin, hallway, and boiler room) in Malone Middle School.

particles generated at this site. One of the major contributors to the risk of an explosion is the size of the dust particles. In general, the finer the combustible particle is the higher the risk

DOI: 10.1021/ef5021186
Energy Fuels 2015, 29, 218−226

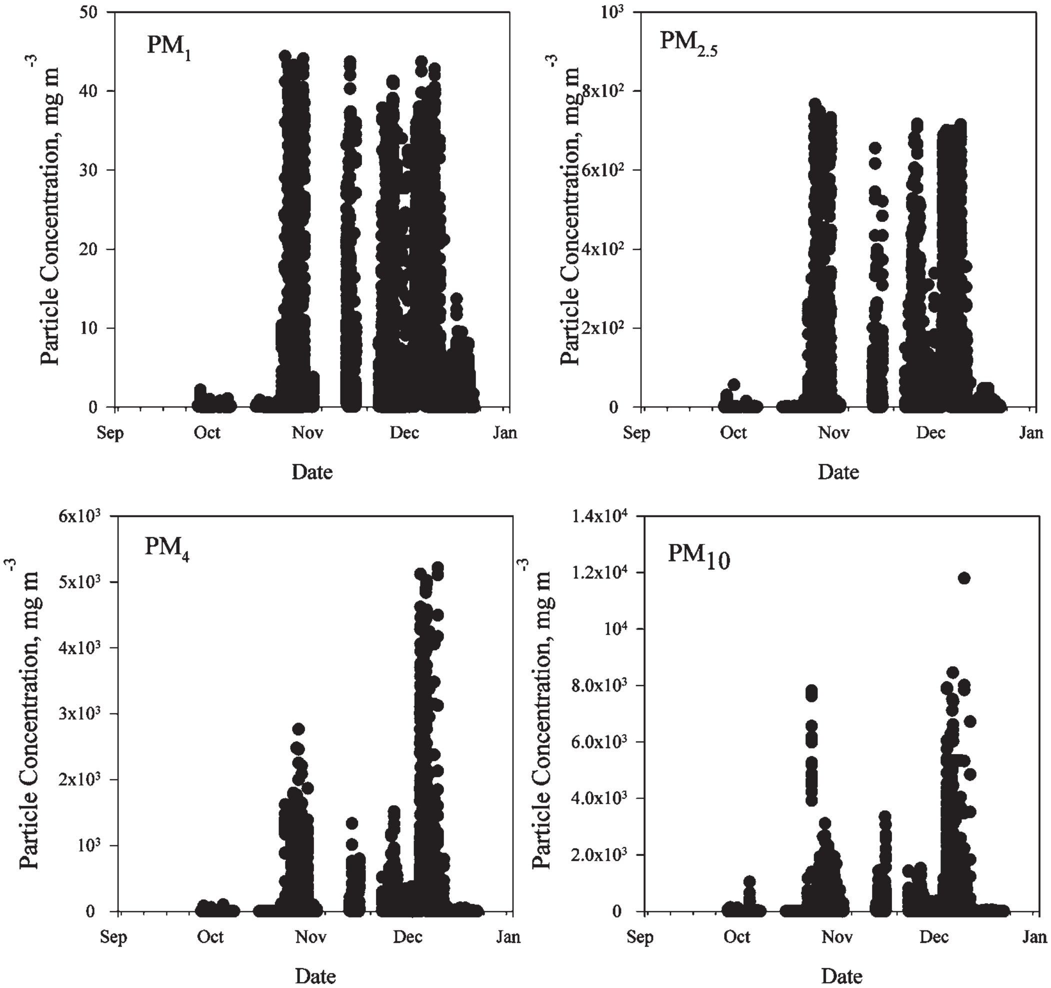

Figure 4. Particle concentration in the air duct exhaust at the storage bin in Malone Middle School.

of explosion. The National Fire Protection Association (NFPA) defines wood dust as a deflagrable (combustible dust) wood particulate with a median diameter of 420 μm or smaller, having a moisture content of less than 25%. The level of explosion limit for wood dust suspended on air is 40 g m^{-3} (4000 mg m^{-3}). Results of concentration of particles are shown in Figure 4. The sensor started having problems after mid-December, so these results are not presented. The data from November until mid-December clearly shows that the concentration of any of the particle sizes measured do not exceeds the concentration of airborne particles in the safety standards established (Max: PM10 ~ 12 000 μg m^{-3}; PM4 ~ 5000 μg m^{-3}; PM2.5 ~ 750 μg m^{-3}; and PM1 ~ 45 μg m^{-3}).

Wild Center. Background sampling started at the beginning of September, but there were unexpected spikes on all sensors that suggested an interference with the signal. The first pellets delivery was on Sept. 29, 2013. Data presented here is ranges Oct. 1–22, 2013; after this period, the system continues with interferences. Figure 5 shows the results of the five sensors for about 20 days in Oct. 2013. CO concentrations reached a maximum 1-h average of around 55 ppm. The 8 h average value reached 35 ppm that is the NIOSH guideline, but it did not exceed the OSHA regulatory standard of 50 ppm. The elevated concentrations only persist until Oct. 4 (around 5 days). These data show a relationship among temperature, CO, and CO_2 that suggests that with an increase in temperature CO and CO_2 will increase the rate of off-gassing from the pellets. The maximum peaks of temperature match with the minimum peaks of %RH and %O_2, suggesting that the off-gassing occurs with a depletion of oxygen and lower RH. This result has been observed in a previous field study of larger scale storage bins (silo) were higher temperatures shows higher emission factors of CO and lower concentration of O_2.[19] The occasionally high temperature in the pellets bin appears to be a leak of heat from the solar-thermal panels on the side of the container. Nevertheless, the O_2 (21%–20.5%) and CO_2 (700–450 ppm) concentrations are quite constant over the rest of the sample period (Oct. 5–22). Thus, the limited decomposition of the pellets and the natural ventilation into this bin resulted in relatively constant atmospheric compositions.

Walker Center. This location has the first imported high-efficiency wood pellet boiler in the Northeastern U.S.A. Walker had a pellet delivery (softwood) on Nov. 4, 2013. The measured values are shown in Figure 6. CO concentrations rose to approximately 40 ppm. Concentrations remained above 10 ppm for 7 days (Nov. 4–11), and after Nov. 17, the concentration dropped to background conditions (<2 ppm). During these 7 days, the temperature showed a weak relationship with the CO and CO_2 off-gassing, in contrast with the observations from the Wild Center (Figure 5).

DOI: 10.1021/ef5021186
Energy Fuels 2015, 29, 218–226

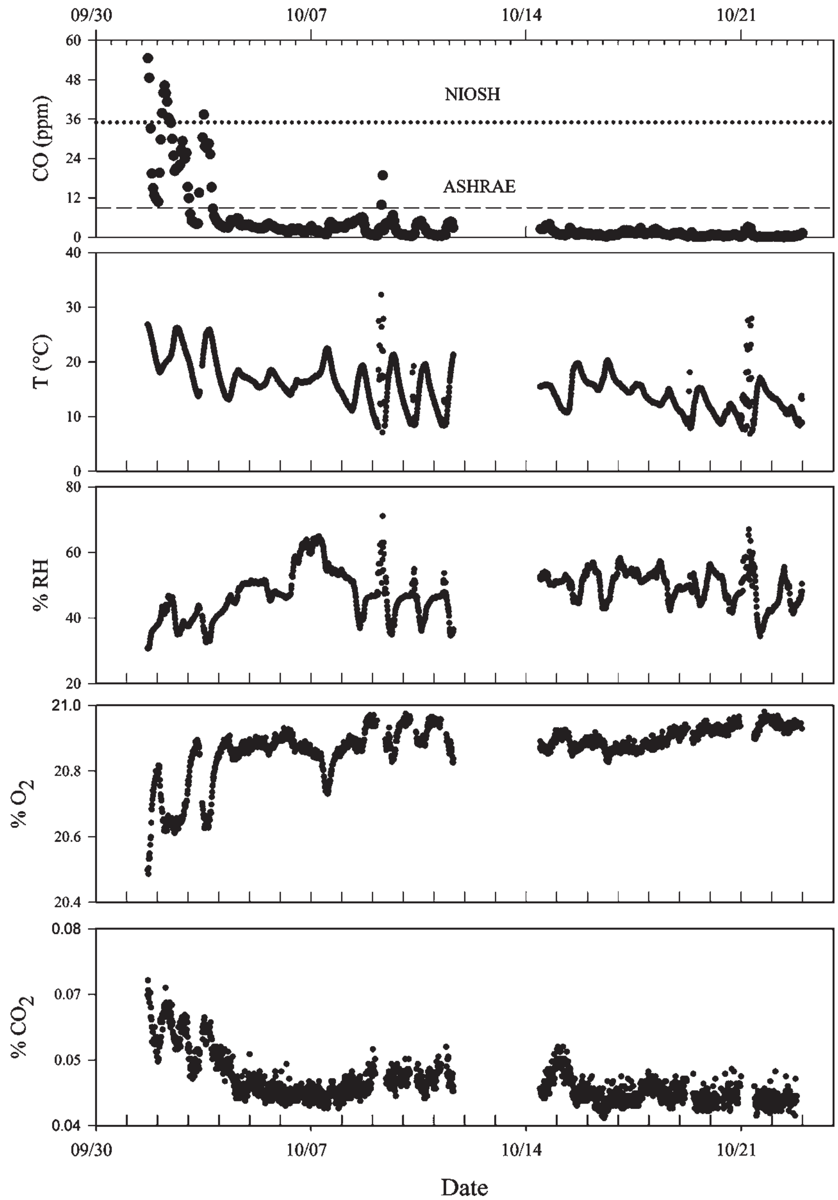

Figure 5. Time series for CO, temperature (T), relative humidity (%RH), $\%O_2$, and $\%CO_2$ in the Wild Center Museum in Tupper Lake, NY.

However, the lower values of RH (from 55 to 25%) and $\%O_2$ (from 20.0 to 19.8%) align with the peaks of CO and CO_2 (600−700 ppm). For O_2, this behavior can be due to the oxidation of the wood pellets. The water vapor variations may be attributed to the infiltration or ventilation in the building, while CO and CO_2 are being produced within the storage bin. The observed results do not suggest that water vapor reduction is attributable to water uptake by the pellets based on a moisture content analysis of the pellets in this storage bin after 4 months that showed a value of 4.5% (manufacturer's specifications for fresh pellets <5%).

During the winter, mid-December to the end of January, all sensors responded with ordinary spikes or off sets, especially the temperature sensor (range: 20−60 °C). This behavior might be the result of a malfunctioning room heater inside the bin that activates at low temperatures to ensure that the pellets do not freeze. In addition, there is an increase in CO (<10 ppm) and CO_2 (0.12%) concentrations at the end of February until the beginning of March that correspond to the starting of the boiler during this limited period. Because of modifications to the boiler system that were being performed, the boiler was not operated during this heating season at any other time. The results presented in the Walker Center shows that this site is not as well ventilated as the Wild Center resulting in a longer period for the CO to dilute. However, the fresh pellets delivered in November generated sufficient CO to exceed the occupational guideline value. Therefore, this storage bin has been defined as a confined place.

Energy Cabin. The Energy Cabin is the smallest bin in this study. The delivery of pellets is performed manually from 40 pounds bags that had been stored and placed outside the cabin generally for more than 2 weeks of storage. Figure 7 shows very low values of CO (<5 ppm) during the entire sampling period except for April when values reached approximately 10 ppm, above the 9 ppm of ASHRAE guideline. This CO off-gassing is followed by an increase in temperature in the bin that coincides

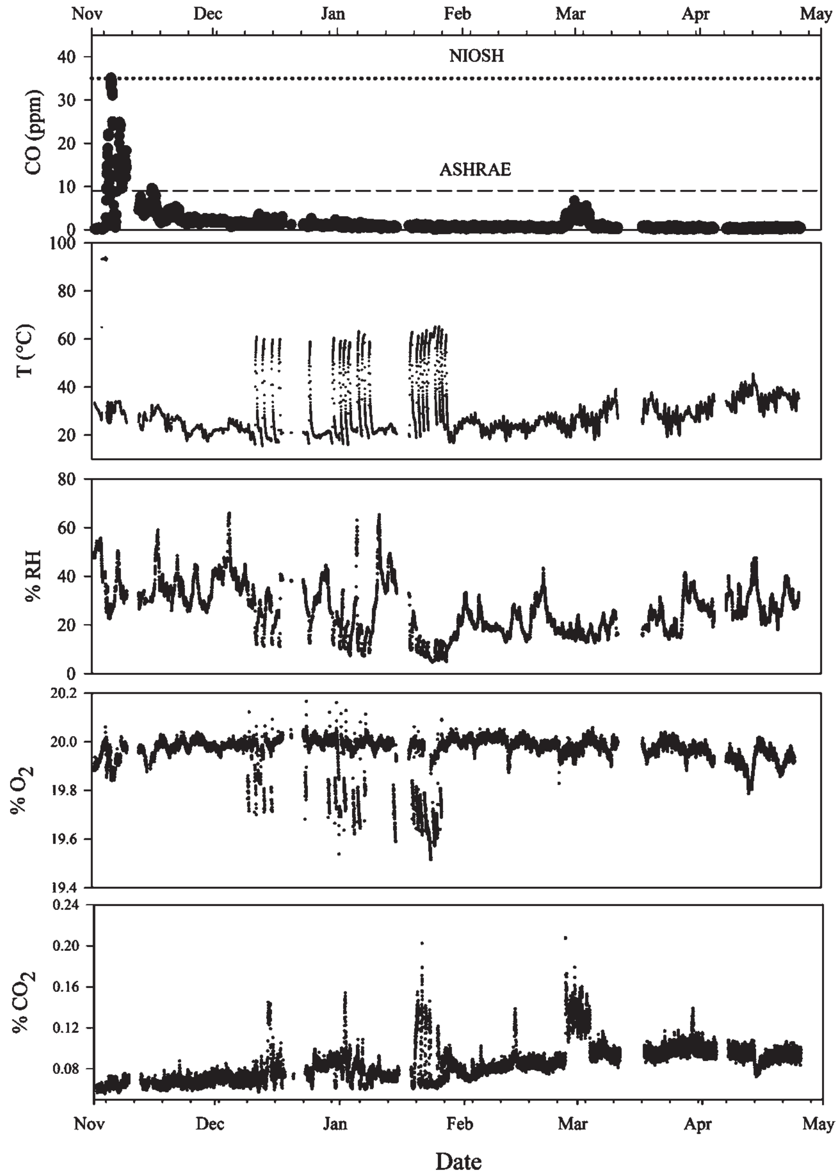

Figure 6. Time series for CO, temperature, relative humidity, $\%O_2$, and $\%CO_2$ in the Walker Center at Clarkson University in Potsdam, NY.

with the minimum RH and O_2 values during this period. In general, there is a weak relation between the CO off-gassing and the temperature, % RH, % O_2, and CO_2 over the entire period at this site. CO (<10 ppm), O_2 (21%), and CO_2 (450 ppm) concentrations are relatively constant over the entire period probably because the wood pellets had an opportunity to age before they were placed inside the bin.

The results presented here for the six different small-scale pellet storage bins show, in general, that the concentration were not as high as reported by Gauthier[9] and Emhofer[18] with all of the concentrations being below 200 ppm. This behavior might be in part due to the intrinsic ventilation of all the sites under study and the chemical composition and quality of the wood pellets manufacturer here (low ash and moisture content). Prior studies showed that commercial wood pellets produce less CO and PM than other solid fuels.[20] Also, the data show that CO levels increased only during the days immediately following the delivery of fresh pellets. It then decreases slowly to background values. Emhofer[18] concludes that storage rooms should not be entered within 4 weeks after pellet deliver, but our data suggest a significantly shorter time, more on the order ~1 week, may be acceptable. However, measurements of the CO concentrations should be made before entry.

Natural ventilation has been recommended by Emhofer,[18] such as utilizing caps on the filling tubes that allow air exchange between the storeroom and the surroundings to reduce CO concentrations. However, caution should be taken with respect to cross ventilation and differences in temperatures between the storeroom and surroundings. Also, as shown in our results at Massena residence, by opening windows (natural ventilation) and installing an exhaust fan (mechanical ventilation); the CO and VOCs (odors) were readily reduced.

■ CONCLUSIONS

This field study demonstrated that there is off-gassing of sufficient CO from stored pellets to represent a hazard that needs to be adequately addressed. Although no concentrations that would directly produce short-term extreme health effects

DOI: 10.1021/ef5021186

were observed, concentrations above levels set as exposure guidelines of 35 ppm in occupational settings and 9 ppm in homes were exceeded, especially immediately after pellet delivery. The concern is that as biomass boilers become more widely used, a broad array of homes with varying levels of natural ventilation will install pellet heating systems with inside the structure storage bins. In energy efficient (low air exchange rates) homes, this situation could produce unacceptable CO concentrations. These results raise a safety question regarding how pellets storage bins are designed and sited. Active and natural ventilation clearly reduces the average concentrations, although higher values were still occasionally observed. Pellet aging clearly reduced the amount of observed CO. There was a clear positive relationship with the off-gassing of CO and CO_2 and temperature where higher temperatures produce higher off-gassing production. Thus, bin temperatures need to be considered when designing or choosing a pellet storage bin.

FACTSHEET
AIR EMISSIONS

July 2011

Wood Pellet Manufacturing Facilities

Under the *Environmental Management Act* (EMA), all high-risk, and some medium-risk, industrial operations in British Columbia are required to have government authorization[1] prior to discharging emissions or waste to the environment. These authorizations are legally enforceable and are subject to pollution preventing conditions and criteria. Authorizations for new, or significantly modified, wood pellet manufacturing facilities are developed based on the Ministry's Guideline for Emissions from Wood Pellet Manufacturing Facilities.

The purpose of this document is to summarize key emissions information contained in the Ministry's Guideline for Emissions from Wood Pellet Manufacturing Facilities.

What are guidelines used for?

Guidelines provide assistance to directors, appointed under EMA, when preparing and issuing authorizations for industrial facilities.

What are wood pellets?

Wood pellets are a type of wood fuel, usually produced as a by-product of sawmilling and other wood transformation activities. The pellets are generally made from compacted sawdust and shavings. The sawdust and shavings may be blended with smaller amounts of processed bark, hog fuel, processed standing dead timber and processed landing debris.

Wood pellets are usually 6 to 8mm in diameter and 2cm in length. However, they can be manufactured in other configurations, such as pucks or logs.

[1] Authorizations may include permits, approvals, operational certificates or regulations. For more information on waste discharge authorizations, see: http://www.env.gov.bc.ca/epd/waste_discharge_auth/index.htm

How are wood pellets produced?

Wood pellets are normally produced by compressing dry wood materials to a desired size. First, raw wood materials are passed through a hammer mill and dryer to achieve consistent moisture content. Then, the dry wood particles are fed to a press. In the press they are squeezed through a die having holes of the required size.

The high pressure causes the temperature of the wood to increase greatly, causing the lignin to plasticize slightly and form a natural 'glue' that holds the pellet together.

How are air emissions produced during the wood pellet manufacturing process?

Air emissions may be produced during the wood pellet manufacturing process from sources such as dryers, coolers, pelletizers, hammermills, and conveyors. Fugitive emissions are also released during the handling, storage and transportation of the materials.

What are the emission limits?

The Guideline for Emissions from Wood Pellet Manufacturing Facilities outlines emission limits for total particulate matter (TPM) and fugitive emissions.

The guideline is based on best achievable technology and describes requirements for both new and significantly modified existing facilities.

New Facilities

The guideline stipulates that all new facilities should install control technologies that will at minimum, achieve the emission limits listed in Tables 1 and 2.

Existing Facilities

The guideline specifies that existing facilities that have undergone significant modifications are expected to meet the applicable monitoring and control requirements listed in Tables 1 and 2. Existing wood pellet manufacturing facilities that have not been significantly modified may continue to operate in accordance with the limits of their current permit.

When has a facility been "significantly modified"?

A facility has been significantly modified if it has undergone a physical or operational change resulting in an increase of 10% or more in the volume of discharge or the total amount of any contaminant released to the environment, based on authorized values.

What is Total Particulate Matter (TPM)?

Particulate matter refers to tiny solid or liquid particles that float in the air. TPM consists of filterable and condensable particulate matter. Filterable particulate matter includes all PM_{10} and $PM_{2.5}$ emissions, where PM_{10} and $PM_{2.5}$ are comprised of particulate matter with aerodynamic diameters less than 10 and 2.5 micrometers respectively. Condensable particulate matter is any material that is not particulate matter at stack conditions, but condenses and/or reacts to form particulate matter immediately after discharge from the stack.

Why are TPM emissions limited?

TPM emissions are limited because they can have negative impacts on local air quality and human health. $PM_{2.5}$ is known to cause aggravation of respiratory and cardiovascular disease, reduced lung function, increased respiratory symptoms and premature death. TPM also impairs visibility, affects climate and can damage and/or discolour structures and property.[2]

TPM emission limits

The TPM emission limits and monitoring frequency for wood pellet manufacturing facilities outlined in the Ministry's guideline are summarized in Table 1.

In addition to emission limits listed below, facilities should strive to maintain opacity below 10%. Opacity can be thought of as the amount of light blocked by TPM.

How frequently should TPM emissions be monitored?

The monitoring frequency listed in Table 1 should be followed except in the case of the implementation of new process units. For new units, an operator should undertake baseline monitoring (stack testing) within six months of start up. Thereafter, the operator should continue monitoring at the prescribed monitoring frequency stated in Table 1.

What are fugitive emissions?

Fugitive emissions are unintentional or incidental releases. The significance of fugitive emissions at wood pellet manufacturing facilities may vary depending on the type of raw material, method of transportation and specific process used in the production of the wood pellets. Major sources of these emissions include raw material handling, raw material storage piles, conveyor transfer points, yard dust, haul road dust and engine exhaust.

Fugitive emission limits

Table 2 provides a summary of the limits and monitoring and control strategies detailed in the guideline to mitigate fugitive emissions.

What are the effluent handling requirements?

If the applied emission control technology uses a solution, such as water, any resulting effluent should be delivered to an approved facility for treatment or disposed of in a manner approved by a director.

[2] More information on how air quality affects human health can be found in the State of the Air Report 2010 at: http://www.bc.lung.ca/airquality/documents/StateOfTheAir2010webrevised.pdf

Are there other considerations?

The information contained in the Ministry's guideline documents are just one of the main pieces of information taken into consideration by the director when approving an authorization. Additional sources of information considered by the director may include environmental impact assessments, local air shed plans, other guidelines and stakeholder input. The director also has the authority to impose emission standards other than those that are recommended in these types of guidelines.

Table 1: Total Particulate Matter Emissions Limits for Wood Pellet Manufacturing Facilities.

Source	Limit[a] (mg/m^3)	Monitoring[b]
Dryer Exhaust	60[c]	Quarterly
Pellet Cooler Exhaust	115[e]	Annual
Other Plant Processes[d]	20[e]	Annual

(a) Concentration limits measured at standard conditions of 20°C, 101.3kPa, dry gas.
(b) All monitoring for this guideline must be carried out in accordance with the latest version of the: *British Columbia Field Sampling Manual – For Continuous Monitoring and the Collection of Air, Air-Emission, Water, Wastewater, Soil, Sediment and Biological Samples.*
(c) The dryer exhaust limit includes filterable and condensable particulate matter. It is an interim two year limit. This limit may be adjusted as more data becomes available.
(d) Other plant processes may include pelletizers, hammermills, storage, screening and conveyors.
(e) Includes filterable particulate matter only.

Table 2. Fugitive Emissions from Raw Material Storage Piles and Road Dust

Source	Limit	Monitoring and Control
Sawdust and Wet Material	No Visible downwind carry over	Visual monitoring with controls as required including: limiting pile heights and limiting exposed pile faces to high winds (e.g. wind breaks; vegetative or screens). Include meteorological controls and planning.
Planer Shavings and Dry Material		As above, plus three sided and covered containment. Prevent vehicle traffic from grinding material finer.
Onsite Haul Roads		Dust suppression in dry season or paving.

Carbon Monoxide Off-Gassing From Bags of Wood Pellets

Mohammad Arifur Rahman, Alan Rossner, Philip K Hopke

Abstract

Wood pellets are increasingly used for space heating in the United States and globally. Prior work has shown that stored bulk wood pellets produce sufficient carbon monoxide (CO) to represent a health concern and exceed regulatory standards for occupational exposures. However, most of the pellets used for residential heating are sold in 40-pound (18.1 kg) plastic bags. This study measured CO emission factors from fresh, bagged-wood pellets as a function of temperature and relative humidity. CO concentrations increased with increasing temperature and moisture in the container. CO measurements in a pellet mill warehouse with stored pallets of bagged pellets had 8-h average CO concentrations up to 100 ppm exceeding occupational standards for worker exposure. Thus, manufacturers, distributors, and home owners should be aware of the potential for CO in storage areas and design facilities with appropriate ventilation and CO sensors.

Keywords: bagged-wood pellets, CO off-gassing, emission factors, exposure

Issue Section: Short Communication

Introduction

The worldwide wood pellet market has grown rapidly. Growth rates have been about 10% annually from ~19.5 million metric tons in 2012 to ~28 million metric tons in 2015 (WPAC, 2017). In 2016, the demand for industrial wood pellets was estimated to be ~13.8 million metric tons (WPAC, 2017). However, a problem exists with respect to the safe handling of wood pellets and that is off-gassing of carbon monoxide (CO) and aldehydes into storage bins and shipping vessels (Svedberg *et al.*, 2004, 2008, 2009; Arshadi and Gref, 2005; Hagström *et al.*, 2008; Kuang *et al.*, 2008; Arshadi *et al.*, 2009; Granström, 2010; Soto-Garcia *et al.*, 2015a). Fourteen fatal accidents have been reported since 2002 resulting from the storage or transport of bulk wood pellets (Gauthier *et al.*, 2012).

Soto-Garcia *et al.* (2015a) measured 8-h average CO concentrations up to 35 ppm in a residential basement. Recently, Rossner *et al.* (2017) measured CO concentrations in areas with indoor storage of bulk wood pellets in homes and reported that 6 of the 16 homes tested exceeded the 9-ppm American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE, 2009) guidance concentration on multiple occasions. These studies were performed using bulk wood pellets, but most wood pellets in the United States are sold and distributed in plastic bags containing 10 to 25 kg (Safe Pellets, 2012). To store and transport the bagged pellets, they are normally stacked on pallets with typically a ton per pallet. The bags are perforated to allow for stacking on the pallets without the air in the bags inflating them and thereby preventing effective packing.

After purchasing bagged-wood pellets, consumers often store 1–3 tons of pellets in an inside storage room or in the basement until they are needed. Pellet manufacturers and distributors generate or store large quantities of bagged pellets in warehouses for extended periods before selling them to the customers. The perforations of the plastic bags suggest that the CO generated from these pellets can emanate from the bags, enter the storage area, and result in exposures to building occupants. There is currently no published information regarding the off-gassing of CO from the stored bagged-wood pellets and the resulting impacts on air quality in occupational or residential spaces.

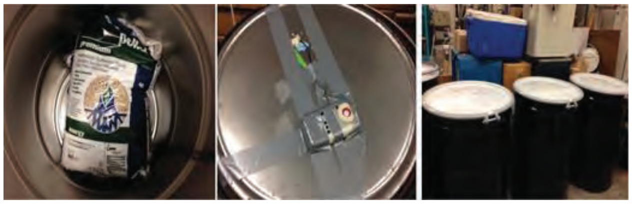
Soto-Garcia *et al.* (2015b) measured the emission factors for CO off-gassing from loose hardwood, softwood, and blended pellets by storing pellets in steel drums and measuring the resulting CO under varying temperature and moisture conditions. Similar results have been obtained in other studies (Kuang *et al.*, 2008; Emhofer *et al.*, 2014). The objective of this present study was to understand the impact of storing bagged pellets by manufacturers, distributers, and consumers by estimating the emission factors for CO off-gassing. CO emissions from bagged pellets were studied as a function of temperature, and relative humidity (RH) that could mimic storage conditions in a warehouse, basement, or garage. Wood type (hardwood, softwood, and blended) affects CO emissions (Soto-Garcia *et al.*, 2015b) and off-gassing from hardwood, softwood, and hardwood/softwood blended bagged pellets was measured. To ascertain if these emissions represented an occupational hazard, measurements were made in the warehouse of an active pellet mill.

Skip to Main Content

Methods

The experiments were conducted in a manner similar to that described by Soto-Garcia *et al.* (2015b) except using 55-gallon (208.2 l) carbon steel drums. The 55-gallon drums were sealed by a metal ring to maintain an airtight fit against a gasket. Two sealed bags of pellets were inserted into each drum for each experiment. A CO monitor (Model ZDL-500, Environmental Sensors Co., USA) and a temperature (T)/RH (EL-USB-2+, EasyLog, LASCAR electronics, China) monitor were attached to the inside bottom of the cover (Fig. 1). The drum was sealed for 20 days to continuously monitor the resulting CO concentrations as well as temperature and RH. The CO monitors measured from ~1 to 2000 ppm and they were calibrated using high purity CO gas (99.999%) diluted with zero air in a Model 146i multigas calibrator and a Model 111 zero air supply (ThermoScientific). Fresh (<2 days after production) bags of pellets (40 lbs, 18.14 kg) were obtained from a local manufacturer. The pellets were typically ~6 mm in diameter and 6–25 mm in length, with a bulk density of (40 lbs ft^{-3}, ~650 kg m^{-3}). Tests were run under different environmental conditions for each type of wood pellets. Three replicate tests of each type of wood pellet were performed. Measurements of CO were data logged every 3 min, and T and RH was measured every 5 min. Each set of measurements was performed for up to 20 days.

Figure 1.



Open in new tab Download slide

Experimental setup of the bag-pellets drum experiment.

Details of these experiments are provided in the Supplemental Information file (available at *Annals of Work Exposures and Health* online). CO emission factors were then calculated from the data. At constant temperature (T) and pressure (P), the concentration of CO off-gassing was converted to an emission factor, *f* (milligram of off-gas per kilogram of wood pellets) using the equation of Yazdanpanah *et al.* (2014) and Tumuluru *et al.* (2015).

$$f = \frac{PCVgMwt}{RTM} * 1000 \tag{1}$$

Where, T = temperature (K); R = gas constant (8.31 J mol^{-1}.K^{-1}); M_{wt} = gas molecular weight (g mole^{-1}); M = mass of the pellets in the drum (kg); V_g = volume of the gas in the drum (m^3); P = pressure in the container.

Field study

To monitor CO in a large-scale pellet storage, a CO logger was place in a large pellet warehouse (Rahman *et al.*, 2017). The warehouse can store 269000 bags (40-lbs bags), equivalent to ~5000 tons of pellets. The warehouse represents a volume of ~480000 ft^3 (13592 m^3). Measurements were made from 25 April to 21 July 2016 and 21 July to 26 October 2016. The break in measurements was to download the data and clear the memory. During these periods, the warehouse was being filled with ~5000 and 2500 tons of pellets, respectively, in anticipation of the 2016–2017 heating season. CO was measured at 5-min intervals in the middle of the storage area at 3.66 m (12 ft) and 1.52 m (5 ft) above the floor level with Lascar CO monitors. When pellets were being loaded into the warehouse or removed for shipment, one of the large doors was open. The warehouse configuration and sampling position are illustrated schematically in Supplementary Fig. S3 (available at *Annals of Work Exposures and Health* online).

Results and discussions

Laboratory study results

A detailed discussion of the laboratory results are provided in the Supplemental Information file (available at *Annals of Work Exposures and Health* online). The maximum CO emission factors are presented in Table 1. The results show that CO emissions increase with temperature at 30% RH for all types of bagged pellets. However, the emission rates are higher for blended wood (70% softwood, 30% hardwood) and softwood compared to hardwood (100%) pellets at all temperatures. Temperature has a significant effect on CO production for all wood pellet types as seen in prior studies (Soto-Garcia *et al.*, 2015b).

Table 1.

Summary of the maximum CO emission factors at different temperature and moisture.

Temperature (°C)	Hardwood		Softwood		Blended wood

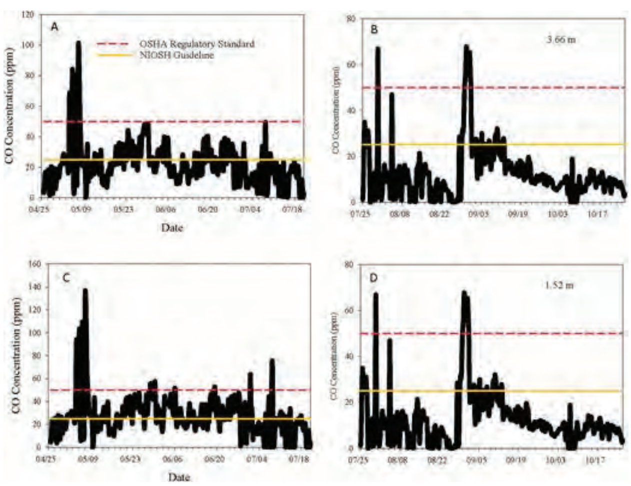
In the United States, the Occupational Safety and Health Administration (OSHA, 1997) permissible exposure limits is 50 parts per million (ppm) averaged over an 8-h time period. Other guidance values like that of the ACGIH are lower (25 ppm over an 8-h period).The CO concentrations for all pellet types at room temperature (22°C) and elevated temperature (30°C) at both RH values were high enough to produce potential in-building concentrations that exceed the ACGIH health-based guidelines of 25 ppm (ACGIH, 2007) and OSHA-regulatory concentration of 50 ppm for occupational settings. In addition, the 9 ppm (ASHRAE, 2009) guideline for homes could be exceeded.

Measured CO concentrations in the warehouse

Fig. 2 presents the 8-h rolling average CO concentrations calculated from the 5-min data. Fig. 2A and B show the CO measured at 3.66 m above the floor while Fig. 2C and D show the measurements at 1.52 m. Temperature and RH were measured in the warehouse. The temperature during the April to June period ranged from 5 to 20°C and the opposite trend of 20 to 5°C during the July to October period. RH was ~30%, similar to what was observed in the drums without added water. These measurements confirmed that concentrations can reach concentrations of regulatory concern. The peaks occurred after a substantial mass of fresh pellets was brought into the warehouse. Workers would bring in a truck load, off-load it, and stack the pallets and leave so the space was not routinely occupied for a continuous 8 h. In April, the warehouse was about 30% full and in May, it was 50% full. In June, the warehouse was at capacity. The maximum 8-h value was 109 ppm exceeding both OSHA regulations and the ACGIH guidance value. Shipments reduced the inventory and additional fresh pellets then were added several times resulting in the peaks observed during the July to October period. There were no short-term spikes to extreme concentrations since the maximum 15-min CO concentrations at 1.52 m were 155 and 113 ppm, respectively, for the two sampling periods.

Figure 2.



Open in new tab Download slide

Time series of rolling 8-h average concentrations of carbon monoxide measured in the storage warehouse of the pellet mill. (A) and (B) show the CO measured at 3.66 m above the floor, while (C) and (D) show the measurements at 1.52 m during the two measurement periods.

Conclusions

The results of this study demonstrated that CO emissions from wood pellets stored in plastic bags within a building are a concern with respect to undesirable exposures of the building's occupants analogous to the problems associated with stored bulk pellets. Environmental factors such as temperature and RH influence the CO emissions. Storage temperature affects CO off-gassing more than the moisture. Faster emissions and higher concentrations were observed with increasing temperature. Pellets stored at high RH showed increased emission rates and higher CO concentrations for all types of pellets than lower RH. Therefore, bagged pellets are best stored in cool and dry places. All types of bagged pellets could produce concentrations exceeding exposure health base limits and prior work in Europe had suggested there are limitations to the effectiveness of passive ventilation (Emhofer *et al.*, 2014), it is essential to design pellet storage spaces with active ventilation and CO monitors for both domestic and commercial buildings storing large quantities of wood pellets.

Fugitive Dust

NHDES limits activities that result in the creation of fugitive dust.

Fugitive dust is an air pollutant generated during commercial or business activities such as sand, gravel and rock crushing, road construction, parking lot and roadway cleaning, building construction and demolition, and earthmoving operations. It is also generated during loading and unloading of materials, wind-blown from material stockpiles and exposed soils, and from vehicular traffic. Fine dust inhaled deep into the lungs has been linked to a variety of health problems, ranging from nose and throat irritation to respiratory illnesses, such as bronchitis, lung-damage and asthma. Dust can migrate into nearby surface water. Fugitive dust that settles on nearby vegetation can weaken or kill the vegetation. Dust restricts visibility at the job site and off-site and contributes to regional haze. Regional haze consists of fine dust particles, smoke, and moisture suspended in the air that impairs visibility. Learn about other impacts to health and the environment.

NHDES regulates fugitive dust created by commercial or business activities pursuant to Env-A 1002. NHDES limits activities that result in the creation of fugitive dust by requiring that fugitive dust be controlled on-site and not allow to migrate beyond the property boundary. Some exceptions to the rule are driving on dirt or gravel roads; application of sand or de-icing chemicals for pedestrian and vehicular safety; and agricultural or forestry industry operations.

Env-A 1002.03 requires that "any person engaged in any activity that emits fugitive dust . . . shall take precautions throughout the duration of the activity in order to prevent, abate, and control the emission of fugitive dust." One way to do that is to develop a fugitive dust control plan and follow best management practices. Further guidance on methods for prevention, abatement and control of fugitive dust.

Abstract: Wood chips, torrefied wood chips, ground switchgrass, and wood pellets were tested for off-gas emissions during storage. Storage canisters with gas-collection ports were used to conduct experiments at room temperature of 20 °C and in a laboratory oven set at 40 °C. Commercially-produced wood pellets yielded the highest carbon monoxide (CO) emissions at both 20 and 40 °C (1600 and 13,000 ppmv), whereas torrefied wood chips emitted the lowest of about <200 and <2000 ppmv. Carbon dioxide (CO_2) emissions from wood pellets were 3000 ppmv and 42,000 ppmv, whereas torrefied wood chips registered at about 2000 and 25,000 ppmv, at 20 and 40 °C at the end of 11 days of storage. CO emission factors (milligrams per kilogram of biomass) calculated were lowest for ground switchgrass and torrefied wood chips (2.68 and 4.86 mg/kg) whereas wood pellets had the highest CO of about 10.60 mg/kg, respectively, at 40 °C after 11 days of storage. In the case of CO_2, wood pellets recorded the lowest value of 55.46 mg/kg, whereas switchgrass recorded the highest value of 318.72 mg/kg. This study concludes that CO emission factor is highest for wood pellets, CO_2 is highest for switchgrass and CH_4 is negligible for all feedstocks except for wood pellets, which is about 0.374 mg/kg at the end of 11-day storage at 40 °C.

1. Introduction

Woody and herbaceous biomasses, stored in humid environments for long periods, will absorb moisture and decompose, bringing about changes in physical properties, chemical composition and energy value [1]. The same authors found that after one year of storage, wood chips lost about 25%–55% of their energy value, which is mainly due to moisture adsorption. These changes in the physical, chemical and energy properties can decrease the market value of the fuels. Wood chips with high moisture are sensitive to biochemical reactions during storage [2,3]. Zoch *et al.* [4] indicated that chips from whole-tree aspen release much more heat and lose dry weight six times faster than clean, debarked chips. Moran [5] reported that the decay rate for mixed hardwood whole-tree chips (mainly oak) stored in an outside pile was roughly three times that for clean, debarked chips. Their research indicated that temperature profile of the wood chips stored for 7–14 days rose to 60–70 °C due to chemical and biological reactions that release oxygen-depleting off gases, such as CO, CO_2, and CH_4, during storage. Quantification of these off-gases has been considered important because fatal accidents have been reported at wood-chip and pellet warehouses during material unloading [6]. The risks associated with the transportation of seemingly harmless cargo (wood pellets and wood chips) are now well known and recorded. Several researchers have indicated that at storage temperatures >30 °C wood chips and wood pellets emit high amounts of CO (>10,000 ppmv), CO_2 (>30,000 ppmv), and CH_4 emission (>2000 ppmv) [7–13]. These reported CO and CO_2 emissions for wood chips and wood pellets are well above the threshold concentration levels established by U.S. Department of Labor Occupational Safety and Health Administration. According to Back and Allen [14], Höll and Pieczonka [15], and Piispanen and Saranpää [16], dry woods like Scots pine and Norway spruce contain about 3%–5% triglycerides, which can undergo oxidation and yield hexanal and other off-gases (such as CO). Svedberg *et al.* [11] indicated that in addition to CO, wood pellets also emitted hexanal during storage.

The threshold level established by U.S. Department of Labor Occupational Safety and Health Administration for carbon monoxide concentration is 35 ppm for a time-weighted 8-h period. Concentration levels ≥800 ppm for 45 min can result in dizziness, nausea, and convulsions resulting in death after a 2–3 h period. The threshold level of CO_2 is 5000 ppm as an 8-h time-weighted average. At very high levels (30,000 ppm (short-term exposure level) and above), CO_2 can cause asphyxiation as it replaces oxygen in the blood resulting in loss of judgment, dizziness, drowsiness, and rapid breathing. The CH_4 threshold level is 500,000 ppm over 8-h time-weighted average. Higher concentrations can result in asphyxiation by displacing oxygen. CH_4 is also one of the main constituents of natural gas, which can result in explosions [7]. In addition to the safety issues, the emissions from biomass can have a significant effect on the greenhouse gas emissions. Emery and Mosier [17] indicated that during storage of biomass, the dry matter losses can increase net greenhouse gas emissions. The same authors suggested a greater understanding of the biomass storage losses and greenhouse gas fluxes is necessary to accurately assess biomass storage options to ensure the design of the biomass supply logistics system meets the greenhouse gas reduction mandates required for biofuel production.

Increasing the storage stability or reducing reactivity of the biomass to the storage environment can help reduce the storage off-gas emissions. In general, both woody and herbaceous biomass is dried to 10% (w.b.) moisture content in a rotary drier to increase their storage stability. This dried biomass is further used for pelletization [18]. Pellets are considered as stable products as they have moisture in the range of 5%–7% (w.b.). Currently, torrefaction (a thermal pretreatment process) helps reduce the biomass moisture content to a very low value about <2% (w.b.) making it hydrophobic and suitable for thermochemical applications like pyrolysis, gasification, and co-firing [19–23]. Torrefaction of biomass is a thermochemical process that can be described as a mild form of pyrolysis at temperatures typically ranging between 200 and 300 °C in an inert and reduced environment, resulting in a solid, uniform product with lower moisture and higher energy content [24–27]. Tumuluru *et al.* [19] described the physiochemical and structural changes in biomass at different temperature regimes. Torrefaction temperatures >200 °C result in breakage of inter- and intra-molecular, hydrogen, C–O, and C–C bonds. Breaking chemical bonds leads to the emission of hydrophilic and oxygenated compounds [19]. Also, the destruction of OH groups during torrefaction makes biomass hydrophobic and increases storage stability [28].

Objective

There is a great deal of interest in understanding the off-gas emissions during storage of different biomass forms used for energy applications. Most of the data reported on storage off-gas emissions were for wood pellets and wood chips. Our earlier work on profiling and quantifying the off-gases [7–10,13] from wood pellets has helped the Wood Pellets Association of Canada to develop material safety data sheets for storage and transportation. Off-gas emissions data for other feedstocks—like switchgrass, and thermally pretreated (torrefied) biomass—that are gaining popularity for bioenergy applications, are not available. The off-gas emission data for herbaceous and torrefied biomass will be very useful in understanding the health-hazard risks and proposing mitigation methods and also will help to develop material safety data sheets for their safe storage and transportation. Our earlier studies on wood pellets indicated that increasing the storage temperature to >30 °C increases the off-gas emissions exponentially during the first 10 days of storage, whereas storage temperatures ≤20 °C resulted in a linear increase in off-gas emission with respect to storage time [7,13]. The specific objective of this study is to examine off-gas-emission concentration from torrefied wood chips, ground switchgrass, raw wood chips, and wood pellets at a 20 °C room temperature and an elevated storage temperature of 40 °C for an 11-day storage period. Further emission-concentration data for all the feedstock was used to calculate an emission factor (milligrams of off-gas emitted per kilogram of biomass).

2. Material and Methods

2.1. Raw Material and Properties

Clean pine-wood chips and wood pellets were collected from a shipping location in Vancouver, BC, Canada (Fibreco, Inc., North Vancouver) and tested for moisture content. The procured wood chips were further torrefied at 250 °C for 30 min in a fixed-bed reactor and then cooled and stored in airtight containers. Wood chips were dried to about 10% moisture content (w.b.) in a convective oven at 40–50 °C. Switchgrass (*Panicum virgatum*) was procured from a farm in Manitoba and ground to a 2-mm particle size using a hammer mill. The ground samples were stored in air-sealed bags in a commercial refrigerator set at 4 °C. Off-gassing experiments were conducted in the same year (2007–2008) the feedstocks were procured. The moisture content of the wood chips, ground switchgrass, torrefied wood chips, and wood pellets at the beginning of these experiments was determined using the AOAC method (*i.e.*, the oven method, where the biomass was kept at 105 °C for 24 h and was expressed in wet basis) [29]. The reported values are an average of three measurements. All raw materials were further tested for bulk and particle density following the ASABE S267 standard procedure [30,31].

2.2. Particle Density and Porosity

A gas multi-pycnometer (QuantaChrome, Boynton Beach, FL, USA) was used to determine the particle density of the feedstocks by calculating the displaced volume of nitrogen gas by a known mass of sample material [31]. The pressure was set at around 40 kPa (near maximum as specified by the instrument specifications). Equation (1) is used to calculate the sample volume (Vp):

$$V_P = V_C - V_R \left(\frac{P_1}{P_2} - 1\right) \tag{1}$$

where:

P_1 = pressure reading after pressurizing the reference cell (kPa)

P_2 = pressure after connecting the reference cell to the sample cell

V_c = sample volume

V_R = reference volume.

The particle density (ρ_s) of the sample is calculated by dividing mass (m_p) by the pycnometer particle volume (V_{pvc}). The experiments were conducted in triplicates. The porosity values were calculated using the bulk and particle-density values using Equations (2) and (3):

$$\rho_s = \frac{m_p}{V_{pvc}} \tag{2}$$

$$\text{Porosity} = \left(1 - \frac{\rho_b}{\rho_s}\right) \tag{3}$$

where:

ρ_b = bulk density

ρ_s = particle density.

2.3. Off-Gas Measurement

Canisters were used to conduct the storage studies (Figure 1). Canisters were filled to about 95% of their volume with different feedstocks. A 3.125-mm-diameter port with a control valve installed on the canister lid was used to collect the off-gas samples. The different biomass materials (*i.e.*, wood chips, wood pellets, torrefied wood chips, and ground switchgrass) were placed in the canister, leaving a headspace of about 5%. In the present study, a minimum head space of 5% was selected based on our earlier study on storage of wood pellets at both low and high storage temperatures [13]. Studies at 20 °C were carried out in a laboratory set at 20 °C and the higher temperature of 40 °C using a laboratory oven. A gas chromatography (GC)-14A fuel-cell analyzer (Shimadzu, Kyoto, Japan) was used to analyze the off-gas samples. A standard gas composition of CO: 1000 ppmv; CO_2: 5000 ppmv; and CH_4: 1000 ppmv was used to calibrate the GC. Approximately 10-mL off-gas sample was collected using an airtight syringe (A-85137-20 mL SGE Gas-Tight Syringe, Luer-Lock, Mandel Scientific, Guelph, ON, Canada) and injected into the GC-14A [7,13]. In the present study off-gas measurements reported are from single measurements by other researchers [7–13,32].

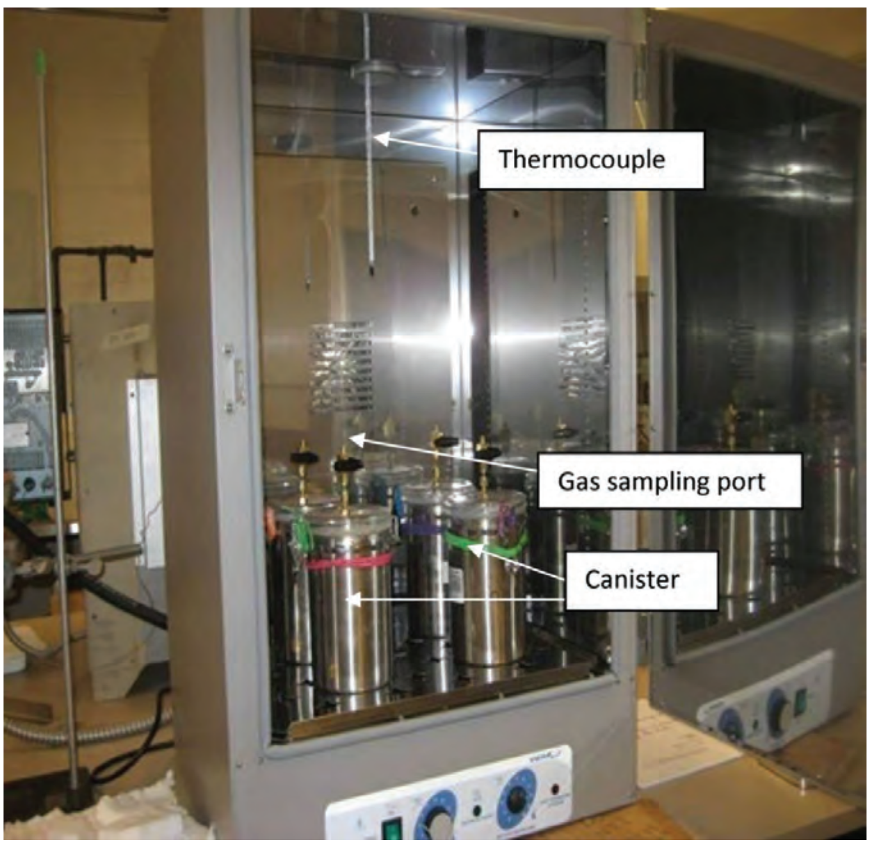

Figure 1. Storage canisters filled with different feedstocks.

2.4. Emission Factor Calculation

Yazdanpanah *et al.* [32] used concentration data to calculate the emission factor (milligrams of off-gas per kilogram of material). Table 1 indicates the equations constants used in the emission factor calculation. At constant temperature *T* (K) and pressure *P* (Pa), the emission factor (f_i) (milligrams of off-gas per kilogram of materials, mg/kg) is related to volumetric gas concentration (C_i), as expressed in Equation (4):

$$f_i = \frac{PC_iVgM_{wt}}{RTM} \times 1000 \quad (4)$$

where:

R = gas constant (8.31 J/mol·K)
T = temperature (K)
M_{wt} = gas molecular weight (g/mole)
M = mass of material in the container (kg)
V_g = gas volume in the container (m^3)
P_a = absolute pressure of the container (generally, there is minimal change in P_a at relatively low temperatures associated with the observed tests [7]). In their study, pressure in the storage container was measured using a pressure transducer (PX143-01BD5V, 91 Pa, Omega, Laval, QC, Canada) and the data was logged into a computer using LabVIEW software
C_i = volumetric concentration of a particular off-gassing measure by GC (expressed as fraction volume/volume).

Table 1. Constants used for emission factor (g/kg) calculation based on off-gas concentration data.

S. No.	Equation Parameters	Value
1	Molecular weight of CO, CO_2, and CH_4 (M_{wt})	28, 44, and 16
2	Volumetric concentration of particular off gas (m^3)	Gas concentrations measured using GC (ppmv/1,000,000)
3	Temperature (K)	293 and 313
4	Pressure (Pa)	101,300
5	Gas constant (R) (J/mol·K)	8.31
6	Mass of the biomass stored in the container (m_w) (kg)	Ground switchgrass: 0.36 Wood pellets: 1.60 Wood chips: 0.64 Torrefied wood chips: 0.54
7	Volume of the gas in the container, including headspace of 5% (m^3)	Ground switchgrass: 0.0021 Wood pellets: 0.00119 Wood chips: 0.00152 Torrefied wood chips: 0.00154

Note: Volume of gas in the container calculation was based on the bulk porosity of the materials. The porosity calculation was based on the bulk and particle-density values.

Equation (5) presents the sample calculation for emission factor (mg/kg) for off-gas CO at the end of 11-day storage at 40 °C storage temperature. The various constants used for calculation of emission factor are given below:

$$\frac{101300 \times 13294.7 \times 0.00118 \times 28 \times 1000}{8.31 \times 313 \times 1.6 \times 1000000} = 10.69\ mg/kg \quad (5)$$

where CO concentration at 40 °C for wood pellets at the end of 11-day storage: 13,294 ppmv (0.013294 m^3); storage temperature: 40 °C (313 K); porosity: 0.41 (calculated using bulk density: 710 kg/m^3; and particle density: 1210 kg/m^3); total porosity (including headspace of 5% of the container): 0.41 + 0.05 = 0.46; volume of the container (m^3): 0.00256; gas volume in the container: total porosity (including 5% of headspace) × volume of the container: 0.00118 m^3; mass of wood pellets in the container: 1.60 kg; molecular weight of CO: 28 (g/mole); absolute pressure in the container: 101,300 (Pa) and gas constant (R): 8.31 (J/mol·K).

3. Results and Discussion

3.1. Physical Properties

The moisture content and bulk- and particle-density of wood chips, ground switchgrass, torrefied wood chips, and wood pellets are given in Table 2. Leaving a headspace of 5%, ground switchgrass of about 0.36 kg, wood pellets of about 1.60 kg, wood chips of about 0.64 kg, and torrefied wood chips of about of 0.54 kg were used to fill the storage canister.

Table 2. Physical properties of herbaceous, woody and torrefied biomass (n = 3).

S. No.	Biomass Feedstock	Moisture Content (%, w.b.)	Bulk Density (kg/m^3)	Particle Density (kg/m^3)	Porosity
1	Ground switchgrass	10.21 ± 0.21	151 ± 9	650 ± 21	0.76
2	Wood pellets	5.02 ± 0.16	710 ± 19	1210 ± 8	0.41
3	Wood chips	12.12 ± 0.12	265 ± 12	580 ± 17	0.54
4	Torrefied wood chips	1.8 ± 0.19	225 ± 23	505 ± 11	0.55

3.2. Off-Gas Concentrations

Figures 2 through 7 indicate the emission levels of CO, CO_2, and CH_4 from ground switchgrass, wood chips, torrefied wood chips, and wood pellets at both 20 and 40 °C for a storage period of 11 days. Figure 2 indicates that the maximum CO emissions were recorded by wood pellets (about 1600 ppmv), followed by wood chips (about 600 ppmv); torrefied wood chips and switchgrass emitted significantly less CO (less than 200 ppmv). Figure 3 shows that a maximum concentration of about 13,000 ppmv was recorded for wood pellets at 40 °C; however, torrefied wood chips show the lowest recorded amount of about 2000 ppmv. Wood chips and ground switchgrass recorded about 3000 ppmv. CO_2 emissions from the four biomass feedstocks at 20 °C indicated that wood pellets emitted a maximum of about 3000 ppmv; switchgrass and torrefied wood chips recorded the lowest amounts (2000 ppmv) (see Figure 4). At 40 °C, wood pellets emitted about 42,000 ppmv, which corroborates results reported in the literature [7–13], whereas torrefied wood chips emitted the lowest CO_2 amounts at about 25,000 ppmv. Wood chips and switchgrass registered at about 30,000 ppmv (see Figure 5). Figures 6 and 7 show the CH_4 emissions at 20 °C and at 40 °C. The torrefied wood chips recorded the lowest CH_4 amounts (about 5 ppmv) at 20 °C, while the wood pellets registered about 45 ppmv. These concentrations can be considered marginal when compared to CO and CO_2 emissions. At 40 °C, the wood pellet samples registered at about 1300 ppmv, which was by far the highest compared with other feedstocks. The torrefied wood chips recorded the lowest amounts, less than 100 ppmv.

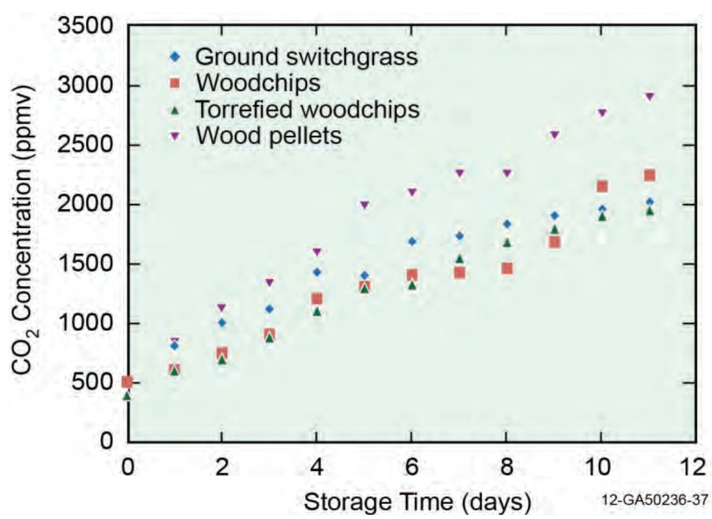

Figure 4. CO_2 concentration at 20 °C storage temperature.

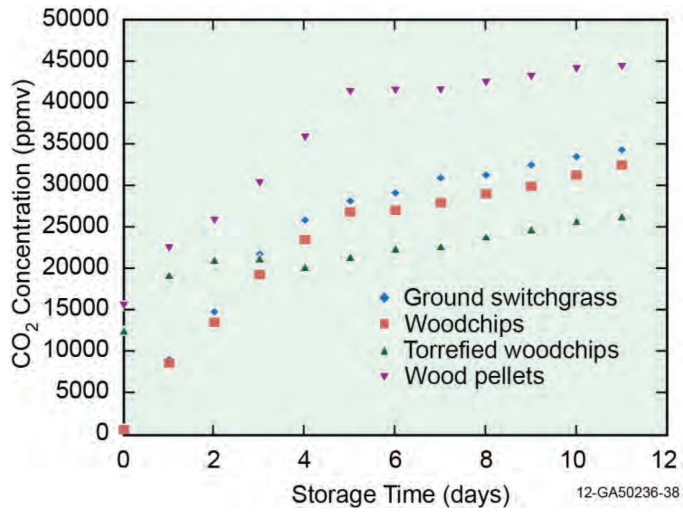

Figure 5. CO_2 concentration at 40 °C storage temperature.

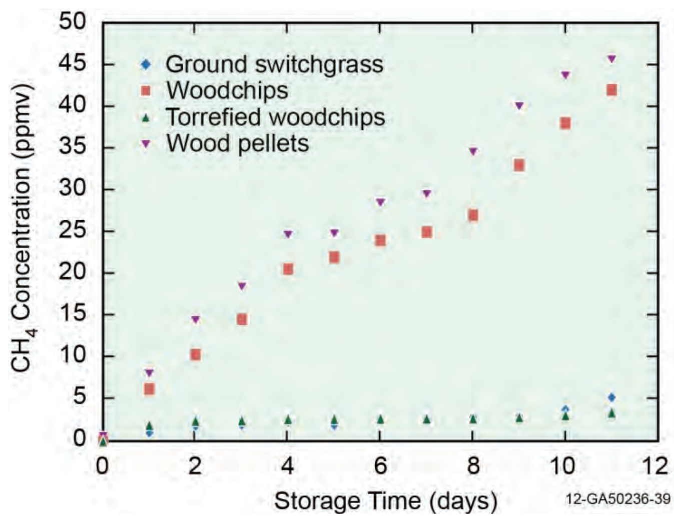

Figure 6. CH_4 concentration at 20 °C storage temperature.

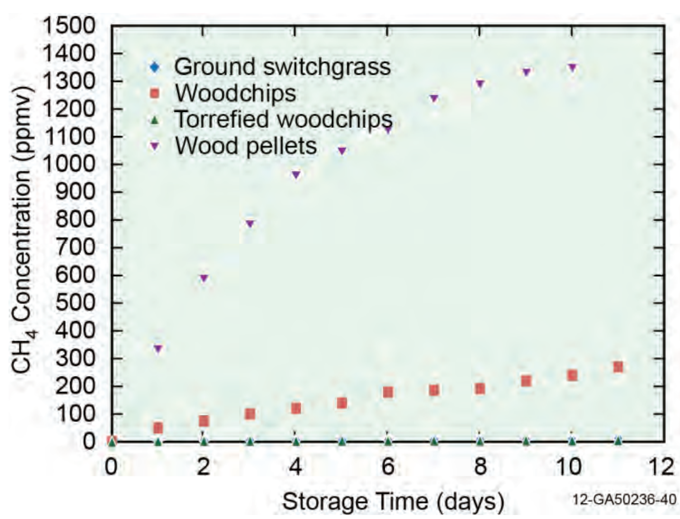

Figure 7. CH_4 concentration at 40 °C storage temperature.

3.3. Emission Factor (mg/kg)

Based on the concentration data, emissions factors were calculated for CO, CO_2, and CH_4 from ground switchgrass, wood chips, torrefied wood chips, and wood pellets stored at both 20 and at 40 °C for an 11-day period. A maximum CO-emission factor of about 10.60 and 6.96 mg/kg was recorded by wood pellets and wood chips, respectively. The lowest CO-emission factor for ground switchgrass was recorded at about 2.67 mg/kg at 40 °C, whereas in the case of torrefied woodchips and ground switchgrass it was about 4.85 and 2.68 mg/kg at the end of the 11-day storage period. At 20 °C, the highest CO-emission factor of 1.81 and 1.43 mg/kg were recorded for wood chips and wood pellets, whereas ground switchgrass and torrefied woodchips recorded 0.38 and 0.85 mg/kg at the end of the 11-day storage period.

For CO_2 stored at 40 °C, a maximum emission factor was recorded for ground switchgrass at about 318.72 mg/kg, followed by 123.50 and 118.68 mg/kg for wood chips and torrefied wood chips, respectively, whereas wood pellets recorded the lowest at about 55.45 mg/kg at the end of the 11-day storage period. At 20 °C, the trend was similar, where ground switchgrass recorded the highest value of 19.98 mg/kg, followed by torrefied and regular wood chips of about 9.39 and 9.09 mg/kg, respectively. Wood pellets recorded the lowest of 3.86 mg/kg at the end of the 11-day storage period. The calculated CH_4-emission factor indicated that at 20 °C, the values are very low for all the feedstocks, whereas, at 40 °C, wood pellets recorded the highest emission factor of about 0.76 mg/kg, and torrefied wood chips, the lowest, at about 0.0104 mg/kg. The emission-factor data for CO, CO_2 and CH_4 calculated for wood pellets has corroborated observations reported in the literature [32]. The same authors indicated that the emission factors calculated for off gases like CO, CO_2, and CH_4 from wood pellets for two different-sized storage containers (5200 L and 45 L) were close and also matched closely with the present observations. We have learned from this study that the emission factor calculated based on the concentrations, is strongly dependent on physical properties like bulk and particle density and porosity, which determines the gas volume in the storage container.

3.4. Discussion

In the present study, torrefied wood chips emitted less CO and CH_4 at both 20 and 40 °C than ground switchgrass, woodchips, or wood pellets. Tumuluru *et al.* [19] suggested that, during torrefaction, the biomass loses some of the low-volatility components and extractives, resulting in a hydrophobic product low in moisture content. These changes in the biomass might result in reduced biomass reactivity in the storage environment and fewer chemical-oxidation reactions during storage. Emissions from torrefied biomass reported in this paper indicate that microbial degradation may not be the reason for off-gas emission, because torrefied biomass has less moisture (Table 2) and absorbs little moisture during storage [19]. The measured emissions could have occurred mainly due to chemical oxidation of the chemical components present in the biomass. According to Yazdanpanah [33], torrefied pellets adsorbed about 20% more CO_2 compared to regular pellets. This may be explained by the rate of reaction between off-gas and biomass solid, which is generally proportional to the accessible surface area of the solid. The lower CO_2 emission detected by torrefied samples in this study could be attributed to the higher adsorption of CO_2 by torrefied samples. The speculation is that the torrefaction process causes dehydration and thus initiates and propagates cracks in the lignocellulosic structure of material. The mass loss also induced changes in density and porosity.

Our earlier studies on off-gases from woody pellets at lower (≤20 °C) and higher (≥30 °C) temperatures indicated that CO and CO_2 emissions and O_2 depletion in the headspace of the storage container are significantly lower at low storage temperatures compared to higher storage temperature. This study has helped us conclude that it is mostly chemical oxidation that results in off-gas emissions from stored wood pellets [7,13], where higher storage temperature accelerates the rate of the oxidation process. The CO, CO_2, and CH_4 off-gas emissions observed from different biomass in the present study can be due to auto-oxidation of the chemical compounds in the biomass. The storage temperature acts as a catalyst to accelerate the chemical oxidation process. Research studies conducted by Back and Allen [14], Höll and Pieczonka [15], and Piispanen and Saranpää [16] on woody biomass (Scots pine and Norway spruce) indicated that triglycerides undergo auto-oxidation in the presence of temperature and emit off-gases like CO and hexanal. Springer and Hajny [34], Kuber *et al* [35], and Kuber [36,37] have established that auto-oxidation of unsaturated fatty acids and other extractives leads to spontaneous heating of wood chips and sawdust during storage. According to Levitt *et al*. [38], when stored at room temperature (particularly in the presence of air and light), organic matter emits small amounts of CO and the emissions are accelerated at elevated temperatures. Svedberg *et al*. [11,12] and Tumuluru *et al.* [13] reported that the emission of these off-gases during storage is due to chemical oxidation of fatty acids, leading to the formation of free radicals. These types of reactions are accelerated by: (a) the environmental conditions of storage, such as temperature and relative humidity; and (b) the biomass-feedstock moisture content and chemical composition. Also, the present study indicates that the off-gas emission concentration varies with the type of the biomass. One major reason for different concentrations observed for different raw and thermally-pretreated biomass feedstock can be different chemical composition (*i.e.*, woody biomass has higher fatty acids and lignin compared to herbaceous biomass). On the other hand, herbaceous biomasses are lower in lignin and free fatty acids [39,40]. Further research is needed to understand the chemistry behind different quantities of off-gas emissions from different biomass feedstocks.

At present, there is a great need to understand the biomass storage losses in terms of dry matter and greenhouse gas fluxes to assess biomass storage options to ensure the design of the biomass supply logistics system which can meet the greenhouse gas reduction requirements for biofuel production. According to Steele *et al*. [41], CO_2 gas emitted during storage due to decomposition process can be used to estimate the dry matter loss. According to their analysis the dry matter breakdown into simple sugars during storage and emits CO_2. Also, the off-gas emission data collected for different woody, herbaceous, and pretreated biomass will help design storage silos by taking into account the hazards associated with off-gases that are emitted and avoid fatal accidents that have been reported in pellet warehouses. This will help mitigate the risks, adopt active control measures, and implement safe working strategies. The off-gas data on herbaceous and thermally-pretreated biomass (like torrefied biomass presented in this paper) will also support developing material safety data sheets for safe storage and transportation of woody, herbaceous and thermally pretreated biomasses.

4. Conclusions

The present experimental study demonstrates that there is off-gassing from stored wood pellets, wood chips, ground switchgrass, and torrefied wood chips posing potential hazards that require mitigation by the proper design of silos and development of safe handling procedures. CO emissions for all the feedstocks at room temperature (20 °C) are above the threshold-level exposure guidelines of 35 ppmv for an occupational setting and 9 ppmv for homes. At the elevated storage temperature of 40 °C, the off-gases CO and CO_2 increase to levels where they could produce fatal accidents within short exposure times. The results indicate that torrefied wood chip emits less CO, CO_2, and CH_4 when compared to wood pellets, untreated wood chips, and ground switchgrass. At 20 and 40 °C, wood pellets recorded the maximum CO concentrations of 1600 and 13,000 ppmv, whereas torrefied wood chips emitted less than 200 and 2000 ppmv. CH_4 emissions recorded for all the feedstocks were less than 100 ppmv at both 20 and 40 °C, except for wood pellets, which recorded 1300 ppmv at 40 °C. The calculated CO emission factors (based on the bulk and particle density and porosity) indicate that wood pellets have the highest emission factor (10.60 mg/kg) at 40 °C, whereas in the case of CO_2, the wood pellets recorded the lowest value (55.46 mg/kg), and switchgrass the highest value (318.72 mg/kg).

Acknowledgments

The reported experimental project was conducted at the University of British Columbia. We thankfully acknowledge the financial support of Wood Pellets Association of Canada and Natural Sciences and Engineering Research Council of Canada under a Collaborative Research and Development Project. We also acknowledge the support from the Department of Energy (DOE) Office of Bioenergy Technology Office, the author Jaya Shankar Tumuluru is an employee of Idaho National Laboratory under Energy Efficiency and Renewable Energy under DOE Idaho Operations Office Contract DE-AC07-05ID14517. The author Shahab Sokhansanj is an employee of Oak Ridge National Laboratory. Accordingly, the U.S. Government retains and the publisher, by accepting the article for publication, acknowledges that the U.S. Government retains a nonexclusive, paid-up, irrevocable, worldwide license to publish or reproduce the published form of this manuscript, or allow others to do so, for U.S. Government purposes. The authors would also like to acknowledge Idaho National Laboratory's R&D Publications Support Team for their editorial and graphics assistance.

Author Contributions

Jaya Shankar Tumuluru conducted the experiments, collected and analyzed the off-gas data, and prepared the draft manuscript. Xingya Kuang and Fahimeh Yazdanpanah supported the experimental work and data analysis, Shahab Sokhansanj, C. Jim Lim, and Xiaotao T. Bi are research advisors on biomass storage, and Staffan Melin is research advisor on wood pellet storage.

PERMIT AMENDMENT NO. 2499-161-0023-V-02-4
ISSUANCE DATE:

GEORGIA
DEPARTMENT OF NATURAL RESOURCES
ENVIRONMENTAL PROTECTION DIVISION

Air Quality - Part 70 Operating Permit Amendment

Facility Name:	**Hazlehurst Wood Pellets, LLC**
Facility Address:	**430 Hulett Wooten Farms Road**
	Hazlehurst, Georgia 31539 (Jeff Davis County)
Mailing Address:	**P. O. Box 1810** **Hazlehurst, Georgia 31539**
Parent/Holding Company:	**Hazlehurst Wood Pellets**
Facility AIRS Number:	**04-13-161-00023**

In accordance with the provisions of the Georgia Air Quality Act, O.C.G.A. Section 12-9-1, et seq and the Georgia Rules for Air Quality Control, Chapter 391-3-1, adopted pursuant to and in effect under the Act, the Permittee described above is issued a construction permit for:

Construction and operation of a new furnace and a dryer controlled by a WESP and RTO, 2 Green Hammermills, 7 Dry Hammermills controlled by cyclofilters and an RTO, 15 presses and 3 coolers controlled by baghouses and an RCO, and a chipper. All permit conditions in Sections 2 through Section 6 of the current permit are replaced. Section 1 of the current permit is updated.

This Permit Amendment shall also serve as a final amendment to the Part 70 Permit unless objected to by the U.S. EPA or withdrawn by the Division. The Division will issue a letter when this Operating Permit amendment is finalized.

This Permit Amendment is conditioned upon compliance with all provisions of The Georgia Air Quality Act, O.C.G.A. Section 12-9-1, et seq, the Rules, Chapter 391-3-1, adopted and in effect under that Act, or any other condition of this Amendment and Permit No. 2499-161-0023-V-02-0. Unless modified or revoked, this Amendment expires upon issuance of the next Part 70 Permit for this source. This Amendment may be subject to revocation, suspension, modification or amendment by the Director for cause including evidence of noncompliance with any of the above; or for any misrepresentation made in App No. **TV-352816** dated **May 6, 2019**; any other applications upon which this Amendment or Permit No. 2499-161-0023-V-02-0 are based; supporting data entered therein or attached thereto; or any subsequent submittal or supporting data; or for any alterations affecting the emissions from this source.

This Amendment is further subject to and conditioned upon the terms, conditions, limitations, standards, or schedules contained in or specified on the attached **22** pages.

PART 1.0 FACILITY DESCRIPTION

1.3 Process Description of Modification

The Permittee proposes to construct and operate one new furnace, one new dryer, one new chipper, 2 green hammermills, 7 dry hammermills, and 3 pellet lines with a total of 15 presses and 3 coolers. Some of the equipment will be new, some existing. The new wood-fired furnace will be rated at a nominal, approximate 200 MMBTU/hour. Particulate (PM) emissions from the furnace and dryer will be controlled with a wet electrostatic precipitator (WESP). PM emissions from the dry hammermills will be controlled by cyclofilters. PM emissions from the presses and coolers will be controlled by baghouses. Volatile organic compound (VOC) and organic hazardous air pollutant (HAP) emissions from the furnace and dryer will be controlled with a Regenerative Thermal Oxidizer (RTO). VOC and HAP emissions from the dry hammermills, presses, and coolers will be controlled with a Regenerative Catalytic Oxidizer (RCO). The RTO and RCO will each have a gas-fired burner rated at 6 MMBTU/hour. The new dryer has a capacity of 78 oven dried tons per hour, and an annual throughput capacity of 675,000 oven dried tons (ODT). ODT = weight of wood in short tons at 11% moisture, calculated.

PART 2.0 REQUIREMENTS PERTAINING TO THE ENTIRE FACILITY

2.1 Facility Wide Emission Caps and Operating Limits

2.1.1 The Permittee shall not discharge or cause the discharge into the atmosphere from the entire facility, any emissions which contain carbon monoxide (CO) in excess of 249 tons during any twelve consecutive months.
[Avoidance of 40 CFR 52.21]

2.1.2 The Permittee shall not discharge or cause the discharge into the atmosphere from the entire facility, any emissions which contain nitrogen oxides (NOx) in excess of 249 tons during any twelve consecutive months.
[Avoidance of 40 CFR 52.21]

2.1.3 The Permittee shall not discharge or cause the discharge into the atmosphere from the entire facility, any emissions which contain volatile organic compounds (VOC) in excess of 249 tons during any twelve consecutive months.
[Avoidance of 40 CFR 52.21]

2.1.4 The Permittee shall not discharge or cause the discharge into the atmosphere from the entire facility, any emissions which contain particulate matter (PM) in excess of 249 tons during any twelve consecutive months.
[Avoidance of 40 CFR 52.21]

2.1.5 The Permittee shall not discharge or cause the discharge into the atmosphere from the entire facility any single hazardous air pollutant which is listed in Section 112 of the Clean Air Act, in an amount equal to or exceeding 10 tons during any twelve consecutive months, or any combination of such listed pollutants in an amount equal to or exceeding 25 tons during any twelve consecutive months.
[Avoidance of Major Source MACT per 40 CFR 63]

2.1.6 The Permittee shall not process through the dryer (DRY) greater than 675,000 ODT of wood during any twelve consecutive months. ODT = weight of wood in short tons at 11% moisture, calculated.
[Avoidance of 40 CFR 52.21]

PART 3.0 REQUIREMENTS FOR EMISSION UNITS

Note: Except where an applicable requirement specifically states otherwise, the averaging times of any of the Emissions Limitations or Standards included in this permit are tied to or based on the run time(s) specified for the applicable reference test method(s) or procedures required for demonstrating compliance.

3.1.1 Updated Emission Units

Emission Units		Specific Limitations/Requirements		Air Pollution Control Devices	
ID No.	Description	Applicable Requirements/Standards	Corresponding Permit Conditions	ID No.	Description
WOOD	Log storage/handling Debarking/screening Chipper Chip piles	391-3-1-.02(2)(n)	3.4.3, 3.4.4, 5.2.7, 5.2.8		
GHM	Green Hammermills (2)	391-3-1-.02(2)(n)	3.4.3, 3.4.4, 5.2.7, 5.2.8		
FUR	Wood fired furnace 200 MMBTU/hr	391-3-1-.02(2)(g) 391-3-1-.02(2)(b) 391-3-1-.02(2)(g)	3.2.1, 3.2.3, 3.4.1, 3.4.2, 3.4.5, 4.2.1, 4.2.4, 4.2.5, 5.2.1, 5.2.2, 5.2.5, 5.2.6, 5.2.14, 5.2.15, 6.2.1-6.2.7	WESP RTO	Wet Electrostatic Precipitator Regenerative Thermal Oxidizer
DRY	Pellet Dryer 78 ODT/hr	391-3-1-.02(2)(b) 391-3-1-.02(2)(e) 391-3-1-.02(2)(n)	2.1.6, 3.2.1, 3.2.3, 3.4.1, 3.4.2, 3.4.3, 3.4.4, 4.2.1, 4.2.4, 5.2.1, 5.2.2, 5.2.5, 5.2.6, 5.2.9, 5.2.14, 5.2.15, 6.2.1-6.2.7		
HAM1-7	Dry Hammermills (7)	391-3-1-.02(2)(b) 391-3-1-.02(2)(e) 391-3-1-.02(2)(n)	3.2.2, 3.2.4, 3.4.1, 3.4.2, 4.2.2, 4.2.4, 5.2.1, 5.2.3, 5.2.4, 5.2.6, 5.2.7, 5.2.8, 5.2.10-5.2.17, 6.2.3-6.2.7	CYFL1-7 RCO	Cyclofilters 1-7 Regenerative Catalytic Oxidizer
PEL1-5	Line 1 Presses (5)	391-3-1-.02(2)(b) 391-3-1-.02(2)(e) 391-3-1-.02(2)(n)	3.2.2, 3.2.4, 3.4.1, 3.4.2, 4.2.2, 4.2.4, 5.2.1, 5.2.3, 5.2.4, 5.2.6, 5.2.7, 5.2.8, 5.2.9-5.2.17, 6.2.1-6.2.7	BH1 RCO	Baghouse 1 Regenerative Catalytic Oxidizer
COOL1	Line 1 Cooler				
PEL6-10	Line 2 Presses (5)	391-3-1-.02(2)(b) 391-3-1-.02(2)(e) 391-3-1-.02(2)(n)	3.2.2, 3.2.4, 3.4.1, 3.4.2, 4.2.2, 4.2.4, 5.2.1, 5.2.3, 5.2.4, 5.2.6, 5.2.7, 5.2.8, 5.2.9-5.2.17, 6.2.1-6.2.7	BH2 RCO	Baghouse 2 Regenerative Catalytic Oxidizer
COOL2	Line 2 Cooler				
PEL11-15	Line 3 Presses (5)	391-3-1-.02(2)(b) 391-3-1-.02(2)(e) 391-3-1-.02(2)(n)	3.2.2, 3.2.4, 3.4.1, 3.4.2, 4.2.2, 4.2.4, 5.2.1, 5.2.3, 5.2.4, 5.2.6, 5.2.7, 5.2.8, 5.2.9-5.2.17, 6.2.1-6.2.7	BH3 RCO	Baghouse 3 Regenerative Catalytic Oxidizer
COOL3	Line 3 Cooler				
HAND	Pellet Handling/storage/ Loadout/silos 1-4	391-3-1-.02(2)(b) 391-3-1-.02(2)(e) 391-3-1-.02(2)(n)	3.4.1-3.4.5, 4.2.3, 6.2.4, 6.2.5		

* Generally applicable requirements contained in this permit may also apply to emission units listed above. The lists of applicable requirements/standards and corresponding permit conditions are intended as a compliance tool and may not be definitive.

3.2 Equipment Emission Caps and Operating Limits

3.2.1 The Permittee shall operate and maintain the WESP and the RTO during all periods in which the furnace (FUR) and the Dryer (DRY) are in operation.
[391-3-1-.03(2)(c)]

3.2.2 The Permittee shall operate and maintain the cyclofilters (CYFL1-7), baghouses (BH1, 2, and 3), and Regenerative Catalytic Oxidizer (RCO) during all periods in which the Dry Hammermills (HAM1-7), Presses (PEL1-15), and Coolers (COOL1-3) are in operation.
[391-3-1-.03(2)(c)]

3.2.3 The 3-hour rolling combustion temperature of the RTO shall be at least 1500°F or the temperature approved by the Division based upon the most recent destruction efficiency test (whichever is higher).
[391-3-1-.03(2)(c)]

3.2.4 The 3-hour rolling combustion temperature of the RCO shall be at least 800°F or the temperature approved by the Division based upon the most recent destruction efficiency test (whichever is higher).
[391-3-1-.03(2)(c)]

3.3 Equipment Federal Rule Standards

Not applicable.

3.4 Equipment SIP Rule Standards

3.4.1 The Permittee shall not cause, let, suffer, permit or allow emissions from any stack, including the Furnace/Dryer RTO stack (S1) or the Dry Hammermill/Press/Cooler RCO stack (S2) the opacity of which is equal to or greater than forty percent.
[391-3-1-.02(2)(b)1.]

3.4.2 The Permittee shall not cause, let, permit, suffer or allow the rate of emissions from the Furnace/Dryer RTO stack (S1) or the Dry Hammermill/Press/Cooler RCO stack (S2) Particulate Matter (PM) in total quantities equal to or exceeding the allowable rate, calculated as follows:
[391-3-1-.02(2)(e)]

$E = 4.1P^{0.67}$; for process input weight rate up to and including 30 tons per hour, or
$E = 55P^{0.11} - 40$; for process input weight above 30 tons per hour

Where:

E = emission rate in pounds per hour
P = process input weight rate in tons per hour

3.4.3 The Permittee shall take all reasonable precautions to prevent dust from any operation, process, handling, transportation or storage facility from becoming airborne. Reasonable precautions that could be taken to prevent dust from becoming airborne include, but are not limited to, the following:
[391-3-1-.02(2)(n)]

a. Use, where possible, of water or chemicals for control of dust in the demolition of existing buildings or structures, construction operations, the grading of roads or the clearing of land;

b. Application of asphalt, water, or suitable chemicals on dirt roads, materials, stockpiles, and other surfaces that can give rise to airborne dusts;

c. Installation and use of hoods, fans, and fabric filters to enclose and vent the handling of dusty materials;

d. Covering, at all times when in motion, open bodied trucks that are transporting materials likely to give rise to airborne dusts; and

e. The prompt removal of earth or other material from paved streets onto which earth or other material has been deposited.

3.4.4 The opacity from any fugitive dust source shall not equal or exceed 20 percent.
[391-3-1-.02(2)(n)]

3.4.5 The Permittee shall not burn fuel containing more than 3 percent sulfur by weight in the Furnace (FUR), the Furnace/Dryer RTO, or the Dry Hammermill/Press/Cooler RCO. The Permittee shall comply with this rule by only burning wood or natural gas.
[391-3-1-.02(2)(g)]

3.5 Equipment Standards Not Covered by a Federal or SIP Rule and Not Instituted as an Emission Cap or Operating Limit

3.5.1 Routine maintenance shall be performed on all air pollution control equipment. Maintenance records shall be in a form suitable for inspection or submittal to the Division and shall be maintained for a period of five (5) years from date of entry.
[391-3-1-.02(6)(b)1(i)]

3.5.2 The Permittee shall maintain an inventory of baghouse filter bags such that an adequate supply of bags is on hand to replace any defective ones.
[391-3-1-.02(6)(b)1(i)]

PART 4.0 REQUIREMENTS FOR TESTING

4.1 General Testing Requirements

4.1.1 The Permittee shall cause to be conducted a performance test at any specified emission unit when so directed by the Environmental Protection Division ("Division"). The test results shall be submitted to the Division within 60 days of the completion of the testing. Any tests shall be performed and conducted using methods and procedures that have been previously specified or approved by the Division.
[391-3-1-.02(6)(b)1(i)]

4.1.2 The Permittee shall provide the Division thirty (30) days (or sixty (60) days for tests required by 40 CFR Part 63) prior written notice of the date of any performance test(s) to afford the Division the opportunity to witness and/or audit the test, and shall provide with the notification a test plan in accordance with Division guidelines.
[391-3-1-.02(3)(a) and 40 CFR 63.7(b)(1)]

4.1.3 Performance and compliance tests shall be conducted, and data reduced in accordance with applicable procedures and methods specified in the Division's Procedures for Testing and Monitoring Sources of Air Pollutants. The methods for the determination of compliance with emission limits listed under Sections 3.2, 3.3, 3.4 and 3.5 are as follows:

a. Method 1 shall be used for the determination of sample point locations.

b. Method 2 shall be used for the determination of stack gas flow rate.

c. Method 3 or 3A shall be used for the determination of stack gas molecular weight. Method 3B shall be used for the determination of emission rate correction factor or excess air. Method 3A may be used as an alternative.

d. Method 4 shall be used for the determination of stack gas moisture.

e. Method 5/Method 202 shall be used for determination of total PM emissions, to include condensable particulates + filterable particulates for Rule (e).

f. Method 7 or 7E shall be used for determination of NOx emissions.

g. Method 9 and the procedures of the above referenced document shall be used to determine the opacity.

h. Method 10 shall be used for the determination of CO concentrations.

i. Method 19 shall be used when applicable; to convert particulate matter, carbon monoxide, and nitrogen oxides concentrations (i.e., grains/dscf for PM, ppm for gaseous pollutants), as determined using other methods specified in this section, to mass emission rates (i.e., lb/MM Btu, lb/hr).

j. Method 26 or 26A shall be used to determine Hydrogen Chloride emission concentrations.

k. Method 25A shall be used for the determination of VOC concentrations in the dryer exhaust stacks.

l. NCASI 105.1 shall be used for the determination of methanol, formaldehyde and acetaldehyde concentrations.

m. Modified EPA OTM-26 Interim VOC Measurement Protocol for the Wood Products Industry (July 2007) or (WPP1) shall be used for the calculation and summation of VOC emissions.

Minor changes in methodology may be specified or approved by the Director or his designee when necessitated by process variables, changes in facility design, or improvement or corrections that, in his opinion, render those methods or procedures, or portions thereof, more reliable.
[391-3-1-.02(3)(a)]

4.1.4 The Permittee shall submit performance test results to the US EPA's Central Data Exchange (CDX) using the Compliance and Emissions Data Reporting Interface (CEDRI) in accordance with any applicable NSPS or NESHAP standards (40 CFR 60 or 40 CFR 63) that contain electronic data reporting requirements. This Condition is only applicable if required by an applicable standard and for the pollutant(s) subject to said standard.
[391-3-1-.02)(8)(a) and 391-3-1-.02(9)(a)]

4.2 Specific Testing Requirements

4.2.1 Within 120 days after initial startup, the Permittee shall conduct performance tests for the following pollutants on the Furnace/Dryer RTO stack (S1):

a. Total particulate matter (PM) emissions including condensable and filterable PM

b. NOx

c. CO

d. VOC

e. Formaldehyde

f. Methanol

g. Acetaldehyde

Subsequent testing shall be conducted at least once every 36 months. The performance tests for NOx and CO, and the tests for VOC and organic HAP must be conducted simultaneously each time a test is required for one of these pollutants.

During the performance tests the Permittee shall continuously measure and record the combustion zone temperature for the RTO and the total power in the WESP. These measurements shall be submitted along with the test reports. During the performance testing, the Permittee shall record and submit the amount of product dried (in both actual and bone-dry tonnages per hour) in the dryer. The tests shall be conducted at the maximum anticipated drying rate.
[391-3-1-.02(3)(a)]

4.2.2 Within 120 days after initial startup, the Permittee shall conduct performance tests for the following pollutants on the Dry Hammermill/Press/Cooler RCO stack (S2):

a. Total particulate matter (PM) emissions including condensable and filterable PM

b. NOx

c. CO

d. VOC

e. Formaldehyde

f. Methanol

g. Acetaldehyde

Subsequent testing shall be conducted at least once every 36 months. The performance tests for NOx and CO, and the tests for VOC and organic HAP must be conducted simultaneously each time a test is required for one of these pollutants. During the performance tests the Permittee shall continuously measure and record the combustion zone temperature for RCO. These measurements shall be submitted along with the test reports. During the performance testing, the Permittee shall record the amount of pellets produced (in both actual and bone-dry tonnages per hour). The tests shall be conducted at the maximum anticipated operating rate.
[391-3-1-.02(3)(a)]

4.2.3 Within 120 days after initial startup, the Permittee shall conduct performance tests for VOC on a silo in the equipment group HAND. During the performance testing, the Permittee shall record the amount of pellets produced. The emission factor shall be based on the results of the test from one silo and the facility production divided by 4 (four silos). The tests shall be conducted on a silo that is loaded at a minimum of 25% of the total HAND throughput.
[391-3-1-.02(3)(a)]

4.2.4 If the results of a PM, VOC, HAP, CO or NOx performance test required in this Section 4 exceed the factor currently being used in Section 6, then the Permittee must calculate emissions using the new, higher factor starting on the test date. The Permittee shall also submit a permit application within 180 days after testing, either requesting the higher emission factor or demonstrating that the emission factor derived is not representative of normal emissions.
[391-3-1-.02(6)(b)1(i)]

4.2.5 The Permittee shall not use monitors or test equipment during performance tests that are not used in normal day to day operations of the facility, to adjust/fine tune the burners prior to performance testing. The Permittee shall submit all test data for pre-tests and post-tests conducted before and following the test along with the source test data to the Division upon request.
[391-3-1-.02(3) and 391-3-1-.03(2)(c)]

PART 5.0 REQUIREMENTS FOR MONITORING (Related to Data Collection)

5.1 General Monitoring Requirements

5.1.1 Any continuous monitoring system required by the Division and installed by the Permittee shall be in continuous operation and data recorded during all periods of operation of the affected facility except for continuous monitoring system breakdowns and repairs. Monitoring system response, relating only to calibration checks and zero and span adjustments, shall be measured and recorded during such periods. Maintenance or repair shall be conducted in the most expedient manner to minimize the period during which the system is out of service.
[391-3-1-.02(6)(b)1]

5.2 Specific Monitoring Requirements

5.2.1 The Permittee shall install, calibrate, maintain, and operate a system to continuously monitor and record the indicated parameters on the following equipment. Each system shall meet the applicable performance specification(s) of the Division's monitoring requirements.
[391-3-1-.02(6)(b)1]

a. The combustion temperature of RTO and RCO. The temperature monitoring device shall have an accuracy of ±2% (°F).

b. The secondary voltage for each field of the WESP. Such devices shall have a required accuracy of ±2%.

c. The secondary current for each field of the WESP. Such devices shall have a required accuracy of ±2%.

5.2.2 The Permittee shall, using the data required to be recorded by Condition 5.2.1, determine the total power for each hour of operation. Total WESP power shall be calculated using the following equation:
[391-3-1-.02(6)(b)1]

$$P_t = \sum_{i=1}^{n} V_i I_i$$

Where:
P_t = Total Wet ESP power (watts)
V_i = secondary voltage (kV) in wet ESP field i
I_i = secondary current (ma) in ESP field i
n = Total number of fields in ESP
i = ith field in ESP (i =1 to n)

5.2.3 The Permittee shall install, calibrate, maintain, and operate pressure drop indicators on the Dry Hammermill cyclofilters (CYFL1-7) and the Press/Cooler baghouses (BH1, BH2, and BH3). Where such performance specification(s) exist, each system shall meet the applicable performance specification(s) of the Division's monitoring requirements. The Permittee shall read and record the pressure drop at least once per day of operation. A logbook containing these records shall be available for inspection and/or submittal to the Division, upon request.
[391-3-1-.02(6)(b)1]

5.2.4 The Permittee shall implement a Preventive Maintenance Program (PMP) for the Dry Hammermill cyclofilters (CYFL1-7) and the Press/Cooler baghouses (BH1, 2, and 3). The program shall be subject to review and if necessary, to assure compliance, modification by the Division and shall include the pressure drop ranges that indicate proper operation for each baghouse. At a minimum, the following operation and maintenance checks shall be made on at least a weekly basis and a record of the findings and corrective actions taken shall be kept in a maintenance log:
[391-3-1-.02(6)(b)1]

a. For baghouses equipped with compressed air cleaning systems, check the system for proper operation. This may include checking for low pressure, leaks, proper lubrication and proper operation of timer and valves.

b. For baghouses equipped with reverse air cleaning systems, check the system for proper operation. This may include checking damper, bypass and isolation valves for proper operation.

c. For baghouses equipped with shaker cleaning systems, check the system for proper operation. This may include checking shaker mechanism for loose or worn bearings, drive components, mounting; proper operation of outlet/isolation valves; proper lubrication.

d. Check dust collector hoppers and conveying systems for proper operation.

e. Check the cyclone filters for clogging and air leaks

5.2.5 The Permittee shall calculate three-hour average WESP secondary power using data measured per Condition 5.2.2.
[391-3-1-.02(6)(b)1]

5.2.6 The Permittee shall ensure that temperatures in the RTO and RCO combustion zones are maintained at or above the levels required by Conditions 3.2.3 and 3.2.4 on a 3-hour rolling average using a temperature sensor. The Permittee shall calculate the rolling three-hour average combustion temperature using data measured per Condition 5.2.1.
[391-3-1-.02(6)(b)1]

5.2.7 The Permittee shall conduct daily inspections of all sources of fugitive dust emissions, including but not limited to the units listed in Table 3.1 of this permit as subject to Georgia Rule 391-3-1-.02(2)(n). Records of each daily inspection shall be maintained and available for inspection or submittal to the Division upon request. The inspection shall include, at a minimum:
[391-3-1-.02(6)(b)1 and 40 CFR 70.6(a)(3)(i)]

a. Check of the working condition of dust control measures such as loadout boots.

b. Verify that baghouses, filters and cyclones used to minimize fugitive dust are operating

c. Documentation of any visible emissions present from any fugitive dust source, including but not limited to the green hammermills (GHM1&2), and the wood piles. Any adverse condition discovered by this inspection shall be corrected in the most expedient manner possible. The Permittee shall record the incident as an excursion and note the corrective action taken.

5.2.8 The Permittee shall perform daily checks of visible emissions from Log Storage/Handling, Debarking/Screening, Chipper, and Chip Piles (WOOD); Green Hammermills (GHM1&2); Furnace/Dryer RTO stack (S1), and the Dry Hammermill/Press/Cooler RCO stack (S2) while the underlying process equipment is operating at the normal, expected operating rate using the procedures below, except when atmospheric conditions or sun positioning prevent any opportunity to perform a VE check. The Permittee shall retain a record in a daily visible emissions (VE) log suitable for inspection or submittal.
[391-3-1-.02(6)(b)1]

a. Determine, in accordance with the procedures specified in paragraph d of this condition, if visible emissions are present at the discharge point to the atmosphere and record the results in the daily VE log. For sources that exhibit visible emissions, the Permittee shall comply with paragraph b of this condition.

b. For each check where a stack is determined to be emitting visible emissions, a qualified observer shall determine whether the emissions equal or exceed a 20% opacity action level, using the procedure specified in paragraph d of this condition. For the purposes of this condition a qualified observer is one that has met the certification requirements of EPA Method 9 – *Visual Determination of the Opacity of Emissions from Stationary Sources*. Also, this determination shall cover a period of six minutes. The results shall be recorded in the daily VE log. For sources that exhibit visible emissions of greater than or equal to the opacity action level of 20%, the Permittee shall comply with paragraph c of this condition.

c. For each occurrence that requires action in accordance with paragraph b of this condition, the Permittee shall determine the cause of the visible emissions and correct the problem in the most expedient manner possible. The Permittee shall note the cause of the visible emissions, raw material feed rate, and any other pertinent operating parameters as well as the corrective action taken, in the maintenance log.

d. The person performing the determination shall stand at a distance of at least three stack heights, which is sufficient to provide a clear view of the plume against a contrasting background with the sun in the 140 degree sector at his/her back.

Consistent with this requirement, the determination shall be made from a position such that the line of vision is approximately perpendicular to the plume direction. Only one plume shall be in the line of sight at any time when multiple stacks are in proximity to each other.

5.2.9 The Permittee shall install, calibrate, maintain, and operate systems to monitor the dried wood rate (ODT/hr) exiting the dryer (DRY), and the pellet production rate (ton/hr) through the Coolers (COOLl-3). The data shall be recorded hourly. Performance specification(s) of the Division's monitoring requirements.
[391-3-1-.02(6)(b)1]

5.2.10 The Permittee shall develop and implement a Preventive Maintenance Program for the catalytic oxidizer (RCO) to assure that the provisions of Condition 1.1 are met. The program shall be subject to review and, if necessary to assure compliance, modification by the Division. At a minimum, the following operation and maintenance checks shall be made on at least an annual basis, and a record of the findings and corrective actions taken shall be kept in a maintenance log:
[391-3-1-.02(6)(b)1]

a. Clean burner

b. Tighten burner valve linkage

c. Visually inspect catalyst bed for plugging. Catalyst bed should be free of particulate matter.

d. Visually inspect the inlet and outlet thermocouples, have thermocouples calibrated for proper operation

e. Visually inspect the inlet and outlet pressure sensors, have sensors calibrated for proper operation

f. Visually inspect crossflow for plugging on burner side. If crossflow is dirty remove and clean with hose and water

g. Visually inspect chamber for cracks

h. Visually inspect process fan rotor for warpage, cracking, abnormal noise, and free spin

i. Rotate the catalyst media annually according to the manufacturer's recommendations

5.2.11 The Permittee shall prepare a core sampling plan for the catalytic oxidizer (RCO) per manufacturer's recommendation and submit to the Division thirty (30) days in advance of conducting any core sampling activity required by Condition 5.2.12.

The following information shall be included in the required core sampling plan:
[391-3-1-.02(6)(b)1, and 40 CFR 70.6(a)(3)(i)]

a. Location of samples taken.

b. Size of samples taken.

c. Number of samples taken.

5.2.12 The Permittee shall take a core sample of the catalyst bed at approximately one year intervals not to exceed fourteen months between tests per the plan submitted in Condition 5.2.11 and test core sample for catalyst activity. The first such sampling shall occur at 12 months from the from the last performance test.
[391-3-1-.02(6)(b)1, and 40 CFR 70.6(a)(3)(i)]

5.2.13 The Permittee shall replace or clean the catalyst per manufacturer's recommendation if the core sample tested per Condition 5.2.12 shows a catalyst removal efficiency of less than 90 percent. This cleaning and/or replacement shall be done no later than thirty (30) days of the facility receiving the test results.
[391-3-1-.02(6)(b)1, and 40 CFR 70.6(a)(3)(i)]

5.2.14 The following pollutant specific emission unit(s) (PSEU) are subject to the Compliance Assurance Monitoring (CAM) Rule in 40 CFR 64.

Emission Unit	Pollutant
Furnace/Dryer (WESP/RTO)	PM and VOC
Dry Hammermills (CYFL1-7/RCO)	PM and VOC
Presses and Coolers (BH1-3/RCO)	PM and VOC

Permit conditions in this permit for the PSEU(s) listed above with regulatory citation 40 CFR 70.6(a)(3)(i) are included for the purpose of complying with 40 CFR 64. In addition, the Permittee shall meet the requirements, as applicable, of 40 CFR 64.7, 64.8, and 64.9.
[40 CFR 64]

5.2.15 The Permittee shall comply with the performance criteria listed in the table below for the PM emissions from Furnace/Dryer.
[40 CFR 64.6(c)(1)(iii)]

Performance Criteria [64.4(a)(3)]	Indicator No. 1 WESP Secondary Power	Indicator No. 2 Water Flow to WESP
A. Representativeness [64.3(b)(1)]	Total power greater than or equal to 80% of the power during the most recent filterable PM performance test for three consecutive readings	Per test
B. Verification [64.3(b)(2)]	N/A	N/A
C. QA/QC Criteria [64.3(b)(3)]	Routine maintenance and annual calibration checks	N/A

D. Frequency [64.3(b)(4)]	Continuous	Continuous
E. Data Collection [64.3(b)(4)]	Data Logger	Data Logger
F. Averaging Period [64.3(b)(4)]	3 hours	3 hours

5.2.16 The Permittee shall comply with the performance criteria listed in the table below for the PM emissions from the Dry Hammermills, Presses, and Coolers.
[40 CFR 64.6(c)(1)(iii)]

Performance Criteria [64.4(a)(3)]	**Indicator No. 1** **Visible Emission**	**Indicator No. 2** **Pressure Drop**
A. Representativeness [64.3(b)(1)]	Daily VE check - Action Level 20% or more opacity of Visible	1” to 10” W.C.(for BH1,2,3)
B. Verification [64.3(b)(2)]	N/A	N/A
C. QA/QC Criteria [64.3(b)(3)]	N/A	Pressure gauges are calibrated and maintained per manufacturer specs.
D. Frequency [64.3(b)(4)]	Daily	Daily
E. Data Collection [64.3(b)(4)]	VE log	Pressure drops are recorded electronically by a Data logger
F. Averaging Period [64.3(b)(4)]	6 minutes	N/A

5.2.17 The Permittee shall comply with the performance criteria listed in the table below for the VOC emissions from Furnace/Dryer, Dry Hammermills, Presses, and Coolers.
[40 CFR 64.6(c)(1)(iii)]

Performance Criteria [64.4(a)(3)]	**Indicator No. 1** **RTO and RCO Combustion temperatures**
A. Representativeness [64.3(b)(1)]	Thermocouples measure combustion zone temperature; not less than 1500 and 800F.
B. Verification [64.3(b)(2)]	n/a
C. QA/QC Criteria [64.3(b)(3)]	Temperature ranges and minimum temperature are established during performance testing. Thermocouples replaced per manufacturer suggested intervals
D. Frequency [64.3(b)(4)]	Continuous
E. Data Collection [64.3(b)(4)]	Temperature are recorded electronically using a data logger
F. Averaging Period [64.3(b)(4)]	3 hour average

PART 6.0 OTHER RECORD KEEPING AND REPORTING REQUIREMENTS

6.1 General Record Keeping and Reporting Requirements

6.1.1 Unless otherwise specified, all records required to be maintained by this Permit shall be recorded in a permanent form suitable for inspection and submission to the Division and to the EPA. The records shall be retained for at least five (5) years following the date of entry. [391-3-1-.02(6)(b)1(i) and 40 CFR 70.6(a)(3)]

6.1.2 In addition to any other reporting requirements of this Permit, the Permittee shall report to the Division in writing, within seven (7) days, any deviations from applicable requirements associated with any malfunction or breakdown of process, fuel burning, or emissions control equipment for a period of four hours or more which results in excessive emissions. The Permittee shall submit a written report that shall contain the probable cause of the deviation(s), duration of the deviation(s), and any corrective actions or preventive measures taken.
[391-3-1-.02(6)(b)1(iv), 391-3-1-.03(10)(d)1(i) and 40 CFR 70.6(a)(3)(iii)(B)]

6.1.3 The Permittee shall submit written reports of any failure to meet an applicable emission limitation or standard contained in this permit and/or any failure to comply with or complete a work practice standard or requirement contained in this permit which are not otherwise reported in accordance with Conditions 6.1.4 or 6.1.2. Such failures shall be determined through observation, data from any monitoring protocol, or by any other monitoring which is required by this permit. The reports shall cover each semiannual period ending June 30 and December 31 of each year, shall be postmarked by August 29 and February 28, respectively following each reporting period, and shall contain the probable cause of the failure(s), duration of the failure(s), and any corrective actions or preventive measures taken.
[391-3-1-.03(10)(d)1.(i) and 40 CFR 70.6(a)(3)(iii)(B)]

6.1.4 The Permittee shall submit a written report containing any excess emissions, exceedances, and/or excursions as described in this permit and any monitor malfunctions for each semiannual period ending June 30 and December 31 of each year. All reports shall be postmarked by August 29 and February 28, respectively following each reporting period. In the event that there have not been any excess emissions, exceedances, excursions or malfunctions during a reporting period, the report should so state. Otherwise, the contents of each report shall be as specified by the Division's Procedures for Testing and Monitoring Sources of Air Pollutants and shall contain the following:
[391-3-1-.02(6)(b)1 and 40 CFR 70.6(a)(3)(iii)(A)]

a. A summary report of excess emissions, exceedances and excursions, and monitor downtime, in accordance with Section 1.5(c) and (d) of the above referenced document, including any failure to follow required work practice procedures.

b. Total process operating time during each reporting period.

c. The magnitude of all excess emissions, exceedances and excursions computed in accordance with the applicable definitions as determined by the Director, and any conversion factors used, and the date and time of the commencement and completion of each time period of occurrence.

d. Specific identification of each period of such excess emissions, exceedances, and excursions that occur during startups, shutdowns, or malfunctions of the affected facility. Include the nature and cause of any malfunction (if known), the corrective action taken, or preventive measures adopted.

e. The date and time identifying each period during which any required monitoring system or device was inoperative (including periods of malfunction) except for zero and span checks, and the nature of the repairs, adjustments, or replacement. When the monitoring system or device has not been inoperative, repaired, or adjusted, such information shall be stated in the report.

f. Certification by a Responsible Official that, based on information and belief formed after reasonable inquiry, the statements and information in the report are true, accurate, and complete.

6.1.5 Where applicable, the Permittee shall keep the following records:
[391-3-1-.03(10)(d)1(i) and 40 CFR 70.6(a)(3)(ii)(A)]

a. The date, place, and time of sampling or measurement;

b. The date(s) analyses were performed;

c. The company or entity that performed the analyses;

d. The analytical techniques or methods used;

e. The results of such analyses; and

f. The operating conditions as existing at the time of sampling or measurement.

6.1.6 The Permittee shall maintain files of all required measurements, including continuous monitoring systems, monitoring devices, and performance testing measurements; all continuous monitoring system or monitoring device calibration checks; and adjustments and maintenance performed on these systems or devices. These files shall be kept in a permanent form suitable for inspection and shall be maintained for a period of at least five (5) years following the date of such measurements, reports, maintenance and records.
[391-3-1-.03(10)(d)1(i) and 40 CFR 70.6 (a)(3)(ii)(B)]

6.1.7 For the purpose of reporting excess emissions, exceedances or excursions in the report required in Condition 6.1.4, the following excess emissions, exceedances, and excursions shall be reported:
[391-3-1-.02(6)(b)1 and 40 CFR 70.6(a)(3)(i)]

a. Excess emissions: (means for the purpose of this Condition and Condition 6.1.4, any condition that is detected by monitoring or record keeping which is specifically defined, or stated to be, excess emissions by an applicable requirement)

None required to be reported in accordance with Condition 6.1.4.

b. Exceedances: (means for the purpose of this Condition and Condition 6.1.4, any condition that is detected by monitoring or record keeping that provides data in terms of an emission limitation or standard and that indicates that emissions (or opacity) do not meet the applicable emission limitation or standard consistent with the averaging period specified for averaging the results of the monitoring)

i. Any consecutive twelve month total PM, CO, NOx or VOC emissions from the entire facility equal to or exceeding of 249 tons.

ii. Any consecutive twelve month total of any single hazardous air pollutant (HAP) or two or more HAPs emissions from the facility equal to or exceeding 10 tons or 25 tons respectively.

iii. Any consecutive twelve month total dryer production that exceeds 675,000 ODT. ODT = weight of wood in tons at 11% moisture, calculated.

c. Excursions: (means for the purpose of this Condition and Condition 6.1.4, any departure from an indicator range or value established for monitoring consistent with any averaging period specified for averaging the results of the monitoring)

i. Any instance in which VE exceed the 20% action level (monitored in accordance with Condition 5.2.4) for two or more consecutive days.

ii. Any three-hour average combustion temperature of the RTO or RCO measured and recorded per Condition 5.2.1 below 1,500°F (for RTO) or 800°F (for RCO) or the combustion temperature established during the most recent Division-approved performance test if used to establish Destruction efficiency.

iii. Any three-hour period during which the average total power for the WESP is less than 80 percent of the value determined during the most recent performance test for PM.

iv. Any adverse condition regarding fugitive dust emissions as required per Condition 3.4.3.

v. Any failure to perform the daily inspections of all sources of fugitive dust emissions (monitored in accordance with Condition 5.2.6).

vi. Any instance in which a Dry Hammermill cyclofilter (CYFL1-7) or a Press/Cooler baghouse (BH1, BH2, and BH3) pressure drop reading (monitored in accordance with Condition 5.2.3) is outside of normal ranges for two or more consecutive days.

vii. Any time period that the annual catalyst bed core sampling was not performed as required by Condition 5.2.11.

viii. Any time period that the catalyst was not cleaned or replaced as required by Condition 5.2.12.

6.2 Specific Record Keeping and Reporting Requirements

6.2.1 The Permittee shall keep operating records to determine the total amount of wood dried in the Dryer (DRY), in ODT on a monthly basis. ODT = weight of wood in tons at 11% moisture, calculated. The Permittee shall also keep operating records to determine the total amount of pellets processed through the Coolers (COOL1-3) in actual tons.
[Avoidance of 40 CFR 52.21]

6.2.2 The Permittee shall submit, with the report required by Condition 6.1.4, a semiannual report that contains the following records. The records shall be available for inspection or submittal to the Division upon request and contain:
[391-3-1-.02(6)(b)1, and 40 CFR 70.6(a)(3)(i)]

a. The total quantity of wood dried (in ODT) in the dryer (DRY) during each calendar month in the semiannual reporting period.

b. The total quantity of pellets produced (in actual tons) through the Coolers (COOL1-3) for the 12 consecutive month period ending with each calendar month in the semiannual reporting period.

6.2.3 The Permittee shall calculate the monthly NOx and CO emissions from the facility (consisting of the RTO and RCO exhaust) using the records from Condition 6.2.1 and the following equations. All emission factors and calculations shall be kept as part of the monthly records, available for inspection or submittal.
[391-3-1-.02(6)(b)1, and 40 CFR 70.6(a)(3)(i)]

$$E_{NOX} = [(EF1_{NOX} \text{ x } DRY) + (EF2_{NOX} \text{ x } COOL)]/2000$$

$$E_{CO} = [(EF1_{CO} \text{ x } DRY) + (EF2_{CO} \text{ x } COOL)]/2000$$

Where:

E_{NOX}	=	Monthly NOx emission in tons
E_{CO}	=	Monthly CO emission in tons
$EF1_{NOX}$	=	Emission Factor (lb NOx/ODT) from the RTO (S1)
$EF1_{CO}$	=	Emission Factor (lb CO/ODT) from the RTO (S1)
DRY	=	Monthly wood production through DRY (ODT)
$EF2_{NOX}$	=	Emission Factor (lb NOx/ton) from the RCO (S2)
$EF2_{CO}$	=	Emission Factor (lb CO/ton) from the RCO (S2)
COOL	=	Monthly pellet production through COOL1-3 (tons)

The Permittee shall calculate NOx and CO emissions by using the following emission factors and the equation provided in this condition. If the emissions testing required in Section 4 reveals emission factors higher than these listed below, the Permittee shall comply with Condition 4.2.4

Emission Point	NOx	CO
RTO (S1)	$EF1_{NOX}$ = 0.66 lb/ODT	$EF1_{CO}$ = 0.66 lb/ODT
RCO (S2)	$EF2_{NOX}$ = 0.06 lb/ton	$EF2_{CO}$ = 0.06 lb/ton

ODT = weight of wood in tons at 11% moisture, calculated. The Permittee shall notify the Division in writing if facility-wide NOx or CO emissions exceed 20.7 tons during any calendar month. This notification shall be postmarked by the fifteenth day of the following month.

6.2.4 The Permittee shall calculate the monthly total PM emissions from the facility (consisting of RTO, RCO, and HAND) using the records from Condition 6.2.1 and the following equations. All emission factors and calculations shall be kept as part of the monthly records, available for inspection or submittal.
[391-3-1-.02(6)(b)1, and 40 CFR 70.6(a)(3)(i)]

$$EPM = [(EF1_{PM} \times DRY) + (EF2_{PM} \times COOL) + SILO]/2000$$

Where:

E_{PM}	=	Monthly total PM emission in tons
$EF1_{PM}$	=	Emission Factor (lb PM/ODT) from the RTO (S1)
$EF2_{PM}$	=	Emission Factor (lb PM/ton) from the RCO (S2)
DRY	=	Monthly wood production through DRY (ODT)
COOL	=	Monthly pellet production through COOL1-3 (tons)
SILO	=	Monthly potential PM emissions from silos = 3,000 pounds

The Permittee shall calculate PM emissions by using the following emission factors and the equation provided in this condition. If the emissions testing required in Section 4 reveals emission factors higher than these listed below, the Permittee shall comply with Condition 4.2.4

Emission Point	PM
RTO (S1)	$EF1_{PM}$ = 0.30 lb/ODT

RCO (S2)	$EF2_{PM}$ = 0.31 lb/ton

ODT = weight of wood in tons at 11% moisture, calculated. The Permittee shall notify the Division in writing if facility-wide total PM emissions exceed 20.7 tons during any calendar month. This notification shall be postmarked by the fifteenth day of the following month.

6.2.5 The Permittee shall calculate the monthly VOC, Formaldehyde, Acetaldehyde, Methanol, and other HAP emissions using the records from Condition 4.2.3 and the following equation(s). All emission factors and calculations shall be kept as part of the monthly records, readily available for inspection or submittal. VOC emissions shall be calculated using EPA OTM-26: VOC = [Method 25A VOC as propane + Methanol as methanol + Formaldehyde as formaldehyde + Acetaldehyde as acetaldehyde] – [(0.65) Methanol expressed as propane]
[391-3-1-.02(6)(b)1, and 40 CFR 70.6(a)(3)(i)]

For each pollutant per month using the following equation.

E_i = $[(EF1_i \times DRY) + (EF2_i \times COOL) + (EF3_i \times SILO)]/2000$

Where:

E_i	=	Monthly emission in tons of pollutant
i	=	VOC, Formaldehyde, Acetaldehyde, Methanol, and other HAP
$EF1_i$	=	RTO emission factor (lb/ODT) for each pollutant
DRY	=	Monthly wood production through DRY (ODT)
$EF2_i$	=	RCO Emission Factor (lb/ton) for each pollutant
COOL	=	Monthly pellet production through COOL1-3 (tons)
$EF3_i$	=	Silo emission factor (lb/ton) for each pollutant
SILO	=	Monthly pellet production through SILOS (tons)

Emission Point	VOC	Methanol	Formaldehyde	Acetaldehyde	Other HAP
$EF1_i$ (RTO) (S1)	0.30 lb/ODT	0.006 lb/ODT	0.007 lb/ODT	0.006 lb/ODT	0.01 lb/ODT
$EF2_i$ (RCO) (S2)	0.19 lb/ton	0.0005 lb/ton	0.001 lb/ton	0.0005 lb/ton	-
$EF3_i$ (SILOS)	0.20 lb/ton	0.001 lb/ton	0.002 lb/ton	0.001 lb/ton	-

VOC and HAP emission factors are EPD emission factors reduced by an estimated 95% reduction from the RTOs.

ODT = weight of wood in tons at 11% moisture, calculated.

The Dryer (DRY) VOC and HAP emission factors ($EF1_i$) shall be multiplied by 20 any time the three (3) hour average RTO combustion temperature falls below 1500 ^{o}F or the target set in the most recent performance test. The hammermill/press/cooler VOC and HAP emission factors shall be multiplied by 20 any time the three (3) hour average RCO combustion temperature falls below 800 ^{o}F or the target set in the most recent performance test.

The Permittee shall notify the Division in writing if facility-wide total VOC emissions exceed 20.7 tons during any calendar month, if any facility-wide individual HAP emissions exceed 0.83 tons during any calendar month, or if any facility-wide combined HAP emissions exceed 2.08 tons during any calendar month. This notification shall be postmarked by the fifteenth day of the following month.

6.2.6 The Permittee shall use the monthly NOx, CO, total VOC, formaldehyde, methanol, and acetaldehyde emission data to calculate the 12-month rolling total of each pollutant emissions for each calendar month in the reporting period. These records shall be kept available for inspection or submittal.
[391-3-1-.03(2)(c)]

6.2.7 The Permittee shall notify the Division in writing within 15 days after startup of the new Dryer (DRY).
[391-3-1-.03(2)(c)]

Received 17 February 2009; in final form 31 May 2009; published online 5 August 2009

Wood pellets emit CO, CO_2, CH_4, and other volatiles during storage. Increased concentration of these gases in a sealed storage causes depletion of concentration of oxygen. The storage environment becomes toxic to those who operate in and around these storages. The objective of this study was to investigate the effects of temperature, moisture, and the relative size of storage headspace on emissions from wood pellets in an enclosed space. Twelve 10-l plastic containers were used to study the effects of headspace ratio (25, 50, and 75% of container volume) and temperatures (10–50°C). Another eight containers were set in uncontrolled storage relative humidity (RH) and temperature. Concentrations of CO_2, CO, and CH_4 were measured by gas chromatography (GC). The results showed that emissions of CO_2, CO, and CH_4 from stored wood pellets are more sensitive to storage temperature than to RH and the relative volume of headspace. Higher peak emission factors are associated with higher temperatures. Increased headspace volume ratio increases peak off-gas emissions because of the availability of oxygen associated with pellet decomposition. Increased RH in the enclosed container increases the rate of off-gas emissions of CO_2, CO, and CH_4 and oxygen depletion.

Keywords: biomass; emission factors; headspace ratio; moisture effect; off-gassing emission; storage; temperature effect; wood pellets

INTRODUCTION

Wood pellets are used for heat and electricity production. More than 800 000 tonnes of wood pellets were exported from Canada to Europe in 2008, mainly from British Columbia. The reaction mechanisms for biomass combustion and emissions from wood pellet combustion have been extensively investigated (Chen and Workman, 1990; Dinu, 2006; Wadso, 2007). Recently, more attention has been given to the emissions from wood pellets during their storage and transportation because these emissions can become a potential health risk (Svedberg *et al.*, 2008).

It is well known that a biomass gradually decomposes chemically and biologically and during these processes it slowly releases toxic gases, leading to depleting oxygen (Reuss and Pratt, 2000; Johansson *et al.*, 2004; Arshadi and Gref, 2005). Svedberg *et al.* (2004) has reported the composition of the off-gas emissions from stored wood pellets, with CO, CO_2, CH_4, and non-methane organic compounds being commonly identified in the off-gases from biomass (Johansson *et al.*, 2004). Kuang *et al.* (2008) developed a kinetic model of off-gas emissions from wood pellets in sealed containers to predict the evolution of emission rate factors at different storage temperatures. Many factors may contribute to the buildup of gas pollutants emitted from wood pellets in storage. Pellets made from aged sawdust might generate less volatile organic compounds (VOCs) than pellets made from fresh sawdust. The level of off-gas emissions was also found to depend on wood species. Pellets made from spruce sawdust emitted less VOCs

than pellets made from pine (Arshadi and Gref, 2005). Although the chemical/physical property changes of wood pellets influence the amounts of emissions, the storage environment and conditions should also be fully considered in the development of off-gassing mechanisms and characterization of emissions from wood pellets in storage.

The objective of this study was to investigate the effect of temperature, relative humidity (RH), and storage headspace on the off-gas emissions from wood pellets in an enclosed storage space.

METHODS

Materials and equipments

Twelve 10-l plastic containers (200 mm diameter and 320 mm high) were used to study gas emissions by loading different weights of wood pellets at different temperatures. Three containers were filled with 1.75, 3.5, and 5.25 kg of wood pellets to fill 25, 50, and 75% of the container volume. The average bulk density of pellets was 700 kg m^{-3}. A pellet mill in British Columbia supplied the pellets. The raw material for wood pellets was fresh pine sawdust and planer shavings from mountain pine (*Pinus contorta* Douglas) beetle-infested trees with an estimated 2 years beyond mortality. The moisture content of pellets as received was 5.1% (wet mass basis).

Four containers having the same head space ratio were each placed in one of the four temperature controlled ovens. Each oven was set at 10, 23 (room temperature), 35, or 45°C. These temperature treatments were repeated for each of the three head space ratios. Ten milliliters of gas samples were drawn daily from the containers by a gastight syringe. The composition of the sampled gas was analyzed by a gas chromatographic method [hydrogen flame ionization detector, (FID) and thermal conductivity detector (TCD)] using a GC-14A (SHIMADZU Corporation, Japan) to quantify concentrations of CO, CO_2, CH_4, O_2, and N_2. Prior to measurements, the temperatures of TCD and FID were set at 100 and 200°C, respectively. The gas chromatography (GC) was calibrated with standard CO, CO_2, and CH_4 gases. The standard CO, CO_2, and CH_4 gas concentrations were 1000, 5000, and 1000 p.p.m., respectively. The certified corresponding purity for each standard gas was 969 p.p.m. for CO based on HP 6890 method, 4898 p.p.m. for CO based on Carle 400 AGC, and 995 p.p.m. for CH_4 based on HP 6890 method. Argon and compressed air were used as the reference and carrier gases. A fused silica capillary column of inner diameter of 0.1 mm and 50 m long was used. Gas removal from each container at each time step and composition analysis were repeated twice.

Another set of eight 10-l plastic containers was used to investigate the effects RH and temperature had on wood pellet emissions. Two containers were loaded with 3.5 kg of wood pellets (50% of container volume). A 500-ml dish was filled with water and placed at the bottom of one of the containers to create a humid space. The wood pellets were loaded on a screen (diameter < 1 mm) installed above the water-filled dish. Four groups of containers with the same set were sealed airtight and set at temperatures of 10°C, room temperature (~23°C), 35, and 45°C. A wireless temperature and humidity sensor was placed inside the container on the top of wood pellets. Temperature and moisture were recorded daily. During the first 3 days, 10 ml gas samples were drawn every day. The remaining 27 days, gas samples were drawn every 5 days. A total of 10 samples were removed from each container and measured daily by GC to determine the concentration of CO, CO_2, and CH_4. Tests were run until the concentration of CO, CO_2, and CH_4 did not increase any further, which usually happened after ~30 days.

Data analysis

The concentrations of CO, CO_2, and CH_4 were converted to emission factors using the N_2 balance method (Kuang *et al.*, 2008). As an inert gas, N_2 is assumed not consumed or generated during the storage period. The N_2 concentration measured at the beginning (79%) over that measured after time t is used to calculate the change in the total moles of gas species in the container. Under constant temperature (T) and pressure (P), the concentration can be converted to an emission factor, f_i (in off-gas species per kilogram of pellets), for gas species i by

$$f_i = \frac{P\left(C_i V_g\right) M_{\mathrm{wt}} C_{n0}}{RTM_p \quad C_{nt}}, \tag{1}$$

where C_{n0} is the initial concentration of N_2, C_{nt} is the measured concentration of N_2 at time t, M_p is the total mass of wood pellets in the container calculated by N_2 balance method, and M_{wt} is the molecular weight of the gas species. V_g is the gas volume in the container which equals the difference between container volume (V) and pellets volume (V_{p}) (i.e. $V_{\mathrm{g}} = V - V_{\mathrm{p}}$). P is gas pressure. The volume occupied by pellets (V_{p}) was calculated based on the weight of pellets divided by the average density of a single pellet. The density of a single pellet is calculated as the average values of the weight of single pellets divided by the volume of single pellets. Volume is calculated from measuring diameter and length of the cylindrical pellet.

The previously developed first-order kinetic model (Kuang *et al.*, 2008) for evolution of gas emissions was used to fit the data of each gas species. The concentration (C) and the emission factor (f) for CO, CO_2, and CH_4 were derived from the first-order reaction equation:

$$C_i(t) = C_{i,\infty}\left[1 - \exp\left(-k_i t\right)\right], \qquad (2)$$

$$f_i(t) = f_{i,\infty}\left[1 - \exp\left(-k_i t\right)\right], \qquad (3)$$

where $C_{i,\infty}$ represents the maximum asymptote value for concentration, and $f_{i,\infty}$ represents the maximum asymptote value for emission factor. k_i is the rate constant of the kinetic equation. The time for the emission concentration to reach half of its asymptote value ($\tau_{1/2}$) is calculated to indicate how fast a gas is emitted from the stored pellets.

RESULTS

Headspace volume ratio (V_h/V)

Equation (1) was used to calculate the emission factor for each gas. Figure 1 shows the emission factor for CO_2 measured in 12 containers, three headspace ratios and four temperatures as a function of storage time. The emission factors for CO_2 increase over the storage time, a sharp rise at the beginning but approaching a plateau gradually. At the same temperature, as the headspace volume increased from 25 to 75% of the container volume, the peak emission factor for CO_2 increased. Under the same headspace ratio, the peak emission factor for CO_2 increased as the temperature increased. Figure 2a,b shows the same time dependence of emission factors for CO and CH_4. Table 1 lists peak emission factors. These asymptote factors (f_∞) were calculated by least-square fitting of equation (3) to the experimental data.

Figure 3 shows the rate of oxygen depletion with time. At the same temperature, as the headspace volume increased from 25 to 75% of the container volume, the oxygen depletion decreased. Under the same headspace ratio, the oxygen depletion increased as the temperature increased. Therefore, a larger oxygen depletion occurs at a high temperature and at a low headspace.

The peak emission factors for CO_2, CO, and CH_4 at high temperatures (35 and 45°C) were larger than those at low temperatures (10 and 23°C). A peak emission factor increases monotonously with increasing the headspace. In other words, both

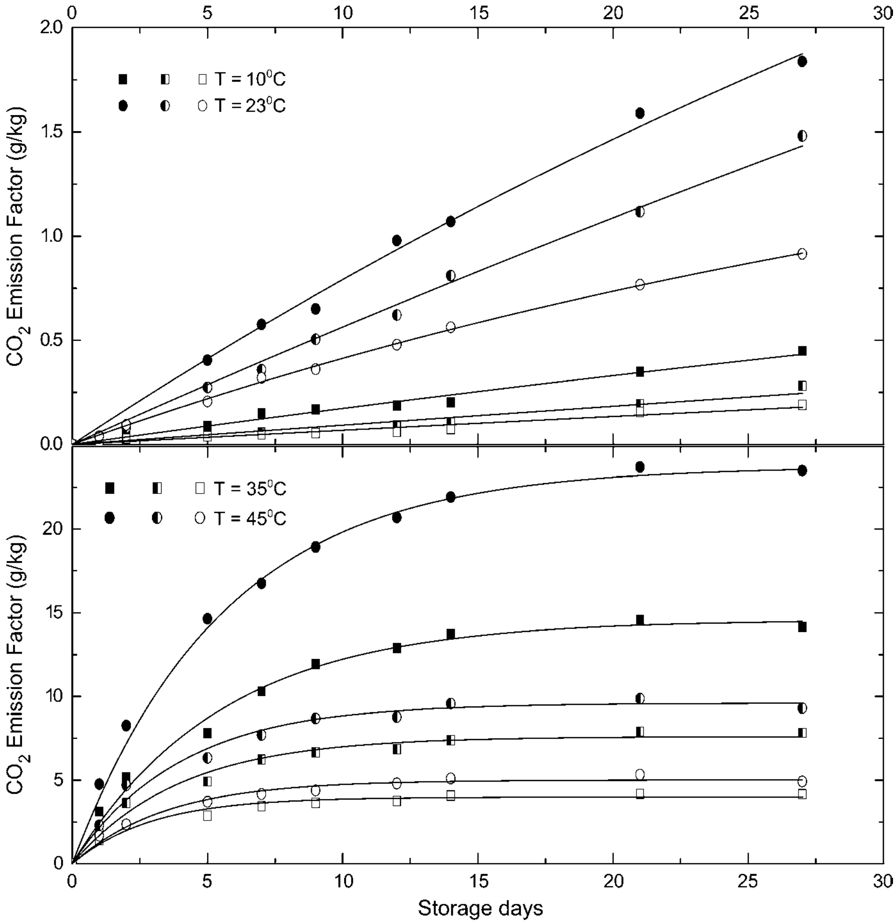

Fig. 1. CO_2 emission factor at different headspaces and temperatures (closed symbols: headspace = 75%; half-closed symbols: headspace = 50%; open symbols: headspace = 25%).

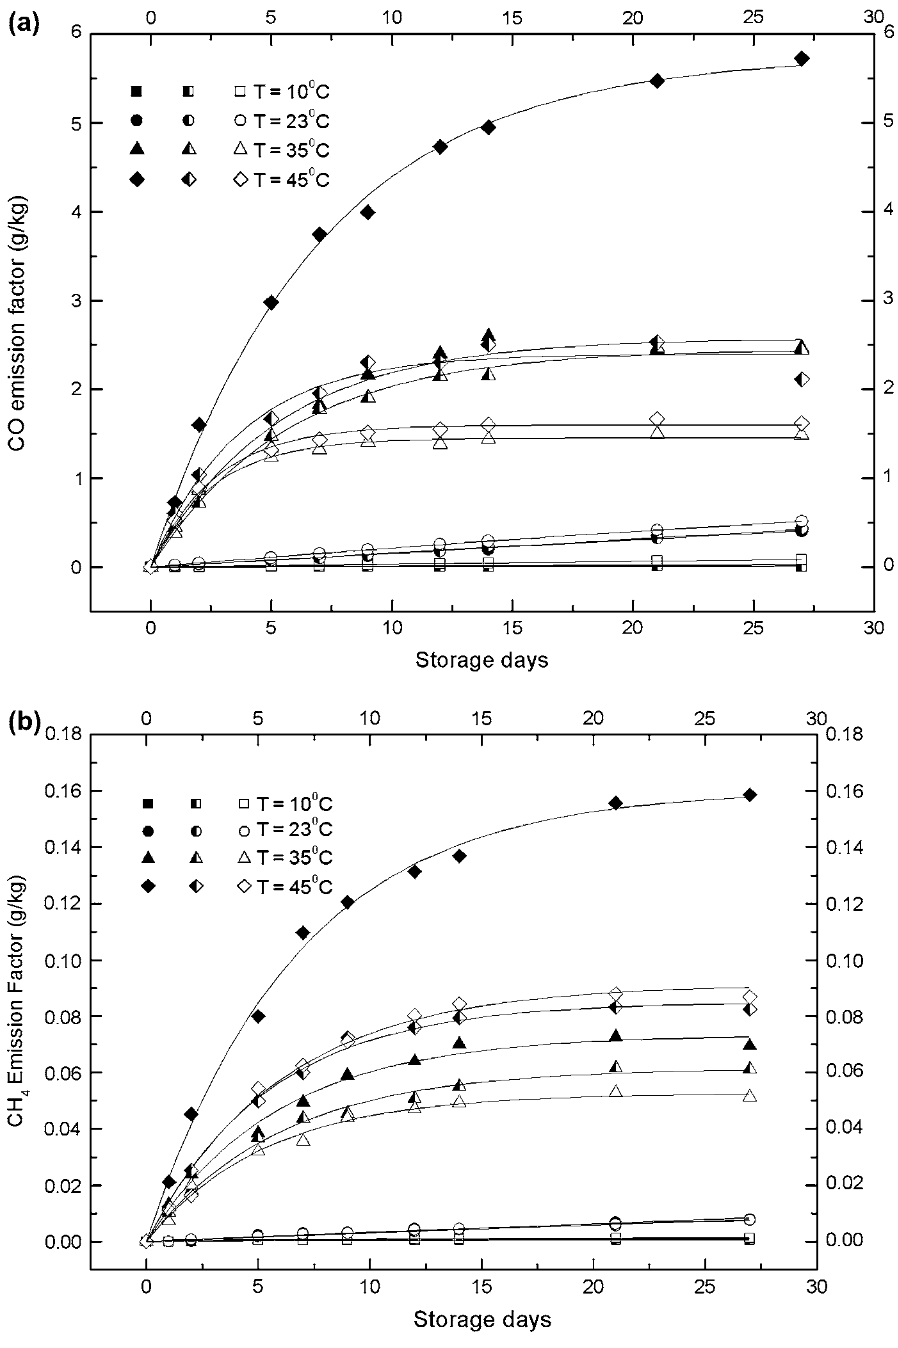

Fig. 2. CO and CH_4 emission factor over time at different headspaces and temperatures (closed symbols: headspace = 75%; half-closed symbols: headspace = 50%; open symbols: headspace = 25%). (a) CO emission factor at different headspaces and temperatures. (b) CH_4 emission factor at different headspaces and temperatures.

temperature and headspaces are important factors affecting the off-gas emissions from wood pellets in storage.

Relative humidity

Figure 4 shows the RH inside each container as a function of storage time. The RH in each container drops sharply initially after loading of wood pellets, indicating that wood pellets absorb the moisture available in the space. Unfortunately, we did not measure the moisture content of samples after each test. In an earlier experiment, Kuang *et al.*, (2008) found an average of 1% point reduction in moisture content when pellets stored in sealed and heated containers. The RH in the container with water placed at the bottom increased gradually over time, with

higher RH at higher temperatures. Although the RH did not remain constant, the average RH in the container with water was generally higher than that in the container without water at the same temperature.

Figure 4a–c shows emission factors for CO_2, CO, and CH_4 measured in the eight containers at different temperatures and RH as a function of storage time. Emission factors increased over time, faster at the beginning but slower when approaching a plateau. The values of peak emission factor (f_∞) and the time to reach the half peak emission factor ($\tau_{1/2}$) are obtained by least-square fitting of experimental data using equations (2) and (3). Table 2 lists the results. The peak emission factor of CO_2, CO, and CH_4 increased as the temperature increased from 10 to 45°C regardless of the RH level. It is also seen that the peak emission factor was higher at high RH at the same temperature. The differences between low and high RH were more significant for CO_2 and CH_4 as temperature increased. Although the peak emission factor did not change a lot between the low and high RH for CO, the time to reach half of the peak emission factor was shorter at high RH than that at low RH.

Figure 5 shows the oxygen depletion over against time in the containers. The oxygen level in the containers decreased more significantly at higher temperatures. The storage RH also affected the oxygen depletion, with a faster oxygen depletion at a higher RH level.

DISCUSSION

The dependence of headspace gas concentrations on temperature has been investigated in our previously published data (Kuang *et al.*, 2008). The current investigation demonstrated that both the headspace volume and the temperature have significant impacts on emission factors and the concentration

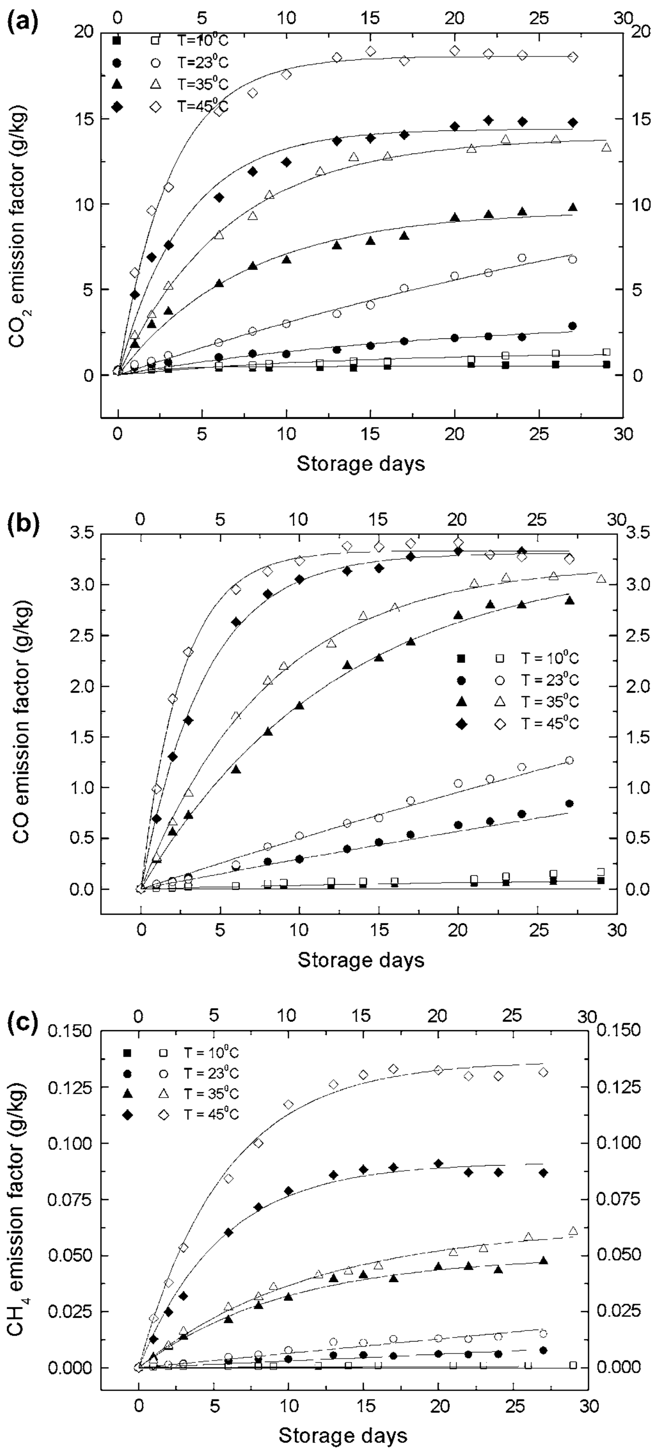

Fig. 4. Emission factors of CO_2, CO, and CH_4 over time at different temperatures and RH (closed symbols: no water present; open symbols: with water present at the bottom).

buildup of CO, CO_2, and CH_4 in sealed wood pellet containers. This can be explained by the decomposition mechanism of wood pellets. Biomass decomposes both chemically and biologically. If the thermal degradation is in dominance, the emission factor will increase with the increase in temperature. However, the biological process may peak at a certain temperature and decrease at higher temperatures at which bacteria and fungi would perish (Agrios, 2004). The results from the current study suggest that chemical

process via auto-oxidative degradation of fats and fatty acids (Svedberg *et al.*, 2004; Arshadi and Gref, 2005) may be the dominant mechanism for off-gassing because the emission rate increases monotonously with increasing temperature from 10 to 45°C, although biological process may also contribute to the emissions for moist biomass under a wet environment. Figure 4 shows that CO_2 emission factor is more sensitive to temperature than CO. This sensitivity is more pronounced at higher storage temperatures than at lower storage temperatures.

Moisture is another important factor influencing the off-gas emissions from wood pellets in storage. RH is investigated in this study, whereas the high moisture content of wood pellets (a high water activity in equilibrium with a high RH) could play an important role on the emissions from wood pellets during storage. It is suggested from the current study that high storage moisture could cause higher emissions of CO_2, CO, and CH_4. Therefore, the control methods such as restricting the storage temperature, RH, or choosing an appropriate headspace ratio in a contained storage space could be effective in reducing the off-gas emissions from wood pellets in order to protect the workers' health.

Further studies of the thermal and biological decomposition of wood pellets under controlled conditions are needed to elucidate to what extent the biological process contributes to the decomposition of woody materials.

CONCLUSIONS

1. Storage temperature is the key factor that affects the off-gassing from stored wood pellets. Higher

peak emission factors are always associated with higher temperatures.

2. Increased headspace increases off-gas emissions because of the availability of oxygen for pellet decomposition.
3. Increased humidity in the headspace in the container increases the emissions of CO_2, CO, and CH_4.

ISSUE BRIEF

A BAD BIOMASS BET

WHY THE LEADING APPROACH TO BIOMASS ENERGY WITH CARBON CAPTURE AND STORAGE ISN'T CARBON NEGATIVE

With every passing year—with every record-setting temperature or unthinkably destructive flood—the dangers of climate change become more apparent. As policymakers around the world increasingly recognize the devastating impacts of climate change, there is growing interest in not just curtailing new emissions of heat-trapping greenhouse gases from smokestacks, tailpipes, and buildings, but also finding ways to remove significant quantities of these gases already in the atmosphere, particularly carbon dioxide. In fact, most pathways modeled by the Intergovernmental Panel on Climate Change (IPCC) to avoid the worst impacts of climate change rely on extensive efforts to remove carbon dioxide from the atmosphere.[1]

One approach championed by the biomass industry is burning plant matter—most notably, trees and other wood from forests—as fuel to create electricity and capturing the resulting emissions from the power plant smokestack.[2] The technical name for this is "bioenergy with carbon capture and storage" (BECCS), and it is virtually the only technological carbon dioxide (CO_2) removal option explicitly included the IPCC's 2018 models.[3] BECCS is a particularly hot topic in the United Kingdom where multiple committees and agencies of the government are studying it.[4] However, despite its prominence in the IPCC report, policymakers should not assume BECCS is carbon negative. Studies have

For more information, please contact:

Sami Yassa, syassa@nrdc.org
Nathanael Greene, ngreene@nrdc.org

already shown that the widespread use of this technology would tax global ecological limits, threaten public health, and cost a fortune.[5] Furthermore, the IPCC models largely looked at scenarios in which biofuels (transportation fuels made from biomass) are supplied primarily by dedicated specialty crops, while the U.K. government is most focused on biopower (electricity made from biomass) from forests and forest residues.[6] The analysis described in this issue brief shows that this forest/wood-based approach to BECCS, as it is likely to be implemented initially, will make the impacts of climate change worse, not better.

The biomass industry wants governments to adopt the idea that BECCS is inherently carbon negative (i.e., that it will result in a net removal of CO_2 from the atmosphere). This claim is based on the erroneous premise that bioenergy on its own is carbon neutral. Forests and other plants absorb carbon; thus, the argument goes, any carbon released while burning bioenergy can be absorbed by new plants as they grow. Artificially capturing and sequestering emitted CO_2, proponents say, would allow those same plants to absorb additional carbon, making the BECCS process carbon negative. However, scientists are clear that this simplistic picture of bioenergy and BECCS is flawed. Biopower from forests without carbon capture is rarely carbon neutral.[7] According to the IPCC, it is inaccurate to "automatically consider or assume biomass used for energy [is] 'carbon neutral,' even in cases where the biomass is thought to be produced sustainably."[8] Since bioenergy is not inherently carbon neutral, BECCS is not inherently carbon negative.

Moreover, adding carbon capture and storage (CCS) to a power plant requires additional energy for installation and operation, and ultimately no CCS technology captures *all* of the CO_2 at the smokestack.[9] Neither of these sources of carbon are currently accounted for by BECCS proponents.

Finally, BECCS proponents try to focus only on the carbon emissions resulting from combustion. However, NRDC commissioned a new analysis to examine the emissions from each step in the biomass supply chain, and our model revealed that more than one third of carbon emissions occurs off-site rather than at the power station and thus cannot be captured by the addition of CCS at the smokestack. This makes it difficult for BECCS to be carbon neutral, much less carbon negative.

This issue brief disaggregates and quantifies these *uncapturable* emissions in one specific and common scenario: pellets made of wood from pine plantations in the southeastern United States fueling a BECCS operation in the United Kingdom. Our analysis shows that this approach to BECCS not only is not carbon negative but drives substantially more carbon pollution than the current electrical grid averages in either the United States or the United Kingdom.

Given this information, it is clear that policymakers should not waste money on this approach to BECCS and should look carefully before betting on BECCS more generally.

© USDA Forest Service

UNCAPTURABLE CARBON EMISSIONS ALONG THE BECCS SUPPLY CHAIN

The process of burning wood to generate electricity at large scale starts long before the smokestack. Producing the fuel requires cutting down trees, transporting the trees, drying the wood, turning the wood into pellets, and transporting the pellets. Only after all that can it be burned in a power plant. However, when talking about CCS, only the emissions from the power plant can potentially be captured; emissions from making and transporting the pellets are uncapturable. In addition, because old trees store more carbon than young growth, harvesting wood leads to "forgone sequestration," the carbon storage that would have occurred over time in the uncut forest but never materializes—a loss that occurs even when accounting for regrowth of the new forest (the difference between dark and light trees in Figure 1). This loss of sequestration also cannot be captured at the smokestack.

To estimate uncaptured BECCS emissions and better understand if and under what conditions BECCS helps fight climate change and when it makes things worse, NRDC commissioned a study to model carbon emissions in one particular supply chain: Wood sourced from loblolly pine plantations in the southeastern United States used to produce pellets, which are then burned as fuel in the United Kingdom.

This scenario is representative of the most common supply chain for biomass to electricity. The largest investments in biopower without carbon capture have been made by the U.K. power company Drax, which operates the single largest power station in the United Kingdom and fuels two-thirds of it with biomass.[10] Drax sources over 60 percent of its wood from the U.S. Southeast, sourcing biomass in the form of wood pellets from Enviva, the largest manufacturer of wood pellets in the world.[11] Drax also operates three company-owned pellet mills in Louisiana and Mississippi, which it uses to self-supply biomass.

Drax is pushing the U.K. government to subsidize BECCS heavily, and the U.K. government appears poised to rely heavily on BECCS in its plan for achieving net-zero emissions by 2050 under the Paris Agreement.[12] While our analysis used data from Drax and southeastern U.S. forests, the results presented below suggest we should be looking closely and skeptically at claims of carbon negative emissions from BECCS more generally.

Using the numbers generated from our model, we found that for every megawatt-hour (MWh) of electricity that a standalone biopower plant would deliver to the grid, the uncapturable emissions along the supply chain equal 558 kilograms of carbon dioxide equivalent (kg CO_2e). The total emissions rate from a bioenergy plant without CCS is 1,481 kg CO_2e/MWh. When you add in CCS—which

FIGURE 1: SOURCES OF EMISSIONS FOR STANDALONE BIOPOWER AND BECCS

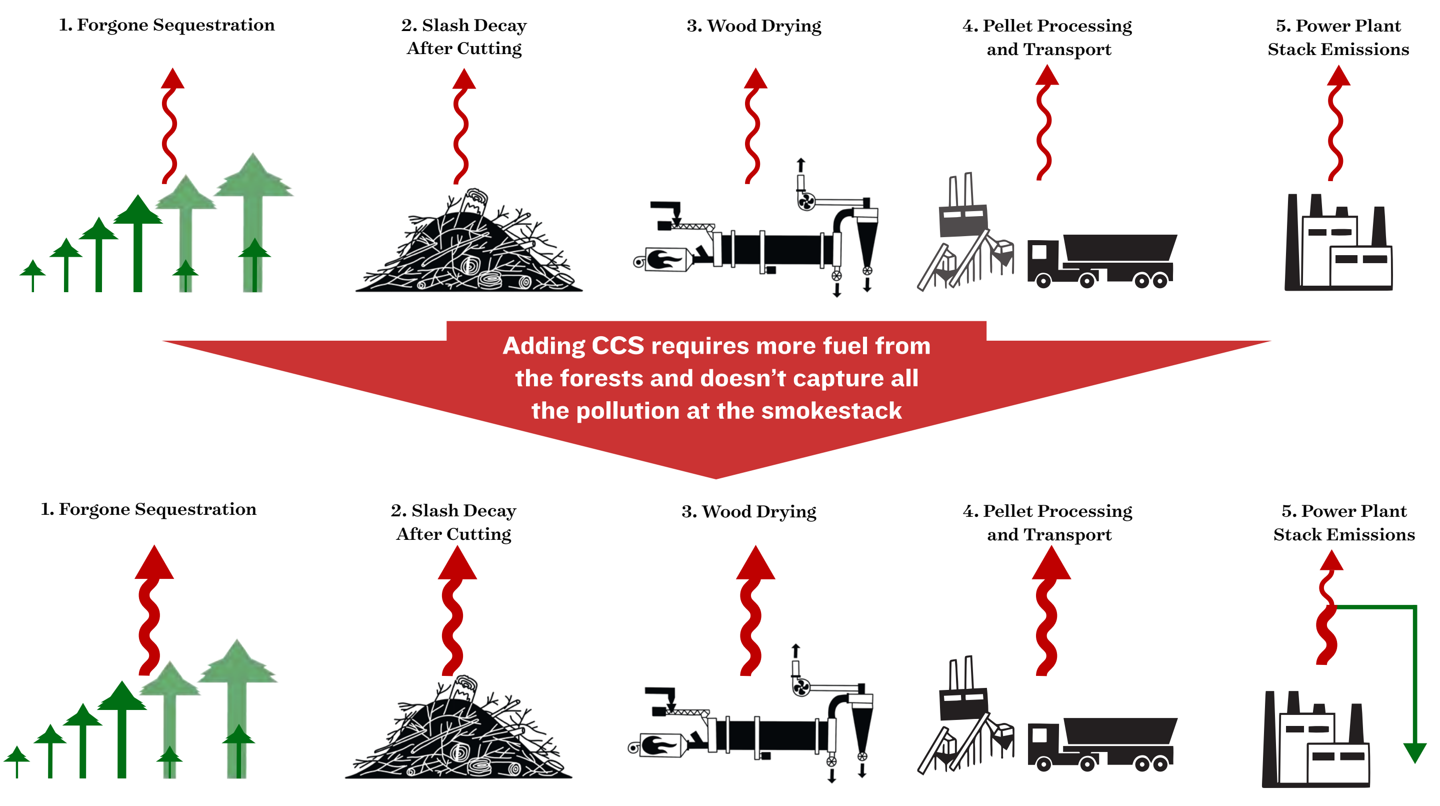

FIGURE 2: SUMMARY OF THE EMISSIONS FROM BIOPOWER AND BECCS

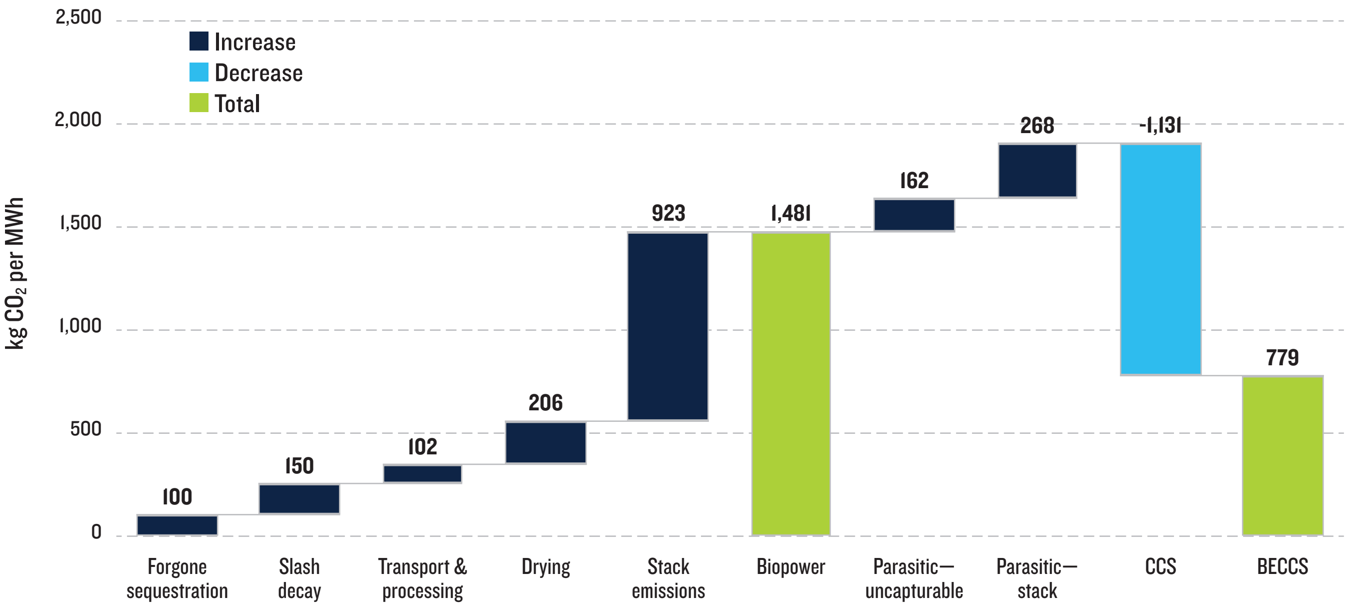

requires more fuel and does not have a 100 percent capture rate—the result is significant remaining emissions: 779 kg CO_2e/MWh, as shown in Figure 2 (for calculations, see the methodology section at the end of this report). This is equal to about 80 percent of what comes out of a coal plant's smokestack per megawatt-hour.

The uncaptured emissions from BECCS are equal to about 80 percent of what comes out of a coal plant's smokestack per megawatt-hour.

Bioenergy Reduces the Amount of Sequestered Carbon in a Forest—Increasing Carbon in the Atmosphere Instead

The common fallacy when talking about large-scale electricity generation from burning forest biomass is that because the trees absorbed their carbon from the atmosphere and can be replanted and grow back, over a long enough period of time cutting and burning forests won't change the balance of carbon stored on the land versus in the atmosphere.[13] Even if this were true, simply maintaining the current amount of sequestered carbon in the world's forests is not enough to avert the worst impacts of climate change. All pathways identified by the IPCC to address the climate crisis involve not just maintaining but enhancing forest carbon sinks.[14] Meanwhile, our model shows that bioenergy does not even maintain carbon sequestration levels; cutting and burning forests in the southeastern United States leads to a net shift of carbon from the land to the air that lasts for decades.

When a stand of mature trees (about 25 years old in a southeastern plantation) is cut down or thinned, new trees can regrow, but the younger stand absorbs less carbon than the mature trees for decades.[15] Forgone sequestration, as mentioned earlier, is the difference in carbon storage between newly planted saplings in a harvested forest and the older forest that would have remained uncut in the absence of bioenergy demand.[16] Forgone sequestration happens even under the best-case scenario in which trees are replanted and/or regrow immediately.

In the southeastern plantations that we modeled, this accumulation of non-sequestered carbon lasts for decades until the new stand has grown old enough to balance out the sequestration debt that the cutting has caused. This picture is a little better when forests are thinned, which is the process of removing some trees so that those remaining have less competition for sunlight and nutrients and therefore can grow faster.[17] In forest plantations, this is done to maximize the financial value of the overall harvest. Unfortunately, the result is still more than two decades of forgone sequestration in the forest.

Forgone sequestration is a significant source of emissions that carbon accounting regimes in the United Kingdom and elsewhere currently ignore.[18] It results in decades during which there is more heat-trapping carbon in the atmosphere than there would have been absent bioenergy production. The IPCC has made it clear that we must immediately, dramatically reduce our carbon emissions to avoid the worst effects of climate change. Deploying biopower plants at a global scale would do the opposite.[19]

Our model was able to quantify this forgone sequestration and found that for a southeastern loblolly pine plantation, harvesting the wood to generate 1 megawatt-hour at a standalone biopower plant leads to between 68 and 370 kg CO_2e of forgone sequestration. The lower end of the range reflects thinning practices, and the higher end represents the impact of clearcutting (where whole sections of forest are cut to the ground and then replanted). For comparison, a natural gas power plant emits about 360 kg CO_2e/MWh at its smokestack.[20]

Leftover Woody Materials Release Carbon as They Decay

After harvesting wood, there are treetops, limbs, and other woody materials left behind; these materials are known as "slash." As slash decays, it breaks down just like a compost pile. Slash returns important nutrients to the forest soils, but most of the carbon ends up back in the atmosphere. Our model found that the slash from harvesting wood to generate 1 megawatt-hour at a standalone biopower plant releases about 150 kg CO_2e.

Drying, Processing, and Transporting Pellets Takes Energy—and Emits CO_2

Wood must be dried before it can be processed into pellets. Just like drying your laundry, drying out this wood requires heat, and making that heat generates significant emissions. Even if the heat comes from burning some of the wood, these are emissions that can't be captured by CCS. Our model found that this step in the supply chain can generate about 206 kg CO_2e/MWh.

In addition to drying, wood needs to be transported to the processing site, ground and compressed into pellets, and then shipped, in our scenario across the Atlantic. All of these steps require the use of heavy machinery, trucks, and ships—all typically run on fossil fuels. These steps alone can generate about 102 kg CO_2e/MWh.

CCS Technology Takes Energy and Does Not Capture Everything at the Smokestack

While the focus of our model is on the uncapturable emissions associated with the bioenergy supply chain, it is important to note that carbon capture and storage technology both requires additional energy and does not have a 100 percent capture rate. Carbon capture technology is still fairly new. Current capture rates stand at around 90 percent, and the literature suggests that it will improve to only about 95 percent once the technology is mature.[21]

At the same time, capturing carbon from flue gas requires extra energy at the power plant.[22] This is especially true if capture technology is bolted on to an existing power plant (as is the case with most current plants) instead of integrated into the plant's design.[23] Our model assumes that adding CCS requires about 29 percent more energy, which is a midpoint between bolting on and integrating capture

© Courtesy of Drax

technology. This means burning more pellets and producing more of the uncapturable emissions discussed above. When considering the additional energy required for CCS technology, combined with the 95 percent capture rate, our study found that generating 1 megawatt-hour at a BECCS power plant leads to 779 kg CO_2e. As noted earlier, this is alarmingly close to the amount of pollution that a coal plant emits.

CONCLUSION

Our modeling shows that employing BECCS at a power station like the one operated by Drax, while relying on the biomass supply chains similar to what Drax predominantly relies on today, will make the climate crisis worse for decades to come. It is possible that burning other types of biomass would be less harmful, but this approach to BECCS isn't even close to carbon neutral, let alone carbon negative.

And there is no reason to think the situation is about to change. In fact, Drax is locking in its import supply chains. The company recently purchased Pinnacle Renewable Energy in Canada, the second-largest producer of industrial wood pellets in the world, and now has ownership interests in 17 other pellet plants and development projects across the United States and Canada.[24] This makes Drax not only the operator of the largest wood-burning power station in the world, but a top pellet manufacturer, with interests in expanding global markets for bioenergy.

What's more, this analysis doesn't take into account other challenges to BECCS. Assuming a carbon-negative approach to BECCS could be found, the amount of land that would need to be dedicated to biomass production would be enormous to meet the expansive visions some have for the technology. The integrated assessment models used by the IPCC for BECCS focus disproportionately on low-carbon energy crops and agricultural residues, they assume ambitious increases in available land and agricultural yields to furnish liquid biofuels, and many treat these feedstocks and end uses as carbon neutral.[25,26,27] Even with their underestimations, the IPCC models that include BECCS

in the pathway for limiting global warming to 1.5 degrees Celsius require up to 0.8 billion hectares of land.[28] That's equal to about 16 percent of the land currently used for agriculture worldwide; devoting that much land to biomass production risks major impacts on freshwater supplies, wildlife habitat, and food security.[29]

Furthermore, burning wood—just like burning fossil fuels—produces a host of local and regional air pollutants that cause an array of health harms, from asthma attacks to cancer to heart attacks, resulting in hospital visits and premature deaths.[30] These can be reduced through pollution controls but not eliminated.

Finally in addition to the terrifying land implications of deploying BECCS at scale and the public health threat from burning wood, there is the financial cost of BECCS. Drax is seeking tens of billions of pounds in subsidies from the U.K. government to try to make BECCS work. A recent estimate suggests that a proposed BECCS plant at the Drax power station will require a total £31.7 billion ($42.9 billion) in subsidies over 25 years.[31]

The bottom line is that policymakers around the world should not bet on BECCS. Any program to subsidize BECCS at Drax or elsewhere using supply chains similar to the one modeled here will be ineffective in drawing down emissions, risk significant harm to nature, and divert public resources that would be better invested elsewhere. Instead, policies and public dollars should be invested in proven options, such as energy efficiency, non-emitting renewables such as wind and solar, and protecting existing forests and growing more of them.

METHODOLOGY

Our analysis is intended to inform policy decisions, not to estimate emissions from specific power plants. To this end, the model we commissioned is heuristic and available to the public. While it has the capacity to look at a range of feedstocks, we have set the inputs to assess both the thinning and the clearcutting of southeastern loblolly pine plantations to generate the wood to produce pellets for electricity.

While the model looks just at the results for a BECCS power plant, we have broken out the results into those for a standalone biopower plant and then a BECCS plant.[32] This highlights the fact that uncapturable emissions are very much a concern for standalone biopower too. This methodology section lays out how we used the results from the model to calculate the emissions presented above.

Forest Emissions

To calculate forest-related emissions, we needed to decide what type of forests to model. Drax reports getting a majority of its pellets from the U.S. South; of that, roughly one-quarter comes from thinnings and 38 percent from "low-grade round wood." (Most of the remainder of the feedstocks are mill residues that don't result in any forgone sequestration.[33]) This categorization is unclear, as thinning is a harvest practice and low-grade round wood is a class of timber. The alternative to thinning in a plantation is clearcutting. To understand the policy implications of building BECCS around similar sourcing, we first assumed that both thinnings and low-grade round wood are coming from loblolly pine plantations and then looked at the two different harvest practices. For this type of southeastern forest, thinning would generate forgone sequestration equal to 68 kg CO_2e/MWh, and clearcutting would generate 370 kg CO_2e/MWh.[34] If we assume that the low-grade round wood comes from thinning, we get 63 percent of the feedstock causing thinning-level forgone sequestration, with no further forgone sequestration from the balance of feedstock. This sets a lower limit of 43 kg CO_2e/MWh of forgone sequestration. On the other hand, if we assume the low-grade round wood comes from clearcutting and weight the forgone sequestration accordingly, we get 157 kg CO_2e/MWh. We have used the midpoint, 100 kg CO_2e/MWh, as the nominal value.

The other source of forest emissions that must be accounted for is the decay of the slash—the tops and limbs left in the forest after thinning or clearcutting. These are important for a healthy, nutrient-rich soil, but some are taken to be burned to dry the wood that will be turned into pellets. Per our model, decay of the remaining slash results in 147–331 kg CO_2e/MWh for loblolly pine and is the same for thinning and for clearcutting.[35] Applying this to 63 percent of the feedstock to mirror Drax's mix, we have emissions of 93–208 kg CO_2e/MWh and a midpoint nominal value of 150 kg CO_2e/MWh.

Pellet Drying, Processing, and Transportation

To look at forest biomass fueling power plants in the United Kingdom, we need to add the emissions associated with pelletizing and transporting pellets to the outputs from our model. Estimates for transport and processing emissions range from 109 to 160 kg CO_2e/MWh.[36] Recent reporting from Drax for processing and transport estimates these emissions at 109 kg CO_2e/MWh, which includes 7 kg CO_2e/MWh of emissions resulting from energy used to dry the wood in advance of pellet production.[37] Because our model has generated a separate estimate for emissions from drying (below), we have adjusted Drax's reported value to 102 kgCO_2e/MWh to reflect transport/processing absent drying and to avoid double counting.[38]

Drying wood in advance of pellet production generates significant emissions. At harvest, a pine bole's mass can be over half water by weight.[39] This means that for every pound of oven-dry wood, green wood can hold more than a pound of water. Feedstock for a wood pellet plant, however, is limited to a moisture content of approximately 12 percent or less to manufacture finished wood pellets with a 7 percent moisture content.[40] For loblolly pine, our model, which is based on a review of the industry literature, generated estimates of pellet manufacturing drying emissions ranging from 190 to 222 kg CO_2e/MWh, and we use the midpoint, 206 kg CO_2e/MWh, as a nominal value.[41]

Carbon Capture and Storage

As explained earlier, capturing carbon from flue gas requires extra energy, known as parasitic load, and capture technology is does not capture all the CO_2.[42] Using capture technology bolted on to an existing power plant is generally assumed to require more energy than capture technology integrated into the power plant's design.[43] We use our assumptions around bolt-on CCS technology to set our high parasitic load value and estimates from the literature for integrated design to set our low value. Our consultant surveyed published literature to discover that estimates of parasitic load for both approaches ranged widely, increasing the power plant's fuel demand by 15 percent to 43 percent. Because assessing this aspect of CCS technology is not our focus here, we simply chose the midpoint of this range, 29 percent, as our nominal value. This extra energy consumption at the power plant means more forests clearcut or thinned; more forgone sequestration; more slash decay; and more pellet drying, processing, and transporting. Adding up the extra uncapturable emissions from the fuel needed to meet the parasitic load, we get 162 kg CO_2e/MWh. Furthermore, when this fuel is burned, there are more emissions at the stack—about 268 kg CO_2e/MWh.[44]

The efficiency of carbon capture technology is also a function of technological maturity. Current capture rates are around 90 percent, and the literature suggests that it will improve to about 95 percent once the technology is mature.[45] We use the more favorable assumption for CCS and use 95 percent as our nominal value for capture efficiency.

Adding Up the Emissions From BECCS

Once the forest is cut and the pellets are made and shipped across the ocean, they are burned in a power plant. The top 10 percent of coal power plants in the United States have an average efficiency of about 37.6 percent.[46] We use this efficiency to model a biopower plant without CCS. Meanwhile, all the carbon contained within the pellets is emitted from the stack. This results in a release of about 923 kg CO_2e/MWh into the atmosphere.[47] These are the stack emissions just for biopower without CCS.

If we add up the emissions for a simple biomass-fueled power plant, we have 559 kg CO_2e/MWh of uncapturable emissions plus 923 kg CO_2e/MWh at the stack for a total of 1,481 kg CO_2e/MWh. Again, these are just the emissions for biopower without CCS.

When we add emissions associated with meeting the parasitic load, we get 162 kg CO_2e/MWh extra uncapturable emissions and 268 kg CO_2e/MWh extra stack emissions. With a 95 percent capture efficiency, 1,131 kg CO_2e/MWh are stored. As is summarized in Figure 2, this leaves BECCS responsible for an increase in pollution of 779 kg CO_2e/MWh.

For reference, the stack emissions of a combined-cycle combustion turbine plant burning natural gas at 50 percent thermal efficiency are 360 kg CO_2e/MWh, and the U.S. national average grid emission rate is 430 kg CO_2e/MWh.[48] In Europe, U.K. grid emissions average 233 kg CO_2e/MWh and E.U. grid emissions average 255 kg CO_2e/MWh.[49]

2 See for example: Drax Group, *Supporting the Deployment of Bioenergy Carbon Capture and Storage (BECCS) in the UK: Business Model Options,* April 2021, https://www.drax.com/carbon-capture/supporting-the-deployment-of-bioenergy-carbon-capture-and-storage-beccs-in-the-uk-business-model-options/.

3 The integrated assessment models used in the IPCC's most recent pathways report relied almost exclusively on afforestation, reforestation, and BECCS. (See Chapter 2.3.4.) Only 2 of the 21 IAMs also explicitly modeled direct air capture of C02. (See Table 2.SM.6.) The report notes that while other forms of carbon dioxide removal have been added to IAMs since the AR5, BECCS is still heavily favored by the models despite BECCS being deployed beyond the world's capacity and other options offering a range of co-benefits. 16 It is tempting to argue that since plantations are grown for merchantable wood, they would be cut down anyway and thus there is no forgone sequestration. There are two reasons this is wrong. First, bioenergy adds marginal demand maintaining or increasing the land area managed, meaning foregone sequestration happens directly or indirectly. Second, in the context of evaluating a climate policy, the alternative should be the best use of the land, which means cutting down a forest comes with the cost of foregone sequestration.

17 This process is known as "release." Release is a forest stand's growth response to the removal of trees (in this case, thinning) that compete for nutrients and sunlight. Maryland Deptartment of Natural Resources, *Glossary of Forest Terms*, accessed September 23, 2021, https://dnr.maryland.gov/forests/Pages/gloss.aspx.

Arkansas_98713/.

25 According to the IPCC, their Integrated Assessment Models (IAMs) assume bioenergy is supplied mostly from second generation biomass feedstocks such as dedicated cellulosic crops (for example Miscanthus or poplar) as well as agricultural and forest residues, with forest residues a relatively very small component. IPCC, *Global Warming of 1.5 °C; Chapter 2,* pg 124.

26 In the IPCC assessments, BECCS is not limited to the power sector, with IAMs projecting on average at least 60 percent of primary energy from BECCS going to liquid biofuels. See Mathilde Fajardy et al., *BECCS Deployment: A Reality Check*, Imperial College of London, Grantham Institute, Briefing Paper No 28, January 2019, 3. https://www.imperial.ac.uk/media/imperial-college/grantham-institute/public/publications/briefing-papers/BECCS-deployment---a-reality-check.pdf.

27 Almost all of the IAMs used by the IPCC assume that the feedstocks and/or end uses as carbon neutral; See, Isabela Butnar et al., "A Deep Dive Into the Modelling Assumptions for Biomass with Carbon Capture and Storage (BECCS): A Transparency Exercise," *Environmental Research Letters*, July, 2020, 7, https://iopscience.iop.org/article/10.1088/1748-9326/ab5c3e/pdf; Duncan Brack and Richard King, "Net Zero and Beyond: What Role for Bioenergy with Carbon Capture and Storage?", Chatham House, Research Paper 29, January 2020, https://www.chathamhouse.org/2020/01/net-zero-and-beyond-what-role-bioenergy-carbon-capture-and-storage-0/beccs-carbon-negative.

32 Please see the supplemental materials for detailed calculations.

33 See, for example, Drax Group, *Annual Report and Accounts 2020*; Drax reports the proportion of feedstocks in its U.S. supply from "mill waste" (35 percent), "branches and tops" (2 percent), "thinnings" (25 percent) and "low grade roundwood" (38 percent).

34 Based on the tCO2e/mmBtu for 20-year foregone sequestration in Technical Appendix (Table 6) converted to an output basis assuming a heat rate of 9.08mmBtu/MWh for a stand-alone biopower plant with no CCS. See pp. 17–18 of the Technical Appendix and supplemental materials; note that this heat rate is aggressive for a solid fuel power plant.

35 See endnote 27.

36 Duncan Brack, *Woody Biomass for Power and Heat: Impacts on the Global Climate* (2017), Chatham House, https://www.chathamhouse.org/sites/default/files/publications/research/2017-02-23-woody-biomass-global-climate-brack-final2.pdf ; Mary Booth, "New UK Biomass Policy Removes Subsidies For High-Carbon Wood Pellets," Partnership for Policy Integrity, (2018); Drax Group, "Biomass Supply Chain Emissions," accessed TK, https://www.drax.com/sustainability/sustainable-bioenergy/sourcing-sustainable-biomass/.

37 Drax's estimates of supply chain emissions report 7 kg CO2/MWh. This represents only 3 percent of drying energy needs based on our estimate of 237 kg CO2/MWh. They have claimed the majority of their drying emissions are zero, based on the false assertion that these "biogenic" sources (such as logging slash) produce no emissions. See Drax Group, *Annual Report and Accounts 2020;* and Drax Group, "The Biomass Carbon Calculator," accessed September 26, 2021, https://www.drax.com/sustainability/sustainable-bioenergy/the-biomass-carbon-calculator/.

38 Note that Drax has reported this for a stand-alone biopower plant; so, we don't need to adjust for CCS.

39 U.S. Department of Agriculture, Forest Products Laboratory, *Wood Handbook: Wood as an Engineering Material*, General Technical Report FPL–GTR–190, April 2010, https://www.fpl.fs.fed.us/documnts/fplgtr/fpl_gtr190.pdf.

40 Jaya Shankar Tumuluru et al., "A Review of Biomass Densification Systems to Develop Uniform Feedstock Commodities for Bioenergy Application," *Biofuels, Bioproducts and Biorefining* 5, no. 6 (October 6, 2011): 683–707, https://doi.org/10.1002/bbb.324.

41 See endnote 27.

42 Hammerschlag, *Uncaptured Biogenic Emissions*, 16–18.

43 Pfaff et al., "Optimized Integration of Post-Combustion CO2 Capture Process."

44 For both the extra uncapturable emissions and the extra stack emissions, we calculate 29 percent of the stand-alone biopower plant emissions in these categories. This means we are reporting emissions on a MWh output-to-the-grid basis.

45 Hammerschlag, *Uncaptured Biogenic Emissions*, 16.

46 On a higher heating value (HHV) basis. Hammerschlag, *Uncaptured Biogenic Emissions*, 17-18.

47 Per our model (see rows 'Tables C1-C4'!110:129), loblolly pine has an emissions rate of 0.1016 tCO2e/mmBtu. Converting this to an output-to-the-grid basis at 9.08mmBtu/MWh results in emissions of 923 kg CO2e/MWh.

48 U.S. EPA, "eGRID Summary Tables 2018."

1 INTRODUCTION

The use of solid biofuels i.e. wood pellets and briquettes has increased significantly during the last 15 years. Biomass briquettes are mainly used by small scale consumer's i.e. private households while biomass pellets are used both within the private sector and for commercial heat and power production in large scale, industrial plants. During the past 10 years wood pellets have become an important energy carrier to substitute coal in the Danish energy sector. Today most pellets used in Denmark are produced abroad and shipped to Denmark in large container vessels where they are used as fuel in combined heat and power plants (CHP-plants), for district heating and small scale pellet boilers. The pellet consumption in Denmark is expected to increase strongly within the next 10 years and it is therefore necessary to provide a guideline for secure handling of solid biofuels. Recently different guidelines have been published by the Association of German Engineers [1], German pellets institute [2] or the Nordic Innovation Centre [3] dealing with safe handling and storage of solid biofuels. Safety considerations of biomass handling have been picked up in several journal articles and books dealing with solid biofuels [4-11].
A number of serious incidents have been reported across Europe in connection with false handling of wood pellets. Some of them have resulted in injury or even death of the handling personnel and some resulted in great damage and financial loss for the companies handling the pellets. Table 1 provides examples of accidents in relation with handling and storage of solid biofuels during the last 10 years. Most people consider wood materials as harmless, natural products and underestimate the risk potential, especially when storing it in closed compartments i.e. silo, storage room or transport vessels.

Table 1: Examples of accidents related to the storage and transportation of solid biofuels [4]

Year	Place	Accident
2002	Rotterdam	A ship loader on board of the "Weaver Arrow" loaded with wood pellets went down in the storage compartment and suffocated
2005	Gruvön	A seaman suffocated on board of the wood freighter "Eken" when he went down the stairs to the cargo room that was filled with pulpwood.
2006	Helsingborg	A seaman on board of the "Saga Spray" suffocated when he went down the stairs to the storage compartment filled with wood pellets. A ship loader and a rescue team rushing for assistance got severely injured
2006	Skelleftehamn	A seaman on board of the "Noren" died when he entered a storage compartment filled with wood chips
2007	Timrå	The captain and one seamen of the wood freighter "Fembria" died when they walked in the storage compartment filled with timber wood.
2007	Finland	A person died when walking into a small (10 t) wood pellets silo.
2008	Finland	Another person died when walking into a small (10 t) wood pellets silo.
2009	Bornholm	Two seaman on board of the "Amirante" died when they entered the cargo room filled with wood pellets. The pellets were loaded one day before.
2010	Germany	A person suffocated in a pellet storage (150 t)
2010	Ireland	A person suffocated in a pellet storage (7 t)
2011	Switzerland	A person suffocated in a pellet storage (100 t)

2 SCOPE

The intention of this guideline is to provide recommendations for the handling of solid biofuels in a responsible and safe way, minimizing risks for health and safety. The guideline is addressing both large and small scale producers, transporters and end users of solid biofuels. Focus is set on wood pellets and wood chips since they are by far the most common type of solid biofuels in Denmark.

3 TERMINOLOGY AND DEFINITIONS

Terms and terminology of this guideline apply as given in EN 14588. Specifications of different types of solid biofuels are defined according to EN 14961-1

4 SOLID BIOFUELS

Solid biofuels cover a wide range of sizes and shapes from wood pellets to straw bales. Solid biofuels and their typical dimensions and preparation method are specified in the European standard EN 14961 as shown in Table 2.

Table 2. Major trade form of solid biofuels according to EN 14961-1 [1]

Name	Typical particle size	Preparation
Whole tree	> 500 mm	No preparation or delimbing
Wood chips	5 to 100 mm	Cutting with sharp tools
Hog fuel	undefined	Crushing with blunt tools
Log wood/firewood	100 to 1000 mm	Cutting with sharp tools
Bark	undefined	Debarking residues from trees, can be crushed, shredded or unshredded
Bundle	undefined	Lengthwise oriented & bound
Fuel powder	< 1 mm	Milling
Sawdust	1 to 5 mm	Cutting with sharp tools
Shavings	1 to 30 mm	Planning with sharp tools
Briquettes	Diameter > 25 mm	Mechanical compression
Pellets	Diameter < 25 mm	Mechanical compression
Small square bales	0.1 m^3	Compressed and bound to cubes
Big square bales	3.7 m^3	Compressed and bound to cubes
Round bales	2.1 m^3	Compressed and bound to cylinders
Chopped straw or energy grass	10 to 200 mm	Chopped during harvesting or before combustion
Grain or seed	undefined	No preparation or drying except for process operations necessary for storage
Shells and fruit stones	5 to 15 mm	No preparation or pressing and extraction by chemicals
Fiber cake	undefined	Prepared from fibrous waste by dewatering

5 GENERAL RISK EVALUATION OF BIOMASS HANDLING AND STORAGE

Major problems that can arise when handling large amounts of biomass are connected to dust formation, off gassing, self-heating and biological hazards. The quality of biomass is subject of large variation and depending on biomass origin, size, shape, composition and moisture content different problems can occur during handling and storage. The most common problems are summarized in the following section:

5.1 Self-heating and self-ignition

Self-heating of biomass can occur either by chemical oxidation reactions and/or microbiological decay. The more fresh the biomass and the higher the moisture content the greater is the risk for self-heating and potential self-ignition. Self-heating of biomass is a serious problem and has been cause of several incidents.
Oxidation reactions require oxygen and the oxidation rate of the biomass seems to depend on the age of the biomass and generally decreases with storage time. The reactions go along with oxygen depletion which is a potential risk for pellet handling personal. The mechanism behind the oxidation reactions are not completely understood but it is likely connected to the biomass extractives. Heat development due to microbiological decay is to large extent depending on the moisture content and the surface area [5].

There are some general recommendations to avoid self-heating and self-ignition of biomass. According to Obernberger and Thek they can be summarized as follows [5]:

- Avoid storage and transport of large volumes if the fuel's tendency for self-heating is unknown
- Be conscious of the risk of self-heating and spontaneous ignition in large storage volumes
- Avoid mixing of different types of biomass fuels in one storage
- Avoid mixing of biomass fuels with different moisture content
- Avoid large parts of fines in the fuel bulk
- Measure and monitor the distribution temperature and gas composition within the stored material
- Prepare (large) silos for gas injection at the bottom of the silo in case a fir should occur
- Pellet storage units must be equipped with size dependent, appropriate means of ventilation control to remove carbon monoxide and carbon dioxide

In case a fire occurs it has to be noted that fire fighting procedures are difficult since water cannot be used in many cases, especially when pellets are stored in a silo. Pellets absorb moisture quickly and swell to about 3 to 4 times of their size, forming a cake like structure that can become very hard and is difficult to remove from the silo. The pellet expansion can in worst case result in a burst and collapse of the pellet silo. Self-heating occurs usually deep inside the bulk and the fire source is therefore difficult to reach.
Gases such as nitrogen and carbon dioxide and foams are usually the methods of choice to extinguish fires in pellet silos. Fire fighting operations, especially in large silos can be very complex and expensive operations. The technical research institute of Sweden (SP Sveriges Tekniska Forskningsinstitut) has published methods for extinguishing fires in wood pellet silos [17,18].

5.2 Off-gas formation and oxygen depletion

Biomass releases CO and CO_2 and oxygen is consumed in chemical oxidation processes and microbiological processes. CO and CO_2 are odourless toxins and can be lethal at low concentrations. Low oxygen concentrations can lead to suffocation of the handling personal when entering closed biomass storage without proper ventilation. Several death cases have been reported in connection with wood pellet storages during the last years both in large silos and container vessels but also in relatively small pellet storage in private homes. A closed biomass storage i.e. pellet storage room should never be entered before it has been ventilated with fresh air. CO and CO_2 are heavier then air and will accumulate at higher concentrations at the bottom of the storage. Furthermore does biomass contains various different volatile organic compounds (VOCs) i.e. terpenes and terpenoids, esters, ethers and aldehydes. A lot of these VOCs can evaporate from the wood and in some cases they might accumulate in concentrations that may cause a health and safety hazard.

5.3 Dust formation

Handling of biomass can liberate significant amounts of dust. Especially dry biomass particles have often a low density and a high drag coefficient and can easily be dispersed in the air. Airborne dust particles pose a great risk to anyone coming into contact with them, mainly through inhalation. Dust can have different impacts on health, but the main effects of biomass dust are on the lungs and the respiratory system. The inhalation of an excessive amount of dust particles can result in irritation of the lungs, nasal and respiratory system. It can give raise to allergic reactions and severe illness such as cancer when exposed repeatedly over a longer period of time. Apart from that dust can irritate the eyes, causing sourness and conjunctivitis. There are clear limitations for dust exposure of working personal on national and international level. For Denmark the Danish Working Environment Authority (Arbejdstilsynet) can be contacted for further information.

The second great risk connected to biomass dust is the risk for dust explosion. Dust has a very large surface area compared to its mass. Ignition of biomass can only occur at the interphase between biomass and air and this causes dust to be much more flammable then bulk material. Depending on biomass type, size and shape of the particles, explosive suspensions can be formed at different mass to oxygen ratios. Those explosive mixtures can be ignited by electrostatic discharges, friction or hot surfaces and can result in fatal damage. There are strict regulations in place to prevent dust explosion accidents. In some cases it might be necessary to classify biomass handling processes according to the ATEX directive. For Denmark the Danish Technological Institute (Teknologisk Institut) can be contacted for further information and help regarding risk evaluation and safety procedures. Table 3 shows an example of the ignition/explosion properties of dust from wood pellets (white dust), bark pellets, coal and a fungi and the used testing standard [5]. The pellet handbook from Obernberger and Thek [5] should be consulted for further reading.

Table 3. Ignition and explosion properties of dust from wood pellets (white dust), bark pellets, coal and a fungi. Data taken from Obernberger and Thek [5].

Test mode	Test parameter (dust < 63 µm)	Unit	White dust	Bark dust	Coal dust	Lycopodium spores	Testing standards
Dust cloud	Auto-ignition Temp (T_C) (Godbert-Greenwald)	°C	450	450	585	430	ASTM E1491
	Min Ignition Energy (MIE)	mJ	17	17	110	17	ASTM E2019
	Max Explosion Pressure (P_{max})	bar	8.1	8.4	7.3	7.4	ASTM E1226
	Min Explosion Pressure Rate (dP/dt_{max})	bar/s	537	595	426	511	ASTM E1226
	Deflagration Index (K_{St})	bar.m/s	146	162	124	139	ASTM E1226
	Min Explosible Concentration (MEC)	g/m³	70	70	65	30	ASTM E1515
	Limiting Oxygen Concentration (LOC)	%	10.5	10.5	12.5	14.0	ASTM E1515 mod
Dust layer	Hot Surface Ignition Temp (5 mm) (T_s)	°C	300	310			ASTM E2021
	Hot Surface Ignition Temp (19 mm) (T_s)	°C	260	250			ASTM E2021
	Auto-ignition Temp (T_L)	°C	[illegible]	[illegible]			[illegible]
	Dust Class (> 0 to 200 bar.m/s)		St 1	St 1	St 1	St 1	[illegible]
	Dust Class (Explosion Severity (ES > 0.5))		Class II	Class II			OSHA CPL 03-00-06

5.4 Biological hazards

Biomass is a natural product and as such a potential feedstock for different types of microorganisms i.e. fungi and bacteria. The risk of microbiological decay of the biomass depends on the biomass properties i.e. size and composition, moisture content and temperature. The major source of decay is caused by fungal infections. Fungi can digest the biomass and form large colonies commonly known as mould. Fungi produce toxins when growing on biomass i.e. mycotoxines and they can be released as dust into the air. Airborne fungal spores and toxins can cause irritations and allergic reactions along the respiratory system. Inhalation and direct contact should be avoided.

6 HANDLING OF WOOD PELLETS

Large amounts of wood pellets are transported by land and sea way, and the intercontinental trade of wood pellets is likely to increase by factor 10 within the next decade. It is therefore important to look on the overall risks involved in handling wood pellets. Mechanical forces during transportation of pellets cause fractures and breakage of the pellets, resulting in fines and dust. Although there are high quality standards (i.e. EN 14961-1) ensuring that pellet producers produce pellets with a high strength and abrasion resistance this problem cannot be eliminated completely. Especially pellets used in large scale applications such as heat and power plants are usually not following those standards. In those cases the quality standards are often agreed directly between the pellet producer and the large scale consumer. The mechanical durability of wood pellets is usually determined in a tumbler, simulating the impact forces that pellets experience during transportation. A standardized method exists to measure pellet durability, and this can be consulted for further reading (EN 15210-1).

To prevent the formation of fines and dust, handling should be as gentle as possible. The more handling steps the more degradation of the pellet. Important factors for handling are the drop height, elasticity of the impact surface and the number of times the pellets are dropped. Pellet degradation is a function of number of impacts and impact force (i.e. drop height) and they should be limited to a minimum to prevent dust and fines formation. There are many different ways of transporting pellets. The most common ways to move pellets from/to storage and transportation vessels are conveying and vacuum pumping. Especially large scale bulk handling of pellets exposes high mechanical load onto the pellets. This can be the case when loading pellets into an ocean vessel or into a large pellet silo at the producer/consumer site. Drop height are usually high (up to 25 m and more). It also has to be considered that pellets drop on each other and that a high weight load is exposed to the pellets lying in the bottom of the vessel/silo.

Pellet abrasion and dust formation takes place along the whole supply chain of the wood pellets from the pellet mill to the customer. Fines and dust formation during handling can occur during all of the steps during the supply chain. The most prominent ones are listed below:

- Conveying the pellets from the pellet plant to storage
- Packing of pellets i.e. big bags
- Conveying to transport vehicle
- Filling transport vehicle
- Discharge transport vehicle
- Conveying to another transport vehicle or to storage
- Filling into storage

Pellets are usually conveyed or transported by pneumatic pumps. The latter one might do severe damage to the pellets when the pressure (velocity of the pellets) is too high and if there are sharp turns in the transport pipe or potential impact sites for the pellets.

Pellet transport can take place either in trucks, trains or ships depending on the transport distance. Trucks are usually used to bridge short distances while trains are used for longer distance. Ship are used to transport large amounts of pellets either directly to the end customer or to a harbor were the pellets are unloaded and distributed to smaller transport vessels. A lot of large scale users are located close to the water so they can receive pellets by ship.

6.1 Loading and transport (in closed vessel)

Large volumes of pellets from oversea are transported in ocean vessels. Especially on the trans-Atlantic route from Northern America to Europe bulk carriers are used. The size varies and is usually ranging from 1.500 to 50.000 deadweight tons (dwt) [5]. During shipping the pellets are kept dry under hatch covers with tight seals. To avoid the penetration of moisture into the storage compartment, ventilation is usually turned off. The storage of large amounts of pellets in a closed compartment on a ship is similar to the risk in a pellet silo and the same safety measures should be taken (see chapter 7).Trucks are a used to transport small amount of pellets (up to 40 tons) to small scale customers. Pellets are loaded either as bulk or in bags. Bulk trucks are sometimes equipped with vacuum pump systems that allow pumping of the pellets and thus a comfortable way to transfer the pellets to a storage compartment. Rail cars and containers are also used for transport if available

6.2 Unloading and internal handling

During receiving and internal operations, the risk of dust generation, ignition and explosion should be minimized. Special precautions should be taken to avoid increase of fines and wear during unloading and receiving pellets. The precautions generally should focus on avoiding over-heated or burning loads, spark detecting and fire extinction systems.

6.3 Conveying

Conveying shall be conducted with a minimum of wear and damage to the solid biofuel. Fuel pellets, in particular, are very sensitive to physical wear and shall be handled with care. Precautions shall be taken to avoid moisture uptake in pellets. Minimal length of belt conveyor line should be applied and many crossings and high drops should be avoided, which raise the content of fines in a batch of pellets.

7 STORAGE OF SOLID BIOFUELS

Due to seasonal fluctuations with periods of high demand (winter) and periods with moderate or low demand (summer months) pellet producers and intermediate traders need large storage space. Also consumers i.e. heat and power producers have a high demand for securing their energy supply and thus keep storage big enough to be able to deal with unforeseen bottlenecks and shortages of supply. Wood pellets are sensitive to moisture uptake and when exposed to rain they swell and lose their pellet structure. High moisture content also promotes microbiological decay and this can result in dangerous conditions such as self-heating and self-ignition. Wood pellets are therefore always stored indoors, either in flat storages i.e. frames, storage halls or in silos. Indoor storage of biomass is a challenge with respect to self-heating of the biomass, dust formation and off-gassing of the biomass. A range of safety measures have to be taken to grant safety. Recent accidents have shown that improper handling of biomass can result in severe damages and risk for life and health of handling personnel.

7.1 Storage types

7.1.1 Silo

Silo storage is the most common way of storing pellets at power plants, pellet producers and harbors. Silos are consuming less space as storage halls and can be filled and emptied easily using screw conveyors. The size of the silo depends on its function. Large silos with several thousand cubic meter volumes are common as intermediate storage at harbors or at large scale pellet consumers. From there pellets are distributed to transport vessels, or feeding bins.

Large scale silos can be different in size and shape depending on the function and construction year. Typically older silos that have previously been used for agricultural products are high and have a small diameter. Newer silos that have been designed and built from wood pellets storage usually have a larger diameter compared to their height. In general there are two different types of pellet silos, silos with a tapered bottom and silos with a flat bottom.
Vertical silos with a tapered bottom can be emptied by gravity using a discharge tunnel and a conveyor. These type of silos are widely used to store agricultural products i.e. grains and are to some extend also used for pellet storage. Agricultural silos usually range from 50 to 10.000 m^3. Dark colors and corrugated metal should be avoided since they increase heat absorption and lower heat transfer. Vertical silos with a flat bottom are emptied using a circulating auger for center feed to a discharge tunnel. They require less space due to their flat bottom and are therefore cheaper to build. However do they require more maintenance and take longer time to empty.

7.1.2 Flat storage

Flat storage building i.e. A-frames, are used for bulk storage of pellets and are used for large storage of pellets in a range from 15.000 to 100.000 m^3. They are used at the pellet producer's site, for intermediate storage at harbors and at the end users i.e. power plant site. Pellets are conveyed into the building and dropped down onto the floor forming a pile and/or moved by front loaders onto a pile. Emptying of this kind of storage is made by front loaders either into a feed system for a boiler (power plant site) or onto trucks, vessels or rail cars for further transportation. Especially moving pellets with a front loader bears the risk for fines and dust formation and as such a risk for health and dust explosion.

7.2 Self-heating and ignition risk

Fires in wood pellet silos due to self-heating are not uncommon and several incidents have been reported during the last years. Also dust explosion incidents have been reported from several plants and facilities handling wood pellets. Fires and explosions can occur along the whole supply chain of wood pellet production and delivery and can take place in the production plant, transport vessel, transfer facilities and at the consumer site. However fires and explosions are not known to be a problem in the bagged pellets marked [5].

The sources of ignition can either be externally from sparks generated by metal pieces or stones coming in contact with the biomass or by overheating of motors, conveyer belts, bearings due to high friction. An accumulation of dust and fines due to improper maintenance and cleaning can increase the risk of fires and dust explosions. Measure to reduce these risk are control measures to remove impurities i.e. stones and metal from the biomass, spark and heat detectors along the transport conveyors, extinguishing systems and fixed control schemes for checking the state of the conveyor belts and bearings to prevent overheating and removal of dust and other debris. The utilization of antistatic and fire resistant material as well as proper grounding of the transport conveyors can reduce the risk of external ignition too.

Pellets in a closed storage environment can heat up due to microbiological and/or chemical reactions. The bulk mass act as insulation and therefore heat is usually built up deep inside the bulk. Microbiological decay requires moisture and it is therefore usually a problem occurring when the moisture content of the biomass is too high or in case of water (rain) coming in contact with the biomass. Microbial decay results in a temperature increase in the stored fuel and peak temperatures of microbial self-heating can be up to 80 °C depending on the type of microorganism [19]. Chemical degradation usually starts to have influence at about 40 °C and at temperatures above 50 °C chemical degradation reactions will exceed the biological ones [19]. Due to poor heat transfer within the bulk mass and the insulating properties of biomass, heat is accumulated inside the bulks that can result in self ignition. The main factors affecting the temperature in a pellet silo are the ambient temperature, moisture content, moisture gradients, size of the bulk and density.

7.3 Monitoring of temperature, off-gasses and moisture

Temperature in a pellet silo should be monitored continuously by sensors embedded in the stored product. An alternative and/or addition to direct temperature measurement can be equipment sensing carbon monoxide, hydrocarbons, radiated heat and smoke as precursors for overheating [5]. Even at low temperatures low temperature oxidation of pellets will result I the formation of carbon dioxide, carbon monoxide, aldehydes and methane and these gasses will deplete the oxygen in the silo. One option to cool and ventilate a pellet silo at the same time is to ventilate a storage silo whenever the ambient outside temperature is lower than the temperature inside the storage. In case of too high temperatures (> 80 °C) emergency procedures should be in place. This could be emergency discharge of the pellets by relocating them into a different storage or outside and thus breaking up the hotspots and cool the pellet bulk. In general the temperature in a pellet silo should be kept below 45 °C.

7.4 Safety measures for handling personnel

Gasses formed in a close pellet silo are a threat for the life of handling personnel and therefore measures should be taken to avoid contact with handling personnel. This can be done by ventilation systems, gas monitoring, warning signs and strict working procedures when opening and entering a pellet silo.

CLIMATE

Are wood pellets a green fuel?

A return to firewood is bad for forests and for the climate

By **William H. Schlesinger**

James Watt's steam engine vaulted coal to its major role as a fuel for the Industrial Revolution. Today, about 40% of the world's electricity is generated in coal-fired power plants, consuming more than 80% of the coal mined each year. Because combustion of coal produces carbon dioxide (CO_2) and other air pollutants, efforts to combat climate change have now turned to seeking alternatives to coal. Natural gas is cleaner and less expensive but, like coal, returns fossil carbon to the atmosphere. Recently, attention has focused on woody biomass—a return to firewood—to generate electricity. Trees remove CO_2 from the atmosphere, and burning wood returns it. But recent evidence shows that the use of wood as fuel is likely to result in net CO_2 emissions and may endanger forest biodiversity.

In recent years, ~7 million metric tons of wood pellets per year have been shipped from the United States to the European Union (EU), where biomass fuels have been declared carbon neutral and are thus considered to count toward fulfilling the commitments of the Paris Agreement. The EU aims to generate 20% of its electricity by 2020 using renewable sources, including burning woody biomass. In part to revive a languishing forest products industry, the U.S. Congress may also declare wood a carbon-neutral fuel. Despite its withdrawal from the Paris Agreement, the United States may see a few utilities switch from coal to wood, which costs roughly the same as natural gas. The switch could be further incentivized with a carbon tax on fossil carbon (*1*).

Cutting trees for fuel is antithetical to the important role that forests play as a sink for CO_2 that might otherwise accumulate in the atmosphere. Each year, an estimated 31% of the CO_2 emitted from human activities is stored in forests (*2*). However, managed forests store less carbon than their

Young loblolly pines are harvested in the southeastern United States.

native counterparts (*3*), and harvesting of native forests will therefore be a source of, not a sink for, atmospheric CO_2. Furthermore, wood contains less energy than coal, and wood burning thus generates higher CO_2 emissions per kilowatt of electricity. The CO_2 emissions from burning wood offset CO_2 that might otherwise be emitted from fossil-fuel combustion (*4*, *5*), but full carbon accounting must also consider how long it takes to restore the carbon pool of forested land that has been converted to atmospheric CO_2 (*6*).

The large-scale abandonment of agricultural activities during the Great Depression (1929 to 1939) led to a rapid expansion of mostly natural forests across the southeastern United States. Later, these natural stands were replaced by plantations of loblolly and slash pine, which were the favorites of the forest products industry because they grow well in the warm, wet climate of the Southeast (see the photo). Loblolly pine plantations achieve a maximum biomass of 125 metric tons per hectare in about 40 years (*7*). But because this species achieves its maximum rate of biomass accrual in about 20 years, rotations are usually kept short to maintain the fastest carbon uptake possible. Thirty-four operating and proposed wood-pellet plants dot the landscape of the Southeast, each anticipated to receive logs from the region within an 80-km radius. Maine and the Canadian Maritime provinces also eye the potential for wood pellets to revitalize their forest products industries; most of this wood would derive from natural forests and not plantations.

It is not only the burning of wood that adds CO_2 to the atmosphere. Making wood pellets and shipping them to Europe can account for about 25% of the total carbon emitted to the atmosphere from the use of wood pellets in European power plants (*8*). Carbon neutrality for wood is only achieved if the areas that are harvested are allowed to regrow such that they store more than their original biomass. Furthermore, the benefits of wood power must be discounted by the loss of the carbon sequestration that would have occurred in the original forests if they had not been harvested (*6*).

Although the carbon uptake by southeastern forests is greatest at about 20 years, regrowing stands continue to have lower biomass than unharvested stands for 40 to 100 years (*9*, *10*). Rotation lengths of less than 40 years seem certain to transfer carbon from biomass to CO_2 in the atmosphere. By contrast, nonwoody biomass fuels such as switchgrass or silvergrass (*Miscanthus*) regrow within a year, balancing the emissions from their combustion to their subsequent uptake of CO_2 through photosynthesis. With wood, there is the assumption—but no guarantee—that new trees will be planted and will persist long enough to pay back the carbon debt created by burning the previous stands. If that carbon stock is not restored, burning wood may actually emit more CO_2 to the atmosphere than burning coal (*10*).

Much of the argument about the carbon neutrality of wood power centers on the time frame of analysis. Because CO_2 persists for many decades in the atmosphere, some scientists argue that CO_2 emitted to the atmosphere does not contribute substantially to global warming in intervals less than a century (*11*). Others hold that all CO_2 molecules in the atmosphere exert the same effect and that plantation rotations of less than 20 years make a substantial net contribution to global warming. Ocko *et al.* (*12*) argue that the impacts on warming should always be reported for both 20- and 100-year periods, so that policy-makers can understand the net CO_2 emissions that are associated with the time horizon of different policy options. Full international participation is paramount; it makes no sense to have Europeans embracing wood pellets as carbon neutral, thereby overlooking the CO_2 emitted during shipment and the losses of carbon stock from forests harvested outside Europe. This is another example of exporting CO_2 emissions beyond the border (*13*).

Many environmental economists believe that the increased value of forests for wood-pellet production will ensure that more forests are planted (*14*); when trees have little or no value, the landscape is more likely to succumb to commercial or residential development. But in the southeastern United States, these forests are most likely to be pine plantations, which are of limited value for the preservation of its rich regional biodiversity. Furthermore, increased demand for wood pellets can raise the price of raw wood, diverting harvest to old-growth forests, which are important areas for biodiversity.

Biodiversity losses in the southeastern United States mostly result from land clearing (*15*), and agricultural clearing during the past two centuries likely already had great impacts on biodiversity. Following agricultural abandonment in the early 20th century, forests are now more widespread but are mostly pine plantations with low biomass and low diversity. Ultimately, the question is what kinds of forests are most desirable for the future. Unless forests are guaranteed to regrow to carbon parity, production of wood pellets for fuel is likely to result in more CO_2 in the atmosphere and fewer species than there are today. ■

Carbon Monoxide (CO) HAZARDS from Wood Pellet Storage

Heating with wood can be an excellent way to keep your home or business warm. When heating with wood pellets, it is important that they be safely stored outside your home or business. If you use a woodstove, pellet stove, hydronic heater, boiler, or fireplace, the devices must be properly installed, vented, and serviced regularly to avoid potentially hazardous situations.

A chemical reaction that produces carbon monoxide (CO) gas can occur when wood pellets are stored. CO is a poisonous gas that can cause death and other harmful health effects if the pellets are not safely stored. It is invisible, tasteless, odorless, and non-irritating. The early symptoms of poisoning can be confused with a flu-like illness.

To minimize the risks of carbon monoxide poisoning, wood pellets should be safely stored in a separate structure outside your home or business. The outbuilding should have ventilation to the outside and any pellet delivery openings should not allow access to children. Signs should be posted at the storage area to warn everyone about potential carbon monoxide hazards.

Visit **www.health.ny.gov** for more information.

Wood pellets should be stored in an outbuilding with hazard signs.

NEW YORK state department of HEALTH

What is carbon monoxide?

Carbon monoxide (CO) is a poisonous gas that can cause death and other harmful health effects. It is invisible, tasteless, odorless, and non-irritating. It is usually produced from burning fuels such as wood, oil, natural gas, propane, gasoline, and kerosene. Stored bulk wood pellets are another source of carbon monoxide so it is important to safely store pellets outside your home or business.

Symptoms of CO poisoning

Symptoms can be flu-like: nausea, headache, dizziness, shortness of breath, sleepiness, weakness, chest tightness, and confusion. In large amounts, CO can cause rapid loss of consciousness, brain damage, or death.

If you suspect CO poisoning

Get outside into the fresh air, open all windows and doors as you leave, and call the fire department from outside of the building.

Call 911 if you or someone else is experiencing symptoms or take the ill person to the emergency room. Tell the physician that you suspect CO poisoning.

Install CO alarms in your home

In New York State, Amanda's Law requires that CO alarms be installed in all homes (single and multifamily) that have any fuel-burning appliance or system. Alarms must be installed on each story where a sleeping area or a CO source is located. Carefully follow manufacturers' instructions for installation, maintenance, and battery/unit replacement.

For more information

Contact the New York State Department of Health's Bureau of Toxic Substance Assessment at 518-402-7800 or toll-free at 1-800-458-1158, or **visit www.health.ny.gov** for more information about health concerns from carbon monoxide.

Visit **nyserda.ny.gov/renewableheatny** for more information on the benefits of high-efficiency, low-emission wood heating systems and participation details for NYSERDA's Renewable Heat NY programs.

ENVIRONMENT CLIMATE CHANGE POLLUTION MISSISSIPPI

A ‘Green’ Energy Project Leaves A Mississippi Town Gasping For Air

European climate subsidies funnel billions to wood-burning power plants that harvest trees from the U.S. South. The industry is taking a toll locally and globally.

By Alexander C. Kaufman

Dec 18, 2021, 05:45 AM EST
Updated Dec 20, 2021

289 COMMENTS

Blackmon Hole, a neighborhood of trailers in Gloster, Mississippi, sits next to the Drax Biomass production facility in the town. Local residents are fighting the plant, which they say is making them sick with its pollution.

TIMOTHY IVY FOR HUFFPOST

GLOSTER, Miss. — Carmella Wren-Causey knew something was wrong as soon as she returned to her hometown last year, a place where she’d slept on her grandmother’s screened porch to smell the sweet, crisp fragrance of longleaf pines on summer evenings. Though it had been years since Wren-Causey, 60, had smoked her last cigarette, she was having a harder and harder time breathing.

Within months of moving into a small, prefabricated home on property her great-grandparents first bought nearly a century ago, even just tending her garden left her so dizzy she felt faint. Dragging the garbage the short walk up to the road required at least three breaks to catch her breath. Hoisting herself into her Nissan pickup became a process: one leg, a gargled inhale, a lean, then the other leg. She could barely sleep at night and recently started going to bed hooked up to an oxygen tank.

She had struggled with breathing problems before. But now her doctor had to increase her medication. She joked that her inhaler had become her best friend. When her two beloved spunky pugs Rayray and Tiny – her "babies" she took everywhere – died suddenly, just three weeks apart, it became a little too true. The dogs had also struggled to breathe, wheezing with anguish shortly before dying.

"The truth is, you got people around here that stay sick. You got people around here that has to use asthma pumps that didn't have respiratory problems before," Wren-Causey said, weeping.

"I go to bed, my lungs hurt," she said. "I wake up, my lungs hurt. It's horrible."

Wren-Causey lives less than a mile from the mill where the British utility giant Drax turns towering tree trunks into wood pellets the size of vitamin capsules, which are then shipped to the United Kingdom to be burned in power plants. When the company opened the mill here eight years ago, tiny Gloster, with its shrinking population of about 800, became part of the $52 billion global supply chain for wood-fired electricity. The industry is on pace to grow 6% or more per year this decade.

To some lifelong residents of Gloster, the Drax plant was a godsend, the first sign of life since 2002, when the lumber mill that was once the town's economic heart closed and left a once-thriving main street a ghost town.

To others, the facility was a curse. Feeding it meant reducing local forests that once teemed with deer and squirrels to plantations of wimpy saplings. And many in this mostly Black community, where median incomes barely hit $10,000 a year, say it has polluted the air with disease-causing gases called volatile organic compounds without delivering them promised new jobs.

Carmella Wren-Causey is one of many residents of Gloster, Mississippi, who says that pollution from the local Drax Biomass plant is making them sick.

TIMOTHY IVY FOR HUFFPOST

Perhaps counterintuitively, the push to build the Drax mill and feed it with Southern forests is the product of policies meant to stop global warming.

European Union and British regulators decided that emissions from wood-fired power plants would not count the same as pollution from fossil fuel generators, making companies like Drax eligible for billions in subsidies for green energy. The firm received nearly $1.1 billion in clean power subsidies last year alone.

Seeing how quickly the industry grew off government funding meant to cut emissions, scientists and activists mobilized to stop its expansion, complaining that the whole thing was built off faulty premises: Trees regrow, but it takes decades to centuries, and burning wood can release more planet-heating gases than coal because you need much more to generate the same amount of power. But it was too late: A multi-billion-dollar industry had already put down roots and cultivated powerful political allies.

In the U.S., federal incentives to build wood-burning power plants are much smaller, and their share of the country's electricity generation has declined over the past seven years. But states, particularly in the South, have lavished tax breaks on firms that harvest and process wood to send it across the ocean. And the industry has boosters inside the Biden administration such as Agriculture Secretary Tom Vilsack and a spurious but catchy new sales pitch promising that new technologies will render it capable of pulling more carbon from the atmosphere than it emits.

"When the industry claims it's carbon neutral, it's saying we recognize there's CO2 coming out of the smokestacks, but it was instantaneously offset by CO2 uptake somewhere else, and therefore it's not in the atmosphere," said Mary Booth, an ecologist and founder of the Partnership for Policy Integrity, an environmental research and advocacy nonprofit. "But that's not what's happening. If you burn a tree, it emits carbon right away. And if you grow a tree, it takes up carbon over a long time."

Drax Biomass, a multinational woodchip production company, operates a facility in Gloster that produces woodchips for the British heating market. Local residents are at odds with each other over the plant, which some say is making them sick, while others support the economic stability provided to local loggers who sell to the plant.

TIMOTHY IVY FOR HUFFPOST

Could Or Should Wood Be A Climate Solution?

Burning plant matter for energy predates even Homo sapiens, as studies show earlier species of hominids used it for fire. But the modern biomass industry, which burns plants or plant-based synthetic fuels to power generators and produce power, did not gain prominence until the 1970s, as the oil crisis spurred interest in alternatives to fossil fuels.

The wood-fired power sector really started booming in the second decade of the 21st century. The United Nations' Intergovernmental Panel on Climate Change had, for decades, advised countries to attribute carbon from chopping down trees to the land-use sector, not energy, to avoid double counting. That meant countries didn't have to report the emissions from wood-burning power plants as part of their overall carbon footprint.

There were various justifications for doing so that have shifted wildly over the years. But one of the more straightforward, if perhaps too ecologically simplistic, explanations was this: Scrap wood or dead trees left to rot would emit carbon anyway, so turning that biomass into fuel that could supplant fossil fuels would balance out the atmospheric pollution ledger.

In reality, it set the stage for creating an accounting convention that would allow some of the richest nations that contributed the most to the cumulative carbon mess in the atmosphere to boost their struggling timber industries and inflate their green bona fides.

The methodology reflected the long-standing view in Europe, where wood-burning furnaces and stoves are common, that wood was a renewable resource. So when the European Union adopted its 2009 Renewable Energy Directive — a plan to reach 20% renewable energy by 2020 to help the bloc adhere to the world's first climate treaty, the Kyoto Protocol — it followed a long tradition of giving wood-fired power plants the same emissions-free status as wind and solar. As a result, coal-dependent countries like Britain and Germany began heavily subsidizing wood burning.

> **"If you burn a tree, it emits carbon right away. And if you grow a tree, it takes up carbon over a long time."**
>
> - Mary Booth, ecologist and founder of the Partnership for Policy Integrity

This was despite the fact that burning freshly cut wood chips, which are wet and far less energy-dense than fossil fuels, can emit between 40% and 60% more carbon per megawatt-hour of electricity than coal. Wood pellets like those the Drax plant produces are dried and therefore more efficient, and generate fewer emissions when they're burned despite spewing more gases where they're produced.

"Sustainable biomass is renewable because of the closed carbon cycle created when trees grow and take CO2 from the atmosphere. Whether the wood is used for bioenergy or these trees naturally decompose, the same amount of CO2 is released into the atmosphere," said Ali Lewis, a Drax spokesperson, in a lengthy email. "The cycle remains in balance because the working forests which supply the low-grade wood used for biomass are replanted and these growing trees absorb more carbon."

The problem, the industry's critics say, is that cycle's timeframe. It takes at least 82 years for a biomass plant's regrown forests to lower that facility's carbon footprint to that of a coal plant. And that's the best-case scenario outlined by a peer-reviewed emissions calculator tool created by Natural Resources Canada, a government agency. Even after 100 years, wood-fired electricity could not close the emissions gap with a natural gas plant, the calculator data show.

Yet by the time this became clear enough to build some kind of political momentum, biomass had not only grown into an industrial heavyweight, it had split the traditional green voting bloc in the EU, attracting support from the usually climate-conscious Scandinavians who also have large timber industries.

The reporting metric also allowed Europe to credit its existing wood-burning operations as renewable energy, effectively juicing its green energy numbers to make the continent look much more ecologically balanced than it actually was.

Biomass had an extra appeal that has become a more prominent industry talking point in recent years. Unlike wind and solar, which can operate sporadically, wood-fired plants can run as long as there’s something to burn, providing the reliable baseload electricity we expect from fossil fuels.

The EU embraced wood at the same time the U.S. leaned into the Northeast’s hydraulic fracturing boom and replaced its coal plants with cheap and abundant natural gas. This presented an opportunity for states across the forested South to revive the timber industry, then on the decline, by welcoming companies that would feed Europe’s growing appetite for pellets.

Gloster’s Drax plant became one of the largest pellet mills in the U.S. when it opened eight years ago.

Blackmon Hole, a neighborhood of trailers, sits next to the Drax Biomass production facility.

TIMOTHY IVY FOR HUFFPOST

Air You Can Taste

In 2013, when wood pellet exports from the U.S. doubled from the previous year to 3.2 million tons, Drax chopped down the pines and oaks that once covered the hill behind Blackmon Hole, a small Black-owned trailer park five minutes from downtown Gloster.

“I used to go hunting up there,” said Pete, a Blackmon Hole resident who declined to give his last name as he sipped a Bud Lite and tinkered with a new transmission in an old gray Ford Crown Victoria. “Now ain’t nothing coming around with all that noise.”

On that late Wednesday afternoon in early December, the maze of towering metal chutes that make up the mill was clanking and humming, a cacophony occasionally joined by the roar of semi-trucks carrying flatbeds of pine logs. A grayish-white cloud billowed from a smokestack.

Air pollution from wood pellet plants comes from various sources. There's the exhaust from a steady convoy of trucks. And, perhaps worst of all, the kiln that dries chipped trees to turn them into wood pellets, spewing loads of volatile organic compounds, or VOCs, that contribute to smog and ozone pollution; aggravate asthma and other lung conditions; cause cancer; and trigger itchy eyes and skin. In between, too, there are additional VOCs sent into the air when the hammermills shred trees and the pellets are fully processed.

The wood pellet industry and regulators almost never account for that pollution in permitting, according to a landmark 2018 study by the Environmental Integrity Project, a watchdog group.

Left: Wood chips from the Drax Biomass production facility litter the roadside in Gloster, Mississippi. Right: Drax Biomass, a multinational woodchip production company operates a facility in Gloster that produces woodchips for the British heating market.

TIMOTHY IVY FOR HUFFPOST

In the middle of the gravel driveway that cuts through Blackmon Hole is a yellow sign that reads: "Slow: Children Playing." Once school let out, at least half a dozen kids chased each other around the lawn between the trailers.

Heading up the hill toward the chainlink fence between the homes and the Drax facility, the air takes on a sharp, peppery flavor. It stung the inside of my nostrils before the smell even registered. My eyes watered and I sneezed; later on, my lungs felt heavy, like an occasional smoker might feel after a rare cigarette.

Jasmine Jenkins lives at the edge of the park, with her daughters, 8 and 3, and her son, 5.

“They’ve had allergies ever since they were born,” Jenkins, 28, said while standing on the steps of her home one night after returning from work. “One of my kids breaks out in hives every two to three months.”

Several feet away stood her neighbor Shirley Bland, who, after 30 years living here, said she only started finding a daily layer of residue on her car once the plant opened.

“It must be what they put up in the air,” said the 57-year-old grandmother. “I keep feeling out of breath.”

The Environmental Integrity Project report found that Drax’s plant was emitting more than three times as many VOCs as the company was legally permitted to emit.

Last fall, the Mississippi Department of Environmental Quality fined Drax $2.5 million and demanded the company install new catalyzing technology to help disintegrate more of the pollution before it enters the atmosphere. An agency spokesperson sent a link to the fine but did not respond to HuffPost’s questions about whether Drax had fully fulfilled the regulators’ demands.

Drax declined my request to visit the plant but said it installed catalytic oxidizers in Gloster and two plants in Louisiana this past summer.

It was the highest fine any wood-pellet plant in the U.S. has incurred, according to the Dogwood Alliance, a North Carolina-based nonprofit that advocates against expanding the biomass industry. But such penalties are not widely publicized, particularly by the states promoting the industry, making it difficult to confirm. It took months for watchdog groups that track the industry, including Dogwood Alliance, to put out a press release about the fine.

Organizers from the Dogwood Alliance came to Gloster in June to hold a town-hall meeting with residents. Upward of 80 people showed up, many complaining about breathing and skin problems.

The gathering drew backlash from local officials. In a post on Facebook, Mayor Jerry Norwood warned that rabble-rousing could drive Drax out of town and take its purchasing power, which helped offset the cost of water, gas and electricity in Gloster, with it.

“If by some chance a big lawsuit should happen and Drax decides to close [its] gates please be prepared for your utility rates to triple,” Norwood wrote.

Erniko Brown, regional partnership engagement manager of the Dogwood Alliance in Asheville, North Carolina, is working with residents of Gloster against Drax.

TIMOTHY IVY FOR HUFFPOST

The warning seems to have resonated. When organizers Erniko Brown and the Rev. Michael Malcom returned months later, about four people came to their information session, expressing fear about their bills going up.

“It’s bullying,” said Malcom, a pastor and environmental justice advocate in Birmingham, Alabama. “I *hate* a bully. And that’s what this is.”

The turnout to the activists’ Dec. 3 town hall meeting was higher, with about a little over a dozen attendees. But at least six of them, including the mayor, came to express concerns that the campaign against Drax threatened Gloster’s economic future.

“I’ve been a Gloster resident all my life. I grew up here. And I don’t want my town to go to dirt,” said Cissy Fenn, 68, a former school teacher.

Brandy Hamilton, one of the Dogwood Alliance’s lead organizers, said her group had no intention of shutting down Drax and told Fenn to lower her voice, asking her to be “mindful that everyone has high emotions.”

“You’ve been in Gloster all your life,” she told Fenn, who is white. “I’ve been Black all my life.”

Fenn looked shocked by the implication that racism had anything to do with the Drax plant. Her husband, Reggie Fenn, 67, spoke up: “Look, we all bleed red.”

“We all have things that make us sensitive to things,” Hamilton said.

“It’s not a Black and white issue at all for me,” Cissy Fenn said. “It’s survival for us.”

“It’s survival for everybody,” Hamilton replied.

Doug Iverson, who once ran a mill that turned grain into feed pellets for livestock, asked Hamilton where she was from. She told him Charlotte, North Carolina. He questioned how the air here could be worse than in such a big city.

“You know, I grew up in this little town, and there was always dust around,” he said. “Once a week I had to dust every piece of furniture you could wipe your hand on.”

“I know you’re not dusting the houses over in Blackmon Hole,” Hamilton said.

Once Norwood, the mayor, joined in, the argument quickly devolved into shouting. Reggie Fenn walked out, then Iverson. Brown, pulling rank, asked her colleague Hamilton to leave and cool off.

Jerry White, 75, the president of the local chapter of the National Association for the Advancement of Colored People, said he doesn’t think “race was the main issue,” but hoped Drax would take additional steps to reduce pollution and help those living in Blackmon Hole.

“We can still find common ground,” he said, visibly drained after the meeting. “I’m trying to look forward to the future. I think about the children, especially in Blackmon Hole.”

Jerry White, president of the local NAACP in Gloster, is helping to organize residents who say they were harmed by Drax's pollution.

TIMOTHY IVY FOR HUFFPOST

On another evening this month in Blackmon Hole, Brown stopped Bland’s grandson — the only person that anyone in or near the trailer park seemed to know who had gotten a job with Drax, working as a janitor — as he drove his car away from his grandmother’s trailer. Brown confronted him about the air pollution.

"To me, it could be pollen," said Bland's grandson, who declined to give his name.

"This ain't pollen season," Brown said, gesturing to the silhouette of the plant in front of a pink dusk sky. "We know where it comes from."

Health vs. Wealth

Others in the community have sought employment at the plant, but say they were repeatedly rejected.

"They said people could get jobs there, but I keep putting in applications and I don't get no job," said Debra Blackmon-Butler, 61, who is related to the families living in Blackmon Hole but lives about a mile away. Instead she drives to Baton Rouge for work, more than an hour south.

In an interview after the heated debate at the town hall, Mayor Norwood said those complaining about the plant were probably unqualified to work there and accused them of trying to extort Drax for money.

"This is a very uneducated town," he said outside the meeting. "They were talking about the number of people from Gloster that work at Drax. But has anybody asked them how many of them can pass a drug test? You have to be drug-tested to get a job there."

Drax said one-fifth of its 63-person workforce at the facility lives in Gloster.

Drax, he said, has helped keep this tiny town afloat. The company paid "almost half a million dollars" to the school district this year, and paid nearly $83,000 for gas, providing the town a surplus that prevented it from raising utility rates when the price of natural gas spiked this fall, the mayor said. Drax did not confirm how much it pays in utilities but said its local taxes amount to about $1 million and listed a series of regional charities and schools to which it donates.

"Where do we get this environmental racism from, and why is that always the narrative? Why isn't it that these companies picked this poor town and tried to help?" said Norwood, who is Black. "That's all I've seen them do."

He said he has talked to another timber-related company about restarting another mill that first closed 19 years ago when Georgia-Pacific left town (the manufacturing giant briefly reopened the lumber plant in 2005 to help process wood debris from Hurricane Katrina, then shuttered for good in 2008).

If Gloster's reputation is as a place with "Black-white racial issues," Norwood said, "they're gonna say there's no way we're coming down with this foolishness going on."

Gloster, located just over 50 miles north of Baton Rouge, Louisiana, is, like many towns in Mississippi: economically depressed.

TIMOTHY IVY FOR HUFFPOST

Attracting companies to Gloster, a town in one of just two Mississippi counties without the four-lane highways trucks need to get products to market, does come at a price, Norwood admitted. Drax received a 10-year tax break from both the town and county. Such incentives are typical for municipalities trying to lure corporations, but they have yielded unfavorable outcomes once the credits end and the corporation relocates.

Drax declined to say whether it would consider leaving town after the tax deal expires, but noted it plans to dramatically increase its production in the coming years.

Norwood said that, even if Drax leaves after another few years, "they still would have helped the town."

Yet the company could end up causing an exodus, too. After years of taking her now-teenage daughter to a clinic for allergy shots every Thursday, Chiquita Cain, 33, moved last month to Baton Rouge, where she's closer to work and further from the environment she said has sickened her kids and left her with constantly irritated skin.

"It's just itchy all day, every day," Cain said. She said she wasn't alone: "My cousin has asthma real bad. My mom has bronchitis. My sister gets bad, bad headaches, so bad she needed to see a neurologist."

Robert Weatherspoon, 64, broke into tears describing how it takes him an hour and a half each morning to clear the mucus from his chest.

“You’re coughing, you’re coughing, you’re coughing, like something hanging up there,” he said. “I thought I’d get used to the pain. But every morning, honest to God, I don’t think I’m going to make it.”

Drax was recently fined $2.5 million by the state of Mississippi for releasing more pollution than allowed by law.

TIMOTHY IVY FOR HUFFPOST

Bullish Or Bullshit On ‘Negative Emissions’

While U.S. exports of wood pellets have roughly doubled since 2014, the amount of electricity Americans generated from wood has fallen steadily since peaking that year. Today, biomass makes up just over 1% of U.S. electricity.

The largest wood-burning power plant in the U.S. opened in Gainesville, Florida, in 2013, and almost immediately caused a public scandal over costs. The deal to buy power from the 103-megawatt Deerhaven Renewable Generating Station proved so controversial —

at roughly $70 million per year over three decades, electricity bills quickly rose – that the city spent $750 million to buy out the remainder of the contract.

In the U.K., by contrast, the 4,000-megawatt Drax Power Station — a massive coal- and wood-burning complex in northeastern England — supplies about 7% of the U.K.’s electricity with millions of tons of wood, much of which comes from forests in the American South.

This week, Drax unveiled plans to spend over $53 million to start work on new carbon capture machines that the company said will catch and store 8 million metric tons of CO_2 per year. Already, the company calls its plant the “largest decarbonization project in Europe” because it had swapped much of its coal-fired production for wood.

The investment news came just a few months after Drax announced a deal with the U.S. engineering firm Bechtel on projects that would equip wood-burning power plants across North America with carbon capture technology.

Will Gardiner, Drax’s chief executive, said the deals demonstrate “Drax’s commitment to deliver a vital technology which is urgently needed to address the climate crisis.”

“It’s no longer enough to reduce emissions,” he said in a statement. “The world has got to start removing carbon from the atmosphere if we are to avert this climate crisis.”

EDWARD CRAWFORD/SOPA IMAGES/LIGHTROCKET VIA GETTY IMAGES

Since trees suck up huge amounts of carbon naturally, Drax and others in the industry say that equipping their plants with technology to capture carbon dioxide from smokestacks and store it underground will make biomass power a potential source of negative emissions. As governments set net-zero targets — points at which the amount of carbon their countries absorb equals or exceeds the CO2 they emit — demand for quantifiable ways to pull carbon from the atmosphere is growing.

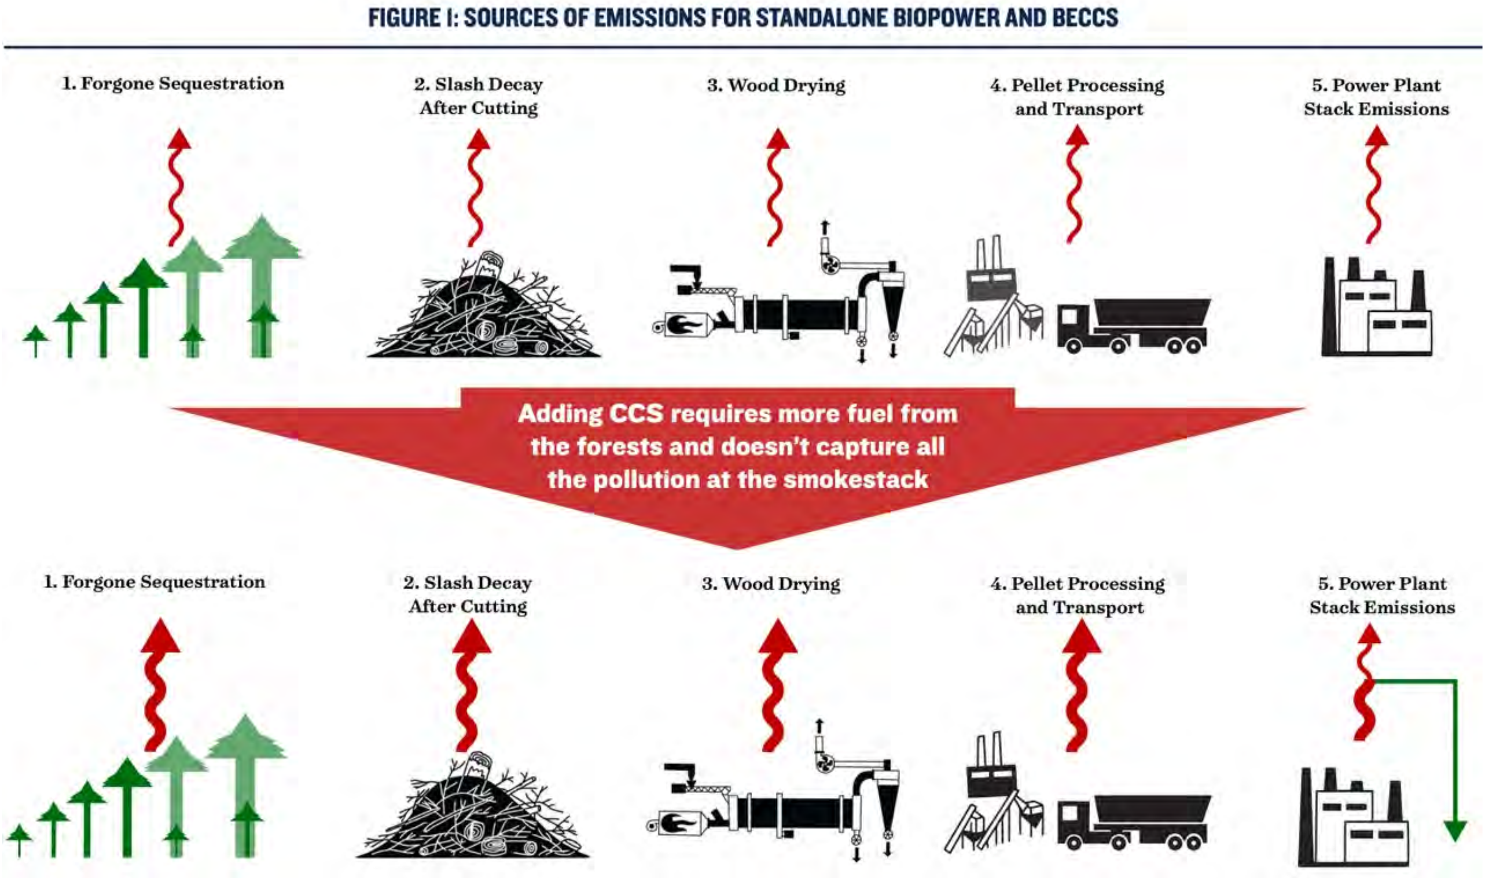
But the U.N.'s IPCC itself acknowledged in its most recent report that the concept of bioenergy with carbon capture "rests on the premise that bioenergy production is carbon neutral."

That, Booth said, renders Drax's claims "bogus."

"Burning trees and using CCS can no more deliver negative emissions than burning trees without CCS can deliver carbon-neutral emissions," she said. "It's the same problem. Trees don't grow back that quickly."

Drax's negative-emissions effort may instead be a play for more subsidies. In a recent blog post, the Forest Defenders Alliance, a European environmental group, noted that Drax's existing subsidies — totaling nearly $2.7 million per day — are set to phase out in five years. So the company, the post stated, is looking for a new "expensive scam" to get "more money out of the public."

A report Drax commissioned and published in March proposes that the U.K. government continue providing subsidies both for power generation and carbon capture after 2027.



A chart from a recent Natural Resources Defense Council report shows the various ways biomass power emits carbon, even with technology to catch pollution at generating stations

NRDC

There are other issues to relying on wood energy at scale. If the world were to supply just another 2% of its electricity demand with wood, it would require doubling the annual harvest of wood, according to Timothy Searchinger, a senior researcher at Princeton University. Providing 3.5% of America’s energy demand would require doubling the number of trees cut down.

Other ways to provide negative emissions, such as direct air capture technology or soil management techniques, wouldn’t require felling forests that are actively sucking carbon as it is. Searchinger compared the proposition to exercise.

“If you eat lots of sugar but work out, you could be reasonably healthy,” he said. “But if you don’t eat lots of sugar and work out, you’ll be healthier.”

If the cost of capturing carbon with technology comes down, he said, you’d be better off burning coal or gas at a power plant than wood, since then you’d get a lot more energy per unit anyway.

Investors seem to be doubting Drax’s claims, too. In October, the S&P dropped the company from its Global Clean Energy Index. This month, Citi downgraded its stock from “buy” to “hold.”

There are some potential places where limited biomass energy could be useful, such as in California, where dead trees in drought-stricken forests need to be cleared anyway to reduce the harmful effects of wildfires, said Holly Jean Buck, a researcher at the University at Buffalo who studies negative emissions and decarbonization.

“The best case for biomass is waste biomass,” Buck said. “We should think more about using waste biomass streams and less about for-purpose crops that could be used for other things, whether those be lumber to build houses or land that could be dedicated to other things.”

(Drax, for its part, said about 40% of its wood does come from sawmill waste, citing data in its own annual report, and insisted the rest of its wood comes from trees that are “not suitable for other uses.”)

Searchinger said the biomass industry’s tree plantations could only contribute to a negative emissions target if the world was actively reducing the amount of land used for agriculture. Instead, in most countries, old-growth woodlands such as the Amazon or Borneo’s rainforests are being felled to make way for cattle ranches and palm oil plantations.

“The only way biomass becomes a potentially [carbon] negative contribution is in a world where we are actively reducing agricultural land and you have a choice as to whether you reforest that land or plant fast-growing woody plantations,” he said. “It’s entirely speculative, but depending on the assumptions you make, you could arguably get more benefit from the fast-growing biomass plantations.”

He added: “There are these theoretical scenarios in which maybe this could be useful, but they’re sufficiently far in the future that they’re irrelevant right now.”

"You got people around here that stay sick. You got people around here that has to use asthma pumps that didn’t have respiratory problems before," Carmella Wren-Causey told HuffPost.

TIMOTHY IVY FOR HUFFPOST

The biomass industry is set to experience its fastest growth in East Asia during the second half of this decade. A report published last year found South Korea was so heavily subsidizing biomass plants that the industry was crowding wind and solar out of the power market. Japan, meanwhile, is pushing ahead with plans to burn residues from palm oil for electricity, threatening even further deforestation.

In a February 2021 letter addressed to Biden, European, British, Japanese and Korean leaders, more than 500 scientists urged them “not to undermine both climate goals and the world’s biodiversity by shifting from burning fossil fuels to burning trees” and to “end subsidies and other incentives that today exist for the burning of wood.”

“Trees are more valuable alive than dead both for climate and for biodiversity,” the letter read. “To meet future net zero emission goals, your governments should work to preserve and restore forests and not to burn them.”

Wren-Causey feels like she can relate.

“I want to live,” she said.

And she has much to live for. She has her husband and young nieces she adores. She cares for an abandoned pony. She’s hoping to start a charity to help local kids, and once a week, she takes elderly women who can’t drive to the post office and bank.

“But every night I’m in bed,” she said. “I’m praying and asking God to please let me wake up in the morning.”

RE: Hazardous Air Pollutant (HAP) Deficiencies in Preliminary Determination for Pacific Northwest Renewable Energy, LLC (PNWRE)

Dear Ms. Whybrew:

In July 2023, Pacific Northwest Renewable Energy, LLC (PNWRE) submitted an air permit application for a 440,800 tpy wood pellet manufacturing facility to be located in Hoquiam, Washington. Although this industry has been operating in US South for more than a decade, this would be the first industrial-scale, export-based wood pellet plant in the US Pacific Northwest.

As attorneys with the Southern Environmental Law Center and Environmental Integrity Project, we have worked extensively on air quality issues at wood pellet plants since 2017, reviewing permits and applications for more than 35 pellet plants located in a dozen states. We have also compiled a database of more than 50 stack tests from these facilities and discovered thousands of tons of excess VOC and HAP emissions, resulting in more than $6 million in environmental penalties and the installation of new pollution control technology at numerous plants.[1]

We write now because PNWRE has **vastly underestimated HAP emissions.** The company claims the facility will emit only 1.3 tons of HAPs per year; this estimate is deeply flawed and based on incorrect or inappropriate emission factors—mostly AP-42 emission factors that are not specific to wood pellet plants. Recent stack tests and air permit applications that are specific to this industry show that a facility this size and with the controls proposed by PNWRE will emit 40 tons or more of total HAPs per year, including more than 20 tons of methanol and a significant amount of the particularly toxic HAP acrolein.

As just one example, the pellet manufacturer Drax, which operates 18 industrial-scale pellet plants, recently applied for an air permit for a 496,000 tpy facility in Longview, Washington. Drax estimates that its facility—which is comparable in scale, control technology, and feedstock to PNWRE—will emit 49 tons of HAPs.[2] This is well in line with numerous other recent

[1] *See, e.g.*, https://www.nola.com/news/environment/british-company-agrees-to-pay-3-2-million-for-air-pollution-at-louisiana-wood-pellet/article_c451e610-4352-11ed-8a54-43df54e33cd5.html.
[2] Letter from Trinity Consultants, on behalf of Drax, to Danny Phipps, Air Quality Engineer, Southwest Clean Air Agency, at Attachment 2: Updated Potential Emission Calculations and Stack Test Data, Table C-2b (Mar. 29, 2023) (Attachment A). Available via Sharefile link at: https://southernenvironment.sharefile.com/d-sa745e15d0ed64ba0bcb8a6fe2cc87102.

applications and stack tests at wood pellet plants,[3] and suggests PNWRE will have the potential to emit about 43 tons of HAPs per year.

Additionally, PNWRE intends to operate wet (aka green) hammermills that will not be vented to any VOC controls and has improperly listed these units as not emitting any VOCs and HAPs. Most comparable mills vent these units to the furnace or dryer RTO for VOC and HAP control, and stack tests on uncontrolled wet hammermills[4] show PNWRE's wet hammermills will emit up to 60 tons of VOCs and six tons of HAPs (in addition to the emission rates calculated above).

Given the foregoing, PNWRE's application is deficient and incomplete. Specifically, as a major source of HAPs, the company must submit a case-by-case Maximum Achievable Control Technology analysis. Additionally, the company's air toxics Ambient Impact Review is wholly irrelevant as it is based on inaccurate HAP emission rates. Finally, the company's BACT analysis for the wet hammermills is incomplete for failing to assess VOC controls.

These are only the most significant issues identified in PNWRE's application. We believe, however, that at minimum ORCAA must withdraw PNWRE's application from notice and comment until the company revises its application to address these issues. Finally, we are happy to share any of the resources that we have gathered concerning this industry.

Respectfully,

/s/ Patrick Anderson

1. Introduction

Since the early 2010s the southeastern U.S. has become a central hub for the sourcing and manufacturing of wood pellets exported to Europe and the U.K. for heating and power generation (*1, 2*). Production continues to rise, with the U.S. exporting approximately 7.26 million metric tons ("tonnes") of wood pellets in 2020, mostly produced in the southeastern U.S., and with the U.K. utility company Drax Power burning more than 4.6 million tonnes of those wood pellets in 2020 (*3, 4*). The Danish energy company Ørsted is another large consumer of wood pellets from the southeastern U.S., providing about one-third of Denmark's district heating and one-fourth of the country's total power generation with wood pellets and chips (see reporting and briefs).

Some of the earliest large-scale pellet manufacturing plants were established in northeastern North Carolina and southeastern Virginia. Enviva owns and operates three plants in that area, including one in Ahoskie, North Carolina, another in Northampton, North Carolina, and a third in Southampton, Virginia (Figure 1). These mills came online in 2011, early 2013, and late 2013, and had a production capacity of approximately 1.4 million tonnes of pellets per year until 2019 when the maximum capacity of the three mills increased to over 1.9 million tonnes per year (*5-8*). Enviva added a fourth mill in Sampson County, North Carolina becoming operational in 2016.

The wood used to produce these pellets is sourced from forests in the vicinity of pellet mills. This demand increases harvest extraction and may be expanding the area of forest that is harvested each year. The industry claims that their material is sourced only from the wood waste or wood 'residue' generated by clearcut harvesting, including tree tops, branches, and discarded trunks that are not of commercial value for sawtimber or other wood products, along with secondary feedstocks from sawmill and wood industry residues. However investigative reporting by watchdog journalists and environmental groups has documented whole trees of large diameter being extracted from mature hardwood forest, including swamplands, and trucked for direct delivery to wood pellet mill sites such as Enviva's Northampton, Southampton, and Ahoskie mills from 2013 through to 2019 (*9, 10*). This has raised an alarm about unsustainable and damaging logging practices used to source this industry, as well as the clearcutting of iconic, hardwood forests within the region. Also of concern is the climate warming impact of the bioenergy sector, which contributes to the clearing of growing forests that were sequestering atmospheric carbon, redirects harvested wood from storage within wood products toward the faster-release carbon emissions pathway associated with prompt combustion to produce energy, and does so with a fuel that is of low energy density and has high greenhouse gas emission per unit of energy produced (*11, 12*).

Pellet mill and biomass energy companies alike have come under pressure to source their material sustainably, leading to the establishment of institutions such as the Sustainable Biomass Program (see https://sbp-cert.org/) which seeks to evaluate the sustainability of biomass extraction operations and to certify them as sustainable where appropriate. The SBP reports for Enviva's mills approach sustainability with an emphasis on (a) biomass growth exceeding harvesting removals, (b) avoiding the use of threatened or endangered species for wood pellet production, (c) avoiding high conservation value areas, (d) use of best practices for forest management and regrowth, and (e) sourcing of pellet feedstocks principally from so-called residues and low value roundwood as described above (*5-7*). However, the large volume of material consumed by Enviva's mills within the region calls into question whether these constraints are truly being met. Moreover, meeting forest harvesting sustainability criteria, as outlined in the SBP program, provides no assurance that atmospheric carbon is not increased by forest bioenergy use (including its harvesting, processing, transport and combustion). Furthermore, the SBP program has been criticized for a lack of independence and other deficiencies in the program's ability to provide credible assurances that its sustainability standards are being met (*13*). Furthermore, Enviva argues that their practices are maintaining a sustainable extent and biomass stock of forestland within the region given the market pull of a new demand for biomass. However, this claim has not been demonstrated with large-scale quantitative measurement, nor has it been analyzed with respect to forest types. It remains unclear how the pattern and rate of forest clearings have responded to pellet mill operations – something that can be reliably quantified with satellite remote sensing of forest extent and annual forest loss conducted at a medium resolution (30 m x 30 m).

This study utilizes the best-available satellite data records to map the harvesting of forests in the source regions of mills over time, and to analyze time series to detect whether harvesting has increased as a result of mill operations. We examine the rates of clearing by forest type. Also, we diagnose whether there has been a conversion of forestlands from hardwoods to softwoods, and if there has been an expansion (or decline) of forest cover in the area surrounding mills.

2. Study Region

The study area encompasses areas within 100 km radii of the Enviva pellet mills at Northampton, Southampton, and Ahoskie (Figure 1) (the "3-mill area"). We define these areas as approximate "source regions" for each of the mills, and confirmed that this extent is consistent with Enviva's Track and Trace tool (https://www.envivabiomass.com/sustainability/responsible-sourcing/track-trace/). The latitude, longitude coordinates for each pellet mill are: Enviva Northampton: 36.504969, -77.611456; Enviva Southampton: 36.666902, -76.971844; Enviva Ahoskie: 36.269097, -76.965500. Also, we defined a reference region, or control, outside of the influence of the three mills to serve as a baseline against which we can measure the influence of pellet mill operations. Use of a control group or reference region is a common approach for measuring the effect of a factor such as a change in land ownership or land conservation status on forest clearing when in the presence of a potentially time-varying baseline state (*14, 15*). We use Enviva's Sampson pellet mill (35.120949 latitude, -78.183700 longitude) as the reference region in this study because it is located within the same general physiographic region as the other three mills, and has a similar forest type composition (Table 1) but experienced pellet mill operations only from 2016. This reference area is representative of the forest clearing trends in a region free of pellet mill activity prior to 2016 when the pellet mill operations began in Sampson.

The source region for these mills rests predominantly within the Atlantic coastal plain (Figure 1). Forest types are dominated by Loblolly/Shortleaf Pine softwood, Oak/Hickory hardwood, and Oak/Gum/Cypress hardwood forest types, with some mixed Oak/Pine stands (Tables 1, 2, Figure 2).

The region's forests are intensively harvested for a range of wood products manufactured at pulp mills and saw timber mills, but this utilization and extraction has been shifting over time. For example, a hardwood paper pulp mill in Franklin, Virginia was closed in 2010, coincident with the economic downturn. This closure reduced the demand for hardwood harvesting in the 3-mill area just before the pellet mill operations came online. Though International Paper Company re-purposed the mill as a fluff pulp mill opening in 2012, the fluff pulp supply relies on softwoods. Thus, a return of forest clearing at the rate prior to pellet mill operations would indicate the effect of pellet mills, particularly for deciduous hardwoods.

Figure 1. Map of the study region displaying the location of the Enviva wood pellet mills used in this study, the perimeter of Enviva's current map outlining its primary wood supply for these mills, and including this study's 3-mill source regions (blue circles) and its reference region (orange circle minus overlap with the blue circles). The base map displays the UDSA-NRCS Major Land Resource Areas our study region is located at, including Atlantic Coast Flatwoods, Tidewater, Coastal Plain, Sand Hills, and Piedmont.

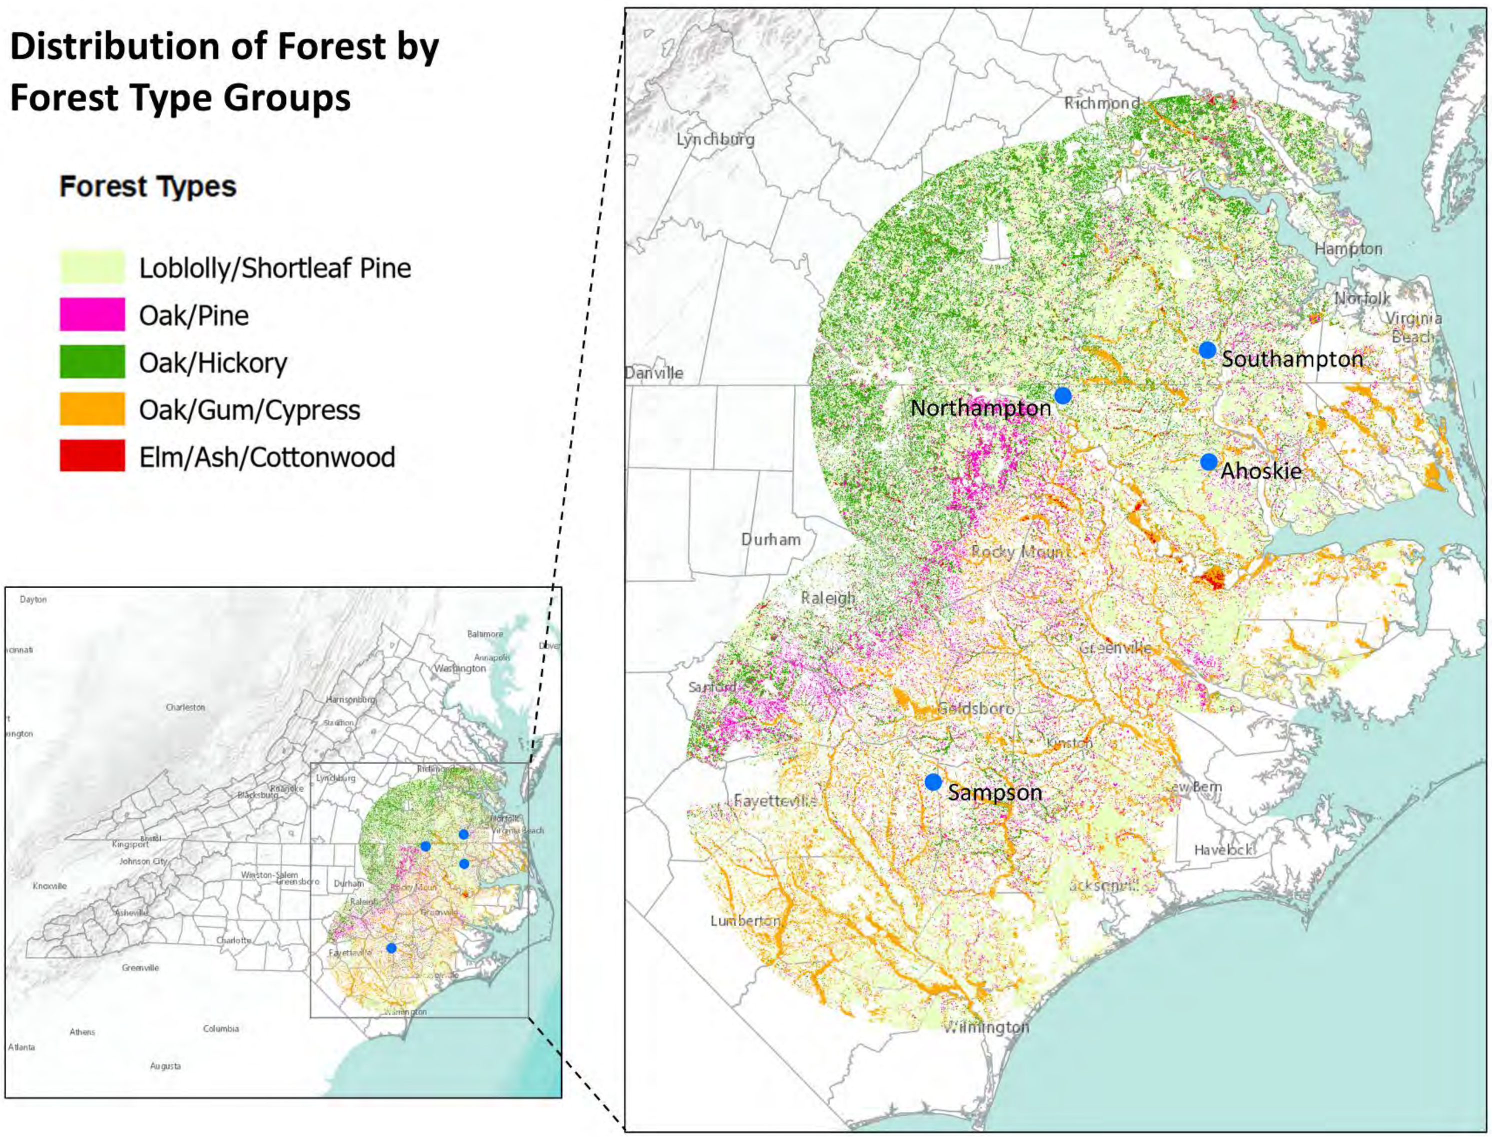

Figure 2. Distribution of forest within the study region according to forest type groups of the U.S. Forest Service.

Table 1. Forest Area in 2000 by Forest Type Group in the 3-Mill and Reference Areas.

	3-Mill		Reference	
Forest Area in 2000	[ha]	[% of total]	[ha]	[% of total]
Loblolly/Shortleaf Pine	1,106,527	51%	604,379	53%
Oak/Pine	187,947	9%	118,990	10%
Oak/Hickory	594,475	27%	118,297	10%
Oak/Gum/Cypress	261,445	12%	295,933	26%

Table 2. Area of forestland by forest type in each 100 km radius surrounding the pellet mill and the reference region, as well as for the 3-mill areas combined.

Forest Area in 2000 [ha]	Northampton	Southampton	Ahoskie	3-Mill	Reference
Loblolly/Shortleaf Pine	844,455	738,936	736,137	1,106,527	604,379
Oak/Pine	152,495	107,925	130,672	187,947	118,990
Oak/Hickory	497,240	327,793	188,556	594,475	118,297
Oak/Gum/Cypress	159,111	173,161	246,187	261,445	295,933
Elm/Ash/Cottonwood	14,960	13,138	9,765	18,427	2,946
Deciduous*	823,805	622,018	575,180	1,062,294	536,166
Coniferous*	844,455	738,936	736,137	1,106,527	604,379
Total	1,668,261	1,360,954	1,311,317	2,168,822	1,140,545

*For the purposes of this study we assign forest type groups as follows: Coniferous includes White/Red/Jack Pine, Longleaf/Slash Pine, and Loblolly/Shortleaf Pine, and Deciduous includes Oak/Pine, Oak/Hickory, Oak/Gum/Cypress, and Elm/Ash/Cottonwood.

3. Methods

We mapped locations of annual forest clearing from 2001 to 2019 with the ~30 meter Global Forest Watch (GFW) year 2000 tree cover and 2001 to 2019 tree cover loss datasets (*16*). To compute areas of forest and of forest loss, we transformed the GFW dataset from its original 0.00025 degree resolution, World Geodetic System 1984 (WGS84) geographical coordinate system to the North American Datum of 1983 (NAD83) coordinate system, and then projected the data to the Albers Conical Equal Area projection with a 30 m resolution. We identified the forest type of cleared areas by clipping the GFW tree cover map to the U.S. Forest Service forest type group map representative of 2000 (*17*) and defined at the 30 m resolution according to the National Forest Carbon Monitoring System (*18*). Forest type groups were also aggregated into softwood coniferous and hardwood deciduous groups to allow us to detect whether forest clearings of hardwood stands increased after the initiation of pellet mill activity. We sampled the maps of forested area and forest clearings for four different pellet mill regions, and for the 3-mill area combined. We then mapped the distribution of forest area, and forest clearings from 2001 to 2019, by forest type on the 30 m x 30 m grid. We confirmed that the tree cover percent of the pixels included as forest in our analysis contains a tree cover percentage representative of true forestland by analysing the GFW tree cover percent. Forest areas included in our study had a median tree cover percentage of 97%, a 20th percentile tree cover percentage of 85%, and a tree cover of less than 40% for fewer than 5% of the pixels classed as forest.

We excluded forest disturbance and forest clearing events that are not likely to be related to market-driven biomass supply for wood products (see Appendix 1 for figures displaying areas filtered out of the analysis). We excluded areas marked as developed in 2016, areas that experienced wildfires, and areas that have a protected or public game land or non-harvestable status. Developed areas were identified with the 2016 National Land Cover Dataset (NLCD, 2016) (*19-22*), including those 30 m pixels classified as developed open space or low, medium, or high intensity developed land. Protected lands were identified with the USGS, Gap Analysis Program (GAP), Protected Areas Database of the United States (PAD-US 2.0) (*23*), with GAP classes 1, 2, or 3, and public, non-harvestable lands such as those owned and managed by the U.S. Fish and Wildlife Service or the U.S. Department of Defense. Wildfires were identified as those areas of moderate to high burn severity from 1999 to 2017 according to the 30 m Monitoring Trends in Burn Severity (MTBS) (*24*) with its data release of August 29, 2018.

We measured the area of forest cleared each year by forest type and by deciduous or coniferous groupings by counting the number of pixels within a region that had loss and multiplying by pixel area (900 m^2 or 0.09 ha). We computed the percentage of forested pixels that were cleared each year by dividing the area cleared in a given year by the area of forest in 2000. We analyzed annual time series of the area of forest loss and the percentage of forest loss relative to forest cover in 2000 for individual forest types and for all forest types combined. We compared pre-mill forest clearing rates to those after the initiation of mill activity (referred to as "post-mill"). We expressed average annual forest clearing for three time periods: 2004-2008, 2013-2015, and 2016-2018, and quantified their ratios to assess the change in clearing after the initiation of mill operations. These time periods were selected to represent pre- and post-mill clearing rates during years of relatively favourable economic conditions as defined by Gross

Domestic Product. This removes variability associated with economic downturns, such as the recent recession in the late 2000s that is well-known to have significantly diminished the forest products industries of the southern U.S. (*25-27*). The years 2001 to 2003 and 2008 to 2010 were excluded because of anomalously low Gross Domestic Product in 2001, 2002, 2008, and 2009 (The World Bank, 2021) (*28*), along with 2003 and 2010 to account for the lag in the return of markets that influence harvesting practices. We identified pre-mill forest clearings as those during 2004 to 2007. With the three mills coming online from 2011 to 2013, we defined post-mill forest clearings in two time periods, 2013 to 2015, and 2016 to 2018.

The forest clearing time series mapped by GFW in its version 1.7 involves two distinct data processing and analysis periods, one for 2000 to 2010 and a second from 2011 to 2019, with the latter involving a more sensitive sensor from Landsat 8 OLI as well as improved validation data and an improved forest loss model (http://earthenginepartners.appspot.com/science-2013-global-forest/download_v1.7.html). To guard against the potential non-stationarity that may result from these methodological changes over time, we compared forest clearing rates within the 3-mill source region to the time series of forest clearings seen within the Sampson pellet mill reference region prior to 2016 when mill operations were initiated there as well. Trends in the GFW dataset from 2011 to 2019 are not subject to this risk of non-stationarity, given temporal consistency in the satellite data and algorithm used to identify forest clearings.

To assess whether mill operations have led to a general increase in forest cover in the 3-mill source region, we measured changes in forest cover over time with the 30 m NLCD land cover datasets for 2001, 2011, and 2016. We did not rely on the GFW forest gain data for this purpose for several reasons. Firstly, at present the GFW forest gain estimates are only available for the period of 2001 to 2012 and thus are only representative of the time period prior to the initiation of pellet mill operations. Secondly, studies evaluating the GFW and similar datasets indicate that estimates of forest gains have lower accuracy than estimates of forest losses (*16, 29-31*), partly because forest growth is a more gradual and complex ecological process (*32*) that is more difficult to detect (*30, 33*). We note the following general correspondences between the NLCD classes and those derived from the U.S. Forest Service forest type group map within this study's regions of interest: NLCD Coniferous corresponds to the Longleaf/Slash Pine and Loblolly/Shortleaf Pine forest type groups; NLCD Mixed corresponds to the Oak/Pine forest type group; NLCD Woody Wetlands corresponds partly to the Oak/Gum/Cypress forest type group but may also overlap with Elm/Ash Cottonwood and other forest types including the pine groups; NLCD Deciduous corresponds to a restricted subset of the Oak/Hickory forest type group. We computed changes in the area forested from the 2001 to 2011 and from 2011 to 2016 NLCD datasets, and quantified the annual average rate of change in forested area for all NLCD forest classes, with emphasis on the Deciduous, Mixed, and Woody Wetlands classes.

Finally, we estimate the total biomass yield associated with clearings in the combined 3-mill source region area, and compare it to the feedstock supply that is consumed by the three mills in recent years. We adopt a typical harvest yield of 93 green tons of biomass per acre (equal to 84 green tonnes of biomass per acre, or 208 green tonnes of biomass per hectare), and a pellet yield of 0.4464 dry tonnes of pellets per green tons of biomass furnished (equal to 0.4921 dry tonnes of pellets per green tonnes of biomass furnished) as reported by Spencer Phillips of Key-Log Economics (*34*). This harvest yield is consistent with the biomass density reported in our own work on southeastern U.S. forests, reporting an average biomass density of about 120 metric tonnes of dry biomass per hectare for harvestable forests (*35*), which equates to approximately 97 green tonnes of biomass per acre assuming a water content of 50%. We compute the potential pellet supply from:

Potential pellet supply [dry tonnes per year] = A x B x P

where A is the area cleared [hectares per year], B is green biomass yield per area cleared [green tonnes biomass furnished per hectare harvested], and P is dry pellet mass produced per unit green biomass furnished [dry tonnes pellets per green tonnes biomass]. Additionally, we compute the true total Enviva pellet supply estimated to be derived from deciduous harvesting from:

Enviva pellet supply from deciduous harvesting [dry tonnes pellets per year] = F x H x PS x P

where F is the pellet feedstock reported by Enviva [green tonnes of biomass feedstock per year], H is the percentage (=78%) from hardwoods as reported in Enviva's supply base reports (*5-7*), PS is the percentage (=87%) of pellets arriving from primary supply via direct harvesting in forests, and P is dry pellet mass produced per unit green biomass furnished [dry tonnes pellets per green tonnes biomass].

4. Results

4.1 Trends in Forest Clearing Rates

Deciduous forest clearing in the 3-mill region rose sharply after 2012 to a peak in 2017 (Figure 3). During the recession-free, pre-pellet-mill period of 2004 to 2008, the 3-mill area saw a gross forest clearing rate of 1.5% per year (16,425 hectares per year) (Table 3). Deciduous forest clearing dropped to 1.1% per year for 2009 to 2012 with the recession and coincident closure of the Franklin, VA hardwood paper and pulp mill. With the initiation of pellet mill operations in the region, deciduous forest clearing returned to the pre-recession level (1.5% per year) by 2013 to 2015, and then rose to 1.7% per year (18,480 ha per year) from 2016 to 2018. Oak/Hickory and Oak/Pine forests saw the largest increase in forest clearing from the mid-2000s to the mid- and late 2010s (Table 4).

Coniferous forest clearing had a similar pattern in the 3-mill region (Table 3, Figure 3). Gross coniferous forest clearing in this area was 2.6% per year from 2004 to 2008, decreased to 2.0% per year from 2009 to 2012, rose to 2.4% per year for 2013 to 2015 and 2.5% per year from 2016 to 2018. Time series of annual clearing rates for the dominant forest types are shown in Figures 4, 5, 6, and 7. A map of forest losses is displayed in Figure 8 for the entire region, and with a focus on specific cutout regions within the vicinity of the 3-mill cluster (Figures 9, 10).

Forests of the reference region experienced similar trends in clearing rates over time but with a smaller decline during the 2009 to 2012 period. Gross deciduous forest clearing in the reference region was fairly steady from 2004 to 2015, at around 1.3% per year. Thereafter, when the Sampson pellet mill began its operations in 2016, deciduous forest clearing rose to 1.9% per year from 2016 to 2018. Similarly, gross forest clearing of coniferous forests in the reference region was about 2.2% per year from 2004 to 2015 and rose to 2.9% per year by 2016 to 2018.

To summarize, we find that the rate of forest clearing increased markedly after the initiation of pellet mill operations at Northampton, Southampton, and Ahoskie. By 2013 to 2015, the 3-mill region saw deciduous forest clearing increase by 1.34 times that of 2009 to 2012, and by 2016 to 2018 it increased by 1.51 times, based on the rates reported in Table 4. By comparison, the reference region saw an increase of only 1.18 times for 2013 to 2015 relative 2009 to 2012. However, once pellet mill operations began at the Sampson mill, deciduous forest clearing rose to 1.54 times the rate during the recession period. Thus, it is very likely that the initiation of pellet mill operations contributed to elevated rates of deciduous forest clearing in the 3-mill region beginning in the early 2010s, and in the reference region beginning in 2016.

4.2 Forest Area Changes, 2001 to 2016

First, we report the area of deciduous forest lost within the 3-mill area according to the NLCD, and focusing only on those areas that are labeled as deciduous forest according to the relatively restrictive classification of the NLCD. We find that the areal extent of NLCD-classified deciduous forest declined within the 3-mill region from 2001 to 2016 with an average annual rate of loss of about 3,861 hectares per year from an initial 320,523 ha in 2001 (Table 5). This is a net loss of NLCD-classified deciduous forest, whereas the prior section analyzed gross forest clearings with the GFW data. Over the 15-year period this translates to a total net loss of about 18.1% of the year-2001 deciduous forest in the 3-mill region, with the annual rate of loss being roughly the same for 2001 to 2011 as for 2011 to 2016. These deciduous forest losses are coincident with smaller gains of mixed forest and coniferous forest, which expanded by 1,387 hectares per year and 505 hectares per year, respectively.

Second, we use the NLCD as a point of comparison for the total forested area estimated with the GFW dataset. To make this comparison it is necessary to combine the NLCD Deciduous, Mixed, and Woody Wetland forest classes together because many of those areas are labeled as deciduous-dominant forest types in this study's forest type assignment to the GFW dataset. When doing so, we find good agreement regarding the area classified as deciduous forest between NLCD and this study's combination of the GFW data with the U.S. Forest Service forest type group map. For the three classes combined, the NLCD reports an average annual net loss of forest area of about 2,313 hectares per year, out of an initial 1.46 million hectares in 2001 across the 3-mill region (Table 5). Over the 15-year period this corresponds to a net loss of 2.4% of the year-2001 Deciduous, Mixed, and Woody Wetland forest areas combined, , with the annual rate of loss being comparable for 2001 to 2011 as for 2011 to 2016. By comparison, the reference region saw a 15-year loss of only 1.1% of its year-2001 Deciduous, Mixed, and Woody Wetland forest areas combined by 2016.

Table 5. Forest area and the change in forest area from the 2001, 2011, and 2016 NLCD datasets for the 3-mill and reference regions.

4.3 Feedstock Supplied by the Harvested Area

We estimate that 1.9 million dry tonnes of pellets would be produced each year if all of the deciduous forest clearing within the 3-mill area (18,480 hectares per year) was used to produce wood pellets (Table 6). This is based on an assumed harvest yield of 84 green tonnes of biomass per acre (208 green tonnes of biomass per hectare), and an assumed pellet yield of 0.492 dry tonnes of pellets per green tonnes of biomass furnished (*34*).

By comparison, Enviva's supply base reports (*5-7*) indicate that each of the three pellet mills consume 700,000 to 980,000 tonnes of green biomass feedstock per year (Table 6). From 2016 to 2018, the three mills combined to consume 2.33 to 2.66 million green tonnes of biomass feedstock per year. Enviva reports that its pellet feedstock in the region is comprised of 22% pine and 78% hardwood, and with 87% coming from primary feedstock including roundwood and whole trees direct from forests with the remainder as secondary feedstock from residual material provided by sawmill and wood industry suppliers. With 78% of the feedstock being hardwood supply and 87% from primary supply, approximately 68% of the feedstock would be expected to arrive directly from recent hardwood harvests in the region. This equates to 0.78 to 0.89 million dry tonnes of pellets per year of Enviva's 3-mill cluster supply coming from hardwood deciduous and mixed forest harvests. This feedstock would consume 41% to 47% of the total biomass from deciduous forest clearings within the 3-mill area.

Table 6. Feedstock supplies for the 3-mill cluster in 2016, 2017, and 2018 from deciduous harvest as reported by Enviva in Supply Base Reports, and the percent of potential production from deciduous forest clearings detected in this study.[1]

	2016	2017	2018
Total Pellet Feedstock	[green tonnes of biomass per year]		
Ahoskie	706,675	706,675	652,083
Northampton	981,002	908,641	862,609
Southampton	970,670	862,567	814,632
Total of Three Mills	2,658,347	2,477,883	2,329,324
Pellets from Deciduous Harvesting	[dry tonnes of pellets per year]		
Ahoskie	235,988	235,988	217,757
Northampton	327,597	303,433	288,061
Southampton	324,147	288,047	272,039

Potential Feedstock from Deciduous Clearing	1,895,914	1,895,914	1,895,914
% Potential from Deciduous Clearings	47%	44%	41%

[1] In 2019, Enviva's total pellet feedstock (including primary feedstock from forests) increased at each of the three mills from 2018 (*5-7*). As reported by Enviva, the 2019 total pellet feedstock (in green tonnes) were: Ahoskie 688,752; Northampton, 1,014,554; Southampton 915,568. For the Southampton and Northampton mills, this increase was above 2017 levels. The same is true for the Enviva Sampson mill, with total pellet feedstock increasing from 852,842 in 2017 and 879,826 in 2018 to 1,016,024 in 2019 (see Enviva Sampson SBP reports 36. Enviva, "Supply Base Report: Enviva Pellets Sampson, LLC, Fourth Surveillance Audit, available for download at https://sbp-cert.org/certificate-holders/#4619," (Sustainable Biomass Program, 2020).) .

5. Conclusions

With analysis of the GFW forest cover and forest loss data, we find that the rate of forest clearing increased markedly after the initiation of pellet mill operations at Northampton, Southampton, and Ahoskie. By 2013 to 2015, the 3-mill region saw deciduous forest clearing increase by 1.34 times over that in 2009 to 2012, and by 2016 to 2018 it increased to 1.51 times. (Table 4 and section 4.1) The reference region, prior to its pellet mill operations, saw a 2013 to 2015 increase of only 1.18 times over the 2009 to 2012 period. However, once pellet mill operations began within the reference region in 2016, deciduous forest clearing rose to 1.54 times the rate during the recession period. Together, these lines of evidence provide a clear indication that the initiation of pellet mill operations contributed to elevated rates of deciduous forest clearing beginning in the early 2010s for the 3-mill region, and in 2016 for the reference region.

With analysis of NLCD land cover data, we find a net loss of forested area within the 3-mill region, with an average annual loss of 2,313 hectares per year from 2001 to 2016. Over the 15-year period this corresponds to a loss of 2.4% of the year-2001 Deciduous, Mixed, and Woody Wetland forest areas combined. By comparison, the reference region saw a 15-year loss of only 1.1%. Despite some gains in coniferous forest types, the 3-mill region saw a combined net loss of forested area from 2001 to 2016, losing 1.5% of the year-2001 forestland. Forest loss rates were generally steady over the two time intervals of 2001 to 2011 and 2011 to 2016. Thus, pellet mill operations do not appear to have induced an increase in forestland area within the region, and in fact deciduous forestland saw a sizeable and steady decline.

Enviva's supply base reports indicate that from 2016 to 2018 the three mills consumed 2.33 to 2.66 million green tonnes of biomass feedstock per year, with 68% of the feedstock from recent hardwood harvests. This deciduous-only, direct-harvest portion of the total feedstock would support the production of 0.78 to 0.89 million dry tonnes of pellets per year from Enviva's 3-mill cluster supply. This corresponds to 41% to 47% of the total biomass extracted from deciduous forest clearings within the 3-mill area. Therefore, pellet mill operations consume a correspondingly large fraction of the total deciduous forest clearing within the region.

With declining deciduous forest cover in the 3-mill sourcing region and with Enviva consuming 41% to 47% of the total biomass extracted from deciduous forest clearings in the area, it is likely that Enviva sourcing is contributing to overall declining carbon stocks in deciduous forests in the 3-mill area. The fact that the wood pellets made from the feedstock sourced from the area's forests is burned for power generation overseas further worsens the carbon and climate profile of pellet mill operations as a whole.

Definitions

Total Hydrocarbons	All organic compounds containing hydrogen and carbon that are detected by a flame ionization detector operated in accordance with U.S. EPA Method 25A.
Volatile Organic Compounds	All organic compounds that are emitted to the atmosphere in a gaseous or vapor form that can participate in photochemical reactions to produce ozone. All volatile organic compounds are considered VOCs unless specifically exempted in 40 CFR 51.100(s). Relevant excluded compounds include methane, ethane, and acetone.
VOC Emissions	Mass emissions of VOC measured on a pounds of carbon basis.

Acronyms

EPA	U.S. Environmental Protection Agency
FID	Flame Ionization Detector
FTIR	Fourier Transform Infrared Spectrometer
HAP	Hazardous Air Pollutant
MC	Moisture Content
MDEQ	Mississippi Department of Environmental Quality
ODT	Oven Dried Tons
THC	Total Hydrocarbons
VOC	Volatile Organic Compounds
C1	Carbon

Units of Measure

ppm	Parts per million (wet basis)
ppmvd	Parts per million (dry basis)
ppm C_3	Parts per million as propane
ppm C_1	Parts per million as carbon
mg	Milligram
kg	Kilogram
µg	Micrograms

Permit Designations/Titles

Dryer 1	AA-001, 30 MMBTU Wood-Fired Dryer (No. 1) with a Multiclone
Dryer 2	AA-002, 45 MMBTU Wood Fired Dryer (No. 2) with a Cyclone
Dry Hammermill 1	AA-006, No. 1 Secondary Hammermill w/High-Eff. Cyclone
Dry Hammermill 2	AA-007, No. 2 Secondary Hammermill w/High-Eff. Cyclone
Pellet Cooler 1	AA-004, Includes Line 1 Press Aspiration (AA-012)
Pellet Cooler 2	AA-014, Pellet Cooler 2 w/Hi-Efficiency Cyclone
Aspiration System	AA-013, Line 2 Pellet Mill Aspiration System
Green Hammermill	AA-016 (Hammermill Bin)

Air Emission Test Report
Wiggins, Mississippi Wood Pellet Production Facility

1. SUMMARY

Enviva Pellets, Wiggins, LLC (Enviva) has sponsored air emission testing to satisfy the requirements of Agreed Order 6366-13 dated June 16, 2013 (the "Order"). These test results are being submitted to the Mississippi Department of Environmental Quality (MDEQ) by October 31, 2013 in accordance with the Order.

The scope of the testing program included volatile organic compounds (VOCs) and six organic hazardous air pollutants (HAPs). Annual emissions of each analyte have been calculated and compared to applicable permit limits. The results of the testing program are summarized in Table 1-1 based on the present maximum permitted production limit of 185,550 ODT per year in the permit.

Table 1-1. Total Emissions at Plant Permit Limit of 185,550 ODT/Year

Analyte	Dryer 1	Dryer 2	Dry Hammermill 2	Green Hammermill	Pellet Cooler 1	Pellet Cooler 2	Aspirator	Dry Hammermill 1	Total
Total VOC	66.3	57.6	11.1	21.1	15.7	7.8	46.4	7.4	233.5
Organic HAPs									
Methanol	1.85	7.26	0.08	0.27	0.16	0.24	0.34	0.05	10.3
Acetaldehyde	0.00	1.40	0.25	0.61	0.39	0.35	0.23	0.17	2.0
Acrolein	1.03	2.32	0.43	1.24	0.77	0.68	0.20	0.29	7.0
Formaldehyde	2.01	3.48	0.39	0.37	0.49	0.34	0.03	0.26	7.4
Phenol	0.00	0.00	0.00	0.00	0.39	0.00	0.00	0.00	0.4
Propionaldehyde	1.06	1.82	0.17	0.09	0.16	0.11	0.00	0.11	3.5
Total HAPS	5.96	14.87	1.32	2.59	2.35	1.72	0.80	0.88	31.89

At the current maximum permitted production limit, VOC emissions remain below the PSD threshold of 250 tons per year. However, HAP emissions exceed the 25 ton per year threshold for major source classification, and methanol exceeds the 10 ton per year single compound threshold for major source classification. Importantly, the plant has never operated at the maximum permitted production limit of 185,550 ODT per year.

Enviva plans to propose to MDEQ a new maximum permitted production limit of 140,000 ODT/year. VOC and HAP emissions based on this proposed maximum permitted production limit are summarized in Table 1-2. Like the current limit of 185,000 ODT/year, to date, the Wiggins plant has also never achieved 140,000 ODT/year.

VOC emissions at the newly proposed production rate limit would be well below the PSD threshold of 250 tons per year. Furthermore, combined HAPs emissions are less than 25 tons per year, and none of the HAPs are emitted at more than 10 tons per year. Because the plant has never achieved a production rate of 140,000 ODT/year, the plant has never exceeded the major source threshold for VOCs or HAPs.

Table 1-2. Total Emissions at Plant Permit Limit of 140,000 ODT/Year

Analyte	Dryer 1	Dryer 2	Dry Hammermill 2	Green Hammermill	Pellet Cooler 1	Pellet Cooler 2	Aspirator	Dry Hammermill 1	Total
Total VOC	50.1	43.4	8.4	15.9	11.7	5.9	35.0	5.6	175.9
Organic HAPs									
Methanol	1.40	5.48	0.06	0.21	0.12	0.18	0.26	0.04	7.7
Acetaldehyde	0.00	1.06	0.19	0.46	0.29	0.26	0.17	0.12	2.6
Acrolein	0.78	1.75	0.33	0.93	0.58	0.51	0.15	0.22	5.3
Formaldehyde	1.52	2.62	0.30	0.28	0.37	0.26	0.03	0.20	5.6
Phenol	0.00	0.00	0.00	0.00	0.29	0.00	0.00	0.00	0.3
Propionaldehyde	0.80	1.37	0.13	0.07	0.12	0.08	0.00	0.08	2.7
Total HAPS	4.50	12.28	0.99	1.95	1.78	1.30	0.61	0.66	24.06

These tests were conducted in accordance with the emission test protocol[1] submitted to MDEQ on July 31, 2013. The scope of the emission test program was increased since submittal of the test program protocol in order to ensure that Enviva evaluated emissions from all possible sources of VOCs and HAPs.

The air emission tests were conducted by Air Control Techniques, P.C. using EPA Reference Methods 1, 2, 3, 4, 25A, and 320. The emission tests were conducted from Thursday, October 10 through Sunday, October 13, 2013. This report summarizes the emissions test data, quality assurance data, test method procedures, sampling equipment calibrations, process operating conditions, and test program participants.

2. EMISSION TEST PROGRAM DESCRIPTION

2.1 Wiggins, Mississippi Plant Description

Enviva operates a plant producing wood pellets. The plant consists of a wood receiving yard, log debarkers and chippers, two rotary dryers, two hammermills, two pellet presses and coolers, and an aspiration system. The plant processes wood composed of a range of hardwoods and softwoods.

2.2 Purpose and Scope of the Emission Test Program

Based on a voluntary self-evaluation, Enviva reported to the Mississippi Department of Environmental Quality (MDEQ) that it may have underreported emissions of volatile organic compounds (VOCs) in its permit application. Enviva's concern was based on a set of engineering-oriented tests [2] conducted in November 2012 that indicated that VOC emissions from a hammermill source and a press cooler aspiration vent may be higher than previously known. While emissions from specific wood pellet plants are highly dependent on the specific equipment employed and to a lesser degree the hardwood/softwood mix of raw material, Enviva's preliminary findings in the November 2012 engineering test are generally consistent with other recent findings in the Wood Pellet Industry, specifically the engineering-oriented tests[3] at a Georgia Biomass, Inc. plant in Waycross, Georgia and Green Circle Bio Energy in Cottondale, Florida.

This air emission testing program is intended to address Enviva's concern and fulfills the requirements of the Order. Specifically, Enviva agreed to generate VOC emissions data for the following sources.

- Dryer 1 multiclone stack
- Dryer 2 cyclone stack
- Secondary Hammermill 2 cyclone outlet
- Pellet Mill 2 Aspiration System

Since signing the Order, Enviva has determined that it would be beneficial to expand the scope of the emission testing program to include these three additional sources.

- Green Hammermill
- Pellet Cooler 1
- Pellet Cooler 2

The tests at Secondary Hammermill 2 cyclone outlet also represent emissions from Secondary Hammermill 1. Secondary Hammermill 2 is identical to Secondary Hammermill 1 except for the larger capacity of Secondary Hammermill 2.

2.3 Test Participants

The Enviva project manager for this project was Mr. Michael Doniger, Director of Plant Operations. He was assisted by Mr. Joe Harrell, Environmental Manager, Mr. Mike Jones, and Mr. Gary Williams, Wiggins Plant Manager.

Mr. Mike J. Doniger, Director, Plant Operations
Enviva, LP
7200 Wisconsin Avenue, Suite 1000
Bethesda, Maryland 20814
Phone: (301) 657 5560 Extension 163
Email: Michael.Doniger@envivabiomass.com

Mr. Joe Harrell, Environmental Manager
Enviva, LP
142 NC Route 561 East
Ahoskie, NC 27910 USA
Phone (252) 209-6032, Extension 202

Enviva retained Air Control Techniques, P.C. to conduct the air emission testing program at the Wiggins plant. The Air Control Techniques, P.C. project manager was John Richards, Ph.D., P.E, QSTI. He was assisted by David Goshaw, P.E., QSTI, Todd Brozell, P.E., QSTI, and Jonas Gilbert. Tom Holder, QSTI provided quality assurance services for the test program. Contact information for Air Control Techniques, P.C. includes the following.

Air Control Techniques, P.C.
301 East Durham Road
Durham, N.C. 27513
Phone: (919) 460-7811
John Richards (john.richards@aircontroltechniques.com)
David Goshaw (dave.goshaw@aircontroltechniques.com)
Todd Brozell (todd.brozell@aircontroltechniques.com)
Jonas Gilbert (jonas.gilbert@aircontroltechniques.com)
Tom Holder (tom.holder@aircontroltechniques.com)

Enthalpy, Inc. provided the laboratory analyses of the samples. The Enthalpy project manager for this project was Mr. Bryan Tyler. He was assisted by Dr. Grant Plummer, Mr. Clint Thrasher, and Mr. Steve Eckert, President.

Enthalpy Analytical, Inc.

3. TEST MATRIX AND TEST RESULTS

3.1 Test Matrix

Table 3-1 summarizes the test program analytes, sampling methods, and analytical methods used for the seven sources listed in Section 1.1

Table 3-1. Test Matrix, Air Emission Testing
Enviva Pellets, Wiggins, Mississippi

Analyte	Test Method	Number of Runs	Run Length	Analytical Method
Acetaldehyde, Acrolein, Formaldehyde, Methanol, Phenol, Propionaldehyde	EPA Method 320	3	60 min	FTIR
Gas Flow	EPA Method 2	3	60 min	Manometer
Gas Molecular Weight, Oxygen, Carbon Dioxide	EPA Method 3	3	60 min	Fyrite® Analyzer
Gas Moisture	EPA Method 4	3	60 min	Gravimetric
Total Hydrocarbons (THC)	EPA Method 25A	3	60 min	FID

The tests were conducted on Thursday, October 10 through Sunday October 13, 2013. During all of the tests, the plant operated with a 60% softwood/40% hardwood feed.

3.2 Test Results

The VOC and organic HAP test results and calculated annual emission rates are summarized in Tables 3-2 through 3-8. VOC and HAP emissions were measured simultaneously at each of the seven emission units tested.

The VOC emissions have been calculated based on the total hydrocarbon data provided by Method 25A. The Method 25A data have been converted from a wet to a dry basis to account for the moisture in the stack gas stream. Total hydrocarbon concentrations (THC) has been used as a surrogate for VOCs.

The VOC emission calculations do not include any corrections for methane, ethane, or acetone despite the fact that these compounds are detected by Method 25A but are not classified as VOCs. Accordingly, the reported VOC emissions are biased to higher-than-true levels to the extent that these three compounds affected the Method 25A results.

The Method 25A data reflect the combined THC concentrations consisting of (1) alpha and beta pinene, (2) numerous other terpenes such as limonene and 3-carene, and (3) the organic HAPs. The organic HAP emissions discussed later in this report are also classified as VOCs and represent a small fraction of the total VOC emissions reported.

Method 320 was used to measure six organic compounds. Several of the organic compounds were below the detection limits of Method 320 in this matrix of gaseous constituents. These non-detection concentrations are designated by shading in Tables 3-2 through 3-8.

3.3 Emissions Data Evaluation

Method 25A VOC Concentrations

The VOC emissions from the various process units ranged from 0.10 to 1.79 pounds per ODT. VOC emissions were highest from the two dryers.

Dryer 1 had an emission rate of 1.79 pounds per ODT, and Dryer 2 had an emission rate of 1.03 pounds per ODT. This is equivalent to a 79% difference despite the fact that the dryers were handling similar hardwood/softwood blends and were generating wood with similar outlet moisture levels. The dryer outlet temperatures were also similar. These data clearly demonstrate that VOC emissions from the dryers are due to two factors: (1) the performance of the wood waste burner supplying the heat to the dryer, and (2) volatilization of VOCs from the wood in the dryer. Of these two sources, contributions of the burner are most important.

Due to the dominance of the burner in establishing the VOC emission rates from the combined burner/dryer source, the importance of the hardwood/softwood ratio is less important than previously thought. Changes in the hardwood/softwood ratio do not necessarily affect the VOC emissions from the burner.

The emissions of organic HAP compounds are not sensitive to the hardwood/softwood ratio. The data summarized in the Phase I report indicate that emissions of organic HAPs decreased slightly as the softwood content increased from 10% to 100%.

The data summarized in Tables 3-2 through 3-8 indicate that the total VOC emissions from the Wiggins Plant exceed 100 tons per year calculated as carbon. These tests confirm that the plant is a major source for VOCs.

The accuracy of the VOC data is demonstrated by a Method 25A response factor of approximately 1 for the group of compounds present in the gas stream. The Method 25A response is expressed in terms of a response factor that is defined as the observed Method 25A concentration divided by the true concentration. The Method 25A FID has a response factor close to 1.0 for a large set of organic compounds. Some high molecular weight organics have a response factor larger than 1, and in some cases, approaching 1.5. For these compounds, Method 25A is biased to higher-than-true concentrations. Some low molecular weight highly oxygenated organic compounds such as methanol and formaldehyde have very low response factors in the range of 0.1 to 0.4. For these compounds, Method 25A is biased to lower-than-true concentrations.

As part of the laboratory tests reported to MDEQ in Enviva's Phase I emission study dated July 31, 2013[4] (the "Phase I Study"). Air Control Techniques, P.C. has taken the following two independent approaches in assessing the Method 25A response factors: (1) direct measurement of the Method 25A response factor using an alpha-pinene gas standard, the dominant organic compound measured during the laboratory tests and (2) a comparison of the Method 25A concentration data with the summed concentrations of all of the specific organics measured simultaneously using NCASI Method 98.01 and EPA Method 18. The results of these response factor analyses are presented in Tables 3-9 and 3-10.

Table 3-9. Alpha-Pinene Method 25A Response Factor[1]	
Alpha-Pinene Gas Standard, as $C_{10}H_{16}$	259 ppm
Alpha-Pinene Gas Standard, as C_3	863 ppm
FID Response, as C_3	888 ppm
Response Factor as C_3	1.03

1. Note: This table was included in the Phase I Study report to MDEQ.

Table 3-10. Calculated Method 25A Response Factors in Phase I Laboratory Tests[1]					
Run	Process Type	Softwood Content, %	Method 25A versus Combined NCASI 98.01 and Method 18	Dominant Compounds	Other Important Compounds
4	Dryer	10	0.72	α-and β-Pinene	Acetone, Methanol
5	Dryer	10	0.70	α-and β-Pinene	Acetone, Methanol
6	Dryer	10	0.75	α-and β-Pinene	Methanol, Formaldehyde
21	Dryer	10	1.23	α-and β-Pinene	Acetone, Methanol
22	Press	10	1.05	α-and β-Pinene	Acetone, Methanol
7	Dryer	70	0.85	α-and β-Pinene	Acetone
8	Dryer	70	0.90	α-and β-Pinene	Acetone
9	Dryer	70	1.02	α-and β-Pinene	Acetone
10	Dryer	70	0.91	α-and β-Pinene	Acetone
24	Press	70	1.51	α-and β-Pinene	Acetone, Methanol
11	Dryer	100	0.99	α-and β-Pinene	Acetone
12	Dryer	100	0.96	α-and β-Pinene	Acetone
13	Dryer	100	0.85	α-and β-Pinene	Acetone
14	Dryer	100	0.87	α-and β-Pinene	Acetone
16	Dryer	100	1.09	α-and β-Pinene	Methanol, Acetone
19	Dryer	100	1.21	α-and β-Pinene	Methanol, Acetone
20	Press	100	1.13	α-and β-Pinene	Methanol, Acetone
Test Program Average			0.98		

1. Note: This table was included in the Phase I Study report to MDEQ.

The excellent agreement between the Method 25A total concentration and the combined concentrations of all of the organics measured by NCASI 98.01 and EPA Method 18 demonstrate that Method 25A is an appropriate VOC measurement technique for wood pellet production facilities.

Method 320 HAP Concentrations

At the maximum permitted production limit of 185,550 ODT per year, five of the six organic HAP compounds measured by Method 320 were each emitted at a rate less than 10 tons per year. The methanol emission rate at this production level was 11.0 tons per year. The combined emission rate of all six organic HAPs was slightly over 31.1 tons per year at the maximum permitted production rate.

The list of HAPs specifically included in the test protocol included methanol, acetaldehyde, acrolein, formaldehyde, phenol, and propionaldehyde. This list was compiled based on (1) the organic compounds identified in laboratory analyses of pellet production facilities emissions, (2) previous emission tests conducted in the Pellet Manufacturing Industry, and (3) organic HAPs identified in studies of other wood products industries—specifically, MDF production.

The results of this test program indicate that this list of HAPs compounds needs to be amended. Phenol was detected at low concentration in only one of the tests of the seven process units. Furthermore, propionaldehyde was not detected in most of the tests.

The low to non-detectable phenol emissions data are consistent with the results of the Phase I Study. Phenol was not identified at detectable concentrations in any of the laboratory studies summarized in the Phase I Study report. The emission rates of phenol reported in the November 2012 Wiggins report [2] ranged from 0.0002 to 0.0018 pounds per hour—all insignificant emission rates. Phenol was also not listed in previous emission tests reviewed in preparation for this test program. Phenol was included in the test protocol primarily because other researchers such as Beauchemin and Tampier,[5] Milot, [6] and Milot and Mosher [7] listed phenol due to its inclusion in tests conducted at MDF and particleboard facilities. However, phenol emissions in MDF and particleboard production are due to the use of phenolic resins and similar binders. There is no reason to expect any appreciable phenol formation in pellet production considering (1) the lack of binders of any type in pellet production, (2) the higher moisture levels in pellet production as compared to MDF and particleboard processes, and (3) the lower material temperatures in pellet process equipment. Air Control Techniques, P.C. has assigned zero values to non-detected concentrations.

Acetaldehyde, propionaldehyde, and acrolein had very low concentrations in most of the emission tests summarized in this report. The IR absorption spectra of both water and the terpene compounds overlap the absorption spectra of acetaldehyde, propionaldehyde, and acrolein. Accordingly, the reported concentrations of these three compounds are biased to higher-than-true levels to the extent that this interference could not be avoided by Method 320 spectral absorption modeling. Zero values have been assigned when these concentrations were below detection limits of Method 320 due, in part, to the interference bias.

The use of zero values for non-detected compounds is an appropriate approach for any source, such as pellet production, where there are a few dominant compounds (i.e. methanol and formaldehyde) and a large number of possible compounds at extremely low levels such as phenol, acetaldehyde, and propionaldehyde. The use of non-detect or one-half non-detect concentrations in emission calculations for a large number of compounds potentially present at trace levels inherently makes any source “major” regardless of the actual emissions, size, or operations characteristics of the emission unit.

3.4 VOC and Organic HAP Emission Summary

Table 3-11 summaries annual emissions of VOC and organic HAP compounds. The annual emission rates are based on operation at the permit limited production rate of 185,550 ODT.

As discussed, the plant has never operated at the maximum permitted production limit of 185,550 ODT per year. The VOC and HAP emissions based on the newly proposed maximum production rate of 140,000 ODT/year are summarized in Table 3-12.

The VOC emissions at the lower production rate are well below the PSD threshold of 250 tons per year. The combined HAPs emissions are less than 25 tons per year, and none of the HAPs are emitted at more than 10 tons per year. Accordingly, at this production limit, the plant is not above the major source threshold for HAPs.

Table 3-11. Total Emissions at Plant Permit Limit of 185,550 ODT/Year									
Analyte	Dryer 1	Dryer 2	Dry Hammermill 2	Green Hammermill	Pellet Cooler 1	Pellet Cooler 2	Aspirator	Dry Hammermill 1	Total

4. SAMPLING LOCATIONS

4.1 Dryer # 1 Stack Sampling Location

The Dryer 1 sampling location meets EPA Method 1 location requirements as indicated in Figure 4-1. Twelve sampling points were used to measure the gas flow rate.

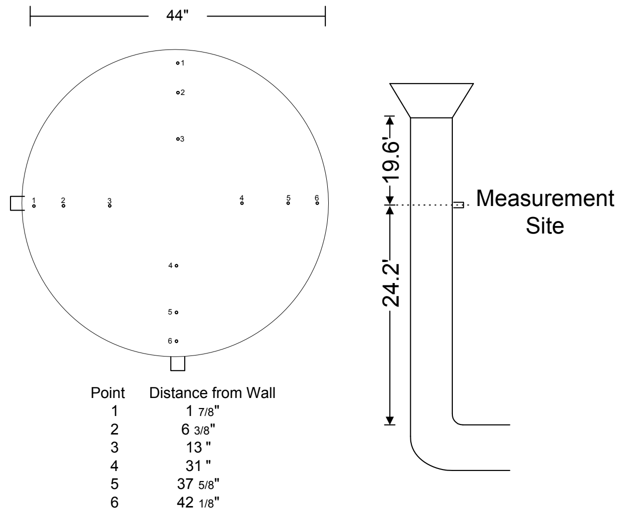

Figure 4-1 Dryer # 1 Stack Sampling Location

The downstream[1] flow disturbance is the stack discharge. The upstream flow disturbance is the duct from the fan entering the base of the stack.

During the sampling program, only the port facing south was used. The port facing east was blocked by the stack support equipment and the Dry Hammermill 1 ductwork. Test personnel reached all of the sampling ports by angling the probe inserted through the south port.

No cyclonic flow conditions were observed in the Dryer 1 stack. The point-by-point cyclonic flow checks indicated an average flow angle 3.1 degrees. This meets the requirements of Section 11.4 of Method 1. A photograph of the Dryer 1 stack is shown in Figure 4-2.

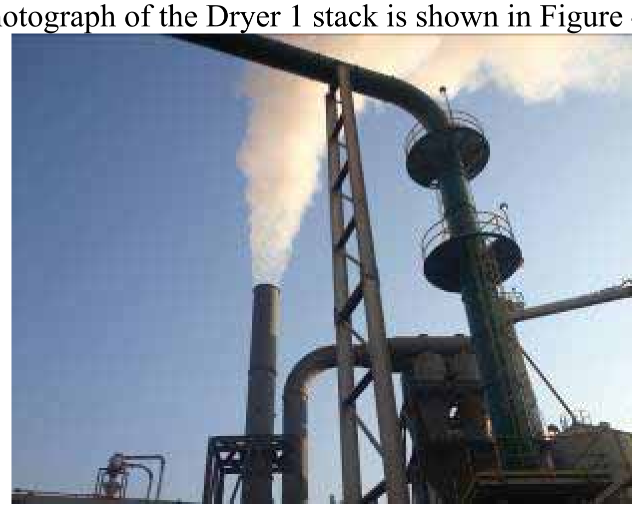

Figure 4-2. Photograph of the Dryer 1 Stack

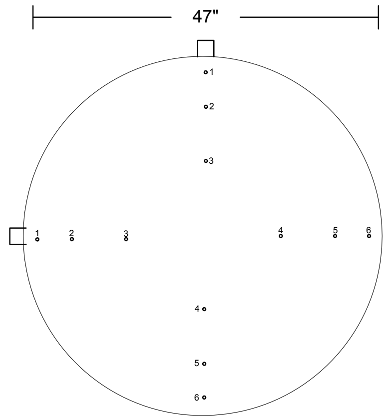
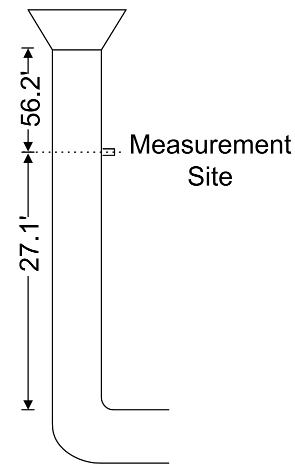
[1] "Upstream" and "downstream" are defined based on the sampling location as the reference point.

4.2 Dryer 2 Stack Sampling Location

The Dryer 2 sampling location meets EPA Method 1 location requirements as indicated in Figure 4-2. Twelve sampling points were used to measure the gas flow rate.





Point	Distance from Wall
1	2 1/8 "
2	6 7/8 "
3	13 7/8 "
4	33 1/8 "
5	40 1/8 "
6	44 7/8 "

Figure 4-3. Dryer # 2 Stack Sampling Location

The downstream flow disturbance is the stack discharge. The upstream flow disturbance is the duct from the fan entering the base of the stack.

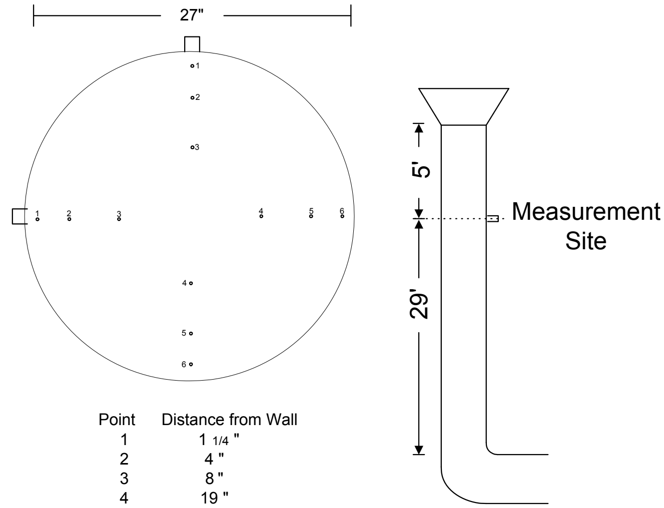
During the sampling program, only the port facing west was used in the test program. The port facing north could not be reached without potentially interrupting operation of the CEM sampling equipment. Test personnel reached all of the sampling ports by angling the probe inserted through the west port.

No cyclonic flow conditions were observed in the Dryer 2 stack. The point-by-point cyclonic flow checks indicated an average flow angle 2.4 degrees. This meets the requirements of Section 11.4 of Method 1. A photograph of the Dryer 2 stack is shown in Figure 4-4.

Figure 4-4. Photograph of the Dryer 2 Stack

4.3 Dry Hammermill 2 Cyclone Outlet Sampling Location

The Dry Hammermill 2 sampling location meets EPA Method 1 location requirements as indicated in Figure 4-5. Twelve sampling points were used to measure the gas flow rate.



Point	Distance from Wall
1	1 1/4 "
2	4 "
3	8 "
4	19 "
5	23 "
6	25 3/4 "

Figure 4-5. Dry Hammermill 2 Sampling Location

The downstream flow disturbance is an elbow in the fan outlet duct. The upstream flow disturbance is the fan discharge. During the sampling program both ports were accessible.

No cyclonic flow conditions were observed in the Dry Hammermill 2 stack. The point-by-point cyclonic flow checks indicated an average flow angle of 0.6 degrees. This meets the requirements of Section 11.4 of Method 1. A photograph of the Dry Hammermill 2 stack is shown in Figure 4-6.

Figure 4-6. Photograph of the Dry Hammermill 2 Sampling Location

4.4 Pellet Mill Aspiration System Sampling Location

The Pellet Mill Aspiration System has a six-inch diameter. Gas flow rate sampling was performed in general accordance with EPA Method 1A. The sampling port location met EPA Method 1 location requirements as indicated in Figure 4-7. A total of eight sampling points were used—four in a horizontal direction and four reached by an angled probe in the vertical direction. Due to the position of the duct and surrounding equipment, it was not possible to sample from any orientation except horizontal.

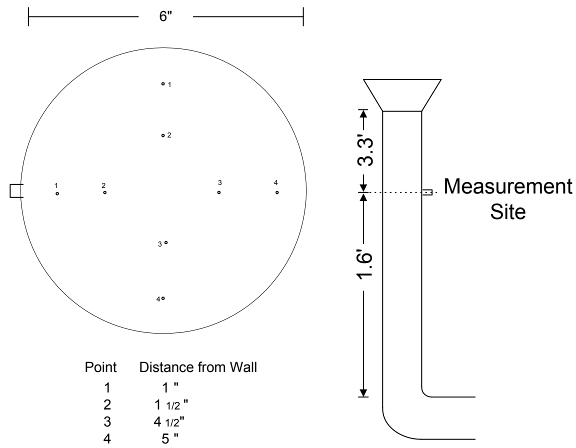


Figure 4-7. Pellet Mill Aspiration System Sampling Location

The upstream flow disturbance was an entry duct from Pellet Mill 6. The downstream flow disturbance was the fan inlet.

No cyclonic flow conditions were observed in the Pellet Mill Aspiration System outlet duct. The point-by-point cyclonic flow checks indicated an average flow angle of 0.75 degrees. This meets the requirements of Section 11.4 of Method 1. A photograph of the Pellet Mill Aspiration System sampling location is shown in Figure 4-8.

Figure 4-8. Photograph of the Pellet Mill Aspiration System Sampling Location

4.5 Pellet Mill 2 Cooler Stack Sampling Location

The Pellet Mill 2 Cooler stack sampling location meets the minimum requirements specified in Method 1, Section 11.1. As indicated in Figure 4-9, the downstream[2] disturbance (stack exit) is 0.6 stack diameters from the sampling location. The minimum allowed by Method 1 is 0.5 stack diameters. The upstream flow disturbance was the fan outlet duct. The distance to the upstream flow disturbance meets Method 1 requirements. Both sampling ports were used in the test program.

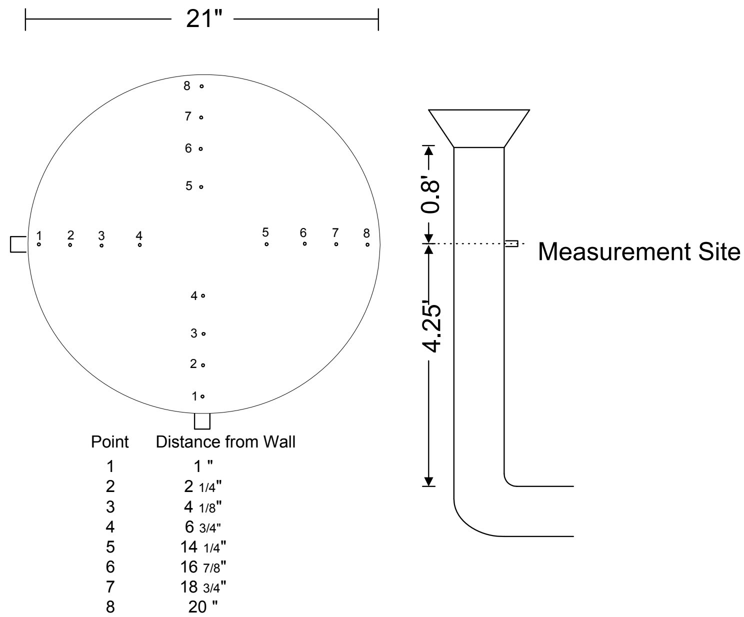

Figure 4-9. Pellet Mill 2 Cooler Stack Sampling Location

No cyclonic flow conditions were observed in the Pellet Mill 2 Cooler stack. The point-by-point cyclonic flow checks indicated an average flow angle of 1.5 degrees. This meets the requirements of Section 11.4 of Method 1. A photograph of the Pellet Cooler 2 stack is shown in Figure 4-10

Figure 4-10. Photograph of the Pellet Cooler 2 Stack

[2] The terms “upstream” and ‘downstream” are defined based on the test location as the reference point. A recent change in a figure in EPA Method 1 has these terms incorrectly stated.

4.6 Pellet Mill 1 Cooler Stack

The Pellet Mill 1 Cooler stack sampling location meets the minimum requirements specified in Method 1, Section 11.1. As indicated in Figure 4-11, the downstream disturbance (stack exit) is 0.6 stack diameters from the sampling location. The minimum allowed is 0.5 stack diameters. The upstream flow disturbance is the fan outlet duct. The distance to the upstream flow disturbance meets Method 1 requirements. Four of the six sampling ports were used in the test program. The plugs in two of the ports could not be removed.

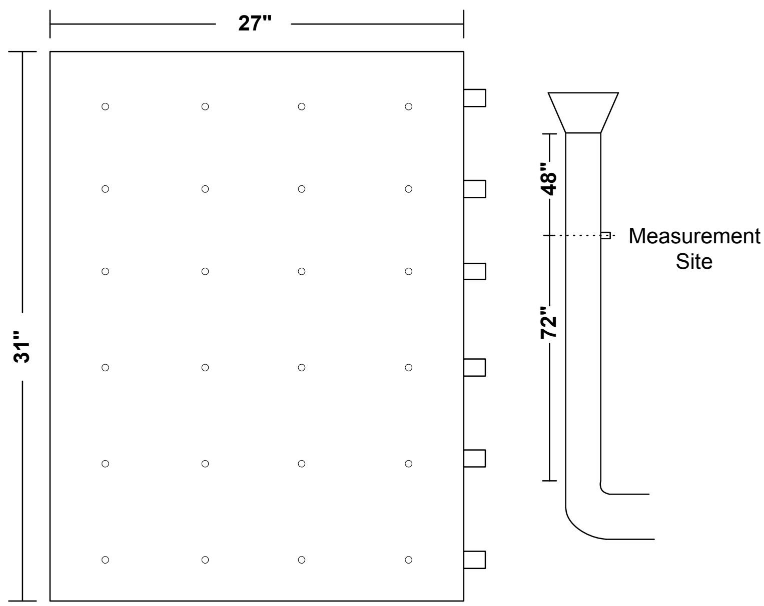

Figure 4-11. Pellet Mill 1 Cooler Stack Sampling Location

No cyclonic flow conditions were observed in the Pellet Mill 1 Cooler stack. The point-by-point cyclonic flow checks indicated an average flow angle of 2.0 degrees. This meets the requirements of Section 11.4 of Method 1. A photograph of the Pellet Mill 1 Cooler Stack is shown in Figure 4-12.

Figure 4-12. Photograph of the Pellet Mill 1 Cooler Stack

4.7 Green Hammermill Stack Sampling Location

The Green Hammermill stack sampling location shown in Figure 4-13 meets the minimum requirements for a downstream flow disturbance specified in Method 1, Section 11.1. The upstream flow disturbance is the fan outlet duct. The downstream flow disturbance is the stack discharge. The distance to the upstream flow disturbance meets Method 1 requirements. Only one sampling port could be reached safely. All of the sampling ports were reached by angling the Pitot tube inserted through the port facing south.

Figure 4-13. Green Hammermill Stack Sampling Location

No cyclonic flow conditions were observed in the Green Hammermill stack. The point-by-point cyclonic flow checks indicated an average flow angle of 1.7 degrees. This meets the requirements of Section 11.4 of Method 1. A photograph of the Green Hammermill stack is shown in Figure 4-14.

Figure 4-14. Photograph of the Green Hammermill Fan Inlet

5. TESTING PROCEDURES

5.1 Flue Gas Velocity and Volumetric Flow Rate - EPA Method 2

The flue gas velocities and volumetric flow rates during all of the emission tests were determined according to the procedures outlined in U.S. EPA Reference Method 2. Velocity measurements were made using S-Type Pitot tubes conforming to the geometric specifications outlined in Method 2. Accordingly, each Pitot was assigned a coefficient of 0.84. Velocity pressures were measured with fluid manometers. Effluent gas temperatures were measured with chromel-alumel thermocouples attached to digital readouts.

5.2 Flue Gas Composition and Molecular Weight - EPA Method 3

Flue gas analyses and calculation of flue gas dry molecular weights were performed in accordance with EPA Method 3. A stainless steel probe was inserted into the gas stream to collect a representative sample of the flue gas during each test run. The samples were analyzed using a Fyrite gas analyzer. Moisture was removed from the sample gas by means of a knockout jar located prior to the sample pump.

5.3 Flue Gas Moisture Content - EPA Method 4

The flue gas moisture content was determined in conjunction with each test run according to the sampling and analytical procedures outlined in EPA Method 4. Wet impinger sampling trains were used to withdraw and analyze the stack gas. The impingers were connected in series and contained water in the first two impingers followed by an empty impinger and then a silica gel impinger. The impingers were contained in an ice bath to assure condensation of the flue gas stream moisture. Any moisture that was not condensed in the impingers was captured in the silica gel; therefore, all moisture was weighed and entered into moisture content calculations.

5.4 Total Hydrocarbons – EPA Method 25A

Continuous emissions monitoring was conducted for volatile organic compounds. The sampling and analytical procedures for VOCs were conducted in accordance with EPA 25A. The CEM system consisted of a sample acquisition system, the THC emission monitor, and a data acquisition system (DAS). A California Analytical Model 300 flame ionization detector was used for the Method 25A tests.

The sample acquisition system included an in-stack probe, a heated out-of-stack glass mat filter for particulate matter removal, a heat-traced Teflon® sample line, a Teflon® heated-head pump, and a gas manifold board. All components of the sample acquisition system that contacted the sampled gas were constructed of Type 316 stainless steel or Teflon®. The sample gas was continuously extracted from a central point within the duct at a constant rate (±10%) for the duration of each test run. The wet, filtered gas was transported to a heated-head pump located at the CEM laboratory. The sample gas was sent directly to the VOC analyzer. Care was taken to ensure that the sample gas was greater than 250°F during transport from the stack to the VOC monitor. All pretest and posttest calibration procedures were performed as outlined in the EPA Reference Method 25A.

Total organic hydrocarbon concentrations were measured on a wet basis using a California Analytical 300 FID continuous emission monitor. The THC concentrations were monitored on a propane (C_3) basis using a flame ionization detector (FID). The FID was fueled by a gas mixture consisting of 40% helium and 60% hydrogen to reduce the effect of oxygen synergism. The

THC analyzer was calibrated with a set of at least four gas standards. Calibration tests were performed prior to and following each test run.

Outputs from the individual emission monitors were connected to a computerized data acquisition system. Outputs from the analyzer were sent to a portable computer via a National Instruments™ FieldPoint controller. The signals were downloaded to a STRATA© software program every two seconds. The two-second readings were averaged for the duration of the test run.

Total mass emissions of VOCs were determined based on the Method 25A total hydrocarbon concentration data. The mass emissions were expressed on a pounds mass of carbon per hour.

5.5 Organic HAP Compounds – EPA Method 320

Testing for wet-basis organic HAP concentrations was conducted by extractive Fourier transform infrared (FTIR) spectroscopy using EPA Method 320 (40CFR, Part 63, Appendix A). Sample gas was continuously passed through the sampling system, which included an in-stack probe, a heated out-of-stack glass mat filter for particulate matter removal, a Teflon® heat-traced sample line, a MIDAC Fourier Transform Infrared (FTIR) spectrometer, a Teflon® heated-head pump, and a gas manifold board as shown in Figure 5-1. All components of the sample acquisition system that contacted the sampled gas were Type 316 stainless steel or Teflon®. All components of the sampling system and the FTIR cell were maintained at or above 120° C. Air Control Techniques, P.C. took great care to ensure that the sampling system contained no “cold spots” to prevent organic HAP loss. The sampling rate was maintained at approximately 10 liters per minute.

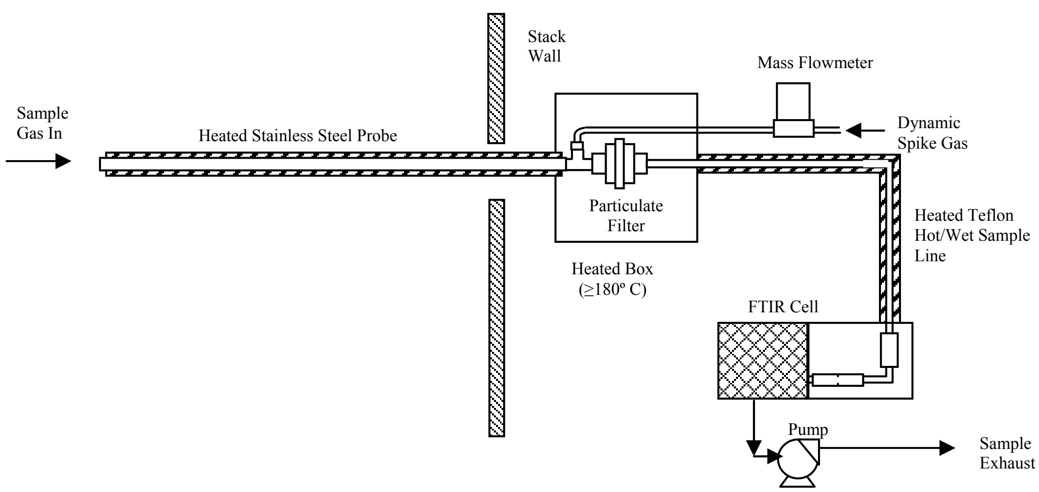

Figure 5-1. Method 320 Organic HAP Sampling System

The FTIR system included a MIDAC Corporation I-1301 spectrometer equipped with a heated, nominal 10-meter path absorption cell, a potassium bromide (KBr) beam splitter, zinc selenide (ZnSe) non-hygroscopic windows, and a liquid nitrogen-cooled Mercury Cadmium Telluride detector. Measurements were made using a MIDAC Model I-1301 high resolution Michelson interferometer with AutoQuant Pro software. Sample gas continuously passed through the sampling system, and sample spectra (based on 50 co-added interferograms) were recorded every minute. The system's nominal spectral resolution was 0.5 cm^{-1}. Samples and standards were analyzed at temperatures greater than 120°C and near ambient pressures.

The inside walls of the cells were polished stainless steel to minimize interaction of the sample with the cell walls, and the cell mirrors were of bare gold. The gas pressure in the FTIR sample cell was monitored with a pressure transducer connected directly to the sample cell. The heated sample cell was wrapped in an insulating thermal jacket, and the temperature was controlled with type J thermocouples. The absorption cell volume was approximately 2 liters.

The FTIR system was operated via a portable computer, and a data archive storage system (USB Mass Storage Drive) was used for data backup. All interferograms, single beams, absorbance spectra, and background single beams were stored and have been archived. The filename, time, pressure and temperature of the sample cell, scan rate, background identification and other pertinent information was recorded by hand during the test program.

Air Control Techniques used the program AutoquantPro™ Version 4.5.0.195, (©Midac Corporation, 2012) to collect and analyze all the infrared field data. The program allows the development and storage of analytical "methods" for analysis of spectral data (absorbance) files. The reference spectra used for these analyses were developed by MIDAC Corporation, EPA, and Enthalpy Analytical, Inc. One "model" was developed for determining the absorption path length and one additional "method" for determining the concentrations of the target compounds for each source.

The concentration uncertainty reported by AutoquantPro is called the Standard Error of the Estimated Concentration, or SEC; it is also known as the Marginal Standard Deviation. The uncertainties in the concentration are proportional to the square root of the sums of the squares of the residual. After the residual spectrum is obtained, which we will call R, the error variance for the case of a single reference spectrum is calculated as follows.

$$\sigma^2 = \frac{\sum_i R_i^2}{(n-1)}$$

Where n is the number of observations. The SEC is given by the following.

$$SEC = \frac{\sigma\, C}{\sqrt{\sum_i \mathrm{A}_i^2}}$$

Where **A** is the spectrum and **C** is the known concentration of the reference.

The 95% confidence interval is 1.96 times the SEC.

6. QUALITY ASSURANCE

6.1 Method 1 Quality Assurance

All S-type Pitot tubes used in this project conformed to EPA guidelines concerning construction and geometry. Pitot tubes were inspected prior to use. Information pertaining to S-type Pitot tubes is presented in detail in Section 3.1.1 of EPA Publication No. 600/4-77-027b. Only S-type Pitot tubes meeting the required EPA specifications were used in this project.

The thermocouples used in this project were calibrated using the procedures described in Section 3.4.2 of EPA Publication No. 600/4-77-027b. Each temperature sensor was calibrated at a minimum of three points over the anticipated range of use against NIST-traceable mercury in glass thermometer.

6.2 Method 4 Quality Assurance

Pretest and posttest leak checks were conducted on each Method 4 sampling train used. The observed leak rates for the sampling trains were below 0.02 actual cubic feet per minute as required by Method 4.

All dry gas meters were fully calibrated to determine the volume correction factor prior to field use. Post-tests calibration checks were performed as soon as possible after the equipment was returned to the laboratory. Pre-and post-test calibrations agreed within ±5 percent. The calibration procedure is documented in Section 3.3.2 of EPA Publication No. 600/4-77-237b.

The scales used at the test location to determine flue gas moisture content were calibrated using a standard set of weights.

6.3 Method 25A Quality Assurance

At the beginning of the test day, a linearity calibration test was performed on each analyzer. The continuous emission monitoring instrument response did not differ by more ±5 from the propane calibration standard. Linearity results for the test program are provided in Table 6-1 through 6-8.

Prior to and following each test run, a system calibration test was performed. The system test was performed to verify that the sampling system did not contain leaks (system bias) and to measure a change in analyzer response during the test program (system drift). The system bias was less than ±5% of full-scale, and system drift was less than ±3% of full scale. System calibration results for the test program are provided in Tables 6-1 through 6-8.

6.4 Method 320 Quality Assurance

Air Control Techniques, P.C. performed daily quality assurance checks. Background scans and calibration transfer standard (CTS) spectra tests were performed prior to and following each test series. An analyte spike was performed using methanol.

The flow rate at the outlet of the pump was measured while the probe was plugged to verify that the sampling system was leaks. The flow rate was less than 200 ml/min.

The FTIR cell was tested for leaks by closing the value while the cell was at minimum absolute pressure.

Background Spectra

Sample spectra were divided point-by-point by a 128-scan background recorded using N_2. The single beam spectrum was constantly monitored, and a new background was generated approximately following each test series or when residual and absorbance spectra indicated component build-up on the optical surfaces or alignment-related baseline shifts.

Calibration Transfer Standards and Absorption Path Lengths

A cylinder of 100 ppm ethylene in nitrogen served as the CTS. A CTS gas was introduced to the FTIR and allowed to reach steady state. The CTS was used to determine effective cell path length based on comparisons of the “field” CTS spectra to a laboratory CTS spectrum recorded by MIDAC. As shown in Table 6-9, the maximum path length deviation was less than 5% of the average.

Table 6-9. CTS Results Summary

Date	Time	CTS Scan (pathlength)	SEC (ppm)	Cell Press. (psi)	Cell Temp (deg C)	Deviation from Previous	Deviation from Average
10-Oct	806	8.78	0.137	14.7	121	NA	-0.6%

	Average	8.725	0.133				

Background Spectra

On-site test personnel performed matrix spiking using a certified calibration standard of methanol and SF_6. The methanol gas standard was introduced into the sampling system upstream of the particulate matter filter at an average dilution ratio of less than 10% of the total sample volume. Analyte spiking was performed to demonstrate the suitability of the sampling system. The dilution factor was calculated based on the ratio of the SF_6 tracer gas analyzed directly by the FTIR and the in-stack measured concentration.

$$\frac{SF_6 \text{ during spike}}{SF_6 \text{ direct}} = DF$$

The recovery was calculated using the mean concentration of the spiked analyte (S_m), the native concentration of the analyte in the stack (S_u), the dilution factor (DF), and the cylinder concentration (C_s).

$$\text{Recovery}(\%) = \frac{\text{Sm} - \text{Su}\ (1 - \text{DF})}{\text{DFxCs}}$$

As shown in Table 6-10, the percent recovery was 100±30% as required by Method 320.

Table 6-10. Spike Recovery Results Summary						
Direct Cylinder Spike, ppm		System Spiked Gas, ppm		Native Concentration, ppm		Recovery, %
methanol	SF_6	methanol	SF_6	methanol	SF_6	
101.26	2.84	9.867	0.272	0.496	-0.00789	94.6

Minimum Detectable Concentration

EPA Method 320 and the equivalent ASTM Standard D6348-03 specify a number of analytical uncertainty parameters that the analyst may calculate to characterize the FTIR system performance.

QA Review

Before the test program began, an analysis of possible analytical interferents (e.g., H_2O, CO_2, CO, pinenes) based on previous stack test data. Analytical wavelengths were determined to minimize analytical uncertainty and detection limits using reference spectra and the FTIR instrument that was used for the field testing.

At the conclusion of the testing a quality assurance review of the test data was performed. This review included examination of the sample spectra and the quantitative analytical results. It also included spot-checking the analysis results by hand. These examinations included visual comparisons of the sample and reference spectra.

7. PROCESS DOCUMENTATION

Enviva Pellets Wiggins, LLC personnel logged the following process data during each test run of each process unit.

- Throughput in tons per hour (all process units)
- Inlet temperature (dryer)
- Outlet temperature (dryer)
- Cyclone static pressure drop (dryer, hammermill, presses)
- Wood feed % softwood content

Method 1 - Air Control Techniques, P.C.

Date: 10/10/2013

Client	Enviva
Job #	1911
Plant Name	Wiggins
State	Mississippi
City	Wiggins
Sampling Location	Green Hammermill

No. of Ports Available		2
No. of Ports Used		1
Port Inside Diameter, Inches		3
Distance From Far Wall To Outside Of Port, Inches		30
Nipple Length And/Or Wall Thickness, Inches		3
Depth Of Stack Or Duct, Inches		27
Stack Or Duct Width (if rectangular), Inches		
Equiv. Diameter = 2DW/(D+W), Inches		27
Stack/Duct Area, Square Feet (□ x R^2 or L x W)		3.9761
	Upstream	Downstream
Distance to Flow Disturbances, Inches	348	60
Diameters	12.89	2.22

2 diff nipples probe marked to inside of port

Note: If more than 8 and 2 diameters and if duct dia. is less than 24" use 8 or 9 points.

Diameters			
Velocity	UP	Down	Particulate
12	8	2	12
12	7	1.75	12
12	6	1.5	16
16	5	1.25	20
16	2	0.5	24 or 25

Method 1 - Air Control Techniques, P.C.

Date: 10/11/2013

Client	Enviva
Job #	1911
Plant Name	Wiggins
State	Mississippi
City	Wiggins
Sampling Location	Dry Hammermill 2

Note: If more than 8 and 2 diamteters and if duct dia. is less than 24" use 8 or 9 points.

Diameters			
Velocity	UP	Down	Particulate
12	8	2	12
12	7	1.75	12
12	6	1.5	16
16	5	1.25	20
16	2	0.5	24 or 25

No. of Ports Available		2
No. of Ports Used		2
Port Inside Diameter, Inches		0
Distance From Far Wall To Outside Of Port, Inches		22
Nipple Length And/Or Wall Thickness, Inches		0
Depth Of Stack Or Duct, Inches		22
Stack Or Duct Width (if rectangular), Inches		
Equiv. Diameter = 2DW/(D+W), Inches		22
Stack/Duct Area, Square Feet		2.6
(□ x R^2 or L x W)		
	Upstream	Downstream
Distance to Flow Disturbances, inches	52	8
Diameters	2.36	0.36

2 diff nipples probe marked to inside of port

Point Location Data

Point	% of Duct Depth	Distance From Inside Wall	Distance From Outside of Port	
1	3.2	6/8	6/8	1
2	10.6	2 3/8	2 3/8	
3	19.4	4 2/8	4 2/8	
4	32.3	7 1/8	7 1/8	
5	67.7	14 7/8	14 7/8	
6	80.6	17 6/8	17 6/8	
7	89.5	19 6/8	19 6/8	
8	96.8	21 2/8	21 2/8	21

APPENDIX E

Example Calculations

EXAMPLE CALCULATIONS

Run Number: Dryer 1 – Run 1

Stack Gas Temperature, °R

T_s = 460 + ts

T_s = 460 + 146.3 = 606.3 °R

Volume of Dry Gas Sampled at Standard Conditions, Dry Standard Cubic Feet

$$V_{mstd} = [17.64][\gamma][V_m]\left[\frac{\left(P_{bar} + \frac{\Delta H}{13.6}\right)}{T_m + 460}\right]$$

$$V_{mstd} = [17.64][0.9728][33.201]\left[\frac{\left(29.90 + \frac{1.00}{13.6}\right)}{541.3}\right]$$

$V_{mstd} = 31.564\ ft^3$

Volume of Water Sampled, SCF

V_{wstd} = 0.04715 [Weight of Condensed Moisture]

V_{wstd} = 0.04715 [129.5]

$V_{wstd} = 6.106\ ft^3$

Fraction of Water Vapor in Sample Gas Stream

$$\%H_2O = \left[\frac{V_{wstd}}{V_{mstd} + V_{wstd}}\right] \times 100$$

$$\%H_2O = \left[\frac{6.106}{31.564 + 6.106}\right] \times 100$$

$\%H_2O = 16.21$

Dry Mole Fraction of Flue Gas

M_{fd} = 1-%H2O/100

M_{fd} = 1-[16.21/100]

M_{fd} = 0.838

Molecular Weight of Sample Gas, Dry

$M_d = 0.44[\%CO_2]+0.32[\%O_2]+0.28[100-\%O_2-\%CO_2]$

$M_d = 0.44[2.0]+0.32[19.0]+0.28[100-19.0-2.0]$

M_d = 29.08 pounds/pound-mole

Molecular Weight of Sample Gas, Actual Conditions

$M_s = [M_d \text{ x } M_{fd}]+[0.18 \text{ x } \%H_2O]$

M_s = [29.08 x 0.838]+[0.18 x 16.21]

M_s = 27.28 pounds/pound-mole

Average Stack Gas Velocity, Feet/second

$$vs = K_p C_p \left(\sqrt{(\Delta p)}\right)_{avg} \left[\sqrt{\frac{T_s + 460}{P_s M_s}}\right]$$

$$vs = (85.49)(0.84)\left(\sqrt{(0.1.283)}\right)\left[\sqrt{\frac{606.3}{(29.84)(27.28)}}\right]$$

vs = 70.18 feet/second

Wet Volumetric Flue Gas Flow Rate at Stack Conditions, Cubic Feet per Minute

Q_{aw} = 60 x vs x A

Q_{aw} = 60 x 70.18 x 10.56

Q_{aw} = 44,461 Actual Cubic Feet per Minute

Dry Volumetric Flue Gas Flow Rate at Standard Conditions, Cubic Feet per Minute

$$Q_{sd} = 60 \times Mfd \times vs \times A \times \left[\frac{528}{ts + 460}\right]\left[\frac{Ps}{29.92}\right]$$

$$Q_{sd} = 60 \times 0.838 \times 70.18 \times 10.56\left[\frac{528}{606.3}\right]\left[\frac{29.84}{29.92}\right]$$

Q_{sd} = 32,360 Dry Standard Cubic Feet per Minute

Average THC Dry Basis Concentration as Propane

$C_{THCD} = (C_{THCW})/(M_{fd})$

Where: C_{THCd} = dry basis concentration of THC in ppm
M_{fd} = dry mole fraction from Method 4 concurrent run

$C_{THCD} = 66.7 / 0.838 = 79.6$ ppm THC as propane

Average THC Dry Basis Concentration as Carbon

$C_{THCD} = (C_{THCW})$ x $(3) / (M_{fd})$

Where: C_{THCd} = dry basis concentration of THC in ppm
M_{fd} = dry mole fraction from Method 4 concurrent run

C_{THCD} = (66.7) x (3) / 0.838 = 238.8 ppm THC as Carbon

VOC Emission Rate in Pounds Per Hour

$E_{VOC} = (C_{VOC})(Q_{SD})$ (60 min/hr) (C_F)

Where: Q_{SD} = measured flow rate in stack in dscfm
C_F = Conversion factor in lb/scf – ppm
C_F = 3.117×10^{-8} for Carbon

E_{VOC} = (238.8) (32,360) (60 min/hr) (3.117×10^{-8}) = 14.5 lb/hr as Carbon

APPENDIX F

Gas Cylinder Certification Sheets

Airgas

CERTIFICATE OF ANALYSIS
Grade of Product: EPA Protocol

Airgas Specialty Gases
630 United Drive
Durham, NC 27713
919-544-3773 Fax: 919-544-3774
www.airgas.com

Part Number:	E02AI99E15A00A6	Reference Number:	122-124323950-1
Cylinder Number:	CC410934	Cylinder Volume:	146 Cu.Ft.
Laboratory:	ASG - Durham - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22012	Valve Outlet:	590
Gas Code:	APPVD	Analysis Date:	Jul 02, 2012

Expiration Date: Jul 02, 2015

Certification performed in accordance with "EPA Traceability Protocol (Sept. 1997)" using the assay procedures listed. Analytical Methodology does not require correction for analytical interferences. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.
Do Not Use This Cylinder below 150 psig.i.e. 1 Mega Pascal

Airgas

CERTIFICATE OF ANALYSIS
Grade of Product: EPA Protocol

Airgas Specialty Gases
630 United Drive
Durham, NC 27713
919-544-3773 Fax: 919-544-3774
www.airgas.com

Part Number:	E02AI99E15A0333	Reference Number:	122-124344171-1
Cylinder Number:	CC148274	Cylinder Volume:	146 Cu.Ft.
Laboratory:	ASG - Durham - NC	Cylinder Pressure:	2015 PSIG
PGVP Number:	B22012	Valve Outlet:	590
Gas Code:	APPVD	Analysis Date:	Nov 05, 2012

Expiration Date: Nov 05, 2020

Certification performed in accordance with "EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (May 2012)" document EPA 600/R-12/531, using the assay procedures listed. Analytical Methodology does not require correction for analytical interference. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.

Do Not Use This Cylinder below 100 psig, i.e. 0.7 megapascals.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty
PROPANE	850.0 PPM	836.9 PPM	G1	+/- 1% NIST Traceable
Air	Balance			

CALIBRATION STANDARDS

Type	Lot ID	Cylinder No	Concentration	Expiration Date

CERTIFICATE OF ANALYSIS

Grade of Product: CERTIFIED STANDARD-SPEC

Part Number:	X03NI99C15A1FX5	Reference Number:	83-124390037-1A
Cylinder Number:	CC90659	Cylinder Volume:	144.4 CF
Laboratory:	ASG - Port Allen - LA	Cylinder Pressure:	2015 PSIG
Analysis Date:	Sep 30, 2013	Valve Outlet:	350S
Lot Number:	83-124390037-1A		

Product composition verified by direct comparison to calibration standards traceable to N.I.S.T. weights and/or N.I.S.T. Gas Mixture reference materials.

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration (Mole %)	Analytical Uncertainty
SULFUR HEXAFLUORIDE	3.000 PPM	3.127 PPM	+/- 5%
METHANOL	100.0 PPM	91.71 PPM	+/- 2%
NITROGEN	Balance
