FOGH is a broad-based 100% volunteer tax-exempt 501(c)(3) citizens group made up of crabbers, fishers, oyster growers and caring citizens. The mission of FOGH is to foster and promote the economic, biological, and social uniqueness of Washington's estuaries and ocean coastal environments. The goal of FOGH is to protect the natural environment, human health and safety in Grays Harbor and vicinity through science, advocacy, law, activism and empowerment. Your tax-deductible contribution can help FOGH maintain the quality of Central and Southwest Washington's coastal environment.

Re: Notice of Construction for Pacific Northwest Renewable Energy wood pellet manufacturing facility in Hoquiam, WA (Grays Harbor County)

The undersigned organizations and concerned Cascadians submit these comments strongly opposing the proposed Pacific Northwest Renewable Energy (PNWRE) wood pellet production and storage project. This project will irrevocably harm our climate, communities, and forests. The Notice of Construction Application contains serious errors and omissions, and it does not use the best available science in assessing the air impacts of this project. We urge you to reject the application and undertake your own analysis of all air emissions caused by this project, in order to comply with the Clean Air Act and the Washington State Environmental Policy Act (SEPA).

We are particularly concerned about the unacceptable public health and safety harms that the PNWRE wood pellet project would pose to the port community of Hoquiam. PNWRE's application indicates many serious errors around hazardous air pollutants (HAPs) and volatile organic compounds (VOCs). The application vastly underestimates HAPs: PNWRE claims the facility will emit only 1.3 tons of HAPs per year, while stack tests and air permit applications of similar size and controls show it will emit at least 40 tons of HAPs. The pollutants, which include formaldehyde, acrolein, and methanol, are toxic or can cause cancer, even in small amounts. In particular, they cause health problems for children, the elderly, and people with asthma or COPD.

PNWRE's application also fails to include any controls for volatile organic compounds (VOCs) in its wet hammermills and employs an irrelevant air toxics Ambient Impact Review. Especially as the proposed facility is within a mile and a half of Emerson elementary school, Hoquiam middle school, and Hoquiam high school, this significant deficiency is reason enough to withdraw the application from notice and comment. PNWRE should be required to submit a case-by-case Maximum Achievable Control Technology analysis. For additional information on the facility's application deficiencies, please find attached a letter from Southern Environmental Law Center (SELC) Clean Air Act experts with significant knowledge of wood pellet permits.

Furthermore, wood pellet storage and handling operations at ports create substantial fire and explosion hazards.

Wood pellet piles are prone to spontaneous combustion, and fine wood dust released during pellet production, transportation and handling can "pose catastrophic fire and explosion hazards." Repeated fires and explosions at wood pellet storage silos at ports across the Southeastern US have harmed residents with air pollution from fires

that have burned for days, weeks, or months, and have injured or killed workers. As one of many examples, a fire at a wood pellet storage silo at Port Arthur, Texas burned for 102 days in 2017, sending smoke into the adjacent neighborhoods and causing the hospitalization of many residents.

Another issue of community concern is the amount of noise that PNWRE will create. According to its operational plan, the PNWRE facility will run virtually non-stop: 24 hours a day, 7 days a week, for 52 weeks. This would mean an increase in heavy truck traffic and hammermill pounding nearly every day. Never-ending noise from a pellet mill that operates nearly 24/7 is a health hazard. In communities with existing facilities in the Southeast, even neighborhoods that are several miles away from the plants can hear the steady pounding of heavy machinery stripping and grinding logs. We urge ORCAA to evaluate the potential noise impacts on local communities – including the schools – that would arise from hundreds of additional daily truck trips through small rural communities and the port area.

While expressing concern for the climate and the environment, PNWRE proposes to build an industrial-scale wood pellet production facility – an industry Washington has yet to experience – and ship the pellets overseas to be burned in converted coal-fired power plants. If built, this project will worsen the climate crisis and harm public health at every stage of the wood harvest, truck transport, production, marine vessel transport, and combustion process. The project would increase logging rates in Washington's forests, both on the Olympic Peninsula and in the Willapa Hills, releasing their stored carbon at a time when we must increase forest protection and forest carbon storage. Significant greenhouse gas emissions and air pollution would be emitted at every step – from cutting forests, trucking cut trees long distances in hundreds of daily trips, chipping wood and producing pellets, shipping pellets overseas to countries in Asia and Europe that currently incentivize woody biomass energy, and burning those pellets in power plants. There is a scientific consensus in the U.S. and internationally that burning wood is not categorically “carbon neutral.” As climate policies catch up with the science, many states and countries are revising their biomass energy policies to reduce or eliminate incentives for wood-burning. If, and when, subsidies disappear, the community will be left with a stranded asset.

Finally, ORCAA cannot rely on the invalid SEPA Determination of Non-Significance (DNS) to meet its own SEPA obligations. The PNWRE DNS review was limited to the immediate environmental impacts of constructing and operating the facility; it is deeply flawed in at least two major respects: (1) it contains serious errors even in its limited calculations with respect to air pollution emissions at the facility, including greenhouse gases, VOCs, and HAPs, and (2) it fails to conduct a lifecycle greenhouse gas analysis of the direct and indirect greenhouse gas impacts of producing, transporting, and burning the wood pellets. ORCAA must deny the NOC Application and conduct its own SEPA review that validly analyzes the significant air pollution caused by this project, including all VOCs, HAPs, and greenhouse gas lifecycle emissions.

Thank you for the opportunity to provide comments in opposition to the proposed project.
